repressing the encroachment of his followers; but on reviving the Danegelt, which had been abolished by Edward the Confessor, the discontents were renewed. These he repressed with his usual vigor, and a temporary calm succeeded. The resistance of two powerful Saxon nobles, Edwin and Morcar, who had formed an alliance with the kings of Scotland and Denmark, and with the prince of North Wales, soon after drew William to the north, where he obliged Malcolm, king of Scotland, to do homage for Cumberland. From this time he treated the English like a conquered people, multiplied confiscations in every quarter, and forced the native nobility to desert the country in great numbers. In 1069 another formidable insurrection broke out in the north, and at the same time the English resumed arms in the eastern and southern counties. William first opposed the storm in the north, and executed such merciless vengeance in his progress that the whole country between York and Durham was turned into a desert; and above 100,000 of both sexes and all ages are said to have perished. There being now scarcely a landed proprietor who had not incurred the forfeiture of rebellion, he put into execution his plan of introducing a total alteration of the state of English law and property, by dividing all the lands into baronies and adopting the feudal system in regard to land tenure and services. He also reduced the ecclesiastical property to a similar system, and, to prevent resistance from the clergy, expelled most of the English church dignitaries, and placed Normans or other foreigners in their stead, Lanfranc being made archbishop. Still further to humble the English, he caused French to be used in the courts of justice and in law proceedings, and ordered it to form a leading part of instruction in all the schools throughout the realm. In 1076 he received a demand from Pope Gregory VII, requiring him to do homage for his kingdom, and to pay the accustomed tribute from England to the Holy See. William denied the homage; nor would he allow the English prelates to attend a general council summoned by Gregory, but consented to the levy of Peter's pence. Toward the end of his reign he instituted that general survey of the landed property of the kingdom, the record of which still exists under the title of 'Domesday Book.' The manner in which he laid waste a large district in Hampshire, where he demolished villages, churches and convents, and expelled the inhabitants for 30 miles round, merely to form the New Forest for hunting, exhibits his indifference to the suffering of his subjects, as well as his love of the chase, which he further protected by a most severe code of game laws. In 1087 he went to war with France, whose king had encouraged a rebellion of Norman nobles, entered the French territory, and committed great ravages, but, by the starting of his horse at Nantes, received an injury which caused his death, at the Abbey of Saint Gervais, near Rouen (1087). He left three sons—Robert, to whom he bequeathed Normandy; William, who inherited England; Henry, who received only his mother's property, and five daughters. William the Conqueror was the most powerful sovereign of his time. He possessed superior talents, both political and martial, and employed them with remarkable

vigor and industry. His passions were, however, strong; his ambition severe and merciless; and his love of sway often led him to disregard all restraints of justice and humanity. Consult Lappenberg, 'England under the Anglo-Norman Kings,' translated by Thorpe (1857); Palgrave, 'Normandy and England,' Vol. III (1864); Freeman, 'History of the Norman Conquest of England' (1867-71); Stubbs, 'Constitutional History of England' (1874); Green, 'Conquest of England' (1884); Freeman, 'William the Conqueror' (1888); Round, 'Feudal England' (1895).

**WILLIAM II**, surnamed **RUFUS**, from his red face, king of England: b. Normandy, 1056; d. New Forest, Hampshire, 2 Aug. 1100. He was the third son of William I and was sent to England by his father the day before the death of the latter with a recommendation to the barons and bishops that he should be the Conqueror's successor. His wishes were respected and William Rufus was crowned at Westminster 26 Sept. 1087. The division of England and Normandy did not, however, please the great barons, who possessed territories in both; and a conspiracy was formed for effecting the deposition of William in favor of his brother Robert; but the conspiracy was repressed with great vigor; the confederate nobles were forced to withdraw to Normandy, and their English estates were confiscated. It is worthy of notice that in this instance a Norman ruler was supported by his English subjects against his Norman ones. Once firmly seated on his throne, William forgot his promises to the English; and the death of Lanfranc, archbishop of Canterbury, freeing him from an authority which he respected, he extended his rapacity to the church, and seized the temporalities of vacant bishoprics and abbeys, to which he delayed appointing successors. In 1090 he made an incursion into Normandy, to retaliate on his brother Robert; but a reconciliation was effected between them. In 1096 Robert mortgaged his dukedom to William for the sum of 10,000 marks to enable him to fit out an expedition and join the crusaders in the Holy Land. William accordingly took possession of Normandy and Maine, although in the case of the latter he was not allowed to do so without a struggle. William Rufus met his death while hunting in the New Forest. His body was found pierced by an arrow, which is generally believed to have been shot, whether accidentally or purposefully cannot be said, by a French gentleman named Walter Tyrrel. Tyrrel immediately galloped to the coast, and embarked for France, where he joined the crusaders. The body was interred without ceremony at Winchester. This event took place when the king was in the 44th year of his age, and 13th of his reign. William Rufus possessed vigor, decision and policy, but was violent, perfidious and rapacious. Consult Freeman, 'Norman Conquest of England,' Vol. V (1876), and his 'Reign of William Rufus' (1882).

**WILLIAM III**, king of England and hereditary stadtholder of Holland: b. The Hague, 4 Nov. 1650; d. Kensington, England, 8 March 1702. He was the son of William II of Nassau, prince of Orange, and his mother was Henrietta Mary Stuart, daughter of Charles I of Eng-

land. Educated by the grand pensionary, John De Witt, he gained the love of the people, who in 1672, when Louis XIV invaded the republic, appointed him at once captain-general, grand-admiral and stadtholder of the United Provinces, after enforcing the abrogation of a resolution which De Witt had got passed in 1667, and which declared that in future no captain-general should at the same time be stadtholder. William's management of the war against France was masterly. In the campaign of 1673 he opened the sluices in the dikes around Amsterdam, inundating the whole of the neighboring district and forcing the French to retire. He was able to keep the enemy in check, and by his policy engaged the empire, Spain and Brandenburg to take part with Holland, so that at the Peace of Nijmegen in 1678 the integrity of Holland was respected. William's whole policy was directed against Louis XIV, for whom he entertained a personal hatred, and to curb the ambition of the French monarch he instituted the league of Augsburg, July 1686, between the emperor, Spain, Sweden and Holland, to which Denmark and some German princes also acceded. His wife, Mary, whom he had married in 1677, was the daughter of James II of England, and presumptive heiress to the throne. Unexpectedly James' second wife gave birth to a son, 10 June 1688, and the greater part of the Parliament and of the nation now feared that the bigoted James would introduce Roman Catholicism as the state religion and subvert the constitution. Rumor also asserted that the prince was supposititious. The Episcopalians and Presbyterians in England, under these circumstances, united, in order, by the aid of Holland, to give Mary the succession to the throne. William foreseeing that England, by the policy of his father-in-law, would become more and more closely connected with France, joined with the great majority of the British nation; and the pensionary Fagel persuaded the States-General to support him with ships and troops for the preservation of British freedom and the Protestant religion. William arrived suddenly at Torbay, 5 Nov. 1688, with a fleet of 500 sail, ostensibly equipped against France, and with 14,000 troops. Upon his landing a great part of the nobility immediately declared for him; and James' soldiers by degrees went over to him. In December the king fled with his family to France, after which William made his entry into London. The two houses of Parliament in convention now declared that James II had broken the fundamental compact between the king and the people, and by withdrawing from the kingdom had abdicated the government. On 13 Feb. 1689 Mary was proclaimed queen, and William, her husband, who had meanwhile gone over to the English Church, was proclaimed king. At the same time the declaration or bill of rights settled the limits of the royal power and the order of succession. Scotland followed England's example; but in Ireland, whither Louis XIV sent James with an army, the majority of the Roman Catholics maintained the cause of the deposed king. But William's victories over the army of James on the Boyne, 1 July 1690, and at Aughrim, 13 July 1691, assisted by the clemency with which he treated the vanquished party, made him master of Ireland. In the war

on the Continent he was less successful. At Steinkirk he was defeated by Marshal Luxembourg in 1692 and at Neerwinden by the same general in 1693; but always succeeded in wresting from the French the fruits of their victories by skilful retreats and marches. Louis was finally compelled to acknowledge him as king of England at the Peace of Ryswick in 1697. The Parliament insisted at that time on the disbanding of nearly the whole army, deeming a standing army incompatible with the security of the constitution. Soon after, the will of Charles II of Spain, who had made the grandson of Louis XIV his heir, induced William to arm all Europe against Louis in the great alliance of The Hague 7 Sept. 1701. But in the midst of these projects he broke his collar-bone by a fall from his horse between Kensington and Hampton Court, 21 Feb. 1702, and died in consequence of the accident. His wife, Mary, had already died childless in 1694. William's manners were too cold and ungracious to allow him to be popular with the English people. Under a reserved exterior he concealed a strong love of renown and power, and to obtain the majority of votes in Parliament made use of bribery. Immersed in politics and war, he had neither leisure nor inclination for literature and art. In conversation he was grave and unattractive; but in business, penetrating, quick and decided; in danger, undaunted; in difficulties, unshaken; in war, bold without ostentation. Consult Burnet, 'History of His Own Times'; Trevor, 'Life and Times of William III' (1835); Macaulay, 'History of England'; Hallam, 'Constitutional History'; Ranke, 'History of England' (1875); Traill, 'William III' (1888); Hippold, 'William III, Prince von Oranien, Erbstatthalter von Holland, König von England' (1900); Lodge, R., 'History of England' (1910).

**WILLIAM IV**, king of Great Britain and Ireland, third son of George III: b. 21 Aug. 1765; d. Windsor, 20 June 1837. From 1779 to 1790 he served in the navy, and after quitting active service was raised successively to all the higher grades of naval command, becoming in 1801 admiral of the fleet. In 1789 he was raised to the peerage with the title of Duke of Clarence. He frequently spoke in the House of Lords, and held the office of lord high-admiral (1827-28). He became heir presumptive to the throne in 1827 and succeeded his brother George IV as king 26 June 1830. On his accession he retained the ministers then in office with assurances of his confidence in their zeal and ability. In the new Parliament, which met in November, the ministry, being left in a minority on a motion of Sir H. Parnell for referring the civil list to a select committee, immediately sent in their resignation; and a Whig administration was formed with Earl Grey at its head. The great events which render his reign memorable are the passage of the reform act, the abolition of slavery in the colonies and the reform of the poor laws. William IV married in July 1818 Adelaide, sister of the Duke of Saxe-Meiningen, by whom he had no surviving children. He had, however, a large family by Mrs. Jordan, the celebrated actress, who was for many years his mistress, while Duke of Clarence. Her liaison with the duke lasted from about 1790 till 1811, when an arrangement was

made by which she and her family were provided for. William IV was succeeded by his niece Victoria. Consult Fitzgerald, 'Life and Times of William IV' (1884); Walpole, 'History of England from the Conclusion of the Great War in 1815' (1878-86); Malloy, J. F., 'The Sailor King, William IV' (1903).

**WILLIAM I, or WILHELM I, emperor of Germany and 7th king of Prussia:** b. Berlin, 22 March 1797; d. there, 9 March 1888. He was the second son of Frederick William III and Louisa of Mecklenburg-Strelitz, and from his earliest years was trained in military exercises. In the campaign of 1813-14 he joined the Prussian forces as captain, receiving then, for his bravery in the field, the "Cross of Saint George" from the Tsar Alexander. On the death of his father in 1840 he became heir presumptive to the throne, and received the title of Prince of Prussia. On the outbreak of the revolution in 1848 he left Berlin for England, but was soon recalled and in the following year proceeded against the insurgents with military vigor and suppressed the insurrection in Baden and the Palatinate. His brother having become incapable of ruling William (1857) was appointed regent, and in January 1861 became king, being crowned at Königsberg in October of the same year. With the assistance of Otto von Bismarck (q.v.) as president of the Cabinet and Von Roon as War Minister, he demanded from the nation a large scheme of army reform, and his foresight in this matter was justified by the Prussian success in the war with Denmark (1864) and the complete overthrow of Austria at Sadowa (1866). The latter war had been brought about by the diplomacy of Bismarck, who now proceeded to form a North-German Confederation with King William as its head, and to conclude a treaty of alliance, offensive and defensive, with the South German States. This growing power of Prussia provoked the jealousy of France, and a crisis was reached in the negotiations concerning the Spanish crown. War was proclaimed between Prussia and France (1870), and the South-German States having declared in favor of the former, King William led the combined German forces through the campaign, which resulted in the defeat of Napoleon at Sedan, and finally in the siege and capitulation of Paris. Meanwhile the North-German Parliament, uniting with the German princes, desired the king to become German emperor. This honor he accepted, and he was crowned as Emperor William I at Versailles on 18 Jan. 1871. After the conclusion of peace with France, and having entered Paris with his army, the emperor returned to Berlin amid great enthusiasm. The latter part of his reign was passed in consolidating the power of the new German empire, and in parliamentary and political conflicts with the Catholic, Liberal and Socialist parties in the state. (See GERMANY). His life was attempted several times. Among biographies are those of Forbes (1888); Smith, G. B., (1887); Strauss (1887); Simon (French, 1887, Eng. trans.); Mareks, 'Kaiser Wilhelm I' (1899). Consult also Von Sybel, 'Die Begründung des Deutschen Reichs' (1889-94; Eng. trans. 1890-92); Malleson, 'Refounding of the German Empire' (1892); Krause, 'Growth of German Unity' (1892); Oncken, 'Das Zeitalter des

Kaisers Wilhelm' (1890-92); Blume, 'Kaiser Wilhelm' (Berlin 1906); Delbruech, F., 'Die Jugend William I' (Berlin 1907).

**WILLIAM II (Friedrich Wilhelm Victor Albert), ex-German emperor and king of Prussia,** commonly called Kaiser Wilhelm, son of Frederick III and Victoria, Princess Royal of Great Britain, and grand-son of William I: b. Berlin, 27 Jan. 1859. At birth he suffered an injury of the left arm which would have disqualified a private person for the army, but nevertheless he received a thorough military education. In 1869 he was enrolled in the army as second lieutenant, in 1874 entered the gymnasium at Cassel, and three years later, as first lieutenant, was admitted to the University of Bonn, where he remained until 1879, his principal studies being political science and law. He married (27 Feb. 1881) Princess Victoria of Schleswig-Holstein-Sonderburg-Augustenburg, and they had issue: six sons and a daughter.

In 1880 William entered the army to which he devoted himself with all earnestness, and in 1885 became colonel of the Hussars of the Guard. In spite of his physical defect he was soon one of the most capable and dashing officers in the army. He also displayed talents in literature and art, which he has pursued in various directions. Strengthened by physical culture and the diversions of hunting and other sports in which he excelled, he came to the throne (15 June 1888) well trained in mind, inured to exacting labors and filled with self-reliance and enthusiasm. Statecraft he had learned in the school of Bismarck (q.v.), and his political and personal ideals were imbued with veneration for his grandfather, whose conviction of "divine right" he embodied in his own view of the imperial office. His personal aggressiveness and military methods gave rise to popular fear of indiscretions whereby he might endanger the peace of Germany and of the world, but he vigorously repelled those suspicions of his motives which led to his designation as the "War-lord." Quite early in his reign Gladstone expressed a fear of what might happen through the young kaiser's indiscretions, but the warning was largely unheeded. During the mortal illness of his father when crown prince, William was called upon to repudiate a charge of conspiracy to keep him from the throne; his own behavior in the three months of his father's reign betrayed no want of filial devotion. Upon his father's death his attitude toward his mother was the subject of much criticism, but on his accession William at once asserted his ideas of personal rulership, which he maintained in theory, and in practice relaxed only in submission to demands of policy. After he had been on the throne two or three years, there were 1,800 Germans in confinement for *lèse majesté*, many of whom had been guilty of most trifling indiscretions in speaking of the young kaiser. This created scandal, and William became aware that it was a bad policy and the law was relaxed. The kaiser soon actively concerned himself with every department of German life, and his personal sway was qualified only by the limitations of the constitution and of public opinion. By travel in which he visited all the principal capitals of Europe, he familiarized himself with inter-

national affairs and became an expert in world-politics. When Moltke died the emperor declared that he had "lost an army," but when he quarreled with Bismarck he showed no misgivings at the loss of the masterful chancellor and reputed creator of the empire, whose retirement he virtually compelled in March 1890. By this act, cleverly characterized by his critics as "dropping the pilot," he made himself more distinctly master of the ship of state. He had evidently begun to have confidence in his own powers and judgment. His able chancellors—Caprivi, Hohenlohe, Bulow—were compliant to the imperial will. Shortly before Bismarck's death the emperor sought reconciliation, and their friendship was partially restored. In some things, notably in maintaining the Triple Alliance, the emperor followed the policy of Bismarck. William measured his strength against all liberalizing parties, and his early solicitude for the laboring classes latterly seemed lost in his bitter antagonism to socialistic elements. Bismarck's *kulturkampf* legacy William sagaciously disposed of through concessions which he turned to profit by making an implicit alliance of the Vatican and the German schools in his anti-revolutionary policies and by remodeling the schools themselves.

With all his alleged autocratic tendencies William undoubtedly sought the aggrandizement of Germany, her industrial and commercial supremacy, colonial expansion and primacy among the great powers. He extended the imperial influence to Turkey and Asia Minor, and strengthened German interests in the Far East and in Africa and South America. He held the press to a strict account; the army and navy, which he would make superior to all others, he kept in strong control. For many years his attitude indicated no menace, rather a promise of protection to the cause of peace, which on more than one occasion he doubtless aided in preserving. Herein his conduct was less aggressive than many of the speeches in which he addressed himself through Germany to the world. The sending of his brother, Prince Henry of Prussia, to the United States, in 1902, did much to promote friendly sentiment and to cover up the unpleasantness aroused in America over the suspicious conduct of the German naval vessels at Manila Bay when Admiral Dewey opened the battle there with the forces of Spain in May 1898.

Notwithstanding William's general good conduct, his occasional outbursts of ambition, and his persistence in building up the army and navy, constantly aroused suspicions of his intentions. From 1895 to 1908 he was continually at war with the Reichstag over the development of naval power. He kept demanding and he got larger and larger appropriations for battleships. He developed the Heligoland stronghold and the Kiel Canal, and managed things so that the Baltic was virtually a German lake. He backed and encouraged Zeppelin in the development of his great unwieldy aircraft, designed to maintain supremacy in the air. The apprehension developed by all these things in the British isles was so marked that 28 Oct. 1908 William permitted an interview to be printed in the *London Telegraph*, in which he explicitly stated that he held the friendliest feelings toward Eng-

land and that his naval policy was intended for the protection of German interests in the Far East. This did not particularly reassure the British and it did create a stir among Eastern diplomats, especially in Japan, China and Russia, as well as among Germans at home.

With all his wonderful abilities for organization and domination William had a streak of indiscretion in many of his public utterances, and was frequently expressive of ideas appropriate to sovereigns of the Middle Ages. He was a firm believer in the divine right of kings and of kaisers in particular. On numerous occasions he spoke of himself as "the instrument of the Lord," and took such excessive interest in the army, so often spoke of his confidence in it, and permitted and even fostered such arrogance in his offices, that the whole world came to recognize that the army ruled Germany and the kaiser ruled the army. The important men were the generals, and the business interests too often centered around the Krupp works.

From other viewpoints William was much admired. He had a keen interest in industrial development, and understood and appreciated the wonders of modern mechanism. He was a musician of no mean ability and fond of the theatre. He had energy plus, and gave more thought to the details of Germany's progress than had any other ruler. Had his ambition stopped here, he had gone down to history as one of the world's most efficient sovereigns, who though ruling with a rod of iron, sought mainly the progress of the country as a whole. But his selfish ambition had no bounds. It is now generally conceded that almost from the first day of his reign he began to plan for world domination; that he dreamed of what Napoleon might have done had he been a little more shrewd and painstaking, and resolved that he, William, would show the world that one man could raise himself to the topmost pinnacle and not only rule Germany, but through Germany might rule the civilized earth.

His effort to attain his ends by means of the cruel World War made him the most hated man on the globe. His intentions were laid bare, and he stood in naked repulsiveness the embodiment of mad and selfish ambition that cared not what seas of blood flowed so long as "I am lord of all." It is difficult for this generation to judge calmly of the character of the world's greatest criminal, as he appears to our eyes in 1920, an exile and outcast in Holland, awaiting judgment and condemnation. Only the historians of the future can sift his character and determine with some degree of accuracy the elements that ruled him. Was he so obsessed with the idea of becoming the world's ruler that he became irresponsible in his personal conduct and dead to all sense of suffering inflicted on millions of his own people and the people of other lands? Or was he always callous to the feeling of humanity and sympathy, rather enjoying, like Nero, the sufferings of his victims?

The principal details of William's career are given elsewhere in the articles on GERMANY and the EUROPEAN WAR, to which the reader is referred. For his earlier career consult

CHARLES H. COCHRANE,  
*Editorial Staff of The Americana.*

**WILLIAM I**, prince of Orange, count of Nassau, surnamed the **SILENT**: b. Castle of Dillenburg, Nassau, 16 April 1533; d. Delft, Holland, 10 July 1584. He was the eldest son of William, count of Nassau, and Juliana, countess of Stolberg, and was educated in the Roman Catholic faith by Maria, queen of Hungary, sister of Charles V. He spent nine years in attendance on the person of the emperor, who had so high an esteem for his spirit, prudence and intelligence that he asked his opinion respecting the most important matters, and when he was but 22 entrusted him with the chief command of the army in the Netherlands, in the absence of Philibert, duke of Savoy. He also recommended him to his successor, Philip II, who regarded him with distrust. As Cardinal Granvella had now the entire confidence of Philip, and Margaret of Parma, who was charged with the government of the Netherlands, was obliged to do whatever Granvella suggested, especially with respect to the introduction of the Spanish inquisition, and the erection of new bishoprics, the Count of Egmont, the Prince of Orange and the Count of Horn represented to the king in writing, that unless the cardinal were speedily recalled his violence would drive the country to rebellion. Though Philip looked on this step as treason, he concealed his anger, and recalled the cardinal (1564). After the remonstrance offered in 1566 by 300 noblemen (the Gueux), with Count Louis of Nassau, the brother of William, at their head, against the introduction of the Inquisition and the establishment of new bishoprics, had been rejected and the Duke of Alva had been appointed governor of the Netherlands, William had a meeting with Egmont, Horn, his brother Louis and others at Dendermond, to deliberate on the means of averting the threatening danger. The majority advised an armed resistance, but this proposal came to nothing on account of the opposition of the Count of Egmont. The prince with his family now went to his castle at Dillenburg. Alva arrived in the Netherlands in 1567 and many men of consequence, including Egmont and Horn, were immediately arrested. In the beginning of 1568 he caused the prince and others, who had retired from the country, to be summoned before the Council of Twelve. The prince did not appear, in consequence of which Alva declared him an outlaw, confiscated his property and removed his son Philip William, from the University of Louvain, and sent him as a hostage to Spain. The Prince of Orange now determined on waging war against Alva. In a document issued in the summer of 1578, and called his "justification," he gave the reasons for his conduct and publicly professed the Protestant religion. In consequence of this he received aid in money and

troops from several Protestant princes. William now raised an army of 24,000 Germans, who were joined by 4,000 French soldiers, conducted his forces with great skill across the Rhine and Meuse, entered Brabant and defeated a division of the hostile army but was unable to bring the Duke of Alva, who threw himself into the fortresses, to an engagement, or to excite the people, who feared the Spaniards, to a general insurrection. His army now dispersed. He then took part in an expedition to France against the Catholic party of the Guises (1569). In France Admiral Coligny had advised him to fit out privateers against the Spanish, and establish himself particularly in Zealand and Holland, from which the Spaniards would hardly be able to drive him. The prince followed this advice, and the privateers made themselves masters, in 1572, of the town and harbor of Briel, on the island of Voorn and also took Flushing. As Alva's tyranny became more intolerable and the people were exasperated by new exactions, several cities of Holland, Zealand, Overijssel and Gelderland publicly declared for the Prince of Orange. Relying on the assistance of France, which Admiral Coligny had promised to obtain for him, William crossed the Rhine, but the news of the massacre of Saint Bartholomew deprived him for the time of all hope of French aid. He then retired into the province of Holland, which steadfastly supported him. He now resumed negotiations with France and obtained a treaty in which France promised to support him, provided that it should receive the protectorate over all the provinces of the Netherlands, which he succeeded in wresting from the Spaniards. At the end of 1573 Alva was recalled and replaced by Requesens. In 1574 Louis and Henry of Nassau, William's brothers, made an effort to join him, but were totally defeated by Requesens at Mookerheide, near Nijmegen. Both of William's brothers fell on the field of battle. This blow was compensated by the relief of Leyden, at that time hard pressed by the enemy. The raising of the siege of Leyden saved the province of Holland for the time, but the Spanish were still formidable, and Holland might have been completely crushed had it not been for the death of Requesens, which took place in March 1576. After this event William succeeded in bringing about the so-called pacification of Ghent (8 Nov. 1576), in which nearly all the provinces of the Low Countries united to expel the foreign troops, and promised mutual toleration in matters of religion. The new stadtholder, John of Austria, sought to break the force of the union by granting, in the perpetual edict, almost all the demands of the people (1577), but his conduct soon manifested his insincerity and the states of Antwerp then called the Prince of Orange to their aid. The people received him with acclamations in Brussels, and he was appointed to the rank of lieutenant-general. The war was now renewed and by the victory at Gemblours in the end of January 1578, the Spaniards recovered their superiority in the Walloon provinces, which were zealously Catholic. In 1579 Don John of Austria died, and the king appointed Alexander Farnese of Parma as his successor. The policy of Farnese

ded in gaining over to the king the south-provinces and the prince, therefore, brought the northern provinces, Holland, Zealand, Utrecht, Gelderland and Friesland, into closer union by the union of Utrecht, 23 Jan. 1581, and thus laid the foundation of the republic of the United Netherlands. In 1580, finding it impossible to triumph over them by fair means, put a price upon his head.

This step induced the united provinces to renounce their allegiance to Philip, and William offered the dignity of sovereign count of Holland and Zealand, which he accepted. An edict of Philip proclaiming a reward for the life of William was not without effect. In 1582 an attempt was made by a Spaniard named Jauregui to assassinate him at Antwerp, and a second attempt made at Delft on 10 July 1584, by a Burgundian fanatic, Balthasar Gerard, failed. William of Nassau was four times dethroned by Maurice of Nassau, who distinguished himself as a general in the Thirty Years War, was one of his sons and William's grandfather in England. Consult Gachard, *Revue de Guillaume le Taciturne* (1866); Motley, 'The Rise of the Dutch Republic' (1856); Klose, 'William I von Nassau' (1864); Juste, 'Guillaume le Taciturne' (1873); Putnam, 'William the Silent, Prince of the Dutch Republic' (1895); Fredrickson, 'William the Silent' (1897); *Cambridge Modern History* (Vol. III).

**WILLIAM I, Frederick**, king of the Netherlands, grand duke of Luxemburg, prince of Orange and duke of Nassau: b. The Hague, 17 Feb. 1772; d. Berlin, 12 Dec. 1843. He was the eldest son of William V, Prince of Orange, and was married to Frederike Louise, daughter of Frederick William II of Prussia in 1791. He distinguished himself in wars with the French republic, and being in exile with his father, the hereditary prince of the Dutch republic, in 1795, and several years lived at Fulda. After his father's death, in 1806, he succeeded to the principality of Nassau and joining the Prussian army.

Napoleon was captured at Jena and his sessions confiscated. Released soon after, he fought against the French at Wagram. At the Congress of Vienna the kingdom of the Netherlands was formed composed of Holland, Belgium and 16 March 1815 William I proclaimed king. His hereditary estates in the Netherlands, Prussia and Nassau, were given in exchange for the grand duchy of Luxembourg. Belgium was, however, separated from the Netherlands by the revolution of 1830, and as William was unwilling to recognize its existence as an independent state, he became unpopular. He continued to protest up to 1839, when he next year abdicated in favor of his son, William III, and retired to Berlin at the same time with an unimpaired fortune.

**WILLIAM II, Frederick George Louis**, king of the Netherlands: b. The Hague, 2 Dec. 1817; d. 17 March 1849. He was the eldest son of the preceding monarch; distinguished himself in the Peninsular War under Lord Wellington and also commanded the army of the Netherlands at the battle of Waterloo. In

1816 he was married to the grand duchess Anna Paulovna, sister of Alexander I of Russia. His reign began at his father's abdication in 1840, but although he brought order out of the financial chaos caused by his father, he was by nature opposed to political reform. In 1848 events obliged him to consent to an entire reorganization of the government, but his death took place before the new constitution could go into effect.

**WILLIAM III, Alexander Paul Frederick**, king of the Netherlands: b. The Hague, 19 Feb. 1817; d. Loo, 23 Nov. 1890. He was the eldest son of the preceding emperor and his reign was chiefly distinguished by undertakings for internal improvement. Under his rule, the kingdom enjoyed uninterrupted peace and material prosperity. He carried out the parliamentary reforms instituted in 1848 and in 1862 decreed the abolition of slavery in the Dutch West Indies. In 1866 the Dutch province of Limburg, a member of the Germanic Confederation from 1815, was restored to the Netherlands and by the treaty of 11 May 1867, the grand duchy of Luxemburg was declared neutral territory under the sovereignty of the house of Orange-Nassau. While Prince of Orange, he married in 1839, the Princess Sophia Frederica Matilda, daughter of the late King William I, of Wurtemberg. They had two sons, William Nicholas Alexander Frederick Charles Henry, Prince of Orange (b. 4 Sept. 1840; d. 11 June 1879), and William Alexander Charles Henry Frederick (b. 25 Aug. 1851; d. 21 June 1884), the last male heir of the house of Orange. In 1879 King William was married to Emma, Princess of Waldeck-Pyrmont, their daughter Wilhelmina becoming heir to the throne.

**WILLIAM I**, surnamed THE LION, king of Scotland: b. 1143; d. Stirling, 1214. He was a grandson of David I and brother of Malcolm IV, whom he succeeded in 1165. The source of his designation is one of the mysteries of history. His predecessors had long contested with the kings of England the sovereignty of Northumberland and other districts of the north of England, but under Malcolm these claims were virtually abandoned and the king of Scots received, as an equivalent for them, the earldom of Huntingdon and other valuable estates. William still coveted the Northumbrian region and while attending Henry II of England in his wars upon the Continent, is supposed to have asked for a portion of the disputed territory. On being refused he invaded the district after the example of his ancestors, but on 13 July 1174 fell into the hands of the English. For security he was conveyed to Normandy, and there consented, as the price of his liberation, to perform that homage for his kingdom which the English kings so long vainly required from the government of Scotland. The treaty of Falaise, as the arrangement was termed, from the place of its adjustment, was revoked in 1189 by Richard I of England in consideration of a payment of 10,000 marks, needed for his expedition to Palestine. William had several disputes with the Church, but was one of the early benefactors of the regular ecclesiastics,

and founded in 1178 the great abbey of Arbroath, which he dedicated to Saint Thomas a Becket.

**WILLIAM IX, DUKE OF AQUITAINE AND COUNT OF POITOU**, the first great Provençal poet: b. 1071; d. 1127. He appears to have led a very licentious life, which is constantly reflected in his poems. His poetical work is of special interest as it stands at the beginning of the Classical period in Provençal literature, and marks the transition from the popular minstrel ballads to the more Classical and arbitrary literature of the courts of the several Provençal principalities. Much of the work of William of Aquitaine is very close to the popular poetry that he must have found existing in the south of France when he began to write. One of his poems—a romance of licentious adventure, probably quite in the style of the approved poetry of his time—shows special signs of being close, not only to the popular ballad, but bears imprinted upon it the stamp of the loose manners and customs of the age in which it was written. In his poetry there is already developed the stereotyped poem describing the devotion of the knight to his lady. So assured is this form even at this early day, in the mouth of one who, on his own confession, was true to no lady, that it would seem as if it must have already existed long enough to have acquired a set form and character. But the disappearance of practically all the Provençal poetry of the time preceding the practical activity of William of Aquitaine, has obliterated the record of the past upon which he undoubtedly builded. William of Aquitaine led a very active life, most of which was taken up with wars against the neighboring rulers. He led a plundering expedition into Normandy and conquered Toulouse. But his greatest exploit was the crusade of the year 1100, on which he started out for Palestine with an army of 60,000. He reached Jerusalem, but was finally defeated and forced to flee with a handful of followers. On the way back he was shipwrecked; so that it was over three years before he reached home. Notwithstanding this religious expedition William quarreled with the Church, defied the papal authority and was twice excommunicated. A poem written toward the close of his life, however, expresses repentance for his sins and his ecclesiastical attitude and repentance. In it he vows the renunciation of all worldly pleasures and the dedication of himself to the service of God. It seems probable, in view of what is known of his life, that his execution was not equal to the facility of his poetical expression. Consult Holland and Kellar for an incomplete edition of his works (1850); Sachse, 'Über das Leben und die Lieder des Troubadours Wilhelm IX Graf von Poitou' (Leipzig 1882).

**WILLIAM OF LORRIS**, French poet: b. about 1212. His chief fame rests on the 'Romance of the Rose' of which he wrote the first 4,000 verses. This is a long allegorical poem written in 1237, but left unfinished by the author who is supposed to have died young. It has been said that the 'Romance of the Rose' is a sort of art of love. At any rate it was the forerunner of a kind of literature which became

very popular in France and continued to exercise its influence for a considerable length of time there and in most of the Latin and Germanic countries of Europe. His work is among the best and most original of his age; but the rhetorical figures and allegories which were its most distinguishing feature were seized upon by subsequent writers, imitators of the 'Romance of the Rose,' and the result was a very extensive and popular literature which tended to grow more and more untrue to nature, art and correct literary expression. See 'Romance of the Rose.' Consult Jarry, L., 'Guillaume de Lorris et le testament d'Alphonse de Poitiers' (Orleans 1881); Langlois, E., 'Origines et Sources du Roman de la Rose' (Paris 1891); Paulin, 'Histoire Littéraire de la France' (Paris).

**WILLIAM OF MALMSBURY**, *mamz'-ber7*, English historian: b. probably in Somersetshire, about 1070; d. Malmsbury, Wiltshire, about 1143. He was educated at the Benedictine Abbey of Malmsbury of which he subsequently became librarian and precentor, and from which his name is derived. His works are in Latin and are of great historical value. They include 'De Gestis Regum Anglorum,' a general history of the kings of England from 449 to 1128; 'Historia Novella,' containing the narration to 1142; 'De Gestis Pontificum Anglorum,' an ecclesiastical history of England down to 1123; 'Vita S. Dunstani'; 'Vita S. Wulfstani,' etc. The best edition of his English and Church histories is that of Stubbs in the Rolls Series (1887-88). Consult Birch, 'Life and Writings of William of Malmsbury' (1874); Stubbs' Prefaces in the Rolls Series; Norgate, 'England Under the Angevin Kings,' Vol. I (1887).

**WILLIAM OF NEWBURGH**, English chronicler: b. Bridlington, Yorkshire, about 1130; d. Newburgh, near Coxwold, Yorkshire, about 1198. He was educated, lived all his life, and died in the Augustinian Abbey of Newburgh. He is one of the chief authorities for the reign of Henry II. His 'Historia Rerum Anglicarum' covers the period from 1066-98, is written in five books, and is highly valuable as a broadminded, just and clear presentation of the happenings of the times, though his statements are not always accurate. His other works consist of three sermons. Consult Howlett in the Rolls Series, 'Chronicles of Stephen, Henry II and Richard I' (1884).

**WILLIAM OF NORMANDY (THE CLERC)**, a French poet of the first half of the 13th century. He wrote principally moral poems and religious legends and traditions. There has been much strife among critics as to just what poems of those attributed to him were really written by him. Among his surviving poems about which there does not seem to be any reasonable doubt, are 'Le Bestiaire divin' (edited by Hippeau in 1852; and by Reinsch 1890); 'Le Besant de Dieu' (edited by Hippeau, 1852; by Martin, 1879); 'Les Joies Notre-Dame' (edited by Reinsch, 1879); 'Sainte Madeleine' (edited by Schmidt, 1890); 'Tobie' (edited by Schmidt, 1880), and 'Le Roman des Romans.' Among the poems which have been attributed to him by some critics and editors, a verdict strongly contested by others, are cer-

and 'Fergus.' Consult Mann, 'Derwin des Guillaume le Clerc' (in *le Studien*, 1889); Schmidt, 'Guilerc de Normandie im besondere denenlegende' (in *Romanische Studien*); Seeger, 'Ueber die Sprache des Clerc de Normandie' (Halle 1881).

**AM OF TYRE**, Syrian historian born probably in Syria, about 1120-1184. He was educated at An-erusalem, and in 1175 was made bishop of Tyre. He was one of the six who represented the Latin Church of the Lateran Council in 1179. His *Itinerarium in Partibus Transmarinis Gesse* is one of the best histories of mediæval Latin kingdom in the East from which he also wrote '*Historia de Orientis Principibus*.'

**AM OF WYKEHAM**, wîk'am, late, architect and statesman: b. Wiltshire, 1324; d. South Waltham, 24 Sept. 1404. He received a liberal education from the lord of Wyke, as afterward recommended by him to Edward III, who made him chancellor and surveyor of the several of the realm. He built Windsor Castle, and making orders, held various ecclesiastical offices, becoming bishop of Winchester in 1367, and as lord chancellor of England 1367-1373 a grammar school at Winchester still exists as Winchester College, Oxford, which he completed. He was lord chancellor for the second time and rebuilt the nave of Winchester Cathedral in the Third Pointed manner 1395-1404. He is buried in a magnificent chantry in the south arcade of the nave at Winchester. Consult 'Three Chancellors' (1860); 'Life of Wykeham' by Lowth (1758), and Moberly

**HENRY**, Fort, in the town of Fort George, at the head of Lake George August 1757, it was taken from the hands of French and Indians under

**AM JEWELL COLLEGE**, locality, a suburb of Kansas City, Mo. Founded in 1849 by the Baptists of Missouri. William Jewell of Columbia, Mo., was the leader in the movement for the establishment of the college, and contributed largely toward the endowment, hence the college was named for him. It was opened in 1850, and on account of financial difficulties was closed in 1855-57; just as the college was becoming prosperous, the Civil War broke out and the work to suspend from 1861 to 1865 was a part of that time the building was destroyed by the Federal troops. Since 1877 the endowment has been raised to over \$200,000. The college offers four courses or groups, leading to the degree of A.B. Some studies are in the liberal arts, and some are free electives. The curriculum includes several theological courses, the completion of which by arrangement with the Southern Baptist Theological Seminary, Louisville, Ky., entitles the student to that seminary. The degree of A.M.

is conferred for graduate work. There are also courses in elocution, oratory and music, and an Academic Department. A college band and a college orchestra are maintained. There are 44 scholarships. The student organizations include four literary societies, Philharmonic (a musical society), a Young Men's Christian Association and missionary societies. The buildings include Jewell Hall (the original building), Vardeman Hall, Brown Hall, Wornall Hall, Ely Hall, The Cottages, and the gymnasium. The library contains 29,000 volumes; the students average 350, and the faculty 28, while the productive funds total \$513,330.

**WILLIAM AND MARY COLLEGE**, located at Williamsburg, Va. It was chartered in 1693, thus being the second oldest college in the United States; but an attempt was made to found a college at Henrico in Virginia as early as 1619 when a grant of land for a "seminary of learning" was made by the Virginia Company; a collegiate school was established at Charles City in 1621, but closed on account of Indian troubles in the next year. In 1635 Benjamin Symes established a free school in Elizabeth City County, the first in the 13 colonies. In 1660 the Virginia assembly voted a grant of land for a college, but the disturbed condition of England at that time, and the disorders within the colony, prevented any further progress toward establishing an institution of higher learning until 1691, when Rev. James Blair was sent to England to obtain a charter from the Crown. In this he was successful, the charter being signed 8 Feb. 1693. Certain lands, a duty on the exports of tobacco, and other funds were appropriated to the use of the college. During the Revolutionary War the college lost a large part of its endowment, the buildings were occupied by the British and the American and French troops, and the institution was closed for a short time in 1781. After the Revolution, the college was reorganized and received a grant of land from the Virginia legislature; George Washington served as chancellor from 1788-99. During the Civil War the college was closed, and about 90 per cent of its students enlisted in the Confederate service. It was occupied by the Federal troops and most of its buildings and property destroyed. In 1869 the main building was restored, and the college again opened, but under serious embarrassment; so serious did the financial difficulties become that its sessions were suspended in 1882, until 1888, when the State legislature appropriated \$10,000 a year, gradually increased to \$50,000. In 1893 the college received \$64,000 from Congress as indemnity for loss suffered during the Civil War.

The college has always given history and political science a recognized place in its curriculum, and was the first American institution to establish chairs of law and history. Partially perhaps for this reason, its influence has always been felt in State and national history; it numbers among its graduates some of the leading men of the nation, including three presidents of the United States (Jefferson, Monroe and Tyler), also Chief Justice Marshall, Edmund Randolph and General Scott. The first chapter of Phi Beta Kappa was established at William and Mary 5 Dec. 1776. The college was also the

first to introduce the elective system which was done in part in 1779 under Jefferson's guidance. In 1819 Jefferson declared in a letter to Francis Eppees that at William and Mary the student could pursue the course of his choice. At this time there appear to have been two classes of students -- "regulars and irregulars." The first class took a prescribed course for A.B., the latter followed their own inclinations, and attended the schools of their own selection. The college was also the first to try the honor system, and a remarkable degree of freedom was permitted the students in the lecture room and on examination. They were neither watched nor spied upon, and their word was taken as conclusive on any subject. There are now two courses offered, the Collegiate and the Normal. The Collegiate course is entirely elective in accordance with the group system; three degrees are conferred, A.M. (for graduate work), A.B. and B.S., according to the subjects elected. The Normal course is two years in length, to which is added one year's practice work in the Matthew Whaley Model and Practice School. The most recent new feature at the college is the admission of women to all the classes. The campus consists of 42 acres upon which there are 13 buildings. In the centre is the main college structure. Though it has passed through three fires, the walls are the same as were originally put up in 1693. They are, therefore, the oldest college walls in the United States. The lawn in front of the college is covered with beautiful trees, and the buildings are furnished with electric lights, artesian well water, and new equipment. The college receives annually from the legislature \$50,000. The students average 237, and the teaching force 22. Young women were admitted upon equal terms with young men for the first time in September 1918.

**WILLIAM PENN CHARTER SCHOOL**, a secondary day school for boys, located at Philadelphia. In 1683 the governor and council of the province engaged a schoolmaster (Enoch Flower) for "the instruction of the youth" of Philadelphia; from this grew the Charter School, founded in 1689 and incorporated in 1698 by the council and lieutenant-governor as "the public school founded in Philadelphia at the request, costs and charges of the people of God called Quakers." Although supported by the Quakers, it was open to all, and for more than 60 years continued to be the only public place for instruction in the province. In 1701 Penn was asked to confirm the lieutenant-governor's charter by one under his own hand and seal. This he did on the same day that he chartered the city itself. The school therefore enjoys, in this regard, a unique distinction. The two subsequent charters issued by Penn, one in 1708 and the other in 1711 (the last the legal one under which the board now works) rendered broader and more far-reaching the measures for the school's future development. The school was entirely emancipated from denominational control, and the title of the corporation changed by omitting the words "at the request, costs and charges of the people of God called Quakers," thereby giving the final charter standing "The Overseers of the Public School founded by Charter of the Town and County of Philadelphia." The word "public" in the word "public"

being used in the English sense, open to all willing to pay the fees). The school premises are now located in the heart of the city and, taken with the beautiful playing fields in the suburbs presented to the school in 1903, are valued at \$250,000; and the scholarship funds amount to about \$50,000. It is purely a day college preparatory school for boys, and has for years been famed for both its high standard of scholarship and the intelligent care devoted to physical training. The students have long numbered over 500, it being the largest boys' day school of its class in the United States. Its attendance is not confined to residents of Philadelphia.

**WILLIAM TELL.** See **WILHELM TELL.**

**WILLIAMS, Alphens Starkey**, American soldier; b. Saybrook, Conn., 20 Sept. 1810; d. Washington, D. C., 21 Dec. 1878. Graduated from Yale in 1831, he studied in the law school there in 1831-33, and in 1836 began legal practice in Detroit, Mich. There he held local offices, and in 1840-44 was probate judge of Wayne County. He became proprietor of the *Daily Advertiser* of Detroit in 1843, and remained its editor until 1848. During the Mexican War he was lieutenant-colonel of the First Michigan volunteers. In May 1861 he received the commission of brigadier-general of volunteers. Later he was a division commander in the Shenandoah, and in 1862 became temporary commander of the 12th corps, which he directed until April 1863, leading it at South Mountain and Antietam. He was also in command of a corps at Gettysburg and, after his transfer to Tennessee, at Lookout Mountain. After commanding a division of the 20th corps in Sherman's Atlanta campaign, he was appointed in November to command that corps, and led it in the "March to the Sea" and the campaign in the Carolinas. Upon the capture of Savannah he was brevetted brigadier-general of volunteers. Mustered out in January 1866, he was Minister to San Salvador in 1866-69 and member of Congress in 1875-78. In 1870 he was Democratic candidate for the governorship of Michigan.

**WILLIAMS, Anna Bolles**, American writer of juvenile tales; b. New London, Conn., 1840. She published, under the nom-de-plume J. A. K., 'Birchwood' (1885); 'The Fitch Club'; 'Professor Johnny' (1887); 'Rolf and His Friends'; 'Who Saved the Ship'; 'The Giant Dwarf'; 'The Riverside Museum'; 'History of the Rogerenes.'

**WILLIAMS, Arthur Llewellyn**, American Protestant Episcopal bishop; b. Owen Sound, Ontario, 30 Jan. 1856. He received an academic education and engaged in the railroad business in Colorado for several years. He then studied theology and was graduated at the Western Theological Seminary, Chicago, in 1888. Admitted to the diaconate in 1888 and to the priesthood in 1889, he served as missionary in White River Valley, Colo., 1888-89, was rector of Saint Paul's Church, Denver, 1891-92 and of Christ Church, Chicago, 1892-99. In October 1899 he was consecrated bishop-coadjutor of Nebraska.

**WILLIAMS, Benjamin**, American statesman; b. North Carolina, 1754; d. Moore County,

4. He served in the revolutionary war, was promoted colonel for service at Yorktown. He was member of Congress 1793-1800, or of North Carolina 1799-1802, and 1803-06.

**WILLIAMS, Channing Moore**, American Episcopal bishop: b. Richmond, Va., 29; d. 2 Dec. 1910. He was graduated from William and Mary College in 1853, the Theological Seminary at Alexandria, in 1855. He took deacon's orders in 1856 and was ordained to the priesthood in 1857. He served as a missionary in China in 1858 and in the last-mentioned year was appointed bishop of Yeddo, Japan, resigning in 1889, when he retired from his duties, but continuing his missionary work some years.

**WILLIAMS, Edward** (bardic name, Iolo Idris), Welsh poet and Celtic scholar: b. Llanidloes, Glamorganshire, 1745; d. Llanidloes, Glamorganshire, 17 Dec. 1820. With Thomas Jones and Pughe, he edited the *Archæology* (1801-07), and himself 'The Fair Pilgrim, a Poem Translated into the Welsh' (1792); 'Poems Lyric and Heroic' (1794); 'Psalms of the Church of Christ' (1812) in Welsh. To the *Archæology* he appended specimens of Druidical poetry, which, after a long protracted controversy on the non-production of their manuscripts, commonly looked on as a literary curiosity. Williams was a friend of Southey and the most among Welsh poets of his posthumous Welsh work, 'Secrets of the Isle of Britain' (1829) was his son, Taliessin Williams. Consult *Recollections and Anecdotes of Edwards* (1850).

**WILLIAMS, Eleazer**, American mission-ary: b. about 1788; d. Hogansville, Ga., N. Y., 28 Aug. 1858. He received a secondary education in Massachusetts upon the outbreak of the War of 1812 and came to a United States government post among the northern Indians, and later engaged in several actions and was severely wounded at Plattsburg (14 Sept. 1814). After the war he became a clergyman of the Protestant Church, and for many years was a missionary among the Indians of the Wisconsin region. By many he is identified with Louis XVII of France on this subject much has been written. See J. H. Hanson's article in *Putnam's Monthly* 1853 to M. H. Catherwood's (1901). Among his writings were *Against Our Common Enemy* (1815) and *Relation into Mohawk of the 'Book of Revelation'* (1853).

**WILLIAMS, Ephraim**, American soldier: b. Mass., 24 Feb. 1715; killed near Fort Mifflin, N. Y., 8 Sept. 1755. In early life a sailor, but in the war with France, served as captain of a New England regiment in Canada. He received from Massachusetts a grant of land in the present township of Williamstown and was made commandant of all the frontier posts west of the Hudson River. When hostilities broke out he was put in command of a regiment to join the New York forces under

Sir William Johnson, who was marching northward to attack the French. He was proceeding with a large body of soldiers to attack Dieskau's advance force, when the whole party was entrapped in an ambuscade of French and Indians, and at the first fire Colonel Williams fell mortally wounded. While in camp at Albany he had made his will, bequeathing his property for the establishment of a free school in Massachusetts, which later became Williams College. In 1854 the alumni of Williams College erected a monument to his memory on the spot where he fell. See **WILLIAMS COLLEGE**.

**WILLIAMS, Francis Churchill**, American author, son of Francis Howard Williams (q.v.): b. Philadelphia, Pa., 23 April 1869. He was graduated at the University of Pennsylvania in 1891 and until 1900 was engaged in journalism. His books include 'J. Devlin, Boss' (1901); 'Stories of the College' (joint author, 1902); 'The Captain' (1903). He was literary adviser to J. B. Lippincott Company, Philadelphia (1902-06). Since 1907 he has been associate editor of *The Saturday Evening Post* and contributor of biographical and critical articles and fiction to the magazines.

**WILLIAMS, Frederick Ballard**, American artist: b. Brooklyn, N. Y., 21 Oct. 1871. He studied at the Cooper Union Art School and at the National Academy of Design in New York, and specialized in landscape and figure paintings. He was elected to the National Academy in 1909. He was awarded a medal at the Panama-Pacific Exposition, San Francisco, in 1915. Among his works in public collections are 'Happy Valley' (Metropolitan Museum of Art, New York); 'Chant d'Amour' (Brooklyn Institute Museum); 'Vivacetto' (Albright Gallery, Buffalo); 'Conway Hills' (National Gallery, Washington), etc.

**WILLIAMS, Sir George**, English founder of the Young Men's Christian Association: b. Dulverton, Somerset, 11 Oct. 1821; d. London, 6 Nov. 1905. He became converted in 1837 and was active in attempts to promote the religious welfare of his associates. In 1841 he went to London, gathered together the young men employed in the same establishment as himself, and on 12 June 1844, organized, with others, a society called the "Young Men's Christian Association," which was designed to be "a society for improving the spiritual condition of young men engaged in the drapery and other trades." He was treasurer of the Young Men's Christian Association, 1863-85, and succeeded Lord Shaftesbury as its president in the last-named year. He was knighted in 1894. (See **YOUNG MEN'S CHRISTIAN ASSOCIATION**). Consult Stevenson, *Historical Records of the Young Men's Christian Association from 1844 to 1884* (1884).

**WILLIAMS, George Frederick**, American politician: b. Dedham, Mass., 10 July 1852. He was graduated from Dartmouth in 1872, studied later at Heidelberg and Berlin, was admitted to the bar and has since practised his profession in Boston. He edited Williams' 'Citations of Massachusetts Cases' and the 'Annual Digest of the United States,' Vols. X to XVII. He was a member of the State legislature in 1889, sat in Congress 1891-93 and was an unsuccessful Democratic candidate for governor of Massachusetts in 1895, 1896 and 1897.

**WILLIAMS, George Henry**, American senator, Cabinet officer and jurist: b. New Lebanon, N. Y., 23 March 1823; d. 4 April 1910. He was admitted to the bar in 1844 and removed to Iowa where he engaged in practice. He was judge of the First Judicial Court of Iowa in 1847-52; and in 1853-57 he was chief justice of the Oregon Territory. He was one of the framers of the constitution of the State of Oregon, and served as United States senator for that State in 1865-71. He was Attorney-General under President Grant in 1872-75. His nomination by President Grant for justice of the Supreme Court of the United States was not confirmed by the Senate. After his retirement as Attorney-General he practised law at Portland, Ore., and he was mayor of that city in 1902-05.

**WILLIAMS, George Huntington**, American geologist: b. Utica, N. Y., 28 Jan. 1856; d. there, 12 July 1894. He was graduated at Amherst College in 1878, later studied at Brunswick and Göttingen and took the degree of Ph.D. at Heidelberg in 1882. He was afterward connected with the faculty of Johns Hopkins University, and was appointed professor of inorganic chemistry there in 1892. He made special investigations of the geology of Maryland and materially assisted the United States Geological Survey of that State. He was editor of the department of mineralogy and petrography of the 'Standard Dictionary' (1893); was author of 72 papers on geology, and of 'Elements of Crystallography' (1890).

**WILLIAMS, George Washington**, American author: b. Bedford Springs, Pa., 16 Oct. 1849; d. 1891. He was of African descent, served in the Civil War, subsequently attended school and was for a time engaged as a preacher and then as a journalist. In 1877 he was graduated from the Cincinnati Law School and in 1879-81 served in the Ohio legislature. He was United States Minister to Haiti in 1885-86, and in 1888 was a delegate to the World's Conference of Foreign Missions at London. He was editor of the Cincinnati *Southwestern Review* and of the Washington *Commoner*, and published 'History of the Negro Race in America from 1619 to 1880' (1883); 'History of the Negro Troops in the War of the Rebellion' (1887); 'History of the Reconstruction of the Insurgent States' (2 vols., 1889), etc.

**WILLIAMS, Gershom Mott**, American Protestant Episcopal bishop: b. Fort Hamilton, N. Y., 11 Feb. 1857. He studied at Cornell, 1875-77, was in mercantile business for several years and after studying law was admitted to the Michigan bar in 1879. The next year he was ordained to the Episcopal ministry and held rectorships at Detroit, Buffalo, Milwaukee and Marquette (1880-96). In 1896 he was consecrated bishop of Marquette.

**WILLIAMS, Helen Maria**, English author: b. London, 1762; d. Paris, 15 Dec. 1827. She was introduced to public notice by Dr. Andrew Kippis, who recommended very highly her first work, a legendary tale in verse, entitled 'Edwin and Ebruda,' which was published in 1782. Between this period and 1788 she published an 'Ode on Peace' (1783);

'Peru, a Poem' (1784); and a collection of miscellaneous poems (1786). In 1790 she was in Paris, in the same year published a set of 'Letters Written in France,' and in 1791 a second series, 'Letters from France,'; in 1795 a third, 'Letters Containing a Sketch of the Politics of France.' These 'Letters' expounded the doctrines of the Girondists, on the downfall she was in great danger, and some time imprisoned. They are one-sided and replete with inaccuracies and misrepresentations. Among her remaining works are 'A Tour in Switzerland' (1798); 'Narrative of Events in France' (1815); 'Correspondence of the XVI<sup>th</sup> Century' (1803); 'Letters on the Events Which Have Passed in France since the Restoration 1815' (1819); an English translation of Goethe's 'Personal Narrative' (1814); 'The novel' (1790); and the story, 'Perour's Bellows-mender' (1801), on which was Lord Lytton's 'The Lady of Lyons.' She may be made of several well-known by her, such as 'My God, all Nature owes to Thee' and 'While Thee I Seek, Proclaim Thy Power.'

**WILLIAMS, Henry Shaler**, American geologist and paleontologist: b. Ithaca, 6 March 1847. He was graduated from Cornell in 1868, occupied the chair of geology at Cornell in 1879-92, resigning in the last-mentioned year to accept a similar chair at Yale, which he held until 1904, when he returned to Cornell. He was secretary of the International Congress of Geologists at Washington in 1891 and chairman of the section of geology and petrography of the American Association of Advanced Sciences in 1892. He has made extensive studies of the Devonian and Carboniferous systems and has published 'The Geology of the Upper Devonian' (1885); 'Fossils of the Upper Devonian' (1884-87); 'The Onondaga Zone and Its Fauna' (1890); 'Contributions to the Geology of the Devonian and Carboniferous' (1890); 'Shifting of Faunas as a Problem of Geologic Geology' (1903); 'On the Theoretical Organic Variation' (1911), etc.

**WILLIAMS, Isaac**, English theologian: b. near Aberiptwith, Cardiganshire, Dec. 1802; d. Stinchcombe, Gloucestershire, May 1865. He studied at Trinity College, Oxford, in 1831 became Fellow there and was a priest's orders, and was known as one of the leading Tractarians (q.v.). He was New College curate at Saint Mary's and was later in charge of the church at Littlemore. With Newman and Keble he contributed to the *Trinitarian Magazine* the verse later collected as 'The Apostolica' (1836); and in the 'Times,' he wrote Tract 80, 'Reserve for Communicating Religious Knowledge,' the subject of much discussion. In 1842 he was an unsuccessful candidate for the Oxford curacy, the defeat being regarded as a first for the Tractarians as a party. From 1848 he was curate at Dartington, and afterward resided at Stinchcombe, where he was somewhat in the clerical duties of the parish. Among his further publications are books of poetry, such as 'The Church' (1838; 8th ed., 1859; reprinted 1899); 'Thoughts in Past Years' (1842); and 'The Baptistery, or the Way to Eternal Life' (1842-44; 6th ed., 1863); an

volumes of prose, chiefly sermons. 'Selections' from his writings appeared in 1890; his 'Autobiography' in 1892.

**WILLIAMS, James Douglas**, American politician: b. Pickaway County, Ohio, 16 Jan. 1808; d. Indianapolis, Ind., 20 Nov. 1880. After a common-school education, he became a farmer in Knox County, Ind., first held office in 1838 as justice of the peace for Harrison township in that county, and in 1843 was elected as a Democrat to the house of representatives in the general assembly. He sat in the house during seven sessions, and in the senate for 12. In 1874 he was chosen to Congress, where he served until 1876, resigning upon his nomination as governor of Indiana. He was elected to the office in October, after a vigorous contest, his Republican opponent being Gen. Benjamin Harrison. His administration was one of economy and stability. His chief interest was in connection with the development of the agriculture of Indiana, and he was an incorporator and president of the State Board of Agriculture. He was widely known by his sobriquet of "Blue Jeans."

**WILLIAMS, Jesse Lynch**, American author: b. Sterling, Ill., 17 Aug. 1871. He was graduated at Princeton in 1892 and has published 'History of Princeton University' with J. De Witt (1898); 'The Stolen Story and Other Newspaper Sketches' (1899); 'The Adventures of a Freshman' (1899); 'New York Sketches' (1902); 'The Day Dreamer' (1906); 'My Lost Duchess' (1908); 'The Girl and the Game, and other College Stories' (1908); 'Mr. Cleveland, a Personal Impression' (1909); 'And So They Were Married,' a comedy (1915); 'Remaking Time' (1916), etc.

**WILLIAMS, John**, English prelate, archbishop of Canterbury: b. Aberconway, Carnarvonshire, Wales, 25 March 1582; d. Glodded, 25 March 1650. He was educated at Cambridge, took orders in the English Church in 1609, succeeded Bacon as keeper of the great seal in 1621, an office which he held till 1626, and was consecrated bishop of Lincoln in November 1621. Though a favorite with James I, he incurred the dislike of Charles I, and having supported the Petition of Right in 1628, was prosecuted by Laud before the Star Chamber, charged with betraying the king's secrets. After eight years' legal proceedings he was suspended from his see, fined successively £10,000 and £8,000 and imprisoned in the Tower, 1636-40. Released by the Long Parliament and restored to his see, he was made archbishop of Canterbury in 1641, but was again sent to the Tower with 11 other bishops on account of their protest against the validity of acts passed during their enforced absence from the House of Lords. He was released in 1643 and during the civil war supported the royal cause and fortified and held Conway Castle. Consult 'Scrinia Reserata,' a Latin life of the prelate, by Hacket and Philips (1700).

**WILLIAMS, John**, American clergyman, known as "the redeemed captive": b. Roxbury, Mass., 10 Dec. 1664; d. Deerfield, Mass., 12 June 1729. He was graduated from Harvard in 1683, was settled in Deerfield in 1686, and ordained in 1688. On 29 Feb. 1704, a party of 200 French and 142 Indians surprised the

town, and some of them, breaking open Williams' house, killed two of his children and his negro servant, and forced him with his wife and six of his surviving children (his son Eleazer was absent) to set out with other prisoners for Canada. On the second day's march Mrs. Williams fell from exhaustion, and was dispatched with a tomahawk. About 20 other prisoners were murdered under similar circumstances. On his arrival in Canada, after a journey attended by almost unexampled hardships, Williams was treated by the French with great humanity and even courtesy, and at length was redeemed, and arrived in Boston, 21 Nov. 1706, with 57 other captives, among whom were two of his children. His daughter Eunice, 10 years of age, was left behind, and married an Indian. Williams, soon after his return, resumed his pastoral charge at Deerfield and published a narrative of his captivity, entitled 'The Redeemed Captive Returning to Zion' (1707), a narrative of his adventures which furnishes a good picture of the frontier dangers of the time.

**WILLIAMS, John**, English missionary: b. Tottenham, Middlesex, 29 June 1796; d. Erromango, New Hebrides, 20 Nov. 1839. At 14 he was apprenticed to an ironmonger, but having offered himself to the London Missionary Society, was sent in 1816 to Eimeo, one of the Society Islands. Later he settled in Raiatea, the largest of the group, and labored here with marvelous success, his powers of organization being as conspicuous as his zeal. In 1823 he went to Raratonga, the chief of the Hervey Islands, where he met with continued success. He next built a boat with his own hands in which during the next four years he visited many of the South Sea Islands, extending his missionary labors to the Samoa Islands. In 1834 he returned to England, there superintending the printing by the Bible Society of his Raratongan New Testament, and raising \$20,000 to equip a missionary ship for Polynesia. In 1838 he went out again, visited many of the stations he had already established, and sailed as far west as the New Hebrides, where he hoped to plant a mission, but was killed and eaten by the savages natives of Erromango. He published 'Narrative of Missionary Enterprises' (1837). Consult the biographies by Campbell (1842) and Prout (1843).

**WILLIAMS, John**, American Protestant Episcopal bishop: b. Deerfield, Mass., 30 Aug. 1817; d. Middletown, Conn., 7 Feb. 1899. He was graduated from Harvard in 1835, studied theology and was ordained deacon in 1838 and priest in 1841. From 1837 to 1840 he was tutor in Washington (now Trinity) College, then was for a time assistant minister of Christ Church, Middletown, Conn., and rector of Saint George's, Schenectady, N. Y., 1842-48. In 1848 he was elected president of Trinity College and professor of history and literature. He was consecrated assistant bishop of Connecticut in 1851, but retained the presidency of Trinity for two years longer, and then became vice-chancellor. Several students for holy orders having placed themselves under his direction, an informal theological department grew up, which was afterward incorporated as the Berkeley Divinity School at Middletown, Bishop Williams remaining the principal instructor. On

the death of Bishop Brownell in 1865, he assumed sole charge of the diocese, whose administration had for a long time been practically in his hands, and at the same time became chancellor of Trinity College. In the General Conventions of 1883 and 1886, he was chosen chairman of the House of Bishops, and in 1887 succeeded Bishop Lee as presiding bishop of the Episcopal Church. His published works include 'Thoughts on the Gospel Miracles' (1848) and 'Studies in the Book of Acts' (1888).

**WILLIAMS, John Joseph**, American Roman Catholic prelate: b. Boston, Mass., 22 April 1822; d. there, 30 Aug. 1907. His elementary education was obtained at the cathedral parochial school; in the Sulpician College, Montreal, Canada, he studied philosophy, and later theology with the Sulpicians in France. In 1845 he was ordained priest by Archbishop Affre and upon returning to Boston, Mass., was appointed assistant at the cathedral, in 1855 becoming its rector. Two years later he was made vicar-general of the diocese and rector of Saint James' Church, both of which positions he held for nine years, being then chosen coadjutor to Bishop Fitzpatrick, whose death, however, occurred before the arrival of the papal bulls for Father Williams' consecration. Therefore, on 11 March 1866, Father Williams was consecrated bishop of Boston. A vast territory was then under his jurisdiction, as his diocese included the entire State of Massachusetts, but when, in 1870, Bishop Williams went to Rome to attend the Vatican Council, he applied for the division of his diocese, the result being that Springfield, Mass., was erected into an episcopal see. In 1875 Pope Pius IX elevated Boston to a metropolitan see, Bishop Williams becoming its first archbishop, the pallium being conferred upon him 2 May 1875. Foremost among the monuments to his zeal and energy are the new Holy Cross Cathedral of Boston and Saint John's Theological Seminary.

**WILLIAMS, John Sharp**, United States senator: b. Memphis, Tenn., 30 July 1854. He is the descendant of one of the most distinguished of Southern families, whose founder was John Williams, member of the Continental Congress. John Sharp Williams studied at the Kentucky Military Academy, the University of the South, at Sewanee, Tenn., and at the University of Virginia. His general training was completed at the University of Heidelberg, Germany; but on his return home he studied law at the University of Virginia and privately at Memphis. In 1878 when he was only 24 years old he settled at Yazoo, Miss., where he arose immediately to eminence at the local bar. Following the bent of Southerners he also became a landowner and planter. In the early '90s he began to take an active interest in politics and was elected to the national House of Representatives where he remained from 1893 to 1900. He entered Congress in the midst of that trying period when all the agricultural interests of the country were sorely depressed and when laboring men were uniting with farmers' organizations in the hope of weakening the grip of merchants and industrial leaders upon the government. Williams was in full sympathy with their efforts. He was an ardent advocate of a low tariff, and an advocate of actual free trade. He was a member of that

group of earnest Democrats who opposed President Cleveland in 1895 when the so-called gold bonds were issued to a syndicate controlled by Messrs. Belmont and Morgan of New York as a means of maintaining the credit of the treasury. Mr. William Jennings Bryan, the leader of these protesting Democrats. In 1895 Mr. Williams signed, with Bryan and other leaders of Congress and newspapers, an address to the people which had a great influence upon the history of the country. It proved to be the beginning of the campaign of Mr. Bryan for the control of the Democratic National Convention of 1896. It was not a protest against the proposed gold standard which Eastern men, Democratic and Republican, were clamoring; it was an appeal to independent Democrats very much like that of Salmon P. Chase and others issued in 1854 against the famous Nebraska Free Silver Convention. It rallied the whole West, Republican party, and when the Republicans met in convention in Saint Louis, it was with great difficulty that the party was prevented from voting against the gold standard. But the Democratic National Convention which met in Chicago was entirely won and Mr. Bryan made candidate for the Presidency. Mr. Williams was an earnest champion of free and free silver and as such had a large share in the extraordinary campaign in which both were lost. Williams continued an influential member of the House of Representatives during the Roosevelt Presidency he was leader of the minority, a witty, alert and full critic of governmental measures. Although he was never an organizer, nor a politician in the better sense, he was twice a disputed candidate of his party for the Presidency. The last time he offered for Congress in 1908. In that district, he received every vote cast. But he had already made up his mind to enter the Senate. It was at the time of the growing Valet movement in Mississippi. Notwithstanding the popularity of Governor Vardaman, who was elected, Williams, the latter easily won a seat in the Senate. The issue was mainly the question of the negro in the State. Williams taking a more moderate attitude than there would be, the negro question if it were left out of parties. In the Senate Williams fought earnestly for a lower tariff, although he broke with Bryan and many of his earlier political friends and in 1911 aided in the passage of the Smoot tariff which President Taft vetoed. When President Wilson entered office Williams came a warm supporter of the great tariff, finance and income tax laws, which made effective in 1913 and 1914, after all the purposes of the movement of 1890 were almost from the beginning of the European War an advocate of American intervention and when the country entered the war he was an earnest supporter of the Allied cause, his colleague from Mississippi, Senator Overman, took the opposite view. In the winter of 1919 Williams was the only senator who voted against a resolution urging President Wilson to press the cause of Ireland, against the wishes of the British government, before the League of Nations Conference. He declared that the United States should not interfere in the internal relations of a friendly power.

**WILLIAMS, John Skelton**, American financier, government official and railroad organizer: b. Powhatan County, Va., 6 July 1865. He was educated at the University of Virginia, and engaged in banking and other business undertakings at Richmond, gaining a large fortune. He organized the Seaboard Air Line under Southern control and capital, and was its president in 1894-1904. He has been actively interested in the development of Southern resources. He was appointed Assistant Secretary of the Treasury in 1913, and in 1914 became Comptroller of the Treasury, serving also as an ex-officio member of the Federal Reserve Board. In 1918 he was appointed a member of the advisory committee to the Director-General of Railroads and also director of the division of finances and purchases in the department of railroads.

**WILLIAMS, John Stuart**, American senator and Confederate soldier: b. Montgomery County, Ky., 1820; d. there, 17 July 1898. He was graduated at Miami (Ohio) University in 1838, and was admitted to the bar of Kentucky in 1840. He served in the Mexican War, was promoted to the rank of colonel and afterward resumed his law practice. He was a member of the Kentucky State legislature in 1851-52. He was opposed to the secession of the Southern States, but organized a brigade for service in the Confederate army and served as brigadier-general throughout the war. He later urged speedy renewal of allegiance to the United States. He served in the Kentucky legislature in 1873-74, and was United States senator in 1879-85.

**WILLIAMS, Jonathan**, American soldier: b. Boston, Mass., 20 May, 1750; d. Philadelphia, Pa., 16 May 1815. He was secretary to his granduncle, Benjamin Franklin, while the latter was Ambassador to France, and while abroad read widely concerning fortification and made an especial study of military science. He returned with Franklin in 1785 and was for some years a judge of Common Pleas at Philadelphia. In 1801 he entered the army, soon becoming inspector of fortifications and taking command of West Point in 1802-03. He resigned in the year last named, but returned to the army in 1805 as chief engineer and superintendent at West Point. While in charge of the fortifications of New York he built Fort Columbus and Castle William on Governor's Island, Castle Clinton (Castle Garden), and Fort Gansevoort. On the breaking out of the War of 1812, as senior officer at Castle William, he claimed command of that fort, and on his being assigned elsewhere, he resigned. He was elected to Congress in 1814, but did not take his seat. As the first person in the United States to apply the principles of scientific engineering he has often been called "the father of the corps of engineers." He published 'The Use of the Thermometer in Navigation' (1799) and translated 'Elements of Fortification' (1801), and 'Kosciusko's Manœuvres for Horse Artillery' (1808).

**WILLIAMS, Sir Monier Monier-**. See **MONIER-WILLIAMS, SIR MONIER**.

**WILLIAMS, Roger**, pioneer of religious liberty and founder of Rhode Island: b. Wales, 1607; d. Providence, R. I., March 1684. There

is considerable doubt as to the year of Williams' birth; authorities differ. Some of them claim he was born in 1601, others in 1603. The writer after a careful examination of all the records places the date at 1607. Consult Straus' 'Roger Williams, the Pioneer of Religious Liberty,' pp. 5-11.

The most recent investigations have shown that he was the son of James Williams, a merchant tailor of London, and of his wife, Alice Williams. While yet a mere boy, he attracted the attention of Sir Edward Coke, while taking shorthand notes of sermons and speeches in the Star Chamber, and Coke placed him (1621) in the Charter House School. From there (1623) he went to Pembroke College, Cambridge University, from which he took his degree in 1626. Williams soon developed into a decided opponent of the liturgy and ceremonies of the Church, thereby placing himself on the side of the most radical Puritans. On 1 Dec. 1630 he embarked from Bristol with his young wife in the ship *Lyon*, and arrived at Nantasket 5 Feb. 1631. No sooner had he set foot upon the shores of New England than he came in conflict with the ecclesiastical and civil authorities of the colony, whom he found arrayed against him, for asserting and maintaining with unwavering fidelity those principles which have immortalized his name as the champion of religious liberty.

The arrival of Williams in America was noted by Winthrop as that of a "Godly minister." He was already known and esteemed by the leading men in the colony, and he was immediately invited to officiate in the place of John Wilson as teacher of the church at Boston, which, however, Williams declined on the ground that they of Boston were an unseparated people. It is well to note here a distinction between the Pilgrims and the Puritans. The former were Separatists, and were associated as a distinct church before they left Holland. A principle of their Church was, that the state had no right to punish for spiritual sins. The Puritans, on the other hand, though Non-conformists, were not separated from the Established Church. Their scruples were against conforming to many of the ceremonies of that Church. He was invited by the Pilgrim church at Salem to become an assistant or teacher in place of Higginson, who died a few months before. This call Williams accepted, but the civil authorities, the General Court of Boston, interfered and remonstrated with the Salem church for choosing him. He remained at Salem only a short while, and in August removed to Plymouth, where he was received with much respect. Here he remained for two years, supporting himself by manual labor and officiating as "teacher" in the church among the Pilgrim fathers. During his residence here he became intimately acquainted with various Indian chieftains in the neighborhood, which intimacy had an important bearing in his subsequent life in the founding of Rhode Island.

In August 1633 he returned to Salem and resumed his ministerial labors there, but at every turn he found himself in conflict with the clergy and the court of Massachusetts. He was frequently cited to appear before the court. In October 1635 he was tried before the General Court, consisting of the governor, the deputy

governor, eight assistants and some 25 deputies. The formal charges against him were four in number, but the basis of them may be summed up by the statement that he maintained that the civil power has no jurisdiction over the conscience, or, in other words, he maintained the absolute liberty of conscience. The court convicted him and sentenced him to banishment. In January 1636 he left Salem to escape arrest, and to seek a refuge from the tyranny of the church brethren. He went first to Seekonk, and afterward with four companions who joined him embarked in a canoe to seek a spot beyond the jurisdiction of the Massachusetts and Plymouth colonies. The site selected by him was Providence, so named by him in gratitude for "God's merciful providence to him in his distress."

In March 1638 a large section of land was conveyed to him by deed from the Indians, which land he divided equally among his followers. Mrs. Williams and her two infant children joined him, and friends from Massachusetts and England soon joined the Rhode Island colony.

William Coddington, who had been a merchant in Boston, was elected as magistrate with the title of judge, and three elders were elected to assist him. This form of government continued until 1640. Meanwhile the antagonism of the Boston Colony to Williams continued, and a law was passed which practically excluded the inhabitants of Providence from entering Massachusetts. In March 1641 the government of Rhode Island was regularly organized.

The formation of the New England Confederacy, in 1643, which included the four colonies, Massachusetts, Connecticut, Plymouth and New Haven, was a matter of anxious concern to the Rhode Island and Providence settlements. The open hostility of the Confederacy, together with the claim made by Massachusetts that the Rhode Island and Providence colonies had no authority to set up civil government, induced these latter colonies to seek a charter from England. At an assembly held in Newport 19 Sept. 1642, a committee was appointed to procure a charter, and in July 1643 Williams set sail from New York for England. Here on 17 March 1644 he obtained a charter which gave to the towns of Providence, Portsmouth and Newport full power to rule themselves under the name "The Providence Plantations of Narragansett Bay." This charter granted in the most friendly spirit everything that Williams prayed for.

Williams returned to America in 1644, landing in Boston 17 September. He ventured to tread on this forbidden ground by exhibiting a letter from 12 leading members of the Parliamentary party in England, addressed to the government of Massachusetts. He, therefore, proceeded without hindrance to Providence. In May 1647 a form of government was agreed upon after many delays; the office of president of the colony, which so naturally belonged to Williams, was bestowed upon John Coggeshall of Newport. Dissensions arose within and without the new colony; Williams was called upon to pacify the Indians and to settle numerous disputes, ecclesiastical and civil. In October 1652 Williams was again in England

making efforts to secure a renewal of the colony's charter; this he secured and returned to America, landing in Boston in 1654. In this same year the reorganization of the Rhode Island government took place, and on 12 September Williams was elected president of the colony. He was again elected 20 May 1656. In this year the persecution of the Quakers in Boston soon made Rhode Island a Quaker refuge, and they were made welcome largely through the influence of Roger Williams. For many years, until 1677, Williams continued to hold various offices and to guide the affairs of the colony. In the Indian wars of 1675-76, when Providence was attacked, Williams was captain of militia and drilled companies in Providence. See RHODE ISLAND.

The life of Roger Williams was now rapidly nearing its end. His Providence friends did not fully appreciate the life-work of this sturdy champion of soul liberty, which was destined to bring happiness to a continent. At his death the brief record was conveyed to the outer world in a letter dated 10 May 1684, stating "The Lord hath arrested by death our ancient and approved friend, Mr. Roger Williams, with divers others here." He was buried in a spot which he himself had selected on his own land, near where, 47 years before, he had first landed within the colony he founded.

The principles of religious liberty had been proclaimed in all ages and under many climes, with more or less plenitude, but Roger Williams was the first to organize and build up a political community with absolute religious liberty as its chief cornerstone. To him the successful pioneer of these principles is due to a larger extent than to any man, the American system of a "free church in a free State."

No portrait of him in bronze or in marble, or of any kind, has come down to us, and when in 1872 the State of Rhode Island presented a statue of her founder to the nation, which now stands in the rotunda of the Capitol at Washington, the artist had to make the memorial from an ideal conception.

Among the great men of his times with whom Williams stood in close personal relations, besides his early patron, Sir Edward Coke, were Cromwell, John Milton, Sir Henry Vane, the younger, Major-General Harrison of the Parliamentary army, Lawrence Lord, president of the Council of State, and others of distinction in England and America. (See UNITED STATES — CIVIL AND RELIGIOUS LIBERTY). Consult 'Memoirs,' by James D. Knowles (Boston 1833); Gammell (Boston 1846); Elton (London 1842); Guild, R. A., 'Biographical Introduction, etc.' (Providence 1866); 'Works of Roger Williams,' published by the Narragansett Club of Providence (6 vols., Providence 1866-74); biographies by Oscar Straus (New York 1884) and Carpenter, E. J. (ib. 1910); Tyler, M. C., 'History of American Literature, 1607-1765' (New York 1878); Dexter, Henry M., 'As to Roger Williams and his "Banishment" from the Massachusetts Plantation' (Boston 1876).

**WILLIAMS, Rowland**, Anglican clergyman and educator; b. Halkyn, Wales, 16 Aug. 1817; d. Broad Chalk, near Salisbury, Wiltshire, 18 Jan. 1870. He was graduated from King's College, Cambridge, in 1841, and was Fellow and

tutor there in 1839-50. He accepted the chair of Hebrew at the theological college of Saint David's in 1850, acting also as vice-president of that institution. In 1854 he became select preacher at Cambridge and became vicar of Broad Chalk in 1858, while still retaining his offices at the college. His views on inspiration brought him into disfavor with the Welsh clergy and in 1862 he was prosecuted and condemned for heresy in the Court of Arches. He resigned his professorship and retired to his vicarage at Broad Chalk, where he henceforth lived, though in 1864 he secured from the Privy Council a reversal of the judgment against him. His publications include 'Rational Godliness' (1855); 'The Hebrew Prophets' (1868-71); 'Psalms and Litanies' (1872), etc. Consult Williams, Ellen, 'Life and Letters of Rowland Williams' (1872).

**WILLIAMS, Samuel Wells**, American missionary and philologist: b. Utica, N. Y., 22 Sept. 1812; d. New Haven, Conn., 17 Feb. 1884. He was graduated from the Rensselaer Institute, Troy, N. Y., in 1832, and in 1833 went to Canton, China, as printer to the American Mission. He was compelled to remove to Macao in 1835, and in 1845-48 was in the United States, after which he resumed his work in Canton. He acted as interpreter to Commodore Perry on his Japanese mission in 1853-54, and in 1857 resigned his position in the mission and became secretary and interpreter to the United States legation. He assisted in the negotiation and ratification of the treaty of Tientsin in 1858-59. Upon the establishment of the United States legation at Peking under Burlingame in 1862 he became its secretary, occupying the post until 1876, when he returned to the United States and accepted the chair of Chinese at Yale, where he remained until his death. He was editor and contributor to the *Chinese Repository* during the time of its publication (1832-51), and was a leading authority on the Chinese and Japanese languages. He superintended the press work of Medhurst's 'Dictionary of the Hokkien Dialect' (1837) and with Bridgman issued 'Chinese Christomathy' (1841). His other works include 'Easy Lessons in Chinese' (1842); 'The Topography of China' (1844); 'The Middle Kingdom' (1848); 'A Syllabic Dictionary of the Chinese Language' (1874), etc. The two last mentioned are the greatest of his works and are still among the highest authorities in their field. Consult Williams, F. W., 'Life and Letters of Samuel Wells Williams' (1888).

**WILLIAMS, Seth**, American soldier: b. Augusta, Me., 22 March 1822; d. Boston, Mass., 23 March 1866. He was graduated at the United States Military Academy in 1842, and in the Mexican War served as aide-de-camp to Gen. Robert Patterson. He was adjutant of the United States Military Academy in 1850-53, and was thenceforth until his death connected with the adjutant-general's office. He was promoted brigadier-general of volunteers 23 Sept. 1861, and later served as adjutant-general on the staff of Generals McClellan, Burnside, Hooker and Meade. From 1864 until the close of the war he was inspector-general of the army on the staff of General Grant. He was brevetted major-general of volunteers 1 Aug. 1864 for conduct at Gettysburg, and major-

general of regulars 13 March 1865 for his services in the war. His health was seriously undermined in the war but he remained on duty.

**WILLIAMS, Talcott**, American journalist and educator: b. Abeih, Turkey, 20 July 1849. His parents were Congregationalist missionaries. He was graduated at Amherst College in 1873. He was on the staff of the *New York World* in 1873-77; was Washington correspondent of the *New York Sun* and of the *San Francisco Chronicle* in 1877-79; and was editorial writer on the Springfield (Mass.) *Republican* in 1879-81. He was one of the editors of the *Philadelphia Press* in 1881-1912. Since 1912 he has been director of the School of Journalism founded at Columbia University by Joseph Pulitzer. He was president of the American Conference of Teachers of Journalism in 1913. Dr. Williams was associate editor of the second edition of the 'New International Encyclopedia.' He has been the recipient of honorary degrees from almost a dozen prominent institutions of higher learning.

**WILLIAMS, Walter**, American journalist and educator: b. Boonville, Mo., 2 July 1864. He was editor and part owner of the *Boonville Advertiser* in 1884-89; and edited the *Columbia (Mo.) Herald* in 1890-1908. He also edited the *Saint Louis Presbyterian* in 1897-98; the *Daily State Tribune*, Jefferson, Mo., in 1898-1902; and founded the *Country Editor* in 1895. Since 1908 he has been professor of the theory and practice of journalism at the University of Missouri, serving also as dean. He was the organizer and secretary of the World's Press Parliament held at Saint Louis in 1904; was elected the first president of the Press Conference of the world for 1916-20; and was the first president of the American Association of Schools and Departments of Journalism in 1916. He has published 'Some Saints and Some Sinners in the Holy Land' (1902); 'History of Missouri' (1908); 'From Missouri to the Isle of Mull' (1909); 'The Practice of Journalism' (1911); 'The World's Journalism' (1915); 'History of Northeast Missouri' (1915); 'History of Northwest Missouri' (1915).

**WILLIAMS, William**, American patriot and signer of the Declaration of Independence b. Lebanon, Windham County, Conn., 8 April 1731; d. there, 2 Aug. 1811. He was graduated at Harvard College in 1751, in 1755 served on the staff of Col. Ephraim Williams in the Lake George expedition, and after the revolutionary troubles began was an active member of the council of safety, and in October 1775 was chosen a representative in the Continental Congress. His property was nearly all expended in the war, and he was tireless in obtaining private donations to supply the army, going from house to house to collect articles that could relieve the destitution of the soldiery. He held nearly every office in the gift of his constituents, served nearly 50 years in the State legislature, and was a member of the convention of his State which adopted the Federal Constitution.

**WILLIAMS, Sir William Fenwick**, British soldier: b. Annapolis Royal, Nova Scotia, 4 Dec. 1800; d. London, 26 July 1883. He was

graduated at Woolwich in 1821, entered the Royal Artillery in 1825, and after serving in the East Indies several years was appointed British commissioner to the conference in Erzerum, to settle the boundary dispute between Persia and Turkey in Asia. During the Crimean War he was sent as commissioner to the relief of Kars, and there promptly reorganized the troops. After defending Kars for four months against the Russians he met their commander, Gen. Mauravteff, on the heights above the city and defeated him with great slaughter. Assisted by the Hungarian General Kmety, he did all in his power for the defense of Kars, but on 14 Nov. 1855 was forced by famine to capitulate. On his return to England he was created baronet, received the rank of pasha of the highest order and the decoration of the Medjidieh from the sultan; and was made a grand officer of the Legion of Honor of France. He sat in Parliament for Calne 1856-59 and then assumed the command of the forces of British North America. He was administrator of Canada in 1860-61; became full general in 1868; was governor-general of Gibraltar 1870-75; and retired from the army in 1877.

**WILLIAMS COLLEGE**, located at Williamstown, Mass. It owes its origin to the bequest of Col. Ephraim Williams, for establishing a "Free School" in Williamstown. The bequest was made in 1755; the property was sold, and the funds were allowed to accumulate until 1785, when a free school was incorporated by the legislature, and a lottery granted for raising funds to erect a building; in 1790 the building (now West College) was completed, and the school was opened 20 Oct. 1791. In 1793 the institution was incorporated as a college under its present name, the property vested in the free school was transferred to the college, and a grant of \$4,000 was made by the State to purchase a library and apparatus. The college subsequently received other appropriations from the State; in 1796 the legislature granted two townships of land; in 1809 an additional township; and in 1814 appropriated the taxes from the Massachusetts bank for 10 years to Harvard, Williams and Bowdoin, Williams' share in which amounted to \$30,000; in 1859 the legislature appropriated \$25,000, and in 1868, \$75,000. In 1806 the first foreign missionary society in the United States was formed at Williams. In 1836-72 Mark Hopkins (q.v.) was president of the college, and during his administration it attained a high degree of prosperity.

The curriculum prescribes the work of the freshman year, and organizes the courses of the next three years in 11 major groups arranged in three divisions. The aim is to secure the concentration of part of the student's work in one well-defined field and the distribution of another part among different subjects. The degree of A.B. is conferred, and A.M. for graduate work and thesis. There are 70 general scholarships and one special prize scholarship. The principal college buildings are West College, the oldest, erected 1790; East College, erected in 1798; Ingersoll Hall, 1847; and South College; Griffin Hall, 1849; Observatory, built in 1837, under the direction of Prof. Albert Hopkins, the first college observatory in the United

States; Lawrence Hall Library; Jackson Alumni Hall Chapel; College Hall; Clark Field Memorial Observatory, erected 1888, containing a fine meridian circle by A. Repecc Sons, Hamburg; Morgan Hall; Lasell C. sium; Hopkins Memorial Hall; The Chemical Laboratory; Thompson Bic Laboratory; Thompson Physical Labor College Infirmary; Jesup Hall; Williams Grace Hall. The library contains about volumes. The productive fund amou \$2,900,883.58; the student attendance is 5 the faculty 61; the total number of gra nearly 6,000.

**WILLIAMSBURG**, wil'yamz-berg, town, county-seat of Whitley County, Cumberland River, and on the Louisville Nashville Railroad, about 95 miles south of Lexington. It is in an agricultural an mining region, and has flour and lumbe and large coal yards. Pop. 2,000.

**WILLIAMSBURG**, Va., city, coun of James City, County, on the Chesapeake Ohio Railroad, about 48 miles southe Richmond. It is the oldest incorporated t the State. It was established in 1632, an to the Revolution it was the capital of th ince. It was also the State capital until 17 here in 1765 Patrick Henry made his 1 speech against the stamp act, in whic minded his auditors that George III migh by the example of Cæsar and Charles I city has many historic associations cor with the pre-Revolutionary days and th War. It is the seat of William and M. lege (q.v.), and it has the Eastern Lunaa lum, opened in 1773, the oldest institut its kind in the United States. On 3 Ma it was occupied by the Confederate force had withdrawn from Yorktown, and thre later an attack was made by the Union. The battle lasted all day. No decisiv gained by either side. The Federal lo 2,230 and the Confederate losses 1,560, about 2,714.

**WILLIAMSBURG CANALS.** See DIAN CANALS.

**WILLIAMSITE.** An ornamental an precious variety of serpentine of appl color obtained in Lancaster County, Pa.

**WILLIAMSON**, wil'yam-son. 1 William, English chemist and educa- Wandsworth, Surrey, 1 May 1824; d. 19 was educated at Paris, Heidelberg and G in 1849 was appointed professor of pi chemistry at University College, Lond 1875 he accepted the chair of chemistr occupying both chairs until 1887 when signed and was appointed professor en He made important researches on etherif gas analysis, the atomic theory, etc., and several important papers concerning 1 vestigations, including 'Etherification a Constitution of Salts,' which attracted spread notice. He also published 'Ch for Students.' He served two terms president of the Chemical Society of London, a president of the British Association for on

**WILLIAMSON**, Alice Muriel I ston, American novelist, wife of C. N. W son (q.v.); b. Livingston Manor Hous

Poughkeepsie, N. Y., 19th century. She was educated privately and became known as a writer of fiction. Later she collaborated with her husband in writing novels which made their joint signatures "A. M. and C. N. Williamson" widely known. Independently she was the author of 'The Barn Stormers'; 'The Golden Silence,' etc.

**WILLIAMSON, Charles Norris**, English journalist and novelist: b. Exeter, 1859. He was educated at University College, London, and engaged in journalism. He worked for the *Examiner* and on the *Graphic*, and in 1891 founded *Black and White*. He wrote numerous magazine articles and 'Life of Thomas Carlyle' (2 vols., 1881). He is best known, however, for the novels written in collaboration with his wife, A. M. Williamson (q.v.), under their joint signatures. Among them are 'The Lightning Conductor' (1903); 'The Princess Passes' (1905); 'The Car of Destiny' (1906); 'Set in Silver' (1909); 'The Motor Maid' (1911); 'The Heather Moon' (1912); 'It Happened in Egypt' (1914); 'The Lightning Conductor Discovers America' (1916); 'Tiger Lily' (1917); 'Everyman's Land' (1918); 'The Lion's Mouse' (1919).

**WILLIAMSON, Francis John**, English sculptor: b. Hampstead, England, 17 July 1833. He was a pupil of J. H. Foley and later became his assistant, afterward settling at Esher, Surrey, where he has since lived. He has executed many ideal and private commissions, including portraits of the royal family at the order of Queen Victoria. Among his works are statues of Queen Victoria in Australia, India, Ireland, London, etc.; Dean Milman in Saint Paul's Cathedral; and numerous public statues in different parts of the British Isles.

**WILLIAMSON, George Charles**, English writer on art: b. Guildford, Surrey, 1858. He was educated at London University. As an author he began with newspaper articles on local archaeological matters and issued a small book on local coins. He also wrote a book on trader's tokens and another on coins of the Bible. For many years he has been art editor to George Bell and Sons, publishers. He has traveled extensively, visiting the picture galleries of Europe, both public and private. Mr. Williamson is the author of 'Life of John Russell, R.A.'; 'John Downman'; 'Richard Cosway, R.A.'; 'George J. Pinwell'; 'Portrait Miniatures'; 'Bernardino Luini'; 'George Engleheart'; 'Velasquez'; 'Holman Hunt'; 'Lord Leighton'; 'Murillo'; 'Raphael'; 'Cities of Northern Italy'; 'Andrew and Nathaniel Plimer'; 'History of Portrait Miniatures'; 'The Anonimo Morelliano'; 'How to Identify Portrait Miniatures'; 'Life of George Morland'; 'Life of Milton'; 'Guildford in the Olden Time'; 'Catalogue of the Pierpont Morgan Collection of Miniatures' (4 vols.); 'Catalogue of the Pierpont Morgan Collection of Jewels'; 'Catalogue of the Pierpont Morgan Collection of Watches'; 'The Imperial Wedgwood Dinner Service'; 'Miniatures, English and Foreign'; 'Catalogue of the Portraits of Milton,' etc. Mr. Williamson is editor of a new edition of Bryan's 'Painters

and Engravers' (5 vols.) and was a collaborator in *The Catholic Encyclopedia*.

**WILLIAMSON, Hugh**, American physician and legislator: b. West Nottingham, Pa., 5 Oct. 1735; d. New York, 22 May 1819. He was graduated at the College of Philadelphia in 1757, studied theology and in 1759 was licensed to preach in Connecticut. He preached for a time and was professor of mathematics at the College of Philadelphia in 1760-63. He then studied medicine at the universities of Edinburgh and Utrecht, and became a highly successful practitioner in Philadelphia. While in England in 1774 he was examined by the Privy Council in regard to the affairs of the American colonies. He was a surgeon in the North Carolina militia in 1780-82; served in the Continental Congress in 1784-86; and in 1787 was a delegate to the convention which framed the Constitution of the United States. He served in Congress from its first organization until 2 March 1793, when he removed to New York. He wrote 'Paper Currency' (1786); 'Discourse on the Benefits of Civil History' (1810); 'History of North Carolina' (2 vols., 1812), etc.

**WILLIAMSON, W. Va.**, city and county-seat of Mingo County, situated on the Norfolk and Western Railroad, 75 miles southeast of Huntington. The chief public buildings are the county courthouse, city hall and public schools. Because of its location in the coal-producing region of the State, coal-mining is its chief industry. In 1916 the commission form of government was put in operation. Pop. 3,561.

**WILLIAMSON FREE SCHOOL OF MECHANICAL TRADES**, an educational institution for boys dependent upon their own resources, founded in 1888 at Williamson School Station, near Philadelphia, Pa., by I. V. Williamson. It is non-sectarian and preference in admission is given to boys in the surrounding sections. Boys between the ages of 15 and 18 are admitted, and are bound for three years as apprentices to the trustees. There is an academic course for general education and each student is taught one trade, which may be carpentering, brick laying, machine trade, pattern making, steam and electrical engineering or agriculture. The students live in cottages in families of 24 or less. The endowment is about \$3,000,000. There are 20 instructors and assistants, and about 250 students are accommodated. The library contains about 4,000 volumes.

**WILLIAMSPORT**, wil'yamz-pört, Ind., city, county-seat of Warren County, on the Wabash River and the Wabash Railroad, 71 miles northwest of Indianapolis. It was founded in 1827. It is the trade centre of an agricultural region, and is also situated within three miles of large coal mines; it has a building-stone quarry, grist-mills and warehouses; there are two State banks and two weekly newspapers. There is a high school founded in 1884. Pop. about 1,243.

**WILLIAMSPORT, Md.**, town in Washington County, on the Potomac River, the Chesapeake and Ohio Canal, and the Cumberland Valley and West Maryland railroads, 65

miles northwest of Washington. It was founded in 1787; in 1863 Lee's army crossed the Potomac at this point on the march to Gettysburg. It is situated in an agricultural and timber region, and is a shipping point for peaches. It has flour and lumber mills and sash and door factories, a national bank with a capital of \$100,000 and one weekly newspaper. There is a high school, and several elementary schools, including one for colored pupils. Pop. about 1,571.

**WILLIAMSPORT**, Pa., city, county-seat of Lycoming County, on the West Branch of the Susquehanna River, and on the Pennsylvania, the Northern Central, and the Philadelphia and Reading railroads, about 75 miles north of Harrisburg. It is on the Alleghany plateau, covering an area of seven square miles, in an agricultural and mining region. The chief manufacturing establishments are steel works, lumber mills, furniture and rubber goods factories, wood-working machinery works, wire rope, nail and engine factories, boot and shoe factories, silk mills, a sewing-machine factory and fire escape works. In 1918 the estimated number of wage-earners was 6,500, and of wages paid over \$3,000,000. The gross production of these factories was nearly \$14,000,000 in the census year, and fully \$20,000,000 in 1918. The city has an extensive trade in lumber products and coal. Williamsport was for many years a shipping point for lumber, being styled the "Sawdust City." But as the forests were cut the trade disappeared, and numerous foundry and machine shops were located here; gas and gasoline engines are manufactured, also rubber goods, woolen and silk goods, furniture, shoes, etc.

The principal public buildings are the government building, city hall, opera house, city hospital, Home for the Friendless and Masonic Temple. The city has two parks, Brandon and Vallamont; and Sylvan Dell and Starr Island are near by. There are over 50 churches, with 17,000 communicants. The educational institutions are Dickinson Seminary (Methodist Episcopal), a high school opened in 1869, 14 public schools, two large Roman Catholic parish schools and two commercial colleges. There are two dailies and one Sunday newspaper, besides several weeklies and a tri-weekly. The Sunday newspaper *Grit*, has a national circulation.

Williamsport was settled in 1779, and set off as a town in 1795. In 1806 it was incorporated as a borough, and in 1806 was chartered as a city. The city grew slowly until 1850, when the lumber industry began. Since then the growth has been rapid and the manufacturing and commercial industries have kept pace with the population. Pop. 40,000.

**WILLIAMSTOWN**, Australia, a seaport in Victoria, on the southwest shore of Hobson's Bay, immediately opposite Port Melbourne and nine and one-quarter miles southwest of Melbourne. The business interests of the town largely centre in the shipping. The piers are commodious and there are shipbuilding yards, patent slips and a drydock called the Alfred Graving Dock, opened in 1874 and improved in 1897-98. There are glass works, a woolen mill and refrigeration plants. The chief buildings

are the churches, the mechanics' institute, the customhouse, the sailors' rest, banks and similar structures, etc. Basalt and brown coal are worked near the town and several manufactures are carried on. Pop. about 16,000.

**WILLIAMSTOWN**, Mass., town in Berkshire County, on the Hoosac and Green rivers, and on the Fitchburg (Boston and Maine) Railroad, about five miles west of North Adams and 40 miles east of Troy, N. Y. It was settled in 1753 and was named West Hoosic. In 1765 it was incorporated and its name was changed to Williamstown in honor of Ephraim Williams. In 1793 Williams College (q.v.) was opened, since when it has been a favorite residential town. There are five villages within the town limits. The chief industrial establishments are a cotton mill, a large bleachery and large freight yards. Market gardening is carried on to quite an extent. Mission Park is so named because the movement for American foreign missionary work was started here. There are two banks, one national and one State. Pop. about 3,700.

**WILLIAMSTOWN**, Pa., borough in Dauphin County, 26 miles northeast of Harrisburg, on the Pennsylvania and the Williams Valley railroads. It is situated in an anthracite coal mining region, and has hosiery mills. The borough was settled in 1865 and was incorporated in 1888. Pop. 2,904.

**WILLIMANTIC**, wil-i-mán'tik, Conn., city in Willimantic County, at the confluence of the Willimantic and Natchaug rivers, and on the Central Vermont and the New York, New Haven and Hartford railroads, about 32 miles east of Hartford. It has the water power from the Willimantic River, which here has a fall of 91 feet within the city limits. The chief manufacturing establishments are the American Thread Company, cotton warp mills, print factories, silk mills, a foundry, machine shops, a spool factory and silk machinery works. The educational institutions are a State normal school, a high school, public graded schools, a large parish school, a public library containing about 6,000 volumes, and the Dunham Hall Library. There are two banks and a daily and weekly newspapers. It was incorporated as a borough in 1833 and in 1893 was chartered as a city. Pop. about 11,230.

**WILLING**, Thomas, American jurist, merchant and financier: b. Philadelphia, Pa., 19 Dec. 1731; d. there, 19 Jan. 1821. He was educated at Bath, England, and studied law at the Temple, London. He then returned to Philadelphia, where with Robert Morris he established the mercantile firm of Willing and Morris, which became the largest in the country. During the Revolution the firm was commissioned by Congress to purchase the military and naval supplies required by the government. Willing was mayor of Philadelphia in 1763; and in 1767-74 was an associate justice of the Supreme Court of Pennsylvania. He was a member of the Continental Congress in 1774-75, and voted against the Declaration of Independence. However, when in 1780 the Continental army was hard pressed for funds he was prominent among the Philadelphians who raised £20,000, himself contributing £5,000. In 1781 he was one of the founders of the

Bank of North America, the first bank chartered in the country; and he was its president in 1781-92. He was likewise the first president of the United States Bank, founded in 1791.

**WILLIS, H(enry) Parker**, American financial expert: b. Weymouth, Mass., 14 Aug. 1874. He was graduated at the University of Chicago in 1894, took the degree of Ph.D. there in 1897, and later studied at Leipzig and Vienna. He was for a time engaged as a journalist; was assistant to the Monetary Commission in 1897-98; and was professor of finance at George Washington University in 1905-06 and 1907-10. He was expert to the Ways and Means Banking and Currency Committees of the House of Representatives in 1911-13; was appointed secretary to the Federal Reserve Board in 1914; and in 1916-17 he was president of the Philippine Insular Bank, Manila, P. I. He has been professor of banking at Columbia University since 1917. His published works include 'History of the Latin Monetary Union' (1901); 'Our Philippine Problem' (1905); 'Principles and Problems of Modern Banking' (1910); 'The Federal Reserve' (1915); 'American Banking' (1916).

**WILLIS, Nathaniel Parker**, American author: b. Portland, Me., 20 Jan. 1806; d. Idlewild, N. Y., 20 Jan. 1867. He was graduated from Yale in 1827 and was employed by S. G. Goodrich ("Peter Parley") to edit two annuals, the *Legendary* in 1828 and the *Token* in 1829. In 1828 he established at Boston the *American Monthly Magazine*, which, after he had conducted it for two and a half years, was merged in the *New York Mirror*. He then set out on a tour of travel through Europe, visiting France, Italy, Greece, European Turkey, Asia Minor, and finally England, with the rank of an attaché to the American embassy at Paris, but chiefly as a correspondent of the *Mirror*, for which he wrote his 'Pencilings by the Way,' later (1835) published in book-form. He returned in 1836, became in 1839 editor of the *Corsair*, a New York periodical (1839-40), and in the same year again went to England. He returned to New York in 1846 and subsequently directed two short-lived papers, *The New Mirror* (1843-44) and *The Evening Mirror* (1844-45). Once more in Europe in 1845-46, he became in the last-named year editor of *The Home Journal*, the most successful of all his journalistic ventures, in the management of which he was associated with George P. Morris (q.v.). Willis was from the first a facile versifier and a prose-writer of great reportorial cleverness. His scriptural poems were in their day very popular, and many are still readable; and his other verse, when nothing else, was metrically able. Sometimes it reached real poetic value and effective specimens of it have been preserved by the anthologist. His fiction, except the 'Slingsby' papers, written for the English *New Monthly*, is popular but not strong. 'Pencilings by the Way' (1835) abounds in talented sketches of contemporaries. Willis was the most successful American journalist of his time, and his vogue was great. Among his principal works are 'Pencilings by the Way' (1835); 'Inklings of Adventure' (1836); two dramas entitled 'Two Ways of Dying for a Husband' (1839); 'Loiterings of Travel' (1840); 'Dashes at Life with a Free Pencil'

(1845); 'People I Have Met, or Pictures of Society and People of Mark, Drawn Under a Thin Veil of Fiction' (1850); 'Hurrygraphs' (1851); a 'Health Trip to the Tropics' (1853); 'Outdoors at Idlewild' (1854); 'The Rag-bag,' a collection of ephemera (1855); 'The Convalescent, His Rambles and Adventures.' Consult the 'Life' by Beers ('American Men of Letters,' 1885). There is an estimate of Willis in Lowell's 'Fable for Critics.'

**WILLIS'S ROOMS.** See **ALMACK'S.**

**WILLISON, Sir John Stephen**, Canadian journalist: b. Huron County, Ontario, 9 Nov. 1856. He engaged in journalism, became parliamentary correspondent of the *Toronto Globe*, and in 1890-1902 he was its editor. He was editor of the *Toronto News* from 1902, and in that position contributed largely to the defeat of the Reciprocity agreement of 1911 and the downfall of the Laurier administration. He was elected president of the Parliamentary Press Gallery in 1890; and of the Canadian Press Association in 1900. Since 1910 he has been Canadian correspondent of the *London Times*. He was knighted in 1913. He has written 'The Railway Question in Canada' (1897); 'Sir Wilfrid Laurier and the Liberal Party: a Political History' (2 vols., 1903); 'The United States and Canada' (1908); 'The New Canada' (1910).

**WILLISTON, Samuel**, educational benefactor: b. Easthampton, Mass., 17 June 1795; d. Easthampton, 18 July 1874. He was son of the Rev. Payson Williston, who served as Congregational pastor in Easthampton for 44 years. His education was interrupted by ill health; and he began to sell cloth-buttons made by his wife and assistants, the first manufactured in this country. Joel Hayden, of a neighboring town, invented machinery for the work, and went into partnership with Williston, who acquired large wealth in this and other manufactures. Besides giving freely to many objects, he founded (1840) the high-class preparatory school at Easthampton (Williston Seminary), his entire gifts to which were \$770,000. To Amherst College he gave \$150,000, and much to Mount Holyoke Seminary. His benefactions have been estimated at \$1,500,000.

**WILLISTON, Samuel**, American lawyer and educator: b. Cambridge, Mass., 24 Sept. 1861. He was educated at Harvard University. He became assistant professor of law there in 1890, professor in 1895, and since 1903 has been Weld professor of law. He assisted in the codification of the Law of Warehouse Receipts and the Law of Stock Transfer. Besides contributions to legal publications he is author of 'The Law of Sales' (1909); 'Commercial Law' (1915); 'Negotiable Instruments' (1915).

**WILLISTON, Samuel Wendell**, American paleontologist and anatomist: b. Boston, Mass., 10 July 1852; d. 1919. He was graduated at the Kansas Agricultural College in 1872, took the degree of M.D. at Yale University in 1880, and that of Ph.D. there in 1885. He was professor of anatomy at Yale in 1886-90; held the chair of historical anatomy and geology at the University of Kansas in 1890-1902, and was also dean of the Medical School there; and since 1902 he has been professor of paleontology at the University of Chicago. He

nest is placed on the ground, most commonly against a bank among long grass or weeds, but often at the foot of a bush, and, like that of the wood wren, is covered with a dome having a rather wide hole in the side, whence this species and its congeners are called "oven birds." The willow wren is a graceful, active bird, flitting restlessly from twig to twig, and its song is loud and sweet.

**WILLOWS, Cal.**, town, county-seat of Glenn County, on the Southern Pacific Railroad, about 140 miles north by east of San Francisco. In the centre of the town is a grove of willows, the only one in that section, hence the name of the place. The county courthouse is a handsome building, erected in 1894 at a cost of \$150,000. The town ships quantities of farm products and fruit. It has a State bank and three newspapers are issued daily. Pop. 3,800.

**WILLS, William Gorman**, Irish dramatist: b. Kilmurry, Ireland, 28 Jan. 1828; d. London, 13 Dec. 1891. He was educated at Trinity College, Dublin, studied art in the Royal Hibernian Academy, and for a time engaged as a portrait painter. After 1862 he devoted himself extensively to literature, though in 1868 he resumed portrait painting. He was the author of 'Notice to Quit' (1861); 'The Life's Evidence' (1863), and the dramas 'Charles the First' (1872); 'Eugene Aram' (1873); 'Marie Stuart' (1874); 'Jane Shore' (1876); 'Olivia' (1878); 'Sedgemoor' (1881); 'Claudian' (1885); 'A Royal Divorce' (1891), etc., and in conjunction with Sidney Grundy, 'Madam Pompadour.' Consult Archer, 'English Dramatists of To-day' (1882); Cook, 'Nights at the Play' (1883); Wills, Freeman, 'W. G. Wills, Dramatist and Painter' (1898).

**WILLS, William Henry**, English writer: b. Plymouth, England, 13 Jan. 1810; d. Welwyn, Hertfordshire, 1 Sept. 1880. He was a member of the original staff of *Punch*, acting as dramatic critic and also contributing both prose and verse. His contributions included 'Natural History of Courtship'; 'Comic Mythology'; 'Information for the People,' etc. In 1846 he became associated with Dickens, with whom he formed a lifelong friendship, as sub-editor of the *Daily News*. In 1849 he became assistant editor of *Household Words*, and in 1859 of *All the Year Round*. He published 'Old Leaves Gathered from Household Words' (1860).

**WILLS, William John**, Australian explorer: b. Totnes, Devonshire, 5 Jan. 1834; d. Cooper's Creek, Australia, about 1 July 1861. He studied medicine in London and in 1852 emigrated to Australia where he was joined in the following year by his father, and together they practised medicine at Ballarat. In 1855 he became a surveyor of crown lands, and in 1858 was appointed to the staff of the magnetic and meteorological observatory at Melbourne. In 1860 he joined the expedition under Robert O'Hara Burke (q.v.) as third in command, later becoming second, and crossed the continent northward, reaching the Gulf of Carpentaria, but on the return journey both Burke and Wills died of starvation. Wills' journal was recovered and published 'A Successful Exploration from Melbourne to the Gulf of

Carpentaria, from the Letters and Journals of William John Wills' (1863). Consult Howitt, 'History of Discovery in Australia' (1865).

**WILLSON, (Henry) Beckles**, Canadian author and journalist: b. Montreal, 26 Aug. 1869. He was educated at Kingston. He served as newspaper correspondent in Cuba, London and Paris, and is widely known as a magazine contributor. He was appointed major in the Canadian Expeditionary Force. Author of 'The Tenth Island' (1897); 'The Great Company' (1899); 'Lord Strathcona' (1902; 2d ed., 1915); 'The Romance of Canada' (1907); 'Nova Scotia: the Province that has been Passed By' (1910); 'Quebec: the Laurentian Province' (1913); 'The Life of Lord Strathcona' (1915).

**WILLUGHBY, will'o-bi**, Francis, English ornithologist: b. Wollaton Hall, Nottinghamshire, 1635; d. 3 July 1672. He studied at Cambridge, where he became the pupil of the famous naturalist, John Ray (q.v.), and with him made a continental tour (1663-64), making studies and collecting zoological specimens. Ray edited and translated his Latin 'Ornithologia' (1676), and in 1678 published it in English as 'The Ornithology of Francis Willughby.' Ray also edited Willughby's 'History of Fishes' (1686). To the 'Ornithologia' Buffon and Linnæus were much indebted, and it is claimed that Willughby originated the Linnæan system of zoological classification.

**WILMERDING, Pa.**, borough in Allegheny County, on the Pennsylvania Railroad, 13 miles east by south of Pittsburgh. It was founded in 1859 and was laid out by the Westinghouse Air-brake Company, who have here their large manufacturing works. There are also railroad repair shops, two banks and a newspaper. The water supply comes from the Monongahela River; natural gas is used for fuel, and every street is sewerd. Pop. 8,000.

**WILMETTE, Ill.**, village in Cook County, on Lake Michigan, on the northern outskirts of Chicago, and on the Chicago and Northwestern Railroad. It is chiefly a residential suburb and has many beautiful homes. The surrounding district is interested in floriculture. Pop. about 4,943.

**WILMINGTON, Del.**, city, port of entry, county-seat of New Castle County, at the extreme north end of the State, on the Brandywine and Christiana rivers, above their outlet in the Delaware River, and on the Pennsylvania (Philadelphia, Baltimore and Washington), the Baltimore and Ohio and the Philadelphia and Reading railways, about 27 miles southwest of Philadelphia and 69 miles northeast of Baltimore. Several regular lines of steamers, for passengers and freight, connect the city with Philadelphia, and with the Delaware River and Bay ports. It ranks as the first city in the State in population, commerce and industries.

**Industries.**—The chief industrial establishments are shipyards, car works (the Pullman Company and the Pennsylvania have shops in the city), steel works, machine shops, foundries, paper mills, cotton mills, ~~small~~ iron works, and fibre goods factories. Leather goods, especially morocco, are manufactured in

large quantities here. Dupont powder and dye mills, two plants covering 4,000 acres, the largest in the world, located nearby, in New Jersey across the Delaware River, contribute much to the city's trade. The 1909 census located 261 industrial concerns, with 16,285 wage-earners, this being two-thirds of the State's total of factory workers. There are estimated to be 25,000 wage-earners in 1918, an invested capital of over \$50,000,000, and annual gross products of \$65,000,000.

**Buildings and Municipal Improvements.**—The city is on land elevated sufficiently to materially increase its healthfulness. It extends about four miles back from the Delaware. The houses are nearly all of brick and stone—no wooden buildings are permitted to go up in the city proper, but the old wooden buildings are allowed to remain. There are 10 parks, 11 squares, seven playgrounds having a total area of 665 acres. The streets are well paved and sewered. There is a good waterworks system. The principal public buildings are the government buildings, city and county building. A building of special interest is the Old Swedes' Church (Holy Trinity), built of brick in 1698. It is said to be the oldest building in the United States which has been in continuous use as a church since its erection. The city owns and operates the waterworks.

**Churches and Charitable Institutions.**—The principal religious societies in the city are represented as follows: Methodist (white), 18 churches, (colored), seven churches; Baptist (white), nine, (colored), three; Roman Catholic, 13 and Protestant Episcopal, eight each; Presbyterian, nine; Jewish, three Lutheran and Friends two each; Adventist, Unitarian and Swedenborgian, one each. There are a large number of charitable institutions; chief among them are the Home for Friendless Children; Saint Peter's Orphanage (Roman Catholic) for girls; Saint Joseph's Home (Roman Catholic) for colored children; two homes for aged men and women, and three hospitals. At Farnhurst, two miles out, is the Delaware State Hospital for the Insane, and near it the county almshouse.

**Educational Institutions.**—The State Industrial Schools for Girls and the Ferris Reform School for Boys are located near here. Other educational institutions established here are Hebbs School, Wilmington Friends' School, Ursuline Academy, a public high school established in 1872, Goldey College, the Wilmington Business School, public and parish elementary schools, a free public library (established in 1788 and incorporated as the Wilmington Institute in 1859), which now contains about 95,000 volumes; the Historical Society Library, containing 5,000, and the library of the Law Library Association of the county, which has about 16,000 volumes.

**Banks and Finances.**—There are three national banks and one State bank; four trust companies and a number of loan associations. The annual amount of business is about \$180,000,000. The foreign trade transacted through the port of Wilmington in normal years amounts annually to about \$8,000,000, nearly all of which is in exports. The annual cost for city maintenance and operation is about \$1,300,000. The principal items of expenditure are \$300,-

000 for schools; \$120,000 for police; \$75,000 for fire department; \$155,000 for waterworks, and \$190,000 for interest on debt.

**Government.**—The government is vested in a mayor, who holds office two years, and in a council composed of 13 members, who are elected by wards, except the president who is elected at large. The mayor appoints the board of water commissioners and the board of directors of the street and sewer department. The council elects the city auditor, city clerk and inspectors of meat, milk, oil and markets. The judge of the Supreme Court appoints the police commissioners. The board of education, one member from each ward and a president at large, the city tax collectors and city treasurer are chosen by popular vote.

**History.**—The first settlement was made in 1638 by a colony from Sweden, under Peter Minuit. They found here an Indian village called Minquas. The Swedes erected a fort to which they gave the name Fort Christiana, in honor of the young daughter of Gustavus Adolphus, the king of Sweden. The village was called Christianaham. In 1655 the Dutch from New Netherlands bought the land on which Wilmington now stands, and other lands adjoining from the Indians, and took forcible possession of the fort. The name was changed to Fort Altena. The Dutch retained possession for nine years, when they were supplanted by the English. It came under control of William Penn, after which the colony gave more attention to civic pursuits instead of wars and conquests. In 1731 the village was named Willingtoun, in honor of Thomas Willing, who had laid out the town. Later the name was changed to Wilmington. It was incorporated as a borough in 1739, and the first borough election was held 8 Sept. 1740. In 1832 it was chartered as a city.

**Population.**—(1880) 42,478; (1890) 61,431; (1900) 76,556; (1910) 87,411; (1918 est.) 115,000. Consult Powell, 'Historic Towns of the Middle States'; Ferris, 'History of the Original Settlements on the Delaware.'

**WILMINGTON, N. C.,** city, port of entry, county-seat of New Hanover County, on the Cape Fear River, 30 miles from the ocean bar and yet its harbor is of fresh water; and on the Atlantic Coast Line and the Seaboard Air Line railroads. It was first settled in 1730 and was first called New Liverpool and then Newton; in 1739 it was incorporated as a town and named Wilmington, and in 1744 was made the capital of the province. In 1765 the town took a decided stand against British authority and refused to permit a British man-of-war to land a quantity of stamps, this being the first open armed resistance to the Stamp Act. On 18 July 1775, Fort Johnson, at the mouth of the river, was captured by the militia under Col. John Ashe, and the royal governor was forced to leave the place. In 1781–82 Wilmington was occupied by the British, Cornwallis having his headquarters here. During the Civil War Wilmington was the most important port of the Southern States, the "gateway" between the South and foreign nations; and was consequently the chief resort of the blockade runners. The harbor and its approaches were strongly fortified by the Confederates; in January 1865 Fort Fisher was taken by the Federals,

and this resulted in the evacuation of the other forts and the surrender of Wilmington. Wilmington was chartered as a city in 1866.

It is an important commercial city. Improvements in the harbor and river channel have been made by the Federal government at considerable cost. There are weekly steamboat lines to New York, Baltimore and points on the Cape Fear and Black rivers and a large import and export trade, both foreign and domestic.

Wilmington is a city of varied resources, being in the heart of a rich agricultural district and also a port city. Its harbor channel has a mean low depth of 26 feet, with 30 feet projected, and it has over 600,000 square feet of warehouse space, while 16 ocean-going ships can load at one time at its docks. Shipbuilding is one of the liveliest of industries, steel, concrete and wooden vessels being built here simultaneously. At Wilmington is located the only government steel shipyard in the South and the first government owned concrete shipyard in the country.

Other industries located in Wilmington include fertilizer factories, packing-houses, marine railways, candy, woodwork, tea-chest, box, metal and fish can factories, cotton, hosiery and lumber mills, while it is one of the biggest fertilizer distributing points in the country. Immense cotton compresses are located along its river front and exports of cotton to Europe amount to 500,000 bales annually. The commerce on the Cape Fear River at and below Wilmington averaged 945,361 tons, with an average valuation of \$55,685,191 for the five calendar years ending in 1913, and during the five-year period ending 30 June 1915 the foreign exports increased 26 per cent and the imports increased 239 per cent. Even this normal time increase is expected to expand, due to development of trade with Latin America.

Wilmington has many churches and a thorough public school system, its schools being of modern type and all of brick. Its bank deposits in October 1919 were over \$30,000,000.

Here is located the New Hanover County courthouse, as well as many other public buildings, including a new customs-house, costing over \$600,000 and placed in commission in 1919. Many organizations for the social welfare of the community and for dispensing charity are in existence, while the city and county jointly carry on extensive health work, having most stringent regulations, with rigid inspections of food and dairies, while appropriating \$30,000 annually for mosquito extermination work. Wilmington is governed by a council of six, representing as many wards, into which the city is divided, and a mayor. The estimated population of the city in 1919 was 45,000.

JAMES H. COWAN,  
*Secretary, Wilmington (N. C.), Chamber of Commerce.*

**WILMINGTON, Ohio**, city, county-seat of Clinton County, on the Cincinnati and Muskingum Valley and the Baltimore and Ohio railroads, about 43 miles northeast of Cincinnati and 30 miles southeast of Dayton. It is an agricultural region. The chief manufacturing establishments are bent-wood and bridge-work factories, iron furnaces, machine shops, automobile parts factories, creameries and flour and lumber mills. The Wilmington Col-

lege (Orthodox Friends) was established here in 1870. There are two banks and four newspapers, one of which is issued daily. Pop. about 4,491.

**WILMINGTON, Capture of.** After General Terry's capture of Fort Fisher (q.v.) 15 Jan. 1865, Terry posted his troops on an entrenched line across the peninsula, about two miles above the fort. An advance on Wilmington was not considered prudent until he could be reinforced, as General Hoke, the Confederate commander, was holding Fort Anderson, on the west bank of Cape Fear River, about midway between Fort Fisher and Wilmington, and on the opposite bank had thrown up a line of intrenchments across the peninsula in Terry's front, behind which he had about 4,500 men. Fort Anderson was an extensive earthwork, mounting 10 heavy guns, commanding the approaches by land and water and held by General Hagood's brigade of 2,000 men. General Grant ordered General Schofield, with the 23d corps, from Tennessee to the coast of North Carolina to co-operate with General Sherman. Schofield's troops arrived at Alexandria and Washington late in January, where they were detained some days by the ice in the Potomac. General Cox's division of 4,400 men went by steamers from Alexandria and landed on the peninsula, in rear of Terry, 9 February, raising Terry's command to 8,000 men. Schofield now took command; the fleet under Admiral Porter occupied positions in Cape Fear River and off the coast, covering both flanks of Terry's line, and, 11 February, Terry was pushed forward, supported by Cox, drove in Hoke's pickets and intrenched within 500 yards of his main line. An attempt on the 12th to turn Hoke's left by a co-operation of the army and navy was foiled by high winds and a violent storm. On the night of the 14th an attempt was made to move the pontoons upon their wagons along the beach with the troops; the wagons sank deeply in the sand, progress was very slow, and it having become evident that the pontoons could not be got up to the point of crossing of Masonborough Sound before daylight, when the enemy would discover the movement, the attempt was abandoned and attention turned to Hoke's right, where it would not be required to contend with the difficulties of both land and sea. On the 16th Cox's and Ames' divisions were crossed by steamboats to Smithville, on the right bank of the river, where they were joined by Col. O. H. Moore's brigade, of Couch's division, and a battery, and, on the 17th Cox with four brigades and the battery advanced along the main Wilmington road, driving the Confederate pickets and bivouaching near Fort Anderson, with his right resting on the river. Next morning the advance was resumed and the enemy driven within the works. Moore's and Henderson's brigades were intrenched on the south side of the fort, while Cox, with his other two brigades, followed later by Ames' division, started around Orton Pond, covering the Confederate right, to gain the Wilmington road in rear of the fort, the distance to be traveled being about 15 miles. The guns of Fort Anderson opened fire on the two brigades confronting the fort, and the gunboats opened heavily on the fort, the monitor *Montauk* lying close to it and the others on

filading its parapet. General Hagood, warned by his cavalry of Cox's movement around his right, hastily abandoned Fort Anderson during the night, taking with him six light guns and falling back behind Town Creek, eight miles above the fort. Hoke also retreated from his lines opposite Fort Anderson to within four miles of Wilmington. By these movements Schofield gained possession of the main defenses of Cape Fear River and of Wilmington, with several pieces of heavy ordnance and a large amount of ammunition, and with but small loss. In this he had the assistance of the gunboats that moved up the river removing torpedoes and silencing batteries on both banks. On the 19th Cox pursued Hagood to Town Creek, behind which and near its mouth he was found entrenched and had destroyed the only bridge. The creek was not fordable and could not be bridged. Terry also advanced on the east side of the river, following Hoke, and found him in force, and Ames' division was re-crossed to the east bank and joined Terry in the night. Terry again advanced on the morning of the 20th and after some sharp skirmishing came upon Hoke well entrenched with artillery in position. On the same day Cox crossed Town Creek below Hagood's position, by the use of a single flat boat found in the stream, which carried 50 men at a trip, and, by marching through woods and swamps, reached Hagood's flank and rear, attacked and routed his brigade, after a stubborn resistance, capturing two guns, three battle-flags and 375 prisoners, including Colonel Simonton, temporarily commanding the brigade, and nearly all the officers. During the night Cox rebuilt the bridge over Town Creek, crossed his artillery and the next morning pushed on toward Wilmington without opposition. Terry was unable to make any farther advance, but occupied Hoke's attention, so that he could not send any part of his force to replace the losses in Hagood's brigade. On the 21st Cox secured a portion of the Confederate pontoon bridge across Brunswick River, which Hoke had endeavored to destroy, put the 16th Kentucky regiment upon Eagle Island abreast Wilmington and threatened to cross Cape Fear River above the town. Hoke at once set fire to steamers, boats, cotton and naval stores, and abandoned the place, retreating in the direction of Goldsboro. General Terry entered the place without opposition early in the morning of 22 February and pursued Hoke across Northeast River. Schofield reports that he took 51 heavy guns, 15 light ones, and a large amount of ammunition. The Union loss from 11 February to the capture of Wilmington on the 22d was about 200 killed and wounded. The Confederate loss is not definitely known, Schofield estimates it at not less than 1,000, in killed, wounded and prisoners. Consult 'Official Records' (Vol. XLVII); Cox, 'March to the Sea'; Cox, 'Military Reminiscences of the Civil War' (Vol. II).

E. A. CARMAN.

**WILMINGTON COLLEGE**, located at Wilmington, Ohio. It was opened to students in 1870, and chartered in 1875, under the auspices of the Society of Friends. It is open to women on equal terms with men. The college organization includes a preparatory school. Two full collegiate courses are offered, the

classical, for which Greek is required, leading to the degree of A.B., and the scientific, leading to the degree of B.S.; a part of the work of the last two years is elective in both courses. A course in bookkeeping is included in the curriculum. The degrees of A.M. or M.S. are conferred for graduate work. There are six county scholarships and three others; and a student loan fund. The campus consists of 12 acres, and is located in the eastern suburbs of Wilmington. The buildings include the main building, the observatory, South Hall (men's dormitory), the women's dormitory, the gymnasium and the Auditorium. The library contains over 6,000 volumes; the total productive funds are \$83,000.

**WILMOT, David**, American jurist and politician: b. Bethany, Pa., 20 Jan. 1814; d. Towanda, Pa., 16 March 1868. He was admitted to the bar in 1834, and practised at Towanda. He was a member of Congress in 1845-51; was elected as a Democrat, but stood in opposition to the extension of slavery into prospective new territory of the United States; and in 1846 he offered the famous amendment known as the Wilmot Proviso (q.v.). He supported Van Buren in 1848 against Cass, the regular Democratic candidate, and later joined the Republicans. In 1853-61 he was president-judge of the 13th district of Pennsylvania, in 1857 was an unsuccessful Republican candidate for governor of that State, sat in the United State Senate from 1861 to 1863, and from that time until his death served as judge of the United States Court of Claims.

**WILMOT, John**. See ROCHESTER, JOHN WILMOT, 2D EARL OF.

**WILMOT, Robert Duncan**, Canadian statesman: b. Fredericktown, New Brunswick, 16 Oct. 1809; d. Oromocto, New Brunswick, 11 Feb. 1891. He was educated in Saint John, engaged for a time in shipping, and in 1846 entered Parliament, where he sat for Saint John until 1861 and again in 1865-67. He was mayor of Saint John in 1849, surveyor-general of New Brunswick and member of the executive council of the province in 1851-54, provincial secretary in 1856-57, and a delegate to the colonial conference in London, in 1866-67. He became a member of the Senate in 1865, of the Privy Council in 1878, was speaker of the Senate in 1878-80 and in 1880-85 was lieutenant-governor of New Brunswick.

**WILMOT PROVISIO**, an amendment offered in the United States Congress by David Wilmot (q.v.), 8 Aug. 1846, pending the consideration of a bill placing \$2,000,000 at the disposal of President Polk to negotiate a peace with Mexico. The amendment was as follows:

Provided, that, as an express and fundamental condition to the acquisition of any territory from the republic of Mexico by the United States, by virtue of any treaty which may be negotiated between them, and to the use by the executive of the moneys herein appropriated, neither slavery nor involuntary servitude shall ever exist in any part of said territory, except for crime, whereof the party shall first be duly convicted.

It was adopted in the House, and was under debate in the Senate when the hour arrived previously fixed for adjournment of the session. At the next session (8 Feb. 1847) Wilmot again introduced it, and a fierce and angry contest began. The House remained

firm in favor of the amendment, and it was passed (15 February) by a double majority, but was not adopted by the Senate. It had great agitation throughout the country. The principle involved long continued to be an important factor in party politics, its influence being affected by many fluctuations of opinion and political action, and it may be said finally to have triumphed through the act of 19 June 1862 forbidding slavery in "any of the Territories of the United States now existing, or which may at any time hereafter be acquired." Consult Stephens, 'Constitutional View of the Late War Between the States' (1868-70); Wilson, 'Rise and Fall of the Slave Power' (1872-77); Schuler, 'History of the United States of America Under the Constitution' (1879); Von Holst, 'Constitutional and Political History of the United States' (1899).

**WILSON, Alexander**, American ornithologist: b Paisley, Scotland, 6 July 1796; d Philadelphia, Pa., 23 Aug. 1813. In his 13th year he was apprenticed to a weaver, but after seven years abandoned the loom and adopted the life of a peddler. Three years were thus spent and in 1789, having already prepared a volume of poems for publication, he offered his muslins and solicited subscriptions for this work. It was published in 1790, but had little success; and he again returned to the loom. In 1792 he published 'Watty and Meg,' which, having appeared anonymously, was ascribed to Burns, though the style is very different. It is said to have had a sale of 100,000 copies in a few weeks. Having written a severe satire upon a person in Paisley, Wilson was thrown into prison, and was afterward compelled to burn the libel with his own hand at Paisley Cross. Upon his release he came to this country, arriving at Newcastle, Del., in 1794. He again resumed his former trade, but soon turned to schoolmaster, acting in this capacity in several places in Pennsylvania. While thus engaged at Kingsessing near Philadelphia, he became acquainted with William Barrtram, the naturalist, and Alexander Laason, an engraver, whose tastes and instructions stimulated his own talents. He had already undertaken long excursions for making ornithological researches, and devoted much time to the study, when he was engaged, in 1806, to assist in editing the American edition of Rees's Cyclopaedia, and now began to prepare for the publication of his 'American Ornithology,' the first volume appearing in 1808, and the seventh in 1813. The interval had been passed in exploring different parts of the country for the purpose of extending his observations, collecting specimens, and watching the habits of birds in their native haunts. In 1813 the literary materials for the eighth volume of the 'Ornithology' were ready, but its progress was greatly retarded for want of proper assistants to color the plates. Wilson was, therefore, obliged to undertake the whole of this department himself, in addition to his other duties; and these multifarious labors soon exhausted his strength and brought about his death. All the plates for the remainder of the 'Ornithology' having been completed under Wilson's own care, the letter-press of the ninth volume was supplied by his friend, George Ord, his companion in several of his expeditions, who also wrote a memoir of Wilson to accompany

the last volume, and edited the eighth. Four supplementary volumes containing American birds not described by Wilson were published by Charles Lucien Bonaparte (1825-33). An edition of the original work, with Bonaparte's continuation, and notes and life of Wilson, by Sir William Jardine, was published in London in 1832. Wilson continued to write poetry after leaving Scotland, one of his chief productions being 'The Foresters,' a poem describing a pedestrian tour to the Falls of Niagara, and several collective editions of his poems have appeared. A bronze statue of Wilson has been erected at Paisley. Consult 'Life of Wilson,' by Peabody, in Sparks' 'Library of American Biography' (1834-56); Brightwell, 'Difficulties Overcome: Scenes in the Life of Alexander Wilson' (1860); Paton, 'Alexander Wilson, the Ornithologist' (1863); 'Leading Men of Science' (New York 1910).

**WILSON, Allen Benjamin**, American inventor: b. Willet, N. Y., 18 Oct. 1824; d. Woodmont, Conn., 29 April 1888. He was a cabinet maker by trade, but in 1849 invented a sewing machine which made a stitch at each movement of the shuttle, thus enabling the operator to make an endless seam at any curve, and thereafter devoted himself to its improvement. In 1851 he secured a patent for the rotating hook, and a year later invented the four-motion feed, which was subsequently adopted in all machines. In 1860 he entered into partnership with Nathaniel Wheeler (q.v.), with whom he established, at Bridgeport, Conn., the then largest factory in the world for the manufacture of sewing-machines. In 1852 on the re-organization of the firm, he withdrew from the business and settled in Waterbury, where he engaged in other enterprises. See SEWING MACHINES.

**WILSON, Alpheus Waters**, American bishop of the Methodist Episcopal Church, South: b. Baltimore, Md., 5 Feb. 1834; d. Baltimore, Md., 21 Nov. 1916. He was educated at Columbian College, Washington, D. C., was received into the Baltimore Methodist Conference in 1853; and, on the organization of the Baltimore Conference of the Methodist Church, South, identified himself with that body. He became the secretary of the board of missions of his Church in 1878, and was elected bishop in 1882. In 1894 he was a lecturer at Vanderbilt University, and was also author of a book on missions.

**WILSON, Sir Archdale**, English soldier: b. Diddington, Norfolk, 1803; d. London, 9 May 1874. He entered the Bengal Artillery in 1819; distinguished himself at the siege of Bharrpur, 1825-26, and took part in the Sikh War, 1848-49. At the outset of the Sepoy revolt in May 1857 he was the earliest officer to encounter the Sepoys in battle, defeating them on May 30 and 31, and succeeding to the command of the force before Delhi in July, held his position until 14 September, when the city was taken. He was rewarded for his services with a baronetcy, was promoted major-general, made lieutenant-governor in the following March, and took part in the siege and capture of Lucknow, 19 March 1858.

**WILSON, Augusta Jane Evans**, American novelist: b. Columbus, Ga., 8 May 1835; d. 1909. She was married to L. M. Wilson.

Mobile in 1868. She conducted a southern soldiers hospital during the Civil War. Her writings include 'Inez, a Tale of the Alamo' (1856); 'Beulah,' the most popular of her novels (1859); 'Macaria' (1864); 'St. Elmo,' parodied by Webb in 'St. Twel'mo' (1866); 'Vashti' (1869); 'Infelice' (1875); 'At the Mercy of Tiberius' (1887); 'A Speckled Bird' (1902); 'Devota' (1907). The earlier books had a great popularity. They attempted to be massive, but contained no permanent elements, though attaining at times some power of expression. The later volumes, written in the same manner, did not obtain wide recognition.

**WILSON, Sir Charles Rivers**, English financier: b. London, 1831; d. 1916. He was graduated from Oxford in 1851, became a treasury clerk in 1856, was private secretary to Disraeli 1867-68, and comptroller-general of the National Debt Office 1874-94. He became one of the British administrators of the Suez Canal in 1876, and was finance minister to the khedive of Egypt 1877-79. He removed to Canada and was president of the Grand Trunk Railway for 20 years.

**WILSON, Sir Daniel**, Canadian archaeologist: b. Edinburgh, 5 Jan. 1816; d. Toronto, Ontario, 7 Aug. 1892. He was educated at Edinburgh University, and on leaving college entered with earnestness into antiquarian pursuits, and published in 1847 'Memorials of Edinburgh in the Olden Time.' It was followed by 'Oliver Cromwell and the Protectorate' (1848) and 'The Archaeology and Prehistoric Annals of Scotland' (1851). At this time he was secretary of the Scottish Society of Antiquaries, but in 1853 was called to fill the chair of history and English literature in the University of Toronto. While resident in Canada he published 'Prehistoric Man' (1862; revised 1876); 'Chatterton, a Biographical Study' (1869); 'Caliban, the Missing Link' (1873); 'Spring Wild-Flowers' (1875), a volume of poems; 'Reminiscences of Old Edinburgh' (1878); 'Anthropology' (1885); 'The Right Hand: Left-handedness' (1891). In 1881 he became president of Toronto University, a position which he held until his death. In recognition of his services to education and literature he was knighted in 1888.

**WILSON, Edmund Beecher**, American zoologist: b. Geneva, Ill., 19 Oct. 1856. He was graduated at Yale University in 1878 and received the degree of Ph.D. at Johns Hopkins University in 1881. He was professor of biology at Bryn Mawr in 1885-91; and was afterward connected with the faculty at Columbia University, where since 1897 he has been professor of zoology. He was president of the American Society of Naturalists in 1900 and of the American Association for the Advancement of Science in 1913. His works include 'The Embryology of the Earthworm' (1889); 'Amphioxus and the Mosaic Theory of Development' (1893); 'The Cell in Development and in Inheritance' (1896; 2d ed., 1915).

**WILSON, Edward A.**, English physician and explorer: b. 1872; d. Antarctic regions, 29 March 1912. He was graduated at Cheltenham College and at Caius College, Cambridge. He was chief of the scientific staff of Capt. R. F.

Scott's last expedition to the Antarctic in 1911-12. He was one of the five members of the expedition to reach the South Pole and perished with the other two remaining members of the party on the return trip from the pole. Consult 'Scott's Last Expedition' (New York 1913).

**WILSON, Florence**, commonly known by the Latinized form of his name, **FLORENTIUS VOLUSENUS**, Scotch theologian: b. near Elgin, about 1500; d. Vienne, Dauphiny, France, 1547. He was educated at King's College, Aberdeen, became a member of the household of the learned Cardinal du Bellay, archbishop of Paris, and was appointed by Cardinal Sadolet master of the public school of Carpentras. Here he wrote his famous dialogue 'The Tranquillity of Mind' (1543), much prized for its classical erudition and the beauty of its Latin style.

**WILSON, Floyd Baker**, American lawyer and author: b. Watervliet, N. Y., 23 June 1845. He was graduated from the University of Michigan in 1871, and from the Cleveland Law College (now Adelbert University) in 1873. Admitted to the bar in 1873, he practised in Cleveland until 1880, and since the year last named in New York, making a speciality of corporation law. He is the author of 'Uphill,' a novel (1880); 'Paths to Power' (1901), and has translated 'La Coja y el Encogidío' (1901).

**WILSON, Francis**, American actor: b. Philadelphia, Pa., 7 Feb. 1854. He made his first appearance on the stage in a minstrel company, his debut in regular comedy occurring at the Chestnut Street Theatre, Philadelphia, in 1877. He played in various parts with much success, and made his initial appearance in comic opera as Sir Joseph Porter in 'Pinafore.' He later became leading comedian in different New York theatres, and afterward organized his own company, himself playing the leading comedy roles. He published 'The Eugene Field I Knew'; 'Recollections of a Player,' and 'Going on the Stage'; 'Joseph Jefferson' (1906); also the dramas 'The Magic Ring'; 'The Bachelor Baby'; 'The Spiritualist'; 'The Dancing Master.'

**WILSON, George**, Scottish chemist, brother of Sir Daniel Wilson (q.v.): b. Edinburgh, 21 Feb. 1818; d. 22 Nov. 1859. He was educated at the Edinburgh University, became a popular lecturer on chemistry, and in 1855 was appointed professor of technology in Edinburgh University. Among his scientific works were 'Text-book of Chemistry' (1850); 'Researches in Color-blindness' (1855), and 'The Five Gateways of Knowledge' (1856), a delightful hymn or prose-poem of science.

**WILSON, George Grafton**, American educator and authority on international law: b. Plainfield, Conn., 29 March 1863. He was graduated at Brown University in 1886 and took the degree of Ph.D. there in 1889, later studying at the universities of Heidelberg, Berlin, Paris and Oxford. He was professor of social and political economy at Brown University in 1894-1910; and since 1910 has been professor of international law at Harvard University. He has also been lecturer on international law at the United States Naval War College since 1900; and in 1912-13 he was exchange pro-

fessor to France. Since 1907 he has been one of the board of editors of the *American Journal of International Law*. He has published 'Town and City Government in Providence' (1889); 'Insurgency' (1900); 'Submarine Telegraph Cables in Their International Relations' (1901); 'International Law Situations' (15 vols., 1902-16); 'International Law' (1910); 'The Hague Arbitration Cases' (1915).

**WILSON, Gilbert Lord**, American clergyman and author: b. Centre Point, Iowa, 4 March 1856. He was educated at Cornell College and Taylor University. He is a member of various national and international societies of learning, among them being the American Association of Writers, the Society of Economic Endeavor and Research, and the National Geographic Society; he was one of the speakers in the "Hall of Congress" at the Saint Louis Exposition. After collecting a record of eclipses covering over 3,000 years, restoring the ancient five-day, seven-day, eight-day, nine-day and 10-day week calendars of all nations, and reading the Scriptures in eight different languages, he wrote a work on the astronomy of the Bible, 'Christ in Chronology and Science of the Sabbath.' He claimed that the Sunday Seventh Day had been lost, under the 10-day week of Egypt, and restored in Moses; lost again, under the eight-day week of Rome, and restored in Christ, one "like unto Moses." He has published many writings on the Bible and science, and also on a federation "Creed of Christendom."

**WILSON, Harry Leon**, American novelist: b. Oregon, Ill., 1 May 1867. He has edited *Puck* from 1896, and is the author of 'Zig Zag Tales' (1896); 'The Spenders' (1902); 'The Lions of the Lord' (1902); 'Ewing's Lady' (1907); 'Bunker Bean' (1912); 'Rugles of Red Gap' (1915); 'Ma Pettengill' (1919). In collaboration with Booth Tarkington (q.v.) he wrote 'The Man from Home' (1908), which passed several editions and was dramatized.

**WILSON, Henry**, American statesman: b. Farmington, N. H., 16 Feb. 1812; d. Washington, 22 Nov. 1875. His name was originally Jeremiah Jones Colbath, legally changed to Henry Wilson on his reaching manhood. He was a farm apprentice in his native town till the age of 21, when he moved to Natick and learned the shoemaker's trade. After two years' work at this business he had accumulated a small sum of money, which enabled him to attend the academies at Stafford, Wolfborough and Concord. But the loss of some of his money forced him to cut short his plan for an education, and he returned to his work at Natick in 1838, and finally built up a prosperous shoe factory. In 1840 he took an active part in the presidential campaign in behalf of the Whig party, and in the same year was elected to the lower house of the Massachusetts legislature; was re-elected to the State senate. At this time he became known as an active opponent of slavery and in 1845 was selected with J. G. Whittier (q.v.) to present to Congress the anti-slavery petition from Massachusetts against the annexation of Texas. In 1848 he withdrew from the Whig party because of its rejection of anti-slavery resolutions,

and took a prominent part in organizing the Free Soil party, purchasing and editing the Boston *Republican* in the interests of that party. In 1850 and 1851 he was elected to the State senate, and was president of that body during both terms. In 1852 he was president of the Free Soil National Convention, and chairman of the national committee; and in 1853 was a member of the Massachusetts Constitutional Convention. In 1855 he was elected to the United States Senate, and shortly after taking his seat made a speech advocating the repeal of the fugitive slave law and the abolition of slavery in the District of Columbia and in the Territories. For a time in 1855 he was associated with the American party; but on its adoption of a pro-slavery platform he withdrew from it and took an active share in organizing the Republican party on the basis of opposition to the extension of slavery. In 1856 he denounced the assault of Brooks on Sumner, and was challenged to a duel by Brooks; though he refused the challenge, he stated that he believed in his right to defend himself if attacked. During the years of 1856-60 he took part in all important debates in the Senate; and his speech in defense of free labor, in reply to Senator Hammond of South Carolina, was widely circulated in the Northern States. In January 1859 he was re-elected to the Senate by an almost unanimous vote of the Massachusetts legislature; and on the assembling of the Senate in 1861, was made chairman of the committee on military affairs, a post which the Civil War rendered one of great labor and responsibility. In this capacity he introduced and carried through Congress, during the extra session of 1861, the acts to authorize the employment of 500,000 volunteers, to increase the regular army, and to reorganize the military system. In 1865 he was a third time elected to the Senate, and took a prominent part in all the reconstruction measures, favoring the granting of full civil and political rights to the negroes, but also desiring a liberal treatment of the Southern whites. In 1871 he was re-elected to the Senate but resigned in the next year when elected to the vice-presidency of the United States on the Republican ticket. In 1873 he suffered a stroke of paralysis from which he never fully recovered. At the time of his death he was engaged in writing the last volume of his 'History of the Rise and Fall of the Slave Power in America' (1873-75) which he left partially complete. He also wrote 'History of the Anti-Slavery Measures of the 37th and 38th United States Congresses' (1865); 'Military Measures of the United States Congress' (1866); 'Testimonies of American Statesmen and Jurists to the Truths of Christianity' (1867); 'History of the Reconstruction Measures of the 39th and 40th Congresses 1865-68' (1868). Consult Russell and Nason, 'Life and Public Services of Henry Wilson' (1872); Stowe, 'Men of Our Times' (1868).

**WILSON, Henry Bristow**, English Anglican clergyman: b. London, 1803; d. Lee, Kent, 10 Aug. 1848. He was educated at Oxford, took orders in the Church of England and was one of the four Oxford tutors who in 1841 sent a protest to the editor of *Tracts for the Times*.

He later became professor of Anglo-Saxon at Oxford, in 1851 vicar of Great Staughton, Huntingdonshire, and was one of the seven clerical authors of the famous volume of 'Essays and Reviews' (1860); his contribution being 'The National Church.' He was tried for heresy before the Court of Arches but his sentence of a year's suspension from his benefice was reversed by the Privy Council. He was also the author of 'The Communion of Saints: An Attempt to Illustrate the Principles of Church Union' (1851), the Bampton lecture contributed to 'Oxford Essays.'

**WILSON, Sir Henry Hughes**, English general: b. 1864. Early in November 1917 the Allied premiers held a conference at Rapallo, Italy, to discuss the Italian military crisis. It was decided to create a supreme political council of the Allies for the whole of the western front. This council was to be assisted by a military committee composed of three generals. France was represented by General Foch (q.v.); Italy by General Cadorna (q.v.); and Great Britain by General Wilson. The last-named entered the army at 20 and served in the Burmese War 1885-87, was wounded and returned for another two years, winning a medal and promotion. He became a member of the Staff College at Camberley in 1892 and in 1894 staff captain of the intelligence division. He served in the South African War and later was director of military operations at the War Office. He accompanied the British Expeditionary Force to France as subchief of the general staff in August 1914 and was specially mentioned by Sir John French for his services during the retreat from Mons.

**WILSON, Henry Lane**, American Ambassador: b. Crawfordsville, Ind., 3 Nov. 1857. He was graduated at Wabash College in 1879. He edited the *Lafayette* (Ind.) *Journal* in 1882-85; and in 1885-96 he was engaged in law practice and in banking at Spokane, Wash. He was appointed Minister to Chile by President McKinley in 1897, serving until 1905. He was Minister to Belgium in 1905-10; and Ambassador to Mexico in 1910-13. He was in office at the close of the Diaz presidency and during the Madero administration. He opposed President Wilson's policy of refusing to recognize Huerta and eventually tendered his resignation, which was announced by the State Department 4 Aug. 1913 to take effect 14 October. He was special Ambassador to Belgium for the coronation of King Albert.

**WILSON, Horace Hayman**, English Orientalist: b. London, 26 Sept. 1786; d. there, 8 May 1860. Educated for the medical profession, in 1808 he went to Bengal as assistant surgeon in the service of the East India Company, but soon obtained an office in the Calcutta mint, where he became associated with John Leyden. His leisure was devoted to the study of Sanskrit and so soon did he become known as an able Sanskrit scholar that in 1812 he was elected secretary of the Asiatic Society of Bengal. He acted for many years as secretary of the committee of public education, and his exertions contributed to revive the interest of the Hindus in their own literature as well as to create among them an interest in the science and literature of Europe. He remained in India till his election in 1832 to the Boden

professorship of Sanskrit at Oxford University, and in 1836 he was appointed librarian of the East India Company and elected Fellow of the Royal Society. Among his numerous publications are 'The Meghaduta, or Cloud Messenger,' a Sanskrit poem, with an English translation, notes, etc. (1813); 'Sanskrit-English Dictionary' (1819-40); 'Select Specimens of the Theatre of the Hindus' (2 vols., 1826-27; 3d ed., 1871); 'The Vishnupurāna—A System of Hindu Mythology and Tradition,' translated from the original Sanskrit and illustrated by notes (1840; new ed., 1864-77); 'Grammar of the Sanskrit Language for the Use of Early Students' (1841); 'History of British India from 1805 to 1835' (1844-48); 'Rig-Veda-Sanhita,' translated from the original Sanskrit (1850-58), the last volumes being prepared by Cowell and Webster, after Wilson's death; 'Glossary of Judicial and Revenue Terms, from Arabic, Persian, Hindustani, etc.' (1855).

**WILSON, James**, American jurist: b. near Saint Andrews, Scotland, 1742; d. Edenton, N. C., 28 Aug. 1798. Educated at the universities of Saint Andrews, Glasgow and Edinburgh, he came to New York in 1763 but removed to Philadelphia in 1766. After tutoring in what is now the University of Pennsylvania he studied law and was admitted to the bar in 1767. He sat in the Pennsylvania provincial convention in 1775 and in the Continental Congress 1775-77, 1782-83 and in 1785-87, and was a signer of the Declaration of Independence. He served as delegate in the Constitutional Convention of 1787, taking a prominent part in the debates and later helping to secure the ratification of the Federal Constitution by Pennsylvania (1790). His speeches in these conventions have been highly commended for their profound comprehension of constitutional theory. In September 1789 he was appointed an associate justice of the United States Supreme Court and in 1790 became professor of law in the University of Pennsylvania. His writings include such important pamphlets as 'Considerations on the Nature and Extent of the Legislative Authority of the British Government' (1774); 'Address to the Citizens of Philadelphia' (1784). Consult his 'Works,' edited by his son, Bird Wilson (3 vols., Philadelphia 1803-04), and James D. Andrews (Chicago 1896); consult also Alexander, L. H., editor, 'James Wilson' (Philadelphia 1908); Harlan, Justice J. M., 'James Wilson and the Formation of the Constitution' (in *American Law Review*, Vol. XXXIV); Konkle, B. A., et al., 'The James Wilson Memorial' (in *American Law Register*, Vol. LV, 1907).

**WILSON, James**, American globe maker: b. Londonderry, N. H., 1763; d. Bradford, Vt., 26 March 1855. Up to the age of 33 he was a farmer in his native place, at the same time reading and studying geography and astronomy. In 1796 he moved to Bradford, Vt., where he began experimenting with balls turned from blocks of wood and covered with paper. This rude beginning was followed by a much better method. The solid balls were thickly covered with layers of paper firmly pasted together and this shell was then divided into hemispheres, which being removed were again united and finished with due regard to lightness, strength and smoothness. He procured copper plates of

sufficient size for his 13-inch globes, protracted his maps on them in sections, tapering as the degrees of longitude do from the equator to the poles and engraved them with such admirable accuracy of design, that when cut apart and duly pasted on his spheres the edges with their lines and even the different parts of the finest letters would perfectly coincide and make one surface, truly representing the earth or celestial constellations. He published his first globes in 1814. When past 80 he constructed a machine which illustrated the daily and yearly revolutions of the earth; the cause of the successive seasons; and the sun's place for every day of the year, in the ecliptic. These movements were produced by turning a crank, which caused the earth to revolve about the sun in the plane of the ecliptic, always retaining its true relative position. For want of a more definite name the machine was called Wilson's Planetarium. The large copper plate, on which are printed the months of the year, with their days and the corresponding signs of the zodiac with their degrees, was engraved by Wilson after he was 83 years of age.

**WILSON, James**, American politician: b. Ayreshire, Scotland, 16 Aug. 1835. He came with his parents to the United States in 1851, and settled in Iowa in 1855. He was educated at Iowa College, engaged in farming in 1861 and in that year was elected to the State legislature, where he served for three terms, acting as speaker for the last term. He was a member of Congress in 1873-77, State railway commissioner in 1877-83, and in 1883-85 was again a member of Congress. He was a regent of the State University in 1870-74 and in 1890-97 was director of the agricultural experiment station and professor of agriculture at the Iowa Agricultural College, Ames, Iowa. He was appointed Secretary of Agriculture by President McKinley in 1897, was reappointed in 1901 and retained in office by both President Roosevelt and President Taft, serving for a period of 16 years. During this time the Department of Agriculture developed rapidly; forest reserves were made; experiment stations were established; and farm demonstration work carried on on a national scale. Consult 'Year Book of the Department of Agriculture for 1912' (Washington 1913).

**WILSON, James F.**, American politician: b. Newark, Ohio, 19 Oct. 1828; d. Fairfield, Iowa, 22 April 1895. He studied law, settled at Fairfield, Iowa, in 1853, was elected to the convention for a revision of the State constitution in 1856, sat in both houses of the State legislature and was president of the senate in 1861. From 1861 to 1869 he was a member of Congress, where he was chairman of the judiciary committee and one of the managers of the impeachment of Andrew Johnson. In 1883 he was elected to the United States Senate and in 1889 re-elected. He was made a commissioner for the Pacific Railway.

**WILSON, James Grant**, American author: b. Edinburgh, Scotland, 28 April 1832; d. 1914. He was brought to America in infancy by his father, William Wilson (q.v.), served in the Union army during the Civil War and reached the rank of brigadier general. After the war he settled in New York and in 1885 became president of the New York Genealogical and Biographical

Society. Among his numerous publications are 'Biographical Sketches of Illinois Officers' (1862-63); 'Love in Letters, Illustrated in the Correspondence of Eminent Persons' (1867); 'Life of Fitz-Greene Halleck' (1869); 'Sketches of Illustrious Soldiers' (1874); 'Poets and Poetry of Scotland' (1876); 'Centennial History of the Diocese of New York, 1775-1885' (1886); 'Bryant and His Friends' (1889); 'Commodore Isaac Hull and the Frigate Constitution' (1889); 'Life of General Grant' (1897); 'The Presidents of the United States' (1901); 'Thackeray in the United States' (2 vols., 1904). He was the editor (with John Fiske) of 'Appleton's Cyclopædia of American Biography' (6 vols., 1887-89; Vol. VII, 1900), and alone, of 'Memorial History of the City of New York' (1892-93).

**WILSON, James Harrison**, American soldier: b. Shawneetown, Ill., 2 Sept. 1837. He was graduated from West Point in 1860, was promoted lieutenant in 1861 and was chief topographical engineer on the Port Royal expedition. He was brevetted major 11 April 1862 for conduct at Fort Pulaski, Ga., and subsequently was aide-de-camp to General McClellan, participating in the battles of Antietam and South Mountain. In the campaign against Richmond and in the operations against Chattanooga and Knoxville he was assistant engineer and inspector-general of the Army of Tennessee and in 1863 was made brigadier-general of volunteers and brevet lieutenant-colonel of regulars for gallantry at Chattanooga. He was brevetted colonel for conduct at the battle of the Wilderness and was engaged in the siege of Petersburg and in the Shenandoah campaign. In September 1864 he was transferred to the command of the cavalry of the Mississippi Division, took part in General Thomas' campaign in Tennessee and was conspicuous at the battles of Franklin and Nashville. In March 1865 he made a raid into Alabama and Georgia and in 28 days captured Selma, Montgomery, Columbus and Macon, taking 6,820 prisoners, among whom was Jefferson Davis. He received brevet rank as brigadier- and major-general and in 1866 was mustered out of the volunteer service. He was appointed lieutenant-colonel in the regular army in that year, but resigned in 1870 and was subsequently engaged in railroad engineering until the outbreak of the Spanish-American war when he was appointed major-general of volunteers and was assigned to command a division in Porto Rico. In 1900 he joined the China relief expedition and was commander of the American forces in Peking. He was retired with the rank of brigadier-general of the United States army in 1901. In 1902 he represented the United States army at the coronation of Edward VII. He has published 'Life of Andrew Alexander' (1868); 'Life of General Grant' (with Charles A. Dana, 1868); 'China - Travels and Investigations in the Middle Kingdom' (1887; new ed., 1890); 'Life of Charles A. Dana' (1907); 'Under the Old Flag' (1912).

**WILSON, Jeremiah Morrow**, American jurist: b. Warren County, Ohio, 25 Nov. 1826; d. Washington, D. C., 24 Sept. 1901. He received an academic education; was judge of the Court of Common Pleas of Fayette County, Ind., 1860-65; judge of the Circuit Court 1865-71 and member of Congress in 1871-75. After

retiring from Congress he took up the practice of law in Washington, D. C., and during his professional career in that city was connected with numerous famous cases. Besides having acted as attorney for the Union Pacific Railroad and the Mormon Church, he was counsel in the court-martial of General Swain and was connected with the "Alabama Claims" and the French "Spoliation" cases; etc.

**WILSON, John**, American colonial clergyman: b. Windsor, England, 1588; d. Boston, Mass., 7 Aug. 1667. He was educated at King's College, Cambridge, in 1606; was made Fellow there; studied law, but took orders; was minister of Sudbury, Suffolk; and having frequently been suspended as a Puritan, embarked with John Winthrop for America in 1630 and landed at Salem, Mass. At Charlestown he organized what afterward became the First Church of Boston, of which he was ordained pastor in 1632. He visited England in 1634, returning the following year with his wife and also Hugh Peters (q.v.). He was opposed to the so-called "antinomian heresy" of the time; was associated with John Eliot (q.v.) in missionary work among the Indians; and was chaplain to the force sent against the Pequots of Connecticut. He published 'Some Helps to Faith' (1625); a poem, 'Famous Deliverances of the English Nation' (1626); a Latin poem commemorating John Harvard; and 'The Day Breaking, If Not the Sun Rising, of the Gospel' (1647; new ed. 1865). He had, says Cotton Mather, "so nimble a faculty of putting his devout thoughts into verse, that he signalized himself by . . . sending poems to all persons, in all places, on all occasions."

**WILSON, John**, Scottish author, best known by his pseudonym "CHRISTOPHER NORTH"; b. Paisley, 18 May 1785; d. Edinburgh, 3 April 1854. He was educated at Glasgow University and Magdalen College, Oxford, and while at Oxford was noted for his skill in boating, cricketing and other athletic sports. Having at 21 come into a large fortune, he purchased the property of Elleray, on Windermere, and retired there to live at his ease, writing poetry. Here he became closely associated with Wordsworth, Southey, De Quincey and Coleridge. In 1812 he wrote the once-famed 'Isle of Palms.' Another poem in dramatic form, 'The City of the Plague' (1816), was still more successful; but is now forgotten. At this time Wilson suffered reverses of fortune through fraudulent speculation of an uncle and it became necessary for him to earn his livelihood. In 1817 he went to Edinburgh and together with J. G. Lockhart (q.v.), became connected with *Blackwood's Magazine*. His fame with posterity rests on his prose writings and more especially his contributions to this famed Tory organ. Among the numerous papers furnished by Wilson may be mentioned those celebrated ones on fishing, shooting and kindred pursuits produced under the well-known sobriquet of "Christopher North" and above all his renowned 'Noctes Ambrosianæ,' a series of conversations on literary and general subjects, supposed to take place at certain convivial meetings held in Ambrose's Tavern by the contributors to the *Magazine* and since reprinted separately. In 1820 he obtained the chair of moral philosophy in the University of

Edinburgh, a post he occupied with credit for 31 years. In 1822 to 1824 he published three prose works of fiction, 'Lights and Shadows of Scottish Life'; 'The Foresters'; and 'The Trials of Margaret Lyndsay,' which are marked by pathos and beauty of description, but are far from being faithful transcripts of human nature, and degenerate at times into mawkish sentimentality. He resigned his professorship in 1851, and a government pension of £300 per annum was bestowed upon him. There is an incomplete edition of his works by Ferrier (12 vols., 1855-58), and a separate edition of the 'Noctes' by R. S. Mackenzie (5 vols., 1866). Consult 'Mémoir' by his daughter, Mrs. Gordon (2 vols., Edinburgh 1862); Saintsbury, 'Essays in English Literature' (London 1890); Mrs. Oliphant, 'William Blackwood and His Sons' (1897); Douglas, 'The Blackwood Group' (1897); Winchester, C. T., "John Wilson" (in 'Group of English Essayists of the Early Nineteenth Century,' New York 1910).

**WILSON, John**, Scottish missionary: b. Lauder, Scotland, 11 Dec. 1804; d. Bombay, India, 1 Dec. 1875. He was educated at the University of Edinburgh, went to Bombay in the service of the Scottish Missionary Society in 1828, and in 1835 transferred his labors to the mission work of the Free Church of Scotland. He established numerous schools; became vice-chancellor of the University of Bombay; contributed largely to the abolition of the practice of suttee; traveled all over India establishing missionary centres; and was universally honored and beloved by the natives, among whom he spent the remainder of his life with the exception of the years 1843-47. He founded in 1830 the *Oriental Christian Spectator* issued for 30 years, and was the pioneer of Christian periodicals in India. His linguistic ability was remarkable, and his contributions to literature included 'The Parsi Religion' (1843); 'India Three Thousand Years Ago' (1858); 'Memoirs of the Cave-Temples of India' (1859); 'The Lands of the Bible Visited and Described' (1867); and 'Indian Caste' (1877). Consult Smith, George, 'Life of Wilson' (1878).

**WILSON, John Mackay**, Scottish author: b. Tweedmouth 1804; d. Berwick-on-Tweed, 2 Oct. 1835. He edited for several years the *Berwick Advertiser* and was editor and principal author of the popular 'Tales of the Borders' (1835-40). The latest edition, revised and enlarged to 24 volumes, appeared in 1869.

**WILSON, John Moulder**, American military engineer: b. District of Columbia, 8 Oct. 1837. He was graduated from West Point in 1860, received rank as lieutenant in 1861 and subsequently served in the Manassas, Peninsular and Maryland campaigns. He was conspicuous for gallantry at Gaines's Mills and at Malvern Hill in 1862 and in 1863 was promoted captain, subsequently serving in the engineer corps. In 1865 he was brevetted colonel of volunteers and both lieutenant-colonel and colonel of regulars for gallantry at the capture of Spanish Fort in Mobile Harbor and at Fort Blakely. After the war he was in charge of various important engineering works under the government and in 1885-89 was superintendent

of public buildings and grounds in the District of Columbia. He directed the completion of the Washington Monument, the construction of the Army Medical Museum and Library and other public buildings and memorials. He was appointed superintendent of the Naval Academy in 1889; in 1897 was appointed chief of engineers with rank of brigadier-general and was retired at his own request in 1901.

**WILSON, Luther Barton**, American clergyman: b. Baltimore, Md., 14 Nov. 1856. He was graduated from Dickinson College 1875, and also from the University of Maryland Medical College, M.D., 1877. He entered the ministry of the Methodist Episcopal Church, joining the Baltimore Conference in 1878. After several successful pastorates and two terms as presiding elder in Washington and Baltimore, he was elected bishop in 1904. He was Fraternal delegate to the Methodist Church of Canada in 1902. He was one of the chief founders of the Anti-Saloon League of America and one of its first vice-presidents, and when Hiram W. Price of Iowa, the first president, died Bishop Wilson became president and continues to serve in that office. He is a trustee of several institutions and societies and had been for some years president of the board of trustees of Drew Theological Seminary. During the European War he was active in promoting the welfare of the soldier--visiting the firing line in France and Italy several times. He has written 'The Moslem Menace' (1912); with H. H. Meyer and L. H. Hough, 'Marshalling the Forces of Patriotism' (1918); 'America Here and Over There' (1918).

**WILSON, Richard**, Welsh landscape-painter: b. Penegoes, Montgomeryshire, 1714; d. Llan'erris, Carnarvonshire, May 1782. He went to London and studied portrait-painting with Thomas Wright. He was somewhat successful in London, but at length went to Italy where he met Zuccarelli, the artist, who persuaded him to devote himself wholly to landscape. After staying some time at Rome and Naples, where he acquired great reputation, he returned to England in 1755 and settled in the metropolis. He had for a while much employment, but was at length doomed to undergo indifference and neglect, and was glad to obtain the office of librarian to the Royal Academy in 1776. His taste was exquisite and whatever came from his easel bore the stamp of elegance and truth. Among his best works are the 'Noble,' 'Ruins of the Villa of Maecenas,' 'Phaethon,' 'Snowdon,' 'View of Rome from the Villa Malama.' Three of his works are to be seen in the New York Metropolitan Museum. Consult Hastings, Thomas, 'Lithings from the Works of Richard Wilson, with some Memoirs of his Life' (London 1825); Wright, T., 'Some Account of the Life of Richard Wilson' (London 1824).

**WILSON, Sir Robert Thomas**, English soldier and author: b. London, 17 Aug. 1777; d. there 9 May 1849. He was educated at the Westminster and Winchester schools, volunteered for the war in Flanders in 1793-94, and was a member of the staff during the Irish rebellion of 1798. He served in Holland in 1799 and in 1800 was engaged under Abercrombie in Egypt. He served under Lord Hutchinson

on a secret mission to the allied armies on the Russian frontier in 1806-07, and in 1808 commanded a Lusitanian legion and Spanish brigade in Spain and Portugal. He sat in Parliament for Southwark in 1810 and for his espousal of the cause of Caroline he was dismissed from the army in 1821 but subsequently reinstated. He was promoted to full rank as general in 1842-49 was governor of Gibraltar. He was author of several works on military subjects, several of which were not published after his death, when they were edited by his in-law, Rev. Herbert Randolph. The works are: 'History of the British Expedition to Egypt' (1802); 'Sketches of the Campaigns in Egypt' (1810); 'Military and Political Power in Asia' (1817); 'Narrative of Events During the Invasion of Russia' (1860); 'Diary of a Campaign in Egypt' (1860); 'Life of Robert Thomas Wilson' (1863).

**WILSON, Rufus Rockwell**, American author: b. Troy, Pa., 14 March 1865. He was engaged in journalism in Pittsburgh, Philadelphia and New York in 1883-91; in 1891 he became known as magazine writer and newspaper editor, also for a time manager of a newspaper syndicate; in 1892 he engaged in political reform work in 1910, and during the following year organized and superintended Chinese famine relief work. He has written 'Rambles in Colonial Byways' (1900); 'The Capital City' (1901); 'New York, Old and New' (1902); 'Lincoln's Capture' (1903); 'The Sea Rovers' (1904); 'A Noble Company of Adventurers' (1905); 'Literary Landmarks of America' (1906).

**WILSON, Theodore Delevan**, American naval constructor: b. Brooklyn, N. Y., 1840; d. Boston, Mass., 29 June 1903. He served an apprenticeship in the Brooklyn yard and in 1861 was appointed assistant in the construction department of the yard. In 1866 he was appointed assistant constructor; subsequently he was engaged at navy yards at Pensacola, Philadelphia and Washington. In 1869-73 he was in charge of naval architecture and shipbuilding at the Naval Academy, Annapolis, Md., and in the following year was promoted to be master constructor. He was chief constructor of the yard from 1882-93, when he resigned on failing health, and was granted a temporary leave of absence, resuming his duties at the Boston navy yard in 1895. He was a very member of the Institute of Naval Architects of England, the first American elected to that body. He patented in 1880 "air-ports," since generally adopted and in merchant-ships, and in 1880 a patent for a bolt extractor which has since come into general use. During his service he designed the battleship *Maine*, the cruisers *Boston* and *San Francisco*, the gunboats *Conan*, *Union*, *Petrel* and other vessels. He was author of 'Shipbuilding, Theoretical and Practical' (1873), which was adopted as a text-book at the Naval Academy.

**WILSON, Thomas**, English astronomer: b. Buntingford, England, 20 Sept. 1708; d. there 7 March 1755. He was educated at Trinity College, Dublin, and was a

Newchurch Kenyon, 1686-92. He then became chaplain to the Earl of Derby, who appointed him bishop of Sodor and Man in 1697, his consecration taking place in 1698. His episcopate covering a period of 58 years is noted for his strict insistence upon his privileges as head of the ecclesiastical court. This occasioned frequent disputes with the governor of the Isle of Man and he was at one time imprisoned for two months. He was the author of 'Principles and Duties of Christianity' (1707), commonly called the Manx Catechism—the first book printed in the native tongue; 'Short and Plain Instructions for the Better Understanding of the Lord's Supper' (1736); 'The Knowledge and Practice of Christianity Made Easy to the Meanest Capacities' (1775); 'Sacramenta, Private Meditations, Devotions and Prayers' (1800); 'Parochialia or Instructions to the Clergy' (1788); 'Maxims of Piety and Christianity' (1789). He instituted a Manx translation of the Bible, completed 1772-75. Consult 'Lives' by Crutwell (1781); Keble (1847); also Stubbs, J. W., 'History of the University of Dublin' (London 1889).

**WILSON, William**, American poet; b. Perthshire, Scotland, 25 Dec. 1801; d. Poughkeepsie, N. Y., 25 Aug. 1860. He edited the *Dundee Review*, 1821-23, did newspaper work in Edinburgh, where he was a friend of the Brothers Chambers, and coming to this country in 1833 established himself at Poughkeepsie as bookseller and publisher. His 'Poems,' edited by Lossing, appeared in 1870, and revised and enlarged editions in 1875 and 1884.

**WILSON, William Bauchop**, American cabinet officer and labor leader; b. Blantyre, Scotland, 2 April 1862. He came to the United States when a child, and at an early age was employed in the Pennsylvania coal mines. He was a member of a labor union at the age of 11; at 20 he was president of the District Miners' Union, at the same time serving on the executive board of the United Miners' Union; and in 1900 he became secretary and treasurer of the National Union of Miners. He served in Congress in 1907-13, was chairman of the committee on labor, drafted a bill to create a department of labor, and upon the establishment of the department in 1913 he became Secretary of Labor in President Wilson's Cabinet.

**WILSON, William Dexter**, American philosopher and Episcopal clergyman; b. Stoddard, N. H., 28 Feb. 1816; d. Syracuse, N. Y., 30 July 1900. He was graduated from the Harvard Divinity School in 1838 and took orders in the Episcopal ministry in 1842. In 1850-58 he occupied the chair of philosophy at Harvard College, resigning in the last-mentioned year to become registrar and professor of moral philosophy at Cornell University. He was made professor emeritus there in 1889 and during the last years of his life was dean of Saint Andrew's Seminary at Syracuse. He published 'Introduction to the Study of the History of Philosophy' (1872); 'First Principles of Political Economy' (1875); 'The Foundations of Religious Belief' (1883); 'Theories of Knowledge Historically Considered' (1889).

**WILSON, Sir William James Erasmus**, English surgeon and philanthropist; b. London,

25 Nov. 1809; d. Westgate-on-Sea, Kent, 8 Aug. 1884. He went through a course of hospital practice in Paris, where he became known to Cuvier and Geoffroy de Saint Hilaire, later attached himself to the Aldersgate School of Medicine, and was engaged in 1831 as assistant to Dr. Quain, professor of anatomy in University College. His first work, 'Practical and Surgical Anatomy,' was published in 1838, followed in 1840 by the 'Anatomist's Vade Mecum.' About this time he determined to devote himself to dermatology, and soon became the acknowledged authority in that hitherto obscure branch of medical science. He became Fellow of the Royal College of Surgeons in 1843, and president in 1881. In 1845 he was elected a Fellow of the Royal Society. By the time he had reached his 50th year he had amassed considerable wealth, and he then began a series of public and private acts of munificence, founding a professorship of dermatology in the College of Surgeons, the chair of which he filled for nine years, contributing £7,000 to Epsom Medical College, restoring the ancient church of Swanscombe, Kent, founding a chair of pathology at Aberdeen, subscribing liberally to the Royal College of Music, and to the Margate Sea-bathing Infirmary. He devoted much attention to Egyptology, was president of the Egypt Exploration Fund, and furnished £10,000 for the transport of the obelisk known as "Cleopatra's Needle" from Alexandria to its present site on the Thames Embankment. In 1881 he was knighted. Besides many publications in his special science he published, 'Cleopatra's Needle, with Notes on Egypt and Egyptian Obelisks'; and 'The Egypt of the Past.'

**WILSON, William Lyne**, American educator and legislator; b. Jefferson County, Va., 3 May 1843; d. Lexington, Va., 17 Oct. 1900. He was graduated from Columbian College in 1860, and later studied at the University of Virginia. He served as a private in the Confederate army through the Civil War, and in 1865-71 was professor of ancient languages at Columbian College. He was meantime engaged in the study of law, in 1867 was admitted to the bar, and several years later began practicing law in Charlestown, W. Va. He was elected president of the University of Virginia in September 1882 and in the same month was elected to Congress. In June 1883 he resigned his presidency of the university, but served continuously in Congress until 1894. He framed the Wilson Tariff Bill (see **TARIFF**), but disapproved of the amendments it received in the Senate. In 1895 was appointed Postmaster-General by President Cleveland, and from 1897 until his death was president of Washington and Lee University.

**WILSON, Woodrow** (christened **Thomas**), 28th President of the United States; b. Staunton, Va., 28 Dec. 1856. He is the son of Scotch-Irish parents, who had lived in Pennsylvania, Canada and Ohio. James Wilson, his paternal grandfather, emigrated from Ireland in 1807. When young Wilson was about a year old the father, Rev. Joseph Ruggles Wilson, became Presbyterian church in Andover, Mass. His family remained till 1870 when he moved to Columbia, S. C.,

of public buildings and grounds in the District of Columbia. He directed the completion of the Washington Monument, the construction of the Army Medical Museum and Library and other public buildings and memorials. He was appointed superintendent of the Naval Academy in 1889; in 1897 was appointed chief of engineers with rank of brigadier-general and was retired at his own request in 1901.

**WILSON, Luther Barton**, American clergyman: b. Baltimore, Md., 14 Nov. 1856. He was graduated from Dickinson College 1875, and also from the University of Maryland Medical College, M.D., 1877. He entered the ministry of the Methodist Episcopal Church, joining the Baltimore Conference in 1878. After several successful pastorates and two terms as presiding elder in Washington and Baltimore, he was elected bishop in 1904. He was Fraternal delegate to the Methodist Church of Canada in 1902. He was one of the chief founders of the Anti-Saloon League of America and one of its first vice-presidents, and when Hiram W. Price of Iowa, the first president, died Bishop Wilson became president and continues to serve in that office. He is a trustee of several institutions and societies and had been for some years president of the board of trustees of Drew Theological Seminary. During the European War he was active in promoting the welfare of the soldier—visiting the firing line in France and Italy several times. He has written 'The Moslem Menace' (1912); with H. H. Meyer and L. H. Hough, 'Marshalling the Forces of Patriotism' (1918); 'America Here and Over There' (1918).

**WILSON, Richard**, Welsh landscape-painter: b. Penegoes, Montgomeryshire, 1714; d. Llanberis, Carnarvonshire, May 1782. He went to London and studied portrait-painting with Thomas Wright. He was somewhat successful in London, but at length went to Italy where he met Zuccarelli, the artist, who persuaded him to devote himself wholly to landscape. After staying some time at Rome and Naples, where he acquired great reputation, he returned to England in 1755 and settled in the metropolis. He had for a while much employment; but was at length doomed to undergo indifference and neglect, and was glad to obtain the office of librarian to the Royal Academy in 1776. His taste was exquisite and whatever came from his easel bore the stamp of elegance and truth. Among his best works are the 'Niobe,' 'Ruins of the Villa of Maecenas,' 'Phaethon,' 'Snowdon,' 'View of Rome from the Villa Madama.' Three of his works are to be seen in the New York Metropolitan Museum. Consult Hastings, Thomas, 'Etchings from the Works of Richard Wilson, with some Memoirs of his Life' (London 1825); Wright, T., 'Some Account of the Life of Richard Wilson' (London 1824).

**WILSON, Sir Robert Thomas**, English soldier and author: b. London, 17 Aug. 1777; d. there, 9 May 1849. He was educated at the Westminster and Winchester schools, volunteered for the war in Flanders in 1793-94, and was a member of the staff during the Irish rebellion of 1798. He served in Holland in 1799 and in 1800 was engaged under Abercrombie in Egypt. He served under Lord Hutchinson

on a secret mission to the allied ar Russian frontier in 1806-07, and commanded a Lusitanian legion; Spanish brigade in Spain and Portugal in Parliament for Southwark and for his espousal of the cause Caroline he was dismissed from the army in 1821 but subsequently reinstated. His promotion to full rank as general in 1842-49 was governor of Gibraltar. He was author of several works on military subjects, several of which were not published after his death, when they were edited by his son-in-law, Rev. Herbert Randolph. His works are: 'History of the British Expedition to Egypt' (1802); 'Sketches of the Campaigns in Egypt' (1810); 'Military and Political Possibilities of the East' (1817); 'Narrative of Events in the Invasion of Russia' (1860); 'Diary of a Campaign in the East' (1860) etc. Consult Randolph, 'Life of Sir Robert Thomas Wilson' (1863).

**WILSON, Rufus Rockwell**, Author: b. Troy, Pa., 14 March 1860. He was engaged in journalism in Pittsburgh and New York in 1883-91; in 1891 he became known as magazine editor, also for a time as manager of a newspaper syndicate; political reform work in 1910, and in 1911 he organized and superintended Chinese famine relief work. He has written 'Rambles in Colonial Byways' (1900); 'The Capital City' (1901); 'New York, Old and New' (1902); 'Lincaster' (1903); 'The Sea Rover' (1904); 'A Noble Company of Adventure' (1905); 'Literary Landmarks of America' (1906).

**WILSON, Theodore Delevan**, naval constructor: b. Brooklyn, N. Y., 1840; d. Boston, Mass., 29 June 1903. He served an apprenticeship in the Brooklyn yard and in 1861 was appointed chief constructor in the construction department of the Navy. In 1866 he was appointed assistant constructor; subsequently he was chief constructor of navy yards at Pensacola, Philadelphia, and Washington. In 1869-73 he was in charge of naval architecture and shipbuilding at the Naval Academy, Annapolis, Md., and in 1873 he was promoted to be chief constructor. He was chief constructor from 1882-93, when he resigned on account of failing health, and was granted a leave of absence, resuming his duties at the Boston navy yard in 1895. He was a member of the Institute of Naval Architects of England, the first American elected to that body. He patented "air-ports," since generally adopted on iron-hulled merchant-ships, and in 1880 he invented a bolt extractor which has since come into general use. During his service he commanded the battleship *Maine*, the cruisers *Bostwick* and *San Francisco*, the gunboats *Connington*, *Petrel* and other vessels. His 'Shipbuilding, Theoretical and Practical' (1873), which was adopted as a text-book at the Naval Academy.

**WILSON, Thomas**, English Author: b. Burton, England, 20 Sept. 1777; d. there, 7 March 1755. He was educated at Trinity College, Dublin, and was

Newchurch Kenyon, 1686-92. He then became chaplain to the Earl of Derby, who appointed him bishop of Sodor and Man in 1697, his consecration taking place in 1698. His episcopate covering a period of 58 years is noted for his strict insistence upon his privileges as head of the ecclesiastical court. This occasioned frequent disputes with the governor of the Isle of Man and he was at one time imprisoned for two months. **WILSON, William Lyne**, American educator and legislator: b. Jefferson County, Va., 3 May 1843; d. Lexington, Va., 17 Oct. 1900. He was graduated from Columbian College in 1860, and later studied at the University of Virginia. He served as a private in the Confederate army through the Civil War, and in 1865-71 was professor of ancient languages at Columbian College. He was meantime engaged in the study of law, in 1867 was admitted to the bar, and several years later began practising law in Charlestown, W. Va. He was elected president of the University of Virginia in September 1882 and in the same month was elected to Congress. In June 1883 he resigned his presidency of the university, but served continuously in Congress until 1894. He framed the Wilson Tariff Bill (see *TARIFF*), but disapproved of the amendments it received in the Senate. In 1895 was appointed Postmaster-General by President Cleveland, and from 1897 until his death was president of Washington and Lee University.

**WILSON, Woodrow** (christened **Thomas**), 28th President of the United States: b. Staunton, Va., 28 Dec. 1856. He is the son of Scotch-Irish parents, who had lived in Pennsylvania, Canada and Ohio. James Wilson, his paternal grandfather, emigrated from Ireland in 1807. When young Wilson was about a year old the father, Rev. Joseph Ruggles Wilson, became the pastor of the Presbyterian church in Augusta, Ga., where the family remained till 1870 when Dr. Wilson removed to Columbia, S. C.,

where he was a professor in the Presbyterian Theological Seminary. Woodrow experienced some of the terrors of the Civil War when the people of the town of Augusta daily expected a visit from Sherman's army, and again in Columbia where a large part of the city remained a burnt-over area till the Wilson's moved away to Wilmington, N. C., in 1875. Woodrow's early training was received in private schools in Augusta and Columbia, and from his father and grandfather, Dr. Thomas Woodrow, of Columbus, Ohio, the latter being a devotee of the ancient classics and frequently in the Wilson home. From this Presbyterian home, Woodrow went to Davidson College, North Carolina, a staunch Presbyterian college, in the autumn of 1874, where he remained a year. But in the autumn of 1875 he went to Princeton where the father had studied theology and where the great Presbyterian leaders of the country were wont to live and teach.

At Princeton, Wilson took rank as a leader among his fellows, attained a fair standing in his class, but made it plain to all that wide reading and close study of public affairs were his chief interests. He and his family were already close observers of British politics, Gladstone being a hero in their circle. Wilson showed this interest in a remarkable article published, while he was still an undergraduate, in the *International Review*, in which the germ of his first book was uncovered. He was graduated in 1879 and the next year went to the University of Virginia to study law. There he took a law degree in 1881 and early in 1882 settled in Atlanta to practise his profession. There he probably did not make his mark as a lawyer; but he continued his study of government and politics, as illustrated in the workings of Congress. True to his bent, he abandoned the law and entered Johns Hopkins University in 1883 where he wrote his first book, 'Congressional Government,' published in 1885. The same autumn he began teaching history and political economy in Bryn Mawr College and the next year, somewhat against his wishes, he took his examinations at Johns Hopkins and was awarded the degree of doctor of philosophy, then so highly prized among college teachers everywhere. In 1888 he went to Wesleyan University, Middletown, Conn., as professor of history and political economy. There he gained a grip upon student life and opinion that marked all his later educational career. But the popularity of 'Congressional Government' and the importance of its criticism of American governmental practices were making him a national and even international reputation. At Wesleyan he wrote a review of Bryce's 'American Commonwealth,' which brought him into close friendly relations with that eminent Englishman. In this review one sees the reflection of a keen historical mind and independent thinker.

In 1890 Wilson was called to Princeton as professor of jurisprudence and political economy, which position he held till 1910 when he ceased his connection with the university to become governor of New Jersey. As professor at Princeton, he practically founded the department of political science, as it is now taught in all American universities. His power over students, his activity as a leader in the rapid development of the college into a university, his

many articles in periodicals, his lectures in various parts of the country and his books raised him to the foremost position in the faculty and when President Patton resigned in 1902, he was chosen to head the university. He at once set about far-reaching reforms. American college and university students, reflecting the growing riches of their parents, had already become loiterers at their work. Wilson endeavored to compel them to study. Instead of increasing the number of students at Princeton, he pressed so closely his requirements that scores, even hundreds, of young men were sent away each year because they failed in their examinations. Some witty undergraduate is reported to have said that if Dr. Wilson kept on he would make Princeton an educational institution. But the necessity of passing the examinations was not all. Wilson introduced what has been called the preceptorial system at Princeton. By this method every student was brought into close relations with a teacher who made it his business to lead a small group of young men in their work and introduce them to the world of books. The new system cost a great deal of money and Wilson endeavored to collect it. His activity in that direction brought him into closer touch with Princeton men all over the country and he became very popular. His next reform was of a similar nature. There had grown up at Princeton an elaborate club system which was more important to most of the undergraduates than the passing of examinations. To become a member of one of the clubs was the first ambition of most students. Moreover the social life of the students was absorbed by these clubs. Wilson proposed in 1907 that as soon as suitable dormitories could be provided, all students should live together and have their rooms assigned to them by lot; that they should eat together, the rich and the poor, in dining-places on or near the quadrangle; and that the unmarried tutors should live with the students in the dormitories. This reform was aimed at making student life democratic and helpful to all alike. This, too, would cost large sums of money and require several years to become effective. It was, however, too much for the students. Some professors also found the new pace a little too swift and the alumni encouraged resistance.

But before the resistance became effective, a gift to the proposed graduate school, which all held as necessary to the very existence of the university, introduced a new subject of discussion. Dean Andrew West, a close friend of the president, desired the graduate school to be set up at a distance from the quadrangle which Wilson would make the centre of college life. Wilson objected gently. The matter remained in abeyance till in 1909 a conditional gift of something like a million dollars to the graduate school compelled a decision. The gift was to be applied according to the wishes of Dean West. Wilson refused to accept it on those conditions. The segregation of the graduate students seemed to him to thwart the democratic purposes of his whole reform program. The trustees sided with Wilson and the gift was formally declined, but not before the subject had become a national one, for the newspapers of the country discussed the issue. In May 1910, Isaac Wyman of Boston died and left

**WOODROW WILSON**

President of the United States

7, reported to be several millions, to the school. Dean West was to be one of the tutors of the will and he was to use the millions to carry out his ideals in the new

Wilson could not refuse these millions. And, before this time, the opposition to drangle reforms had assumed formidable proportions. Dean West's influence and the students and professors who opposed it were united. The Wilson reforms, as they were in educational circles out the country, were halted. It was widely rumored that Wilson would resign at the end of 1910.

work at Princeton had made Wilson known in the United States as an educator before it took its final turn in 1910. Col.

Harvey, representing the conservative wing of the Democratic party and editor of *The Weekly*, inaugurated a movement to support Wilson's nomination for President of the Democratic party in 1912. Harvey enlisted newspaper editors and political party leaders of the type of James Smith, Jr., of New Jersey in the cause. The country was growing restless with the conduct of the Republican party. Wilson was a progressive Democrat; Harvey and his friends were reactionary Democrats. The next presidential election was then two years off and attention in the Democratic party was one of uncertainty. The efforts of Wilson's

however, had resulted in making him the most prominent political figure and there arose a demand in his home State for his nomination as a candidate for governor. His nomination followed in September 1910, and in October the presidency of Princeton was given up in campaign that Wilson conducted that autumn. A stalwart Republican State attracted attention of the country. The election of Wilson by a majority of 49,000 made him a real contender for the Presidency which his administration as governor further advanced. He did not fulfil the hopes of the conservative Republicans as governor and broke with Smith. He broke with Harvey. When the conservatives abandoned him and endeavored to use their influence to other candidates for the Democratic Presidential nomination, the progressive elements of the Democratic party turned to Wilson. Of greater moment

the break-up of the Republican party in 1912. Colonel Roosevelt endeavored to the renomination of his former friend, but, failing to do so, led a revolt from the convention. It was plain that a new convention composed of the Roosevelt men, announced in Chicago, would nominate a new man. These events focussed the attention upon the Democratic party when it met in convention at Baltimore on July 12. No such convention had ever been held in American political history. It lasted from July to August and was marked from the beginning by intense bitterness between the conservative and progressive elements of the party. In the end, Mr. Wilson the leading candidate was chosen over the other candidates, including Champ Clark of Missouri, Judson C. Wellman of Ohio and Oscar W. Underwood of Alabama.

Mr. Wilson won on the 46th ballot, although the support thrown to him by Jennings Bryan. He then made an active campaign and was elected by a vote of 435 in the electoral colleges

against 88 for Colonel Roosevelt and eight for Mr. Taft, the regular Republican candidate. The popular vote for Wilson, however, totaled only 6,293,019 as against 7,604,463 votes cast for Roosevelt and Taft. But the Democrats won large majorities in both houses of Congress and Wilson entered the Presidency in March 1913, with every branch of the government at his command. He summoned Congress in extra session in April. All the great committees were headed by Democrats, if not by his friends. He urged at once some of the greatest reforms that have ever been effected in the history of the country. Acting on his recommendations Congress reduced the tariff from a general level of 45 to 25 per cent and greatly enlarged the free list. Many economists alleged that for the first time in half a century the tariff was written in the interest of the masses and not in that of the manufacturers. Of even greater importance was the reform of the national currency system in the Federal Reserve Act of 1913, by which the control of the money of the country was taken from private hands and placed in the Treasury Department. The country was divided into 12 banking districts and the reserves of those districts were placed in certain reserve cities in order that the needs of the country as a whole might be better served and what had been called financial panics, produced by the nervous financial state of mind of New York, the reserve centre under the old system, might be averted. This measure was immediately successful. These reforms of 1913 were followed by the Clayton Anti-trust and the Federal Income Tax laws of 1914, the former of which definitely settled an old issue, while the latter subjected the incomes of the country to a graduated tax that quickly proved to be of revolutionary character.

Although the Democratic party was not in entire accord with Wilson, and the Republicans as a whole resisted him with all their might, he held Congress in session almost continuously till the great European War brought another series of problems before the country. But already the Wilson foreign policy was shown in his refusal to allow the army and navy to be used on behalf of money lenders or investors in Mexico and South America. He even went so far as to say at Mobile, in October 1913, that the United States would never again annex a foot of land against the will of those most concerned. This attitude bewildered European diplomats and it angered important elements in the United States. Wilson had an excellent opportunity to illustrate his foreign policy in Mexico where General Huerta rose to the presidency through the assassination of Madero early in 1913. Huerta was favorably disposed toward American investors in Mexico. Wilson refused to recognize Huerta and by his attitude compelled the overthrow of that leader, only to find that the two Mexican generals who had together fought Diaz and Huerta now fell to fighting each other. Wilson gave his support to Carranza, but the months and years that passed did not suffice to pacify the distracted country; and in 1916 Wilson was compelled to send expeditions into the country to compel respect for American law and international rights. The Mexican difficulty, however, soon faded into insignificance in comparison with the difficulties produced by the European War

which began on 1 Aug 1914. While the President was preparing for his first taking of the sense of the country on the policies he had put into practice, this great upheaval set men's thoughts upon other subjects. The election of 1914 resulted in a return to Congress of a majority of Democrats, most of whom were pledged to support the administration.

Meanwhile, on 18 August, Wilson declared in a proclamation to the country that all men must maintain a strict neutrality as between the warring powers. Leading public men and newspapers, regardless of party alignments, gave him hearty support; but as the war continued and cast its shadow over the whole world, the different elements of the composite country took sides. A particular source of irritation was occasioned by German propagandists who did their utmost to break the country's neutrality; others of the same group tried to affect the course of the war by attempting the destruction of bridges and canals and by inciting strikes in munition plants from which the Allies derived a considerable portion of their supplies. Wilson took every possible occasion to press upon the country the necessity of national unity, of devotion to the ideals for which the United States had been established and of refraining from deeds that might commit the country to either side. He went so far even as to say that "there was such a thing as being too proud to fight." He endeavored to bring about peace in Europe by the offer of his services as a mediator. On 7 May 1915, a German submarine commander deliberately sunk the great British liner, the *Lusitania*, sending 1,154 persons to their death, of whom 114 were American citizens. The country was intensely excited; but Wilson felt that he could not then go to war. He demanded apology and reparation and gave Germany solemn warning. Other ships were sunk during the year and other American lives were lost; but confronted with a national election in 1916, neither Wilson nor the Republican national convention of that year proposed war as a remedy. Nor did the Progressive convention, which Colonel Roosevelt dominated, suggest war. The leaders did not know what the people thought. The Republicans finally nominated Mr. Justice Hughes as their candidate and the Progressives confirmed him as their choice. The platforms dealt with domestic problems insisting on foreign affairs only in the commercial rights of the country.

Wilson was renominated. The Democratic platform simply approved the Wilson policies and asked that he be returned to office on the ground that as President he had kept the country out of war. Wilson was re-elected, his plurality reaching 581,941 votes. Yet so close was the contest in the Electoral College that a reversal of 2,000 votes in California would have made Mr. Hughes President. During the campaign Wilson had said that the rôle of neutrality had been about played out. The President's attitude at this time toward the struggle in Europe is best gathered from his address at Omaha on 5 Oct 1916, in which he said: "It will take the long enquiry of history to explain this war, but Europe ought not to misunderstand us. We are holding off, not because we do not feel concerned, but because when we exert the force of this nation we want to know what we are

exerting it for. . . . We want to know whenever we act what the purpose is — what the ultimate goal is." In the request for the passage of the so-called Adamson law, of the preceding September, he had asked for the extension of the United States eight-hour law to include workers in the railroad trains service. A great strike was averted. He was about to make one more effort to bring the European war to an end, when Germany on 12 December asked for a conference of the warring powers for the purpose of securing peace. Germany did not disclose her conditions. Wilson submitted the German proposal to the Allied powers. The reply was a quick refusal. On 22 Jan. 1917, Wilson spoke to the Senate in what was at once called a remarkable address. The principal ideas that later became famous in the Fourteen Points were now suggested to Europe as a basis of peace. He even said that a lasting peace could only be secured by a "peace without victory." He meant that the bitterness of a war to the "last man" ought to be avoided.

His effort failed. On the last day of January the German Ambassador in Washington handed the government a note in which the German government announced its intention to declare a submarine blockade about England, France and Italy and warned all nations to beware on penalty of having their ships and their people sunk without notice. Wilson's reply was to dismiss the German Ambassador and request Congress to declare the country in a state of armed neutrality. Congress failed to grant the request and Wilson set about preparing for American entrance into the conflict. When the regular session of that Congress came to an end, he promptly summoned the new Congress in extra session for 2 April "to receive a communication concerning grave matters of national policy." On 2 April he addressed Congress in a great speech recommending that Congress declare "the recent course of the Imperial German government to be in fact nothing less than war against the government and people of the United States." On 6 April war was declared by large majorities. But Wilson took pains to insist to the country and all the world that the United States did not go to war for any material interests or any imperialistic purposes of any of the powers concerned. It was to be a war to "make the world safe for democracy." He endeavored to convince the people of the United States of the annexations and commercial exploitation were the natural causes of war; and he sought to impress Europe with the idea that democracy was the only safe rule for governments of that absolute equality among all peoples, great and small, was the only safe rule of international conduct. From 2 April 1917 to Nov. 1918, Wilson's career is in great part world history; he swayed the whole world, no other statesman had ever swayed it. An English Liberal has said that "it was like the voice of God talking over our heads to the continent and to the nations of the world." The sum of it all was expressed on 8 Jan. 1918, in the marvelous address in which the Fourteen Points, now so well known to the world, were laid down. He wished to commit all men to the freedom of the seas, the self-determination of peoples, open diplomacy, the

Redfield, Secretary of Commerce

freest possible trade among nations, access of inland nations to harbors, disarmament everywhere and a League of Nations that should lead and guide mankind into better ways. Upon such a basis would the United States conclude peace. From public statements of European leaders and from the avowals of responsible diplomats, these points were accepted, although thoughtful men everywhere doubted whether, at the end, the greater European powers would actually abide by such a program of self-denial.

There was a strenuous protest in the industrial centres of the United States against the possibility of free trade. Colonel Roosevelt denied in a vigorous campaign in the autumn of 1917 that the United States fought to make the world safe for democracy. In January 1918 he and many other prominent leaders, both Democratic and Republican, tried to press through Congress a bill which would have set up a war cabinet to assist the President. Wilson opposed the movement and it failed. But the fight upon the President and his war platform was continued till the Congressional election of 1918. Wilson asked the country in a formal statement to return Democrats to Congress in order that he might the better carry the war to a conclusion. It was a close election in which the Republicans won a majority in the Senate by two votes and in the House by a larger margin. Much money was spent in the campaign and one of the senators was still defending himself in court, late in 1919, against the charge of corrupt use of money. It was the first time that Wilson was confronted with the prospect of a hostile Congress, a fact which appeared the more significant as the near approach of a breakdown of Germany and her allies became known. When an armistice was proposed by Germany, the Allied governments agreed that Wilson should be the common spokesman; but Colonel Roosevelt and Senator Lodge gave out a statement of Republican conditions of peace which were supposed to be more hostile to Germany than Wilson's Fourteen Points. The Republicans announced that they were unwilling to allow Wilson to represent the country in the peace conference.

In his annual message of December 1918, Wilson announced that he would go in person to Paris to aid in the negotiation of a world peace. The leaders of the Senate warned him against this course and many of the greatest papers in the North took the view that it was inexpedient if not improper and unconstitutional for the President to attend the peace conference in person. A former senator and a former attorney-general of the United States gave it as their matured opinions that Wilson would cease to be President the moment his ship passed beyond the boundary of the country. Nevertheless Wilson sailed for Europe on 4 December, and arrived in Paris on the 14th. He received an ovation that surpassed anything witnessed in France since the days of Napoleon I. In London a similar demonstration was made when he arrived there just after Christmas. Early in January he visited Rome where he was counted as a sort of messiah, come to save Europe from the terrors of future wars. These visits were made at the request of the governments concerned and during the delays incident

to the gathering of the peace conference. Still, he was not unaware of the risks of his position. He had remarked to a friend in September preceding that he almost dreaded to think of the end of the war, for then every nation of Europe and every group of interests in the United States would begin to think of selfish ends.

When the peace conference opened, it was promptly discovered that the first of the Fourteen Points, open covenants openly arrived at, could not be realized. Men simply would not discuss in public the graver issues involved, lest the very ends they sought should be jeopardized. The conference decided to sit behind closed doors. Then it was found that the conference was too large for rapid work and a council of five, including Wilson, Lloyd George, Clemenceau, Orlando of Italy and Makino of Japan took its place. This was later changed to a council of four, the Japanese representative simply absenting himself. Wilson labored a month to induce his colleagues to accept the Fourteen Points, including the proposed league of nations, the most important of all. The other representatives endeavored for a month to arrange the preliminaries of a peace without applying the Wilson principles and without accepting the league idea. But unable to agree, the whole conference met on the 14th of February and accepted the idea of a league as a part of the treaty. Wilson returned to America and in public addresses warned his opponents that the covenant of the League of Nations would be so interwoven with the Treaty of Peace that the rejection of the former would involve the rejection of the latter. How little this statement availed its author was revealed in the months that followed.

Returning to Paris about the middle of March 1919, Wilson found the conference had abandoned the League of Nations idea and had set about a peace of indemnities, annexations and reprisals. For a month Wilson fought almost single-handed for a peace which he could call democratic. He won to the extent that France abandoned her demand for a Rhine frontier and agreed to self-determination in Poland and other European submerged nationalities; and the League of Nations was made a part of the treaty. But the concessions greatly weakened the President, while the opposition to him on substantially imperialistic grounds gained constantly in the United States. Wilson returned with the Treaty and, calling Congress together, laid it before the Senate on 10 July 1919. Immediately the bitterest opposition was manifest. Wilson fought for his work at Paris. He recognized that the essentials of his whole career in the White House were under attack. He made a tour of the country on behalf of the adoption of the Treaty and the League of Nations. He spoke at Columbus, Ohio, at Saint Louis, at many other points in the Middle West and on the Pacific Coast. Everywhere he urged acceptance of the Treaty and at many places received extraordinary ovations. But he was taken ill at Wichita, Kans., and was hurried home to Washington, where he was kept in bed for several months. The judgment of history upon his contribution to the progress of "all men everywhere," as the American ideal

runs, cannot now be made up, although none may doubt that he will be counted among the greatest of American Presidents.

The sources of information about Wilson are many. Woodrow Wilson, 'Congressional Government' (1885), 'The New Freedom' (1913), and the volumes of his 'Addresses and Messages,' published from time to time by Harper's, form the chief sources for his ideas and recommendations. The "Congressional Record" and the newspapers of the day from 1913 to 1920 give his addresses to Congress and show how much of his work has passed into law. Consult also Hale, William Bayard, 'Woodrow Wilson: His Story' (1912); Harris, H. W., 'Life of Woodrow Wilson' (1917); Low, A. Maurice, 'Woodrow Wilson: An Interpretation' (1918); Robinson and West, 'The Foreign Policy of Woodrow Wilson' (1917).

WILLIAM E. DODD,  
*Professor of American History, University of Chicago.*

**WILSON, N. C.**, city and county-seat of Wilson County, on the Atlantic Coast Line and the Norfolk Southern railroads, about 42 miles east by south of Raleigh. It is in an agricultural region in which the chief products are cotton and tobacco. It is the largest bright leaf tobacco market in the world. The principal manufacturing establishments are cotton and lumber mills, carriage factories, foundries, machine shops, tobacco works and flour mills. The town owns the electric-light plant, gas plant and the waterworks. The five banks have a combined capital of over \$450,000. There are public and private schools for both races. Pop. 12,000.

**WILSON BILL, The**, a tariff measure enacted by Congress in 1895, succeeding the McKinley Act (q.v.) of 1890. The Wilson tariff bill was based on the cost of raw material rather than on the cost of production, and was passed in the interest of the manufacturer. By this bill wool was placed on the free list or was made free of duty.

**WILSON COLLEGE**, a college for women, located at Chambersburg, Pa. It was established in 1870 under the auspices of the Presbyterian Church. The majority of the board of trustees are Presbyterians and the college is under the special care of the Synod of Pennsylvania. The courses offered are a classical course leading to the degree of A.B. and a scientific course leading to the degree of B.S. Each course is four years in length; the work in all courses includes required and elective studies. Bible study is required in all courses. History and theory of art and music are included among the regular electives; and students can take technical music courses and at the same time do the full amount of work required for the A.B. degree. Courses in physical education are required for three years of the college course, and the outdoor sports of rowing, tennis, basketball and hockey are encouraged. The students maintain three literary societies, one open to all from which the most able members are chosen to the two honor societies; membership in one of these societies is required. The college campus comprises 50 acres located in the suburbs of Chambersburg; the Conococheague flows through the grounds,

affording opportunity for rowing and fishing. The buildings include Main Hall, Fletcher Hall, South College, Science Hall, the dining hall, the gymnasium, with a new swimming pool, Frank Thomson Music Hall, with a large auditorium, the infirmary and faculty residences. The library in 1919 contained 14,000 volumes; the students numbered 245, of whom 219 are candidates for the A.B. degree.

**WILSON'S CREEK, Battle of.** Battle of the American Civil War fought 10 Aug. 1861 near Wilson's Creek, about 10 miles south of Springfield, Mo. General Lyon commanded the Federals who numbered about 6,000, while the Confederates under McCulloch were about 10,000. Lyon on 9 August sent 1,200 men under Col. Franz Sigel to take up position for attack on the Confederate right flank on the morning of the 10th. Lyon meanwhile prepared to attack the Confederate left. Sigel failed in his attack and the Confederates resisted Lyon and compelled his forces to retreat to Rolla. Lyon was killed during the battle. The losses were about even — 1,100 on each side. Consult Johnson and Buel, 'Battles and Leaders of the Civil War' (New York 1887).

**WILSON'S RAID FROM CHICKASAW TO SELMA, ALA., AND MACON, GA.** After the defeat of Hood's army at Nashville (q.v.) 15-16 Dec. 1864, Gen. James H. Wilson proceeded to complete the organization of a cavalry corps, with which it was proposed to overrun the South and destroy its railroads and manufacturing centres. Early in March 1865 27,000 men had been gathered and organized, nearly all well mounted, finely equipped and brought to a high state of efficiency. Some of this force was detached for other duty. Wilson, who had been encamped along the north bank of the Tennessee River from Gravelly Springs to Waterloo Landing, crossed the river on 18 March and started from Chickasaw and Waterloo, on the 22d, for a march through northern Alabama, his first objective point being Selma, a great manufacturing place. He had the three divisions of Gens. Emory Upton, Eli Long and E. M. McCook, aggregating 12,500 mounted men with 24 guns. He had also 1,500 dismounted men, who were to act as train guards till they could be mounted from captured horses. General Sherman says it was the largest, most efficient and most powerful body of horse that had ever come under his command. It was not excelled by any body of cavalry in the army. Accompanying it was a small canvas pontoon train of 30 boats, hauled by 50 six-mule teams, and a supply train of 250 wagons which were sent back to the Tennessee as fast as they were unloaded. This train carried 45 days' rations of coffee, 20 of sugar, 15 of salt and 80 rounds of ammunition. Each man carried five days' light rations, with 100 rounds of ammunition, and five days' rations of hard bread and 10 of sugar and salt were carried on pack animals. As the entire country near the Tennessee was nearly destitute of forage it was necessary to scatter the troops over a wide extent and march as rapidly as circumstances would permit. This, Wilson says, was rendered safe by the fact that General Forrest's Confederate forces were at the time much scattered, some near West Point.

Miss., 150 miles southwest of Eastport, while Roddey's forces occupied Montevallo, on the Alabama and Tennessee Railroad, nearly the same distance to the southeast. By starting on diverging roads the enemy was left in doubt as to the real object and compelled to watch equally Columbus, Tuscaloosa and Selma. Therefore the divisions marched on different roads, but the objective point of each was Selma, distant 180 miles, and the average march of each division to reach it was 250 miles. The command moved southward in three columns and on the 26th reunited at Jasper, about 80 miles southeast of Tuscumbia, from which it crossed the two forks of the Black Warrior, and pushed for Montevallo, a centre of iron manufacture. General Croxton's brigade was detached to move on Tuscaloosa, to burn bridges, factories and public stores, and rejoin the command in the vicinity of Selma. Iron-works and rolling mills were destroyed near Elyton, and 31 March, after passing Montevallo a mile, Upton encountered Roddey, who disputed the road to Randolph. After two brisk engagements Roddey was driven back, losing 100 men, and was pursued by Upton, who occupied Randolph at dark. Here a courier was captured with dispatches to Forrest, showing that several columns were moving to join Forrest for the defense of Selma, and detachments were sent to check them. McCook was left at Randolph to guard the trains and rear, while Wilson, with the divisions of Long and Upton, on 1 April, rode straight for Selma, encountered and brushed away several detachments of Forrest's cavalry and at Ebenezer Church came upon Forrest in position, with the brigades of Roddey, Crossland and D. Adams, about 1,500 men, covering the two roads from Randolph by which Wilson had marched. Long's division and Alexander's brigade of Upton's attacked and carried the position in less than an hour, the Confederates retreating in great disorder toward Selma despite all of Forrest's efforts to rally them. At night the whole command bivouacked about Plantersville, 19 miles from Selma, after almost constant fighting during the day of 24 miles, during which Wilson had captured three guns and over 200 prisoners. Early in the day McCook, with Colonel La Grange's brigade, had been ordered to march rapidly to Centreville, 40 miles distant, to seize and hold the bridge over the Cahaba, and to fall upon Jackson's Confederate cavalry division, which had thrust itself between the main body and Croxton. At daylight, 2 April, Wilson resumed his march and by rapid movement, without opposition, the troops were in sight of Selma and mostly in position by 4 P.M. The city had been sufficiently fortified, as was believed, against any possible cavalry attack. The works contained 24 bastions and a number of strong redans, with deep ditches and an interior line of four detached forts. They were of semi-circular form, nearly three miles in extent, with both flanks resting on the Alabama River, above and below the city. They mounted 32 guns and were held by Forrest, with about 4,000 veteran cavalry and some 2,000 Alabama militia, home guards and citizens, mostly old men and young boys. Wilson had obtained accurate plans of the works and of the ground in front of them. During the day these

sketches were shown to all his general officers and the plan of attack explained, from which it resulted that upon reaching the vicinity of the works, the various brigades went quickly into position, with great precision. At a given signal Long's division was to lead in the assault, supported by Upton, but before the signal had been given Long had become engaged and without waiting he ordered the charge, and in the gathering darkness his men went forward, under a severe fire of artillery and musketry, scaled the works and after a hand-to-hand encounter drove the Confederates from them and took many prisoners. Some of Upton's men joined in the fight. Gens. Forrest, Armstrong, Roddey and Adams escaped, with a number of men, under cover of darkness. A portion of Upton's division pursued on the Burnsville road until long after midnight, capturing four guns and many prisoners. Wilson had engaged and in support 8,000 men. His loss was 44 killed, 277 wounded and seven missing. Forrest's loss in killed and wounded was less. It was one of the most remarkable feats ever accomplished by cavalry, and its result was the capture of 2,700 prisoners, many colors, nearly 2,000 horses, 104 field and siege guns and an immense quantity of ammunition. Wilson destroyed the arsenal, with 44 buildings, covering 13 acres, filled with machinery and munitions, powder works, three gun foundries, three rolling mills and several machine shops, and large accumulations of quartermaster and commissary stores. On the 3d Upton's division was sent from Selma to open communication with McCook and Croxton, west of the Cahaba. McCook had found Jackson's cavalry between himself and Croxton, and after skirmishing with it at Scottsville, had retired east of the Cahaba. Nothing was heard of Croxton and Upton, and McCook returned to Selma on the 6th. Croxton made a wide detour to the west and south of Tuscaloosa, and then northward and eastward across Alabama into Georgia before rejoining the corps. Preparations were now made to march on Montgomery. It was necessary to prepare 900 feet of bridging to cross the Alabama River, which was running high, horses enough had been captured to mount the whole command, supplies in the country were abundant, and on the 9th the entire command, except Croxton's brigade, started for Georgia by way of Montgomery. When the advance, which had not been strongly resisted, was near Montgomery on the 12th, the mayor surrendered the city, Adams, who was in command, having retreated, after burning 90,000 bales of cotton. With bands playing and colors flying the column marched through the city and encamped. Here five guns, a large quantity of stores, small arms and cotton were destroyed, also five steamboats loaded with military supplies. On the 14th the command moved with the greatest celerity to secure the crossings of the Chattahoochee at Columbus, on the direct road to Macon and West Point, further up the river. On the afternoon of the 16th Upton's division, in the advance on the Columbus road, struck Buford's cavalry pickets and drove them rapidly through Girard to the lower bridge over the Chattahoochee. The bridge was fired by the Confederates before it could be seized, and it was then decided

to make a night attack upon the central bridge, one of the three that crossed the river at this point. Three hundred men of the Third Iowa cavalry, properly supported, were selected to make the attack. The lines were quietly formed and moved up to within range of the intrenchments covering the bridge, and at a signal the attack began at 9 P.M.; the troops opened a rattling fire from their Spencer rifles, which was replied to by a storm of canister from 27 guns, but the Iowa men went over the works at many points and all rushed for the bridge. At the same time the Confederates tried to escape by the bridge, which was so crowded with the men of both forces that the Confederates holding the works at the east end of the bridge and commanding it with two guns, were restrained from firing and the Union forces made a rush upon them and gained possession, and Columbus was taken. Wilson's loss was six killed and 24 wounded. He captured 1,200 prisoners, nearly half of the militia that had defended the place under command of Gens. Howell Cobb and Robert Toombs. Columbus was one of the great manufacturing centres of the Confederacy, and its capture resulted in the destruction of a great quantity of war material, 63 guns, the ram *Jackson*, mounting six guns, 125,000 bales of cotton, 15 locomotives, 250 cars, a navy yard and armory, two rolling mills, powder magazines and an arsenal, with a great quantity of machinery, two iron-works, three foundries and 10 mills and factories turning out war material. The Confederates abandoned and burned the gunboat *Chattahoochee* 12 miles below Columbus. On the same day that Wilson captured Columbus, La Grange's brigade captured West Point. La Grange had been detached at Tuskegee and marching northeast, after some sharp skirmishing, appeared before West Point about 10 A.M. of the 16th to find that the bridge spanning the river was defended by an earthwork, mounting three guns, and held by Gen. R. C. Tyler with about 265 men. The fort was taken after a hard fight, during which La Grange's men bridged the ditch of the work, under fire. General Tyler and 18 of his men were killed, 28 wounded and 218 captured. La Grange had seven killed and 29 wounded. The captures were three guns, 500 stands of small arms, 19 engines and 245 cars loaded with army supplies. After destroying the bridges, railway equipment and stores, La Grange moved toward Macon. With the main column Wilson also marched for the same place on the 18th and when nearing the city, on the 20th, his advance was met by a communication from General Beauregard, with information of a truce between Generals Johnston and Sherman. Before the communication could reach Wilson, who was marching near the rear of his column, his advance had dashed into Macon and received the surrender of Gens. G. W. Smith, Howell Cobb and other prominent officers, and these, with the garrison, were held as prisoners of war. Here Wilson heard of the surrender of General Lee, and the next day, 21 April, he received a dispatch from General Sherman to suspend hostilities until notified of the result of the negotiations then pending between Sherman and Johnston. The surrender of Macon included four generals, 3,500 men, five colors, 60 guns, a large number

of small arms and great quantities of stores and supplies.

Croxtun, who had been detached from Cook's division at Elyton on 27 March, with the corps at Macon 1 May. He had Tuscaloosa and advanced as far as Britton, then returned to Tuscaloosa and Jasper, his line of march was 100 miles north, pursued by Wilson, and on the way to Alabama he had a sharp engagement at Mountain, near Talladega. He marched miles, most of the time through a mountainous country, so destitute of supplies that his command could be subsisted and foraged only by the greatest efforts. Swimming four times, destroying five large iron-works — the largest in the cotton States — three factories, numerous mills, immense quantities of supplies, and capturing four guns and several hundred small arms; near 300 prisoners, he rejoined the corps with men and horses in fine condition. He had all 172 officers and men. The closing act of Wilson's campaign was the capture of Jefferson Davis by regiments from his command.

In the campaign Wilson had marched 1,000 miles, captured five fortified cities, 6,820 prisoners and 23 colors. He subsequently paroled over 59,000 officers and men. He had destroyed a vast amount of property of Lee, Johnston and Beauregard of every kind. He lost 99 killed, 598 wounded and 28 missing, an aggregate of 725.

He had conducted the most notable movement of the war, none other equal in skillful planning, bold and successful execution. Consult 'Official Records' (Vol. XLIX, Century Company's 'Battles and Leaders of the Civil War' (Vol. IV); Cox, 'The March to the Sea'; Piatt, 'Life of Gen. George H. Thomas'; Boynton, 'Gen. Geo. H. Thomas at Nashville'; E. A. Carr

**WILTON, Joseph**, English sculptor, born London, 17 July 1722; d. there, 25 Nov. 1790. He studied in Paris and in Rome, and in 1750 won the gold medal awarded by Benedict XIV on the occasion of his jubilee. He returned to England in 1758 and became director of the art gallery of the Duke of Richmond. He was one of the founders of the National Academy and its first exhibitors. His busts and medals were in much demand, among the foremost those of Bacon, Cromwell, Isaac Newton, Peterfield, Chatham and other prominent statesmen. From 1790 until his death he was director of the National Academy.

**WILTON, Me.**, town in Franklin County on the Maine Central Railroad, about 10 miles southwest of Farmington. It was founded in 1789 and in 1803 was incorporated. It has lumber mills, trunk and carriage factories, creameries, woolen mills and agricultural implements works. The educational institutions are the Wilton Academy, public schools and a library. Pop. 2,143.

**WILTON CARPET**, a variety of Brussels carpet made similar to Brussels, excepting that it is flattened instead of being round; it has a groove along the upper surface, which is cut and the wire liberated by which

**WILTS**, or **WILTSHIRE**, England, a southwestern county bounded on the north and northwest by the county of Gloucester, on the west by Somerset, on the south by Dorset and Hampshire, on the east by Hampshire and Berkshire; area, 1,350 square miles. The county town is Salisbury. The north is principally a fertile flat, with scarcely any perceptible slope, except on the frontier where it begins to rise in the direction of the Cotswold Hills and near the centre, where it is broken by a ridge of downs; the south, though presenting at a distance the appearance of an almost uninterrupted plain, has an undulating surface, broken by downs and intersected by some fertile and well-watered valleys. In this south division is Salisbury Plain, an elevated plateau, covered with a scanty herbage. On the plain are the megalithic remains of Stonehenge, situated about nine miles north of Salisbury and those of Avebury, about five miles west of Marlborough. The chief rivers are the Bristol Avon, the Salisbury Avon and its tributaries Bourne, Wily and Nadder. Though the arable land is of considerable extent, the larger proportion of the surface is kept in pasture, devoted chiefly in the south division to the rearing of sheep, and in the north to cattle-grazing and the dairy. Wiltshire bacon and cheese are famous. The manufactures comprise woolen goods for which the principal localities are Wilton, famous particularly for carpets, Bradford, Trowbridge, Westbury, etc.; excellent cutlery and steel goods at Salisbury, ropes and sacking at Marlborough, large engineering works at Devizes; and iron ore found in mines nearby is smelted at Westbury. Pop. 286,822.

**WIMAN**, **Erastus**, American mercantile agent: b. Churchville, Ontario, 21 April 1834; d. Saint George, S. I., 9 Feb. 1904. He entered the mercantile agency service in 1858 and in 1867 removed to New York, where he became interested in rapid transit schemes for Staten Island. He increased the number of steamboat trips between that island and New York from 15 to 65 a day, built the Arthur Kill bridge and in 1902 secured congressional authority for the construction of a tunnel under New York Bay connecting New York, Long Island and Staten Island. His later years were clouded by financial reverses and the frustration of his extensive plans for rapid transit. He wrote 'Chances of Success' (1892).

**WIMBLEDON**, wim'bl-dôn, England, a town of Surrey, eight miles southwest of Trafalgar Square, London. It is practically a suburb of London, being located at the northeast extremity of the common of same name, which until 1889 was well known in connection with the shooting competitions of the National Rifle Association. It has a free library, almshouses, hospitals and many fine residences, being a favorite residential locality. Area, 3,221 acres; pop. 58,003.

**WIMBORNE**, wim'bern, or **WIMBORNE MINSTER**, England, a market-town of Dorsetshire, on the Wimar Allen River, near its confluence with the Stour, about seven miles northwest of Bournemouth. It is of historical interest in connection with its fine cruciform minster, the collegiate church founded by Edward the Confessor which succeeded the convent established by Saint Cuthburh, King Ine's sister, in 705. The minster exhibits vari-

ous styles of transitional architecture from the Norman onward, has a central and a west tower and contains several interesting features, including the tomb of Ethelred I, and a mediæval chain-library, one of the few in existence where the books are chained to the shelves. The grammar school in the town was founded in 1496. Pop. about 5,000. Consult Hutchins, John, 'The History and Antiquities of the County of Dorset' (Westminster 1861); Perkins, 'Wimborne Minster and Christ Church Priory' (1899); Yeatman, 'Wimborne Minster' (1878).

**WIMPLE**, or **WIMPEL**, a covering of silk or linen for the neck, chin and sides of the face, worn usually out of doors. It is still retained as a conventual dress for nuns.

**WINAMAC**, win a-māk, Ind., county-seat of Pulaski County, on the Tippecanoe River, and on the Pittsburgh, Cincinnati and Chicago Railroad, about 90 miles southeast of Chicago and 23 miles northwest of Logansport. It has considerable trade; the principal shipments are farm and dairy products. The principal public buildings are the courthouse, four churches and the public and parish schools. Pop. 1,800.

**WINANDERMERE**. See **WINDERMERE**.

**WINANS**, **Ross**, American inventor: b. Vernon, N. J., October 1796; d. Baltimore, Md., 11 April 1877. He went to England to examine English railroad systems in the interest of the Baltimore and Ohio Railroad; and after his return built the first locomotive used on that railroad. He also invented the camel-back locomotive and the eight-wheeled car, and established in Baltimore some of the largest machine shops in the United States. He was active in political matters prior to the Civil War and in 1861 was elected to the extra session of the Maryland legislature, but was imprisoned in Fort McHenry. He was author of several pamphlets on religious subjects and also of 'One Religion, Many Creeds' (1870).

**WINANS**, **Thomas DeKay**, American engineer, son of Ross Winans (q.v.): b. Vernon, N. J., 6 Dec. 1820; d. Newport, R. I., 11 June 1878. He was taken into partnership by his father on coming of age and was sent by him in company with his brother William to make contracts with the Russian government for furnishing and managing the equipment of a railroad between Moscow and Saint Petersburg. With Andrew M. Bostwick and Joseph Harrison he entered into a contract for \$3,000,000, and afterward was engaged in other lucrative contracts with Russia. Upon his return to the United States he became interested in invention, and with his father and brother invented a system of steam navigation known as the "cigar-ship"; a tubular adjustment for the feeding of young trout; and various other mechanical devices.

**WINATSHIPUM INDIANS**, a small tribe of the Salishan stock of North American Indians, also known as Piskwaus or Pisuquois, residing on Wenatchee River (whence the name of the tribe) and the north branch of Yakima River in Kittitas County, Wash. They took part in the Yakima treaty of 1855, but do not live on the reservation. There are six smaller tribes or bands connected with them and speaking the same language.

**WINCHELL, Alexander**, American geologist: b. North East, Dutchess County, N. Y., 31 Dec. 1824; d. Ann Arbor, Mich., 19 Feb. 1891. He was graduated from Wesleyan University, Middletown, Conn., in 1847, became professor of physics and civil engineering at the University of Michigan in 1853 and of botany and geology there in 1855. He served as State geologist of Michigan 1859-62, professor of geology in the Kentucky University 1866-69, director of the Michigan Geological Survey 1869-71, and chancellor of Syracuse University 1873-74. From 1879 till his death he was professor of geology and palæontology in the University of Michigan. He lectured extensively and published 'Sketches of Creation' (1870); 'Geological Chart' (1870); 'The Doctrine of Evolution' (1874); 'Science and Religion' (1877); 'Pre-adamites' (1880); 'Sparks from a Geologist's Hammer' (1881); 'World-Life' (1883); 'Geological Studies' (1886); 'Walks and Talks in the Geological Field' (1886).

**WINCHELL, Newton Horace**, American geologist, brother of Alexander Winchell (q.v.): b. North East, N. Y., 17 Dec. 1839; d. 2 May 1914. He was graduated at the University of Michigan in 1866. In 1869-70 he was assistant State Geologist of Michigan; he assisted in the Ohio Geological Survey in 1870-72; and in 1872-1900 he was State Geologist of Minnesota, and also professor of geology and mineralogy at the University of Minnesota in 1873-1900. He was archæologist of the Minnesota Historical Society after 1906. He served as president of the American Geological Society in 1902; and he edited the *American Geologist* with his son, Horace V. Winchell, an economic geologist; he was joint author of 'The Iron Ores of Minnesota' (1891), and with another son, Alexander N. Winchell, professor of mineralogy and petrology at the University of Minnesota, he was author of 'Elements of Optical Mineralogy' (1909). Independently he was author of 'Catalogue of the Plants of the State of Michigan' (1861); 'Geology of Ohio and Michigan' (1872-1900); 'The Aborigines of Minnesota' (1911); 'Weathering of Aboriginal Stone Artifacts' (1913).

**WINCHENDON**, Mass., town in Worcester County, on the Miller River, and on the Boston and Albany and Boston and Maine railroads, 36 miles north-northwest of Worcester and 68 miles northwest of Boston. Electric lines connect it with nearby cities. It was settled in 1752 and incorporated as a town in 1764; the town includes the villages of Winchendon, Waterville and Winchendon Springs. It is principally a manufacturing town; the chief manufactures are woodenware, tubs, pails, etc., wood-working machinery, toys, ice-cream freezers, cotton goods, rattan and reed furniture, knit goods, spools, hobblins, chairs, etc.; there is a national bank with a capital of \$200,000, and a savings bank, one of the best in the State. It contains Murdock High School established in 1865 with a school library of about 1,500 volumes, and occupying a fine building valued at \$100,000; the Beals Memorial Library of 12,500 volumes. There is an excellent school system, a board of trade and clubs for both women and men. There are three banks with combined resources of over \$3,600,000. The assessed valuation of the town is \$4,500,-

000. The town owns and operates the system of waterworks. A modern hydro-electric plant furnishes current for lighting and power. Pop. 5,968.

**WINCHESTER, Caleb Thomas**, American scholar and educator: b. Montville, Conn., 18 Jan. 1847. He graduated from Wesleyan University 1869, and studied at the University of Leipzig 1880-81. He served his Alma Mater as librarian 1869-73; was professor of rhetoric and English literature 1873-1890 and since then professor of English literature. He is a lecturer of great charm and wide reputation. He is the author of 'Five Short Courses of Reading English Literature' (1892; 3d ed. 1911); 'Some Principles of Literary Criticism' (1899); 'The Life of John Wesley' (1906), considered by many critics the best published; 'A Group of English Essayists' (1910); 'Representative English Essays, with introduction and notes' (1914); 'Wordsworth—How to Know Him' (1916).

**WINCHESTER, Charles M.**, American printer and publisher: b. Providence, R. I., 2 April 1867. He is the son of a clergyman who was chaplain of the 12th Rhode Island regiment in the Civil War and for many years in charge of the First Christian Church at Middletown, N. Y. Mr. Winchester was educated in the public schools of Middletown; learned the printing trade at Dayton, Ohio, and was proof-reader and foreman of a composing room at Akron, Ohio. He returned to New York City in 1891, where he was employed as a compositor, proofreader and foreman of a composing room. In January, 1896, he moved to Albany, N. Y., to manage a branch in that city for a New York printing concern, which was later merged with the J. B. Lyon Company, of which he became general manager, vice-president and subsequently president and one of the owners. Mr. Winchester became associated in many clubs and fraternal societies of the city of Albany, being active head of several, including the Albany Chamber of Commerce, to which he was elected President in 1919 and again in 1920.

**WINCHESTER**, England, an ancient city, capital of Hampshire, situated on the right bank of the Itchen, 11 miles north of Southampton. The most important edifice is the cathedral; the oldest parts date from the 11th century, but the greater part of the main building was erected at various times from the 13th to the 16th century, William of Wykeham (1324-1404) having an important share in the work. It has a low central tower which alone rises above the general level of the roof; length from east to west, 545 feet, width of the transepts 186 feet. The length of the nave, which has a beautiful interior, is 351 feet, height 86 feet; the transept contains several beautiful chapels and altars. Numerous monuments include the tombs of William Rufus, of Edmund, son of King Alfred, of William of Wykeham, Cardinal Beaufort, and of Izaak Walton; the shrine of Saint Swithin, etc. It is said that there was a Christian church erected at Winchester in the latter part of the 2d century. Late in the 3d century it was converted into a temple to Wodan. In the second half of the 7th century, the exact date not being definitely known, Winchester became an episcopal see with an unbroken line of

bishops, including the famous Saint Swithin, down to the present. Other notable edifices and establishments are Saint Mary's College (Winchester College or School, one of the great English public schools), founded by William of Wykeham in 1387, richly endowed and accommodated in a large range of buildings, of which the chapel, hall and library are beautiful specimens of architecture; the guildhall; the old castle, which has been restored, and assize courts built adjoining; a corn exchange; barracks for infantry; the hospital of Saint Cross, founded in 1132, several other charitable institutions, a free library and museum, school of art, etc. The Abbey Gardens are very beautiful, and statues of Alfred the Great by Hamo Thornycroft, erected for the millenary of the king celebrated at Winchester in 1901, and of Queen Victoria by Alfred Gilbert, adorn the town. There are no manufactures or trade of any consequence. Winchester was called Caer-Gwent by the Britons, Venta Belgarum by the Romans—under whom it was an important place, with a Christian church—and Wintanceaster by the Saxons. It became the capital of England under the Saxons, when the country was united under the sway of Egbert, in the first half of the 9th century, and it retained this dignity till the middle of the 11th century, being a royal residence and place where Parliaments met after this also. After the battle of Naseby it stood a week's siege by Cromwell. Pop. 24,146. Consult Heath, 'Winchester' (Boston 1912); Kitchin, 'Winchester' (London 1890); Varley, 'Winchester' (New York 1910).

**WINCHESTER, Ill.**, city and county-seat of Scott County, on the Big Sandy Creek, and on the Chicago, Burlington and Quincy Railroad, 45 miles west-southwest of Springfield, Ill. It was first settled in 1830. It is in an agricultural region for which it is the shipping point; it contains grain elevators, flour mills, a meat-packing establishment, and a plow factory; there are two private banks. It has a public high school. Pop. 2,000.

**WINCHESTER, Ind.**, city and county-seat of Randolph County, on the White River, and on the Grand Rapids and Indiana, and the Cleveland, Cincinnati, Chicago and Saint Louis railroads, about 68 miles northeast of Indianapolis. It is in an agricultural region and in a natural-gas belt. It has flour and lumber mills, brick and tile works, machine shops, and a number of repair shops. The educational institutions are a high school, established in 1894, public graded schools, and the Randolph County Law Library. Pop. 4,266.

**WINCHESTER, Ky.**, city and county-seat of Clark County, on the Chesapeake and Ohio, and the Louisville and Nashville railroads. 18 miles southeast of Lexington. It is in an agricultural region, in the "Blue Grass" country. It has flour mills, spoke and rim factory, planing mills and machine shops. The principal shipments are farm products and livestock. The educational institutions are the Kentucky Wesleyan College (Methodist Episcopal South), opened in 1866, and the public and private schools. There are also a Carnegie library and hospital. The two banks have a combined capital of over \$200,000. The town was incorporated in 1792. Pop. 7,156.

**WINCHESTER, Mass.**, town in Middlesex County, on the Boston and Maine Railroad, about eight miles north by west of Boston. In 1638 the place was known as Waterfield, which, in 1640, was changed to Charlestown Village. In 1642 it was called Woburn, and in 1850 the present name was adopted. It has many places of great beauty, and it is a favorite residential suburb for Boston. It has manufactories for watch hands, leather and felt goods. There are machine shops and grist mills. A part of "Middlesex Fells," a State park, which has an area of 3,020 acres, is in this town. It has a State Aviary, and a Home for Aged People. The educational institutions are a high school, established in 1850, graded public schools and a public library which contains about 20,000 volumes. There are two banks. Pop. 10,005. Consult Hurd, 'History of Middlesex County' (2 vols., Philadelphia 1890).

**WINCHESTER, Tenn.**, town and county-seat of Franklin County, on the Elk River and on the Nashville, Chattanooga and Saint Louis Railroad, about 80 miles south by east of Nashville. It is near the foot of the Cumberland Mountains, in an agricultural region. The town has considerable mining and lumbering interests. It is a favorite health resort. The chief industrial establishments are lumber and planing mills, wagon and carriage factories, wood-working factories, marble works, flour mills and machine shops. It has one bank with a capital of \$75,000. Pop. about 1,400.

**WINCHESTER, Va.**, city and county-seat of Frederick County, on the Cumberland Valley and the Baltimore and Ohio railroads, about 81 miles west by north of Washington, D. C. It is in an agricultural and stock-raising region and has considerable lumbering interests. It has flour and paper mills, lumber mills, woolen mills, glove factories, tanneries and machine shops. The educational institutions are Valley Female College (Methodist Episcopal South), opened in 1874; the Shenandoah Valley Academy, Fairfax Hall, the Handley Library, the John Kerr High School (white), established in 1872; a high school for colored pupils and elementary schools for both races. The principal public buildings are the courthouse and the city hall. There are National and Confederate cemeteries.

Fort Loudoun, built under Washington, and Washington's headquarters are of historic interest. Washington's occupancy of Winchester was in 1755, after Braddock's defeat. Washington was stationed here, in command of the Colonial and British forces. During the Civil War, Winchester was for some time a battle centre. On 19 Oct. 1864 Sheridan left Winchester on his famous ride to Cedar Creek. Pop. 6,883. See OPEQUON, BATTLE OF; WINCHESTER, MILITARY OPERATIONS AT AND NEAR.

**WINCHESTER, Battle of.** See OPEQUON, BATTLE OF.

**WINCHESTER, Military Operations at and Near.** Winchester was an important strategic point during the Civil War, and it is stated on good local authority that it was occupied or abandoned 68 times by the troops of both armies. It was held by the Confederates until 11 March 1862 when Gen. J. E. Johnston having retreated from Centreville and

Manassas, Gen. "Stonewall" Jackson, under Johnston's orders, withdrew from the place and retired up the Shenandoah Valley, and the Union troops, under General Banks, occupied it on the 12th. General Shields, who had followed Jackson up the valley, with a division of Banks' command, fell back to Winchester and Jackson followed him as far as Kernstown (q.v.), four miles south of Winchester, where Shields attacked and defeated him on 23 March; Jackson again retreating up the valley, Banks following and finally taking up a fortified position at Strasburg. Jackson flanked Banks out of Strasburg by moving through Luray Valley and defeating Colonel Kenly at Front Royal (q.v.) 23 May, and Banks retreated to Winchester closely pursued by Jackson.

**Winchester, First Battle of.**—Banks arrived in Winchester late on the 24th with about 8,000 men and 16 guns. Colonel Donnelly's small brigade was put in position to cover the Front Royal and Millwood roads, and was supported by eight guns, judiciously placed on rising ground. Colonel Gordon's brigade, on the right, held a low ridge running southwest from the town and west of the Valley turnpike, a little over half a mile from the suburbs. Its left rested on the turnpike and its right extended westward along the ascending ridge in front of Winchester. Skirmishers were thrown out in advance and guns were placed on either flank. Five companies of Michigan cavalry were held in reserve under cover of the ridge. Between Gordon and Donnelly was an interval of nearly a mile, which was filled by the principal part of General Hatch's cavalry brigade and two guns. The line formed the arc of a circle, covering Winchester from the west around by the south to the east. Jackson confronted this position with 16,000 men and 48 guns, and with the main body lay close to Gordon, while Ewell, with two brigades which had marched directly from Cedarville on Winchester, bivouacked opposite Donnelly's position. Jackson's plan was to hold Gordon fast, throw Ewell upon Donnelly, and then move his main body around Gordon's right, and he expected to advance upon a disorganized and demoralized army. At dawn of the 25th Ewell advanced the 21st North Carolina and opened with his artillery, whose shells fell among Donnelly's men, as they were preparing coffee and brought them to arms as they saw the Carolinians advancing in line across an open field upon the centre of the position crossing the Front Royal road. The North Carolina men met a severe front and flank fire from the stone fences, and as they fell back Captain Best's guns threw canister into their disordered ranks and they left the field with a loss of 80 officers and men, including the two field officers with them. A Confederate officer says, "The slaughter was appalling and the survivors fled to the rear in the utmost confusion." Ewell now brought up two batteries, and an artillery duel ensued, which soon ceased as a heavy fog settled over the field. Ewell then made an unsuccessful attempt to turn Donnelly's right and then endeavored to turn his left and gain the Martinsburg road in his rear. The attempt was checked, Donnelly losing some ground, but at this moment he received an order to retreat, as Gordon had been driven from position and was in re-

treat through Winchester. Donnelly moved his three regiments and guns from the field in perfect order, under a heavy fire of shot and shell, and continued his retreat, keeping to the right of the Martinsburg road. He had made a successful resistance of over four hours against double his number, with trifling loss.

Jackson attacked Gordon's small brigade with six brigades, his attack beginning at daybreak, and being several times repulsed. Finally he got artillery in position and opened on Gordon's front and gradually worked his infantry toward the left. Then he moved two brigades around Gordon's right. Gordon detected the movement while it was in progress and changed position to meet it, pouring a destructive fire of musketry into the Confederate ranks, making great gaps in the line, without checking its advance; the gaps were closed and with almost perfect alignment the two brigades came on and flanking Gordon's two right regiments drove them back in some disorder. The five companies of Michigan cavalry were now brought up and as quickly swept away. At this juncture Jackson ordered forward his entire line of six brigades and Gordon ordered a retreat through Winchester, which was conducted in a manner to command Jackson's admiration. There was some confusion in the streets of the town, but once clear of it, Hatch's cavalry and the artillery covered the withdrawal, until the infantry was well on the Martinsburg pike. Jackson with his main body pursued five miles beyond Winchester and Banks continued his retreat to the Potomac, crossing it at Williamsport on the 26th. Banks' loss May 23-25, including Front Royal and the retreat from Strasburg to the Potomac, was 62 killed, 243 wounded and 1,714 missing. Jackson's loss was 68 killed, 329 wounded and three missing. Jackson remained at and in the vicinity of Winchester until 31 May, when, his rear being threatened by the converging columns of Fremont from the west and McDowell from the east, he retreated up the valley and the Union troops reoccupied Winchester. Consult 'Official Records' (Vol. XII); Allan, 'Jackson's Valley Campaign.'

During Lee's campaign against Pope the town was occupied by Gen. Julius White with a brigade of over 2,000 men. On the night of 2 Sept. 1862 White, under General Halleck's order, spiked four heavy siege guns in the works and withdrew to Harper's Ferry; the Confederates occupying the place next day. The Confederates held the place in small force until 3 December, when, upon the advance of a Union column from Harper's Ferry, under General Geary, they retired, and Geary occupied the town next day. Geary soon withdrew and the Confederates reoccupied and held the town until near the end of December, when it was again taken by Union troops under General Milroy. Milroy fortified the place and occupied also Berryville and Romney, with outposts toward Strasburg and Front Royal. Harper's Ferry, Martinsburg, Williamsport and posts westward to Cumberland and New Creek were held by Union troops belonging to Gen. B. F. Kelley's command.

**Winchester, Second Battle of.**—When General Lee began his preparations for the second invasion of Maryland, which culminated in the battle of Gettysburg, he turned his

thoughts to the clearing of the Shenandoah Valley. At this time Winchester was held by General Milroy, with the two brigades of Gen. W. L. Elliott and Colonel Ely, numbering about 7,000 effective men. Colonel McReynolds' brigade of 1,800 men was at Berryville. The main works defending Winchester were on a ridge north of the town and consisted of two forts known as the "main fort" and the "Star fort," mounting four 20-pounder Parrotts and two 24-pounder howitzers. Surrounding these were smaller works connected by rifle-pits. The expressed object in holding the place was to observe and hold in check the enemy in the valley, and to secure the Baltimore and Ohio Railroad against depredations. Milroy was expressly instructed to undertake no offensive operations in force. On 7 June General Lee began his operations in the valley by ordering General Imboden, in the upper valley, to make a demonstration with his cavalry brigade on Romney in order to cover the movement against Winchester and prevent the Union troops at that place from being reinforced by Kelley's troops on the line of the Baltimore and Ohio Railroad. General Jenkins' cavalry brigade was ordered to join Ewell's infantry corps near Front Royal. Both Imboden and Jenkins were in position by the 10th, and on that day Ewell set out from near Culpeper Court House for Winchester by way of Gaines' Cross Roads, Chester Gap and Front Royal, to Cedarville, which was reached on the 12th. Here, next day, Ewell detached Rodes' division and Jenkins' cavalry brigade to move on Berryville and endeavor to capture McReynolds' brigade, but, warned by Milroy, McReynolds made good his retirement, with small loss, joined Milroy at Winchester on the night of the 13th, and was assigned to the Star fort, immediately north of the main work. On the same day Early's division marched on Winchester by Newtown and the Valley pike, while Edward Johnson's division moved upon the town by the direct road from Front Royal. The two divisions, driving in Milroy's outposts, were in position before Winchester on the evening of the 13th. For some days Milroy had felt the pressure from Confederate cavalry, but had no idea that Lee was threatening the valley until a prisoner taken in a skirmish on the Strasburg road, on the evening of the 13th, informed him that he was confronted by Ewell's corps and that Longstreet's was near. Fully recognizing the fact that an orderly withdrawal was impracticable, he resolved to act on the defensive, and, if not relieved, force his way through what might appear the weakest part of his lines. At night of the 13th Ewell ordered Early to attack the works on the north and west of the town next morning, while, as a diversion, Johnson demonstrated against the east and south-east. In the forenoon Johnson made his attack on the eastern side of the town, between the Millwood and Berryville roads, held by Colonel Ely's brigade, and was repulsed by the Eighth and 87th Pennsylvania, which charged Johnson's retreating troops, but were speedily driven back by fresh troops, and after some sharp fighting Johnson gained part of the town, but was quickly shelled out and made no further effort. West of the ridge on which the main forts were thrown up, and about 1,300 yards

distant, is another parallel ridge, called Flint Ridge, where an isolated earthwork of slight strength had been thrown up to command the Pughtown and Romney roads. It was held by the 110th Ohio, a company of the 116th, and a regular battery, commanded by Lieutenant Wallace F. Randolph, all under command of Col. J. W. Keifer. Early, leaving Gordon's brigade south of the town to engage Milroy's attention, moved with the remainder of his division to the left and west, then north, crossed the Romney road, and about 5 P.M., having gained Round Mountain, south of the Pughtown road, and put 20 guns in position, without being perceived, opened an unexpected fire on Keifer's work and soon silenced Randolph's battery, upon which Hays' brigade, in two lines, made a quick dash, and after a stubborn resistance carried the work, and captured the battery of six guns. Keifer, with a loss of over 40 men, withdrew under cover of the fire from the guns of the main works. This was followed by an artillery duel which was kept up until 8 P.M., during which Milroy withdrew his detachments to his main works. Darkness ended the contest.

Milroy was now in a critical position. His cannon ammunition was nearly exhausted and he had but one day's rations for his men. At 9 P.M. he assembled his brigade commanders, and it was concluded to give up further effort to defend the place, to abandon all the artillery and wagons, and to force a way through the Confederate lines that night, taking with them only the horses, small arms and usual supply of ammunition. All the guns were spiked and the ammunition thrown into the cisterns. At 1 A.M. of the 15th Milroy, abandoning his sick and wounded, avoiding the town, moved silently through a ravine about a mile and struck the Martinsburg pike, which was followed cautiously, with many halts to close up the stragglers, for about three miles, when, about 3.30 A.M., Elliott's brigade, which was in the advance, was fired upon by Confederate skirmishers, and it was soon ascertained that their main body was east of and very near the road. The retreat had been anticipated and intercepted. Under Ewell's order, General Johnson had left one brigade to prevent Milroy from escaping toward the east, and moved with the remainder of his division by way of Jordan Springs to Stephenson's Depot, about five miles north of Winchester, to intercept the retreat in that direction. Just as Johnson's head of column reached the railroad, 200 yards from the Martinsburg pike, Milroy's men were heard coming down the road and Johnson formed his line on elevated ground in a woods east of the road and in a field south of and adjoining the woods. The greater part of his men were sheltered by a stone fence which bounded a railroad cut. As soon as Elliott took in the situation he formed line of battle with his three leading regiments to push back the Confederates and thus clear the way for the rest of the column to pass on toward Martinsburg. An hour's fight ensued with varying success, Johnson's right being forced back and his artillery silenced, but the left of his line held firm against all efforts to shake it. The main road being blocked, Milroy determined to try another, and directed the troops to fall back a short distance and turn to the right. Part of them did so, but the greater

number filed to the left, leaving the Martinsburg road and taking that to Bath. The diverging columns could not be reunited. A part of the command, accompanied by Milroy, reached Harper's Ferry by way of Smithfield late in the afternoon. Those retreating on the Bath road made good their escape, crossed the Potomac at Hancock and rallied to the number of 2,700 at Bloody Run. The greater part of Ely's and McReynolds' brigades were captured. Johnson claims the capture of 2,300 men, 175 horses and 11 colors. The capture of Winchester and defeat of Milroy gave the Confederates 28 guns, 300 loaded wagons, many horses and 4,000 prisoners. The Union loss was 95 killed, 348 wounded and 4,000 captured or missing. The Confederate loss was 47 killed, 219 wounded, three missing. Consult 'Official Records' (Vol. XXVII); Doubleday, 'Chancellorsville and Gettysburg.'

On marching into Maryland General Early left a small garrison at Winchester, and after the return from Gettysburg Lee's army was encamped around the place until it fell back beyond the Rappahannock. The town was not then reoccupied in force by Union troops, being only visited occasionally by small detachments from Harper's Ferry and Martinsburg. It was subject also to Confederate forays from the upper valley. In December 1863 General Early was sent into the valley, and throughout the winter and early spring of 1864 kept his troops very active, occasionally making dashes into Winchester. On 29 Feb. 1864 General Sigel was assigned to the command of the Union troops in the lower valley, and soon thereafter Winchester was occupied as an outpost to Harper's Ferry and Martinsburg. Sigel was relieved by General Hunter after the battle of New Market (q.v.), 15 May, and when Hunter was repulsed at Lynchburg and forced to retreat to the Kanawha General Early moved down the valley, and driving everything out of it, encamped near Winchester, 3 July, preparatory to his attempt on Washington (q.v.). After his failure on Washington Early returned to the lower valley and being hard pressed from the east and north fell back toward Strasburg, at the same time sending Ramseur's division of infantry toward Stephenson's Depot, a few miles northeast of Winchester, to support his cavalry and check General Averell's division of Union cavalry, advancing from Martinsburg. Averell defeated Ramseur at Stephenson's Depot (q.v.), 20 July, and followed him through Winchester. He was joined by General Crook's division, on the 22d, Crook assuming command, and the two divisions of 11,000 men advanced to Kernstown on the 23d. Early returned, defeated Crook at the second battle of Kernstown (q.v.) 24 July, drove him through Winchester and across the Potomac, and reoccupied Winchester and Martinsburg. Early's successes called for a strong commander of the Union forces to oppose him, and General Sheridan was selected. On 7 August when Sheridan assumed command, near Harper's Ferry, Early's army was concentrated west of the Opequon River, covering Winchester and Bunker Hill. Sheridan advanced from Halltown toward Winchester, on the morning of the 10th, and Early, abandoning Bunker Hill and Winchester, fell back to Strasburg to await reinforcements coming from Lee's army at

Richmond. Sheridan followed to Cedar Creek on the 12th. Early's reinforcements arriving, Sheridan's infantry fell back to Winchester on the night of the 16th, the cavalry following next day. From Winchester Sheridan, on the 17th, fell back to Berryville, behind the Opequon, leaving his cavalry to cover the withdrawal. Wilson's cavalry division, Lowell's cavalry brigade and Penrose's brigade of New Jersey infantry, 850 men, were ordered to cover the flank of the army in its march from Winchester to Berryville. The Jersey brigade was deployed along a small branch of the Opequon, south of and near Winchester, with dismounted cavalry on the flanks, the remainder of the cavalry massed near the town. Early had followed Sheridan from Cedar Creek and, in the afternoon of the 17th, his cavalry advanced driving in the Union cavalry, was checked and held by the Jerseymen, until Wharton's division of infantry attacked their right and Ramseur's their front, while Gordon's division advanced against the cavalry. Under this pressure the entire Union line gave way about dark and fell back to Summit Point. The Jersey brigade lost 97 killed and wounded and about 200 prisoners. The cavalry had about 50 captured. Early again occupied Winchester and advanced to confront Sheridan at Halltown. For some days both parties were feeling each other's lines and suffering some losses, and 2 September, General Averell, who had been guarding the crossings of the Potomac, south of Hancock, advanced through Martinsburg to near Bunker Hill, where he attacked and routed General Lomax's cavalry division of two brigades, capturing two battle-flags, 55 prisoners, some wagons and a herd of cattle, finally driving Lomax nearly into Winchester next day, but Averell, in turn, was driven back by Rodes' infantry division. On the 13th General McIntosh, with five cavalry regiments and two guns, started from Sheridan's lines near Berryville, captured some prisoners, and on approaching Winchester caught sight of an infantry line and charged it, driving it to a piece of woods, which he surrounded, capturing the Eighth South Carolina of Kershaw's division, with its battle-flag. The rest of Kershaw's division advanced and McIntosh fell back with his 143 prisoners. These minor encounters were followed on the 19th by the greatest battle fought at Winchester, which to distinguish it from other battles of Winchester is known as the battle of the Opequon (q.v.), in which Sheridan with 38,000 men defeated Early's 15,000, and drove him from Winchester up the valley, not again to return. From this to the close of the war Winchester remained in Union possession. See also SHENANDOAH VALLEY, MILITARY OPERATIONS IN.

E. A. CARMAN.

**WINCHESTER COLLEGE**, a public school at Winchester, England, the oldest of the "Great Public Schools" of that country. It was founded in 1382 by William of Wykeham, and was opened in 1393, although its buildings were not finished until 1395. The original foundation consisted of a warden, 10 fellows, three chaplains, 16 choristers and 70 students who were to live at the school. Outside scholars, or "Commoners," to the number of 10, were admitted, and this number was afterward increased. The original buildings are still

in use and are exceptionally fine architectural types. Newer buildings have been added at various times as the requirements of the school have demanded them. The Public School Commission in 1862 abolished the sinecure fellowships, thereby saving for the school considerable revenues for improvements. The original foundation openings are filled by competitive examinations, and occur at the rate of about 12 annually. The school from the time of its establishment prepared for New College, Oxford, and it has six scholarships at that institution. The new house built for the "Commoners," together with the accommodations for the 70 students in the old house, permit a total student body of about 450. The curriculum is classical in its base, gives mathematics, one modern language, and chemistry, geology or physics. There is also an army class which offers special instruction for entrance examinations into the army. Consult Holgate, C. W., 'Winchester Long Rolls' (1899); Leach, A. F., 'History of Winchester College' (London 1899); Vaughan, John, 'Winchester Cathedral Close' (New York 1914); Shawell, L. L., 'Enactments in Parliament' (4 vols., Oxford 1912).

**WINCHESTER LINE.** See **BOUNDARIES OF THE UNITED STATES.**

**WINCKELMANN,** vīnk'ĕl-mān, **Johann Joachim,** German archæologist and art historian: b. Stendal, Prussia, 9 Dec. 1717; d. Trieste, Austria, 8 June 1768. The son of a poor cobbler he acquired his early schooling as charity pupil in his native town. He was graduated from a gymnasium at Berlin, and later studied theology at Halle. He next undertook the study of medicine at Jena, but was unable to complete the course because of lack of means and for a number of years he was obliged to serve as private tutor and schoolmaster, but in 1748 he was appointed by Count Heinrich von Büнау secretary in his library at Nöthnitz, near Dresden. In 1755 he joined the Roman Catholic Church, and through the efforts of the papal nuncio at Dresden was enabled to visit Rome. Here he became librarian to Cardinal Archinto after whose death he entered the service of Cardinal Albani, an art connoisseur and collector, and gave the public his ideas on ancient art. The more important of his works are 'Geschichte der Kunst des Alterthums' (1764); and 'Monumenti antichi inediti' (1767-68); with various sets of letters on the remains at Herculaneum and Pompeii. He was recognized as the leading authority in Europe in the field to which he had devoted himself. In 1768 he revisited Germany, but at Munich a longing for Italy so overmastered him that he determined to return. Going by way of Vienna, he was well received there, and was presented to the Empress Maria Theresa, who bestowed rich presents on him. At the beginning of June he departed for Trieste, where, for the sake of the gold medals and valuables in his possession, he was murdered by a fellow-traveler, named Arcangeli. The robber was interrupted, and fled without securing any booty, but was subsequently taken and executed. A collective edition of Winckelmann's works was published (1808-20) and another (1825-29). Winckelmann is considered by all authorities as the founder of modern scientific archæology and his conception of the beau-

tiful elicited Lessing's 'Laokoon.' Consult Justi, 'Winckelmann und seine Zeitgenossen' (2d ed., 3 vols., Leipzig 1898); John, 'Biographische Aufsätze' (1866); Pater, Walter, 'The Renaissance: Studies in Art and Poetry' (London 1910); Vogel, in 'Allgemeine deutsche Biographie,' XLIII (1898).

**WIND,** a current of air established at certain times and places within the body of the atmosphere at large, and flowing during periods longer or shorter in certain general directions; such currents being occasioned chiefly by differences of temperature at different times or localities, and by variations in the production and condensation of watery vapor. The portion of the surface of the globe over which any particular wind, permanent or occasional, may extend, is comparatively small, as is consequently the tract of the entire aerial ocean resting on that surface that is involved. At all times, also, there are parts of the atmosphere that are sensibly at rest or calm; and such apparently motionless tracts of air are sometimes of very great extent. (For a statement of the physical properties of the air, see **ATMOSPHERE**; and in reference to the mechanical principles of equilibrium, mobility and disturbance of a fluid mass circumstanced as is the air, see **PNEUMATICS**). The atmosphere is held to the earth only by gravity and the action of this force does not interfere with its fluidity or elasticity, nor with the effect of any pressures acting at points within it; so that its parts have entire freedom of motion about or among each other, and it is in every part sensitive to the slightest disturbing forces. Since, however, the globe with its aerial envelope is to be regarded as moving in unresisting space, and since the friction of the earth's surface upon the lowest stratum of air, and of the strata successively one upon another, has sufficed to communicate to the entire body the earth's own velocity, it follows that the atmosphere, if it were left at rest within itself, must partake of the earth's movements as perfectly as if it were a solid part of that body. The simplest of the disturbances affecting the atmosphere are the movements of "atmospheric waves" of greater or less magnitude and duration, but of two sorts, the daily and the occasional or irregular, the occurrence of which is shown by certain periodical or rare, but gradual variations of barometric pressure. From the nature of the medium, these waves are, as compared with those of water, on a vast scale. The indications of the barometers at stations scattered over a large area of country show that these waves move singly, and indicate their breadth, and the direction and rate of advance; a generally increased or maximum pressure showing at a given time the presence of the crest, while at distances on either side of this a minimum pressure shows the margins or accompanying troughs of the wave. Of daily atmospheric waves, or tides, there are two: (1) that due to attraction of the sun and moon, and which in periods and character is, therefore, similar to the oceanic tides, but which, its maximum effect on the mercury column not exceeding  $\frac{1}{10}$  of an inch, cannot be a cause adequate to produce winds; (2) the heat tide, or elevation of a crest of air along a meridional line following the sun at no great distance, while the cooling on the opposite side of the globe occasions the ad-

vance of a corresponding line of depression, this tide having, therefore, for its period a solar day, and within that period but a single crest, instead of two opposite ones. Beside these periodic fluctuations, there are occasional vast atmospheric waves, due perhaps to previous winds, to great local disturbances of temperature, or to combinations of causes not yet understood. The disturbances by heat that give rise to ordinary periodical or irregular winds are such as occur along certain latitudes, or as are local and irregular altogether. An increase of temperature equal to 50° F. dilates the air receiving it by only about one-tenth of its volume. From the direct rays of the sun air absorbs heat chiefly near the surface of the earth, and yet slowly even here, the warming of the air being more largely due to secondary radiation from the heated surface of the land or water. The heat acquired within a given time is usually by a very gradual increase and limited in amount. If the warming of the air is quite uniform over a large surface, the equilibrium between the affected and the surrounding bodies may be steadily adjusted and preserved, so that no wind shall result; and it is a common experience of the hot season that, though the air at a place may be intensely heated, or through many degrees within a few hours, yet no wind may occur. During subsequent cooling of the same body of air a wind is more likely to arise, and especially so if clouds form at no great distance. Very generally, however, the effect of heating a tract of air in excess over that around it is to occasion expansion and diminution of density; the column of air so affected moves or flows upward, and while the effect of its momentum further relieves its lowermost portions of pressure and diminishes the resistance they can oppose to the surrounding air, the ascending body, losing at considerable height its excess of heat, acquires the density of air at such elevation and flows over or outward, increasing the weight and pressure of some or all the surrounding portions. The lateral equilibrium below is thus destroyed and a double movement of the air established, the air flowing in from one or more directions below the heated space, and flowing out above. But the momentum acquired in some given direction by the air rushing into the affected space may predominate, and, the conditions of neighboring portions of air favoring, a wind may thus be established that shall blow far beyond the point of first disturbance, as well as successively affect portions of atmosphere further back of it, and also extend widely, continuing for a long time before equilibrium and calm are restored. As a well-known fact, however, high or widely extending winds are more likely to arise just before or during storms in which a considerable body of watery vapor is condensed and precipitated from the air, and yet more likely to be felt chiefly after such storms. Winds are also known to be produced in consequence of rapid and great evaporation, and even during the rapid formation of belts or masses of cloud without rain. In all the great oceans, however, there are certain winds, called trade-winds, which always blow in the same direction, though with seasonal variations in the area over which they blow. These are cold currents of air constantly flowing in from the polar regions to replace the warmer and lighter air which is

constantly ascending from the tropical belt and which finds its way back, at first entirely through the upper strata of the atmosphere, to the regions in which the cold currents take their rise. The direction of these winds, which is nearly due west, but slightly south or north, according as it is a northeast or southeast trade-wind, results from the axial rotation of the earth from west to east. The general character of the air-movement is twofold. There is a movement from the poles toward the equator, and a return movement from the equator to the poles. In low latitudes the latter takes place exclusively in the higher strata of the atmosphere, but in higher latitudes its effect is often felt on the surface of the earth. In these latitudes, then, the winds may be divided into equatorial and polar, the former being as a rule more or less westerly, the latter more or less easterly. The equatorial winds are distinguished in general by the highest temperature, the greatest degree of saturation, the most cloudy weather, the most frequent rainfall and the lowest atmospheric pressure; and the polar by the lowest temperature, the least degree of saturation, the clearest weather, the least rainfall, and the highest atmospheric pressure. This explains why the southwest wind is that which brings the most rain, and why a falling barometer is as a rule a sign of approaching rain, and also why the barometer, as is well known, usually shows an upward tendency with an east wind. Certain winds have a seasonal character, being either confined to certain seasons of the year, as the harmattan of the Guinea coast and the etesian winds that blow from the north in summer in the eastern part of the Mediterranean, or changing their direction at certain seasons, such as the monsoons of the Indian Ocean. (See ANEMOMETER; CHINOOK WIND; METEOROLOGY; SIROCCO). Consult Bigelow, F. H., 'Report on International Cloud Observations' (Washington 1901); Cave, C. J. P., 'Structure of the Atmosphere in Clear Weather' (New York 1912); Ferrel, W., 'Popular Treatise on the Winds' (New York 1899).

**WIND CAVE NATIONAL PARK.** This park, created by act of Congress on 9 Jan. 1903, is 12 miles northwest of Hot Springs in Fall River County, S. Dak. It is on the southeast slope of the Black Hills and has an area of nearly 15,000 acres. The cave has extensive galleries in Pahasapa limestone with many fine crystal formations on its walls. It was once the channel of subterranean streams and owes its origin to the solution of the limestone by water. The name is appropriate because at most times a strong air current is passing into or out of the narrow entrance to the cave. The park includes a game preserve of 4,160 acres in its northwestern corner, maintained by the United States Biological Survey. It contained (1918) 42 head of buffalo, 90 head of elk and a small herd of antelope.

**WIND-FLOWER**, the delicate *Anemone nemorosa*, *A. quinquefolia*, and other members of this genus of the *Ranunculaceae*, so-called because the ancient Greek name of some plant associated in Greece with the winds has been given to the *Anemone*, or because the little plants bloom when spring winds are rampant. The two species mentioned send up an early flowering stem, bearing about its centre a wheel

tely divided leaves; above them hite-petaled starry flower, often bell-pink on the outside. They only in sunshine and nod with collas on cold, dark days and at lants choose mossy stumps in ap thickets for their habitat and al leaves later in summer. On e red wind-flower (*A. hudsoni-* asque-flower (*Pulsatilla patens*)

Another European wind-flower *rumonanthe*, a low, blue-flowered

**P.** See STREAM PIRACY; TREL-

**STRUMENTS**, a general name struments played by the human flute, the cornet, etc., or by artid currents of air, as the organ, ;, in all of which the vibrations of air produce the sound. The its of an ordinary orchestra arc into two classes: wood instrus instruments; the organ or har-classed apart. The woods, some partially composed of ivory, are ute, flageolet, clarinet, basset- d bassoon. Their tone is light, ft, and almost vocal in its char- be produced in all the delicate l diminuendo shadings. The ise the cornet-a-piston, horn, one, euphonium, bombardon, etc. somewhat harder and generally l and majestic than that of the fixed-toned instruments (except they cannot, like the strings, tune, and they can only produce a time. See MUSICAL INSTRU- STRA; ORCHESTRAL INSTRUMENTS;

**INTER.** See DREIKANTER.

**NE.** A contrivance, sometimes *memoscope* for showing the di- wind. The simplest and most of vane consists of an arrow tely on an upright post and free he post or rod often carries a which is placed near the arrow. ites Weather Bureau uses a vane arrowhead balances a tail-piece boards, six inches wide and 36 These boards are close together but diverge about five inches at tremities, thus steadying the os- : axis is fitted with ball-bearings tion and is provided with met- tric arrangement for the auto- ion of wind direction. To indi- local wind the vane must be open space and at a sufficient rrounding buildings or other oh might cause it to show a wind than the true one. See ANE- sult Abbe, 'Meteorological Ap- ethods' (Washington 1887) and to Observers,' issued by the Weather Bureau.

See PROJECTILES.

s, Pa., borough in Somerset nsylvania Railroad and Johns- ine, nine miles south of Johns- def industry is coal mining, the

region being underlaid with the famous Som- erset smokeless coal, and there being within a radius of five miles 15 active mines employing nearly 4,000 men. Next in importance are the lumber and the fire brick manufacturing industries. Each of the two banks has assets of approximately \$2,000,000 and the postal savings bank has deposits of over \$100,000. Practically all residence properties in the borough are owned by the occupants. The electric light and power, as well as water and steam-heat are furnished by subsidiary companies of the Berwind-White Coal Mining Company; the fire department has apparatus and equipment valued at \$22,000. The town has a handsome municipal building, 14 churches, a large opera house, eight hotels and prosperous stores, together with one weekly newspaper, the *Windber Era*. There are over 2,100 pupils in the public schools. Pop. 8,500.

**WINDBREAK**, in agriculture, rows of trees planted along the edge of fields of grain, orchards, etc., to break the force of the wind and to protect the crops.

**WINDER**, win'dér, William Henry, Amer- ican general; b. Somerset County, Md., 18 Feb. 1775; d. Baltimore, 24 May 1824. He was grad- uated from the University of Pennsylvania and became a lawyer in Baltimore. In March 1812, at the breaking out of the war he was appointed lieutenant-colonel of infantry and was made colonel in July of the same year. He led a suc- cessful expedition from Black Rock to the Can- ada shore, 28 Nov. 1812; was promoted to be brigadier-general in March 1813; appointed ad- juant and inspector-general in May 1814; com- manded at the battle of Bladensburg and the unsuccessful defense of Washington, in Aug- ust 1814; and was honorably discharged in June 1815. He then resumed his law practice and was subsequently a member of the Mary- land senate.

**WINDERMERE**, win'dér-mér, or WIN- ANDERMERE, England, a lake in Lanca- shire and Westmoreland, about 11 miles in length and from one-third of a mile to a mile in width, its area being a little over five square miles; its depth varies from 30 to 240 feet. Its out- let is the river Leven, which discharges its wa- ters into Morecambe Bay. The lake is sur- rounded by gentle, well-wooded eminences and the neighborhood is noted for its beautiful scenery, celebrated by the Lake poets, Words- worth, Coleridge and Southey. Wordsworth lived at Rydal Mount, about two miles from the head of the lake. WINDERMERE, a small town near the eastern shore of the lake, is lo- cated in Westmorland and is the terminal of a branch of the London and Northwestern Rail- way. In 1905 this town and Bowness were united into one district. Pop. 2,379.

**WINDGALLS**, puffy swellings about the fetlock-joints of animals, particularly of horses, resulting from an increased secretion of syno- via arising from work, particularly on hard roads; they are generally unassociated with any pain, heat or lameness and are not generally considered to be causes of unsoundness. If the horse is young they may disappear if the animal is allowed a long rest and the parts blis- tered once or twice. Old horses having wind- galls are generally kept at work, the legs being bandaged when in the stable. Consult 'Special

Report on Diseases of the Horse' (United States Bureau of Animal Industry, Washington 1911).

**WINDHAM**, win'dam, William, English orator and statesman: b. London, 3 May 1750; d. there, 4 June 1810. He was educated at Eton, Glasgow and Oxford, and he entered Parliament as member for Norwich in 1784. During the early part of Pitt's administration he sat in the opposition, but during the course of the French Revolution joined Burke in condemning the revolutionary principles and advocating the war that Pitt declared against France. He was Secretary-at-War in Pitt's Cabinet 1794-1801, and under the Fox and Grenville ministry, which came into office in January 1806, held the rank of Colonial Secretary. During his tenure of office, which continued till March 1807, he brought in and succeeded in passing against strenuous opposition, a measure for reducing the duration of the period of enlistment for soldiers, and making various provisions for improving the condition of the soldier. Windham was a man of thoroughly independent character, but his independence sometimes passed over into eccentricity. A collection of his speeches with a memoir by Thomas Amyot was published in 1806, while he was yet in office; his diary was edited by Mrs. Henry Baring in 1866. Consult also 'Correspondence of Edmund Burke and William Windham' (ed. J. P. Gilson, Cambridge 1910); 'The Windham Papers' (2 vols., London 1913).

**WINDHOVER**, a name in Great Britain for the kestrel (q.v.), referring to its habit of holding a stationary position facing the wind, while it searches the ground beneath it for indications of prey.

**WINDHUK, WINDHOEK, or GREAT WINDHOEK**, Africa, city and capital of the former colony of German Southwest Africa, 170 miles east of Swakopmund and the coast, with which it is connected by rail and telegraph. The city is situated in a mountainous district, and at Little Windhuk, a short distance to the southwest, there are hot springs. It is an excellent fruit-growing region and produces grapes, figs, dates, peaches, oranges and pomegranates. It was occupied by the South African Commonwealth Army under the British flag 12 May 1915. The population is about 25,000, of which about 1,500 are whites. See WAR, EUROPEAN—COLONIAL AND JAPANESE CAMPAIGNS.

**WINDLASS**, in mechanics, a machine for raising weights from a pit, consisting of a cylinder or roller moving on an axle supported on a frame and turned by levers inserted in square holes cut in the cylinder, or by a crank fitted on to one or both ends of the axle. One end of a rope or chain is attached to the cylinder, and the other to the weight, which is raised by the rope being shortened in passing round the roller.

**WINDLE**, Sir Bertram Coghill, Irish educator: b. Mayfield, Staffordshire, 8 May 1858. He was educated at Repton School and at the University of Dublin. For four years he was president of the Birmingham Library and at various times was member of the education sub-committee of the Birmingham School Board. Dr Windle is a member of the Joint Universities Catholic Board and from 1884 to 1904 was professor of anatomy and for many years

dean of the medical faculty of Birmingham University and bodies which preceded it. Since 1904 he has been president of University (formerly Queen's) College, Cork and since 1910 has been professor of archaeology there. He is also senator of the National University of Ireland and chairman of the standing committee on Irish Technical Education and Commissioner of Intermediate Education in Ireland. In 1912 he was knighted. His publications include 'Proportions of the Human Body' (1892); 'Life in Early Britain' (1897); 'Shakespeare's Country' (1899); 'The Malvern Country' (1900); 'The Wessex of Thomas Hardy' (1901); 'Chester' (1903); 'Remains of the Prehistoric Age in England' (1904); 'School History of Warwickshire' (1906); 'What is Life? A Study of Vitalism and Neo-Vitalism' (1908); 'Facts and Theories' (1912); 'A Century of Scientific Thought' (1915); 'The Church and Science' (1917), and many scientific papers and articles in *Dublin Review*, *Catholic World*, *America*, and *Studies*.

**WINDMILL**, a machine for furnishing power for grinding grain, pumping water, or doing other useful work, operated by the wind. History does not record the date of invention of the windmill; but it is known that it was used in Europe as early as the 12th century A.D. A common form of European windmill is shown in Fig. 1. The sails, upon which the wind

FIG. 1

acts in driving the machine, consist of a light framework upon which canvas is stretched. The surface of the canvas makes an angle (called the angle of weather) with the plane of the windwheel, and this angle is usually about 18° at the inner end of the sail, gradually decreasing to about 7° at the outer end. The length of the sail is generally about five-sixths the length of the arm, the width of the outer end one-third the length, and the width of the inner end one-fifth the length. For prop-

the axis of the windwheel shaft should be to the direction of wind. In most cases however, inclined upward at an angle of 5° to permit the ends of the sails to clear the tower, and since the direction of the wind in general, horizontal, this condition for action is not fully realized in windmills of the European type. To allow the windwheel to turn as the direction of the wind changes, the upper part of the structure is to rotate about the vertical axis of the tower being supported upon rollers at A and a steering wheel B is provided to maintain its proper relation with the direction of the wind. This auxiliary wheel is so connected, by a gear, with the fixed part of the structure that when it causes the movable part of the tower to turn about its axis. When the windwheel is properly directed the auxiliary wheel presents its edges to the wind, therefore, not affected by it; a change in direction of the wind tends to cause rotation of the auxiliary wheel which in rotating the main windwheel into proper relation with the wind. Before the invention of the steering wheel, and to a large extent since its invention, the main windwheel was

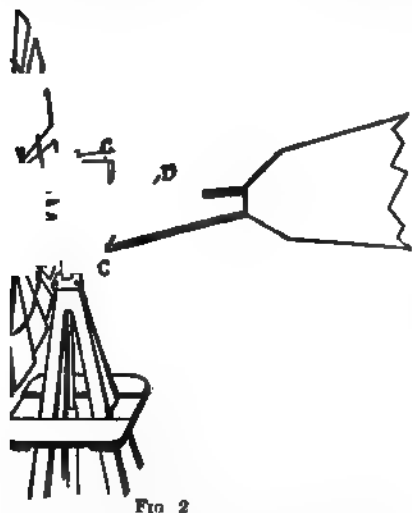

FIG. 2

position by hand. In many cases the tower, instead of merely the upper part is made to pivot about its vertical axis, the latter construction being generally followed in German practice, while that above described is common to machines built by the Americans. In some very crude windmills of the latter type no provision whatever was made for turning the direction of the windwheel. The direction of a windwheel tends to vary with the velocity of the wind. In windmills of the European type where speed regulation is desired, it is effected by varying either the load on the sails or the sail area exposed to the action of the wind. A friction brake is often used to vary the load, while to vary the sail area the sails forming the sail surface is rolled or unrolled, or the sail surface is formed of a material that can be changed by opening or closing the flaps. Devices for varying the sail area are either by hand or by a suitable auto-

matic governor. It is to be observed that the sails of the European windmill occupy only a small portion of the area swept by them. In the American type the sails are much greater in number and occupy, comparatively, a much larger part of the area swept by them. The

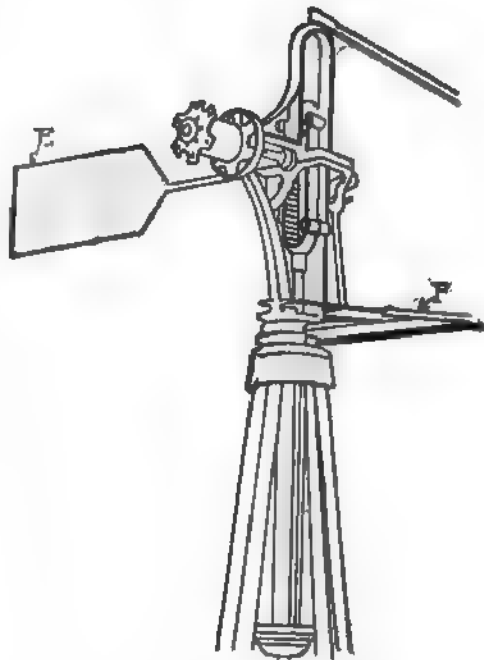

FIG. 3.

greater number of sails makes it possible to reduce the diameter of the windwheel, for a given power, considerably below that necessary in the European windmill; as a result the American windmill is much smaller than that of Europe.

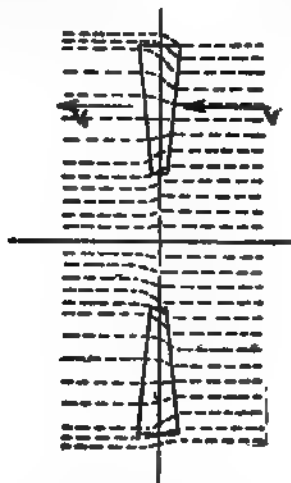

FIG. 5.

The windwheels of the latter were often as large as 100 feet in diameter; those of American type are rarely larger than 30 feet in diameter.

American windmills are built in a very large variety of styles, some being constructed prin-

direction of wind, either by means of a rudder or tail, as in Figs. 2 and 3, or by means of an auxiliary steering wheel, as in Fig. 4. The pressure of the wind upon the windwheel itself, which is placed on the opposite side of the tower to that from which the wind proceeds, as in Fig. 4. When the windmill is to be used for pumping purposes exclusively, the power is, in general, transmitted from the windmill to the pump by means of a reciprocating vertical rod, as in Figs. 2 and 3. Those in which the pump rod makes one complete stroke for each revolution of the windwheel, as in Fig. 4, are termed direct stroke windmills; when the pump rod makes only a fraction of a stroke for each revolution of the windwheel, as in Figs. 2 and 3, the windmill is said to be back geared. The back gearing may be accomplished either by means of a pair of spur gears, as in

Fig. 2, or by means of a rack and pinion, as in Fig. 3. In pumping windmills, the windmill is so placed that the normal direction of the wind passes to one side of the axis about which the windmill pivots. The tail is in each case supported upon the windmill frame by the hinge joints, C, C', and is held in its normal position with reference to the windwheel by the spring D. Wind-pressure upon the windwheel tends, therefore, to stretch the spring, and it does so when it is sufficient to overcome the initial tension of the spring, thus turning the windwheel so that the wind acts obliquely upon it and reducing the exposed sail area. The initial tension of the spring is so determined that it will begin to stretch when the pressure of the wind upon the windwheel approaches the safe limit. In the windmill shown in Fig. 3 the windwheel is so placed that a line through its centre parallel to the normal direction of the wind intersects the axis about which the windmill pivots. The side vane E is fixed to the windmill frame upon which the tail is also carried, being supported by the hinge joints, C, C'. The tail is held in its normal position with reference to the windwheel by means of the spring F. Pressure of the wind upon the vane E tends, there-

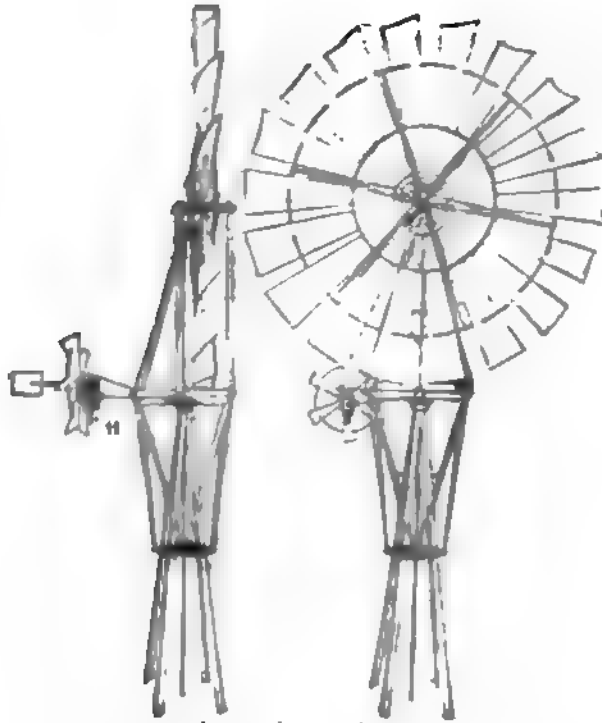

FIG. 2. FIG. 3. FIG. 4.

combination of these methods, together with variations in minor details, result in the large variety of styles. Figs. 2, 3 and 4 show several windmills of the American type, these particular forms being selected because among them may be found example of each of the methods by which the rudder or tail is accomplished. The windwheel may be held in proper position with regard to the direction of wind in three ways, namely, by means of a rudder or tail, as in Figs. 2 and 3, by means of an auxiliary steering wheel, as in Fig. 4; and by the pressure of the wind upon the windwheel itself, which is placed on the opposite side of the tower to that from which the wind proceeds, as in Fig. 4. When the windmill is to be used for pumping purposes exclusively, the power is, in general, transmitted from the windmill to the pump by means of a reciprocating vertical rod, as in Figs. 2 and 3. Those in which the pump rod makes one complete stroke for each revolution of the windwheel, as in Fig. 4, are termed direct stroke windmills; when the pump rod makes only a fraction of a stroke for each revolution of the windwheel, as in Figs. 2 and 3, the windmill is said to be back geared. The back gearing may be accomplished either by means of a pair of spur gears, as in

Fig. 2, or by means of a rack and pinion, as in Fig. 3. In pumping windmills, the windmill is so placed that the normal direction of the wind passes to one side of the axis about which the windmill pivots. The tail is in each case supported upon the windmill frame by the hinge joints, C, C', and is held in its normal position with reference to the windwheel by the spring D. Wind-pressure upon the windwheel tends, therefore, to stretch the spring, and it does so when it is sufficient to overcome the initial tension of the spring, thus turning the windwheel so that the wind acts obliquely upon it and reducing the exposed sail area. The initial tension of the spring is so determined that it will begin to stretch when the pressure of the wind upon the windwheel approaches the safe limit. In the windmill shown in Fig. 3 the windwheel is so placed that a line through its centre parallel to the normal direction of the wind intersects the axis about which the windmill pivots. The side vane E is fixed to the windmill frame upon which the tail is also carried, being supported by the hinge joints, C, C'. The tail is held in its normal position with reference to the windwheel by means of the spring F. Pressure of the wind upon the vane E tends, there-

fore, to stretch the spring, and it does so when it is sufficient to overcome the initial tension of the spring, thus turning the windwheel so that the wind acts obliquely upon it and reducing the exposed sail area. The initial tension of the spring is so determined that it will begin to stretch when the pressure of the wind upon the windwheel approaches the safe limit. In the windmill shown in Fig. 3 the windwheel is so placed that a line through its centre parallel to the normal direction of the wind intersects the axis about which the windmill pivots. The side vane E is fixed to the windmill frame upon which the tail is also carried, being supported by the hinge joints, C, C'. The tail is held in its normal position with reference to the windwheel by means of the spring F. Pressure of the wind upon the vane E tends, there-

which a windwheel will make in a given time varies inversely as its diameter. (6) The gain is gained by having the sail area of a wheel greater than seven-eighths of the swept by the sails, and there is little gained in it more than three-fourths the latter

order that the maximum power may be obtained to stretch the spring F, and the spring is determined that it will be stretched when the pressure upon the vane E approaches the point that any change in the relative position of the windmill is changed so that the swept sail area is reduced, in the same manner with the windmills shown in Figs. 2

In the windmill shown in Fig. 4 it is meant that any change in the relative position of the steering wheel and the main windwheel result in a change in the position of the latter relative to the wind. The frame of the steering wheel is pivotally mounted to the frame which carries the main windwheel and is held in its normal position with respect to it by the coiled spring H. In the ordinary running position the wind falls perpendicularly upon the side of the tail of the steering wheel, and when the pressure upon it reaches the safe limit it overcomes the resistance of the spring and changes the position of the steering wheel so that the wind falls upon the side; this causes the steering wheel to act, and moves the main windwheel so that the wind falls obliquely upon it, thus reducing the swept sail area. Other methods of regulating involving centrifugal governors or variations from the arrangements above described, have been devised, but have not come into extensive use. The particular mechanical details described are subject to very wide variation, but the arrangements shown in the figures serve to indicate the principal types.

Windmills of the usual forms are, in general, mounted upon towers of heights ranging from 10 to 100 or more feet, so that the wind acts upon them will not be seriously impeded by obstructions which may exist in the immediate neighborhood. Provision is always made for controlling, or furling, the windmill from a convenient place near the base of the tower, generally by means of a wire, termed the furl-wire. Furling is in general accomplished by reducing the exposed sail area to a certain extent as to prevent the action of the windmill. The reduction of the exposed sail area in each case accomplished in the same manner as in the process of regulation, except the force necessary to lift the weight or overcome the tension of the spring is applied to the furl-wire and transmitted by a suitable arrangement of levers or pulleys, instead of being supplied by the energy of the wind. Thus in the windmills shown in Figs. 2 and 3 a pull is fitted through the furl-wire is applied to the mill in such manner as to bring it into a position parallel to the plane of the windwheel. In Fig. 5 the auxiliary wheel is turned through an angle of 90 degrees by means of a cord attached to the furl-wire. It is to be observed that in all of the windmills heretofore mentioned the windwheel is adapted to rotate about an axis in its normal position of which is parallel to the direction of the wind. A number of types of windmills have been devised in which the

windwheel rotates about an axis, the normal position of which is in a plane perpendicular to the direction of the wind, but they have not attained a sufficient degree of success to warrant considering them here. If A represents the plane area, in square feet, swept by the sails of the windwheel, V, the velocity of the wind in feet per second, and  $\delta$  the weight in pounds of a cubic foot of the air, then the weight of air available per second for use by the windwheel is  $W = AV\delta$ , and its energy is equal to  $\frac{WV^2}{2g}$ , g being a constant representing the acceleration due to gravity. The power in foot-pounds per second brought to the windwheel by this air is, therefore,  $L = \frac{WV^2}{2g} = \frac{V^3A\delta}{2g}$ . This

expression indicates that, other conditions remaining the same, the power of a windwheel varies directly as the cube of wind velocity, and directly as the area swept by the sails, both of which relations have been substantially verified by experiment. In the construction of wind-

FIG. 6.

mills considerations of strength require that, in general, the linear dimensions of all of the parts shall bear the same proportional relation to each other, regardless of the size of the windwheel. Other conditions being equal, the weight of a windmill, therefore, varies directly as the cube of the diameter of its wheel, while its power varies directly as the square of the diameter of the wheel. Hence, in increasing the size of windmills, the weight, and the consequent cost of material, increase more rapidly than the capacity, and it is not, therefore, found practicable to increase their size beyond a certain degree. When a windmill is in operation the air currents which act upon it are so modified and broken up, by their contact with the sails and other members, as to render accurate mathematical treatment of the case impossible, in the present state of our knowledge. For this and other reasons, mathematical considerations of the case are chiefly of theoretic interest and the development of the form of the windwheel has been due rather to experiment than to theory.

The most notable among the experiments which have been made upon windwheels are those made about the middle of the 18th century, upon windwheels of the European type, by John Smeaton, and those made in 1882 upon windwheels of the American type by Thomas O. Perry. In these experiments the following important facts were, among others, established: (1) The maximum power which may be obtained from a given windwheel varies directly as the cube of the wind velocity. (2) The sail speed of a windwheel, when developing its maximum power, varies directly as the wind velocity. (3) The load upon a windwheel, when developing its maximum power, varies directly as the square of the wind velocity. (4) The capacity of a windwheel varies directly as the square of its diameter. (5) The number of

obtained from a windmill, in winds of varying velocity, the load must vary directly as the square of the wind velocity. In practice the load is seldom, if ever, made to vary in this manner. The most common form of installation is that in which a pumping windmill is directly connected to a single acting pump operating under a constant head. In such cases the average load during a complete cycle of the pump is practically constant regardless of the wind velocity. Moreover, the load varies, in general, from about zero during one stroke to a maximum at about the middle of the other stroke. This periodic variation of load is also a source of loss, especially when the windwheel is rotating slowly, and the amount of kinetic energy stored in it is small. In the case of

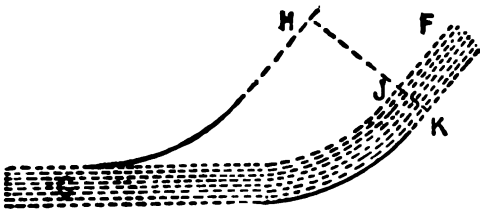

FIG. 7.

power windmills the load depends upon the character of the work. Some grain-grinders for use in connection with power windmills are constructed so that the grain is fed to them by centrifugal action, and in these instances the load upon the windmill is made to increase as the speed increases.

C., 'The Windmill: Its Efficiency and Economic Use' (in United States Geological Survey, Water Supply and Irrigation Papers, Nos. 20, 29, 41, 42, Washington 1899-1901); Powell, F. E., 'Windmills and Wind Motors: How to Build and Run Them' (New York 1910); Dyer, R. M., in *Machinery* (August 1907); Wolff, A. R., 'The Windmill as a Prime Mover' (New York 1885); also manufacturers' catalogues and in works on farm equipment and farm motors, machinery, etc.

**WINDOM**, win'dóm, William, American financier; b. Waterford, Ohio, 10 May 1827; d. New York, 29 Jan. 1891. He was admitted to the bar in 1850, engaged in law practice at Mount Vernon, Ohio, and in 1852 was prosecuting attorney of Knox County, Ohio. He held this position for three years, when he removed to Minnesota. Sent to Congress from that State in 1859, he was re-elected to serve four successive terms, a period of 10 years, ending his career in the House in 1869. He was appointed to the United States Senate in 1870 to fill the unexpired term of Daniel S. Norton, deceased, and was also elected for the terms ending in 1877 and 1883. He resigned, however, in 1881, to accept the Treasury portfolio in President Garfield's Cabinet, and on his retirement from the Cabinet after that President's death he was returned to the Senate where he served the remainder of his term. He was occupied with various financial interests in New York from 1883-89, when he was appointed Secretary of the Treasury in President Harrison's Cabinet and occupied that position until his death. He was one of the earliest expo-

nents of the gold standard, and was considered available as a Presidential candidate in three national conventions, those of 1880, 1884 and 1888.

**WINDOW**, an open space reserved, as in a wall, for the admission of daylight into the interior. (See also **DORMER WINDOW**). The window generally is in a vertical wall. The opening may be filled with glazed sash or casement arranged to open and shut, as in the modern houses; or with glazed sash of wood, iron, or lead fixed firmly to the solid frame of the window, or with only a single panel here and there made to open, as in the case of churches both ancient and modern; or the space may have a slab of semi-transparent stone let into it through which much light may enter, as in some Oriental and ancient European buildings; or a slab of marble with holes cut in it may be inserted, or in place of this a continuous grating, as of bronze, both of which were frequent in classical Roman buildings; or, finally, the space may be left without permanent filling of any sort, shutters being used to close it when needed, as in many parts of Europe in the Middle Ages, and as common now in the tropics. Still a further modification of the last-named scheme is found in those tropical houses which have all the openings filled with *jalousies*, namely, shutters with slats (louver shutters), some of which may even be fixed fast, while others open on hinges. As the climate becomes too warm for the necessity of closing the windows at any time in the year, these devices tend to replace solid shutters and casements.

Architecturally the window is of the greatest importance to certain styles, and in others does not count at all. Thus in Grecian architecture there are no windows; and in Greco-Roman architecture the window has never been a controlling member because the great windows of the public halls are commonly the lunettes under the vaulting, simply pierced and filled with gratings instead of built up solid with masonry. The window of the ancient Roman dwelling, also, so far as we know it, was of less consequence because there were no openings of any great size in the outer walls, and the rooms opening inward upon the court or garden were more or less without walls on that side, a large doorway and a square window above the bed-place needing nothing but a curtain or the like to screen them. Even in Byzantine and Syrian art the window, though beginning to be emphasized by a stone trimming or casing, is not that which the style depends upon. But in the mediæval styles of northern and western Europe the window is the chief feature after the roofs with their fixed slope and their height above the walls. The earliest Romanesque had windows, small indeed, but with jambs richly molded in the thickness of the heavy walls; and the later style takes on some of the variety and brilliancy of the Gothic work. The Gothic window in a church is the opening up of the whole wall space between buttress and buttress and below the vault; and this space tends to be filled with elaborate tracery. Even apart from the tracery, the moldings of the jamb—often with colonnettes produced by fitting a round molding with capital and base, and with sculpture added to the sill-course—may be very decorative. In dwelling-houses

was rare, but the window, if large, was with a pointed arch and the head filled slab of stone pierced with a decorative and supported by colonnettes, or in other way architecturally treated. The numerous windows with square heads, with lintels instead of arches, are made up by moldings, sometimes very richly carved, and by the free use of columns to carry the lintels. In the neo-classic style the windows became customary in the early days of the Renaissance, and were fully developed in the 16th century in England and 50 years later in the north. Under the influence of fenestration this ordering of the window has become a most important part of architecture, especially in the street fronts of cities and villages. The window-casings may even be ornamental in themselves, though with an intention not strictly belonging to them, as pilasters, columns, or columns, as it were, from other parts of the structure: thus, small pediments are used over the window openings, and even columns are used on either side of the window to support these pediments. But the chief thing is still the arrangement of the window in the wall and the proportioning of these windows and the solid wall between them.

**WINDOW GLASS.** See GLASS, VARIETIES

**WINDOW TAX,** a tax formerly imposed in Great Britain on all windows in houses (usually above six in number). It was abolished in 1851, a tax on houses above a certain value being substituted.

**WINDSOR,** win'zor, Canada, a seaport capital of Hants County, Nova Scotia, on the coast of Minas Bay, and on the Dominion Atlantic Railway, 45 miles northwest of Halifax. Its chief institution is King's College or Windsor University, founded in 1788. A busy shipping port, is electrically lighted, and exports a considerable amount of the gypsum limestone of the region. Pop. 3,452.

**WINDSOR,** Canada, the largest town in Ontario, situated on the banks of the Detroit River, opposite the city of Detroit. Railways enter the city, including the Grand Trunk, Canadian Pacific, Michigan Central, and the Ontario division of the Erie. The location makes Windsor one of the desirable residential cities of the province. It has a number of churches and schools, a collegiate institute and Saint Mary's hospital. The chief manufactures are salt, paint and varnish works, sash, door and window factories, boiler works and machine shops, with various minor industries. It has several miles of paved streets and an adequate sewerage system. Pop. 17,829.

**WINDSOR,** Conn., town in Hartford County, on the Connecticut and Farmington roads and on the New York, New Haven and New York Railroad, six miles north of Hartford. It has an agricultural section in which the principal products are vegetables, fruit and tobacco. Principal manufactures are worsted goods, electrical motors, knit goods, tobacco and dairy products. The educational institutions are the Campbell School for girls, the Normal Institute, public schools and a public

library. The first settlement was made in 1633 by William Holmes and companions from Plymouth. They established here a trading post. In 1635 Roger Ludlow and a colony from Dorchester, Mass., settled near the trading post and called the place Dorchester. In 1637 the name was changed to Windsor. In 1639 Windsor united with Hartford and Wethersfield, under "Fundamental Orders," to form the commonwealth of Connecticut. Pop. 4,178. Consult Stiles, 'Ancient Windsor' (New York 1891); 'Memorial History of Hartford County.'

**WINDSOR, or NEW WINDSOR,** England, a town in Berkshire, on the Thames, 21 miles by rail west of London. Windsor and Eton (q.v.) practically form one town, which is chiefly interesting on account of the castle and park, a favorite residence of the English sovereigns since the time of William the Conqueror. The original royal palace, where the Saxon kings lived before the Conquest, was at Old Windsor, about two miles distant, but the present site was chosen and the castle built by William I; later extensions were added by Henry I and Henry II, but during the reign of Edward III it was torn down and rebuilt by William of Wykeham, bishop of Winchester. The new castle received various additions by the orders of succeeding monarchs until the time of Queen Victoria, who restored and sumptuously decorated Albert chapel as a memorial to the Prince Consort, Albert. The buildings comprise upper, lower and middle wards, extending along the crest of an eminence rising 42 feet above the river and covering 12 acres in the Little or Home Park, which is connected with the Great Park and adjoining Windsor Forest, the whole occupying an area of 13,000 acres, 56 miles in circumference. The lower ward on the west contains Saint George's chapel, the Albert chapel, the houses of the military knights, cloisters, etc.; the Middle Ward, dominated by the Round Tower, rising to a height of 80 feet, built by Edward III to accommodate the round table of the Knights of the Order of the Garter, containing the rooms which were up to 1660 used as a prison; the Upper Ward on the east, comprised of the sovereign's private apartments, the library and the long corridor. Saint George's Hall, the Waterloo Chamber, the Throne Room and the old Ball Room, comprising the state apartments in the Upper Ward, have valuable collections of paintings, statuary, etc. Under Saint George's chapel is the burial vault of several English rulers and members of the royal family. The royal palace and the mausoleum of Frogmore, Cumberland Lodge and Virginia Water are in the park. The town hall of Windsor was built by Christopher Wren in 1658. Consult Dixon, W. H., 'Royal Windsor' (London 1879-80); Hope, W. H., 'Windsor Castle: An Architectural History' (2 vols., London 1914); Laking, G. F., 'Furniture of Windsor Castle' (New York 1905); Loftie, W. J., 'Windsor: The Castle, Park, Town and Neighborhood' (London 1886); Tighe, J. E., 'Annals of Windsor' (1858).

**WINDSOR LOCKS,** Conn., town in Hartford County, on the Connecticut River, and on the New York, New Haven and Hartford Railroad, about 12 miles north of Hartford. It was a part of the town of Windsor until 1854,

when it was set off and incorporated. It is a manufacturing town; extensive water power is obtained from the Connecticut by means of a canal. The chief industrial establishments are paper mills, cotton yarn and thread factories, a foundry, machine shops, steel works and silk factories. Other manufactures are furniture, trucks, school globes and carpet-loom chains. The principal public buildings are Memorial Hall, presented by Charles E. Chaffee to J. H. Converse Post 67, G. A. R.; four churches and the public and parish schools. It has one bank. Pop. 3,715.

**WINDSOR MILLS**, Canada, town in Richmond County, Quebec, on the Saint Francis River, 80 miles east of Montreal, on the Grand Trunk and the Canadian Pacific railways. It has abundant water power and manufactures paper and pulp, powder and cheese. Pop. about 2,233.

**WINDTHORST**, Ludwig, leader of the Catholic or Centre party in the German Reichstag from 1874 to his death; b. at Kaldenhof, near Osnabrück in Hanover, 17 Nov. 1812; d. Berlin, 14 March 1891. He received his early education at the Caroline Gymnasium in Osnabrück and studied law at Göttingen and Heidelberg. He began the practice of law at Osnabrück. He occupied various official positions in connection with German courts of law and his talents and impartial character were widely recognized. Politically he clung to the opinion that there should be a union of the German states including Austria. He emphasized the necessity for the preservation of the independence of the various petty German governments and of absolute freedom of religion and education. In 1851 he was elected president of the second chamber of the legislature of Hanover, and in 1853 became the Minister of Justice in the Cabinet of George V. He held this same portfolio ten years later. In this position his treatment of vexed questions between Catholics and Protestants called forth praise from both parties. When the reigning house of Hanover fell as the result of the war of 1866, he was sadly disappointed, but fitted himself at once into the new order of things in the fatherland by accepting election for the town of Meppen to the Prussian Lower House and to the Reichstag of the North German Confederation. Here he soon came to occupy a prominent place as a valuable assistant of the leader of the Catholic party, Mallinckrodt. At Mallinckrodt's death, 1874, Windthorst was selected to replace him. For nearly 20 years he remained a successful leader of the party, which under his influence gradually came to have the balance of power in the Reichstag. While he was a devoted Catholic, he was an intense lover of his country, believed thoroughly in the maintenance of the German army in order to assure peace, and the last speech that he ever made, scarcely a month before his death, was in favor of a liberal program of development for the navy. Once when Vatican influence seemed to be used to urge a political measure, in which the German government was very much interested, he came out distinctly in opposition. Just before the declaration of the infallibility of the Pope, he joined with those who thought the moment inopportune but he was always devoted to the Holy See.

He was the model of a successful party an expert in the management of men; a lent judge of character and one of t Parliamentary debaters of the 19th centi spite of his years of occupation of an inf political position, he died quite poor. the Catholics of Germany wished to re his great services to their cause by scription of a large sum of money, erted it to the foundation of a chu honor of the Blessed Virgin to be ere Hanover. Few statesmen have been m terly maligned than was Windthorst t ginning of his career. After his death ; foes joined with friends in recogniz talents, his uprightness of character and solute purity of his motives, besides h patriotism. His great merit is to ha ceeded in preventing Bismarck from mal (church merely a department of state many. The Catholic party agreed that it his talents as a leader that they owed t their success in the struggle with the Chancellor. Consult Menzenbach 'Wim (Treves 1892); Knapp, 'Windthorst' ( der Zeit Series; Leipzig 1898).

JAMES J. WALSH.

**WINDWARD** (wind'ward) ISLANDS, a group of the West Indies forming the a part of the Lesser Antilles, includin Lucia, Saint Vincent, Grenada and the dines. They are of volcanic origin, the islands are mountainous; the lower leve generally fertile and producing sugar, co spices; logwood and other timber are ; tained. They belong to Great Britain: t ernor resides at Saint George's, Gren islands have no common legislature, tariff; but there is a common court peal, and they unite for other purposes articles under the names of the indivi lands of the group). As a geographic sion the Windward Islands include al bados and the other smaller islands. tween Saint Lucia and Grenada. was applied because the group was exposed of the Lesser Antilles to the trade winds.

**WINE-BERRY**, a Japanese plant (*Phanicolobus*), closely related to the ra with long recurring canes which root at and are clothed with red glandular hair leaflets are usually three, white, toment neath, and the flowers are in dense clusters, forming a loose panicle. The calyx-lobes enlarge in fruit and encl immature berry as in a bur, but e spread apart; the mature fruit is cherry-red in color, in flavor insipia. The wine-berry is frequent in cultivati has run wild in some parts of the United States.

The grape, the whortleberry, the berry and the red and the black curra called wine-berry; as are also the edible like fruits of the poisonous toot-plant (*Sarmentosa*), a large shrub of New i

**WINE MEASURE**, an old E measure by which wines and spirits wer. gallon contained 231 cubic inches.

**WINE PRESS**, a machine in juice is pressed out of grapes. The

of the Bible was a vat in which the juice was expressed by the feet of men who trampled the fruit.

**WINE AND WINE-MAKING.** It may have been design, but it was probably an accident, that first led man to crush or to press grapes in order to obtain a palatable and stimulating beverage. As long as the juice is confined within the grape, it becomes sweeter and sweeter as the fruit grows riper and riper. But when the skin is broken by crushing or pressing, and when the juice is allowed to remain a short time exposed to warmth and air, it changes its character and develops new and unsuspected qualities or properties.

The changes from the fresh grape juice to an alcoholic drink are briefly as follows:

When the juice, or "must," is exposed to temperatures ranging from 59° F. to 65° F. the liquid very soon begins to become turbid, small bubbles collect on the surface and the grape skins, stems and other solid particles form a dense cover or "cap" on the top. Carbonic gas, which is developed in increasing quantities, escapes with a loud bubbling sound, and, as the temperature rises, the juice appears as though it were really boiling. After a few days, and sometimes after a few hours, the ebullition subsides and gradually the crust and undissolved substances fall to the bottom. Meanwhile, the must has lost its sweetish taste and its original character and chemical composition; among other things, it has acquired a richer, deeper color, a vinous flavor and odor, and a certain amount of alcohol.

This interesting natural process, which leads to the formation of alcohol, was described by the term "fermentation," from the Latin *fermentum*, the root word being *fervere*, to boil. This feature of the phenomena, whereby the evolution of the gas makes the liquid appear to boil, evidently struck the early wine-makers and natural philosophers as most important. It was a long time before the true nature of the process of vinous or alcoholic fermentation was clearly perceived and properly understood.

Early in the last century (from 1810-25) chemical analyses by Gay-Lussac, Thénard and De Saussure fixed accurately the composition of sugar in the must and of alcohol in the wine. In 1835 Cagniard de Latour found that the globules were definite organisms, capable of reproducing themselves by budding, and thus apparently belonging to the vegetable kingdom. He came to the conclusion that, in the course of vegetation, these globules, or "ferments," disengaged carbonic acid gas and converted the liquid into an alcoholic liquor.

This discovery was confirmed two years later (1837) by Schwann at Jena and Kützing at Berlin. The newly-found organism was regarded by some as belonging to the fungi and by others to the algæ. Meyen showed that the organism was a fungus and established a new genus for it under the name of *Saccharomyces*. In other words, the agents of alcoholic fermentation are called "yeasts" and belong to the order *Saccharomyces*.

**Recent Researches in Alcoholic Fermentation.**—The work of the great chemist Pasteur threw a flood of light upon the whole process of fermentation. His investigations extending over a series of years were first summed up in

his 'Studies on Wine' ('*Etudes sur le Vin*'), published in 1872, and further in his book, 'Studies on Beer' ('*Etudes sur la Bière*'), published in 1876.

To Pasteur belongs the honor of establishing beyond question that fermentations were the work of infinitely small organisms called "microbes." He classified and described many of these micro-organisms. He divided them into two classes: aerobic, those which cannot live without the presence of free air; and anaerobic, those which can exist in the absence of air. The former *saccharomyces* are found at or near the top of the liquid during fermentation; the latter are at work lower down in the body of the liquid.

The microscopical examination of the agents of alcoholic fermentation has revealed quite a number of different forms and varieties. Some 25 or 30 types of the genus *Saccharomyces* have been identified.

The question may very naturally be asked: Where do these yeast organisms come from? Pasteur showed very clearly that the ripe grape is covered with a mass of micro-organisms. These microbes collect on the fruit and stems, and constitute the "bloom" of the grape. Just why they should fix themselves on the fruit, and remain, as it were, in readiness to be transformed from their dormant state to one of great activity when carried into the juice of the fruit is a mystery. At the same time a great number of other and less desirable yeast cells (bacteria) become submerged in the grape juice, or must, and these foreign yeasts are the ones that give the wine-maker trouble and lead to many diseases of wine.

**Cultivated and Selected Yeasts in Wine-making.**—A brilliant Danish chemist, Emil Chr. Hansen took up the study of alcoholic fermentations and "disease ferments," where Pasteur left off. He brought out many new facts with regard to the many different races or species of *Saccharomyces*, which gave very different characters to beers. Hansen found that it was practical to separate and cultivate the better species or races of brewer's yeasts. With great skill and much care he was able to select two varieties of "low" yeast and then he worked out a method for the cultivation of selected yeasts.

The use of pure cultivated yeasts has been attended with good results in wine-making. Musts which have been prepared with pure yeasts have been compared with musts fermented at the same time without such yeast. In most cases the pure-yeast wine has been regarded as superior to the other. One practical value of employing pure cultivated yeasts in wine-making is that under proper conditions they will control the progress of fermentation, and thus overcome the influence of the undesirable organisms in the must, such as mold-fungi, wild yeasts, bacteria and mycoderma. By using selected yeasts from celebrated vintages, wine-makers have been able to obtain finer flavors and bouquets, all of which adds to the quality and value of their product.

**Fermentation and Enzymes.**—In order to grasp and properly understand the various problems connected with the phenomena of fermentation, it is necessary to say something about its relation to enzymes. The term "enzyme" is now used to indicate the *soluble* ferments

secreted or formed in the yeast cell. Pasteur's theory makes fermentation a vital act, depending on a living organism. However, fermentation may also be a chemical act. About 20 years ago Büchner showed that alcoholic fermentation can be carried out by a soluble ferment which is extracted from the yeast cell. So that we can have the phenomena of fermentation without the growth and multiplication of yeast cells. To this enzyme in the yeast extract Büchner gave the name *zymase*.

The effect of these recent discoveries in fermentation may be very great and far-reaching, and just what practical form they will take in wine-making and other industries it is impossible to predict.

**The Vintage.**—The word "vintage" has come to have quite a wide signification. It may be used to include three distinct steps: (1) the gathering of the grapes; (2) the processes of fermentation, and (3) the general cellar operations connected with the care and handling of the new wine.

The practices of wine-makers are different in different countries and in different localities of the same country. This is owing to difference in soils, climates, conditions, varieties of grapes used, and in the kinds or types of wines to be produced. And yet, the main principles which give the best results in practice in one country are practically the same in any other country where wine is made.

It should be borne in mind, however, that wine-making is partly an art and partly a science. As such, it cannot be learned and mastered by reading, or from books. The best we can here do is to describe briefly some of the more important details connected with the manufacture of wines.

**Gathering of the Grapes.**—The general rule is that grapes should not be gathered till they have reached a state of complete maturity. This condition is shown by certain well-known indications, such as the brownish color of the stem, the softening of the berry and its easy separation from the stem, the skin is translucent, the juice becomes sweet, thick and somewhat sticky.

The wine-maker determines the best time for gathering the grapes by using various instruments, known as a must-scale, mustimeter, glucometer, etc. They are employed for the purpose of finding out the saccharine richness or strength of the grape juice, or must. To judge of the sugar content of the grapes a few bunches representing the average condition are first gathered, the juice is expressed and strained through a cloth, collected in a suitable receptacle, and then the must-scale is carefully dropped into it. The quality of the must will be indicated on the stem of the scale. The grapes should be tested from day to day until the density, as shown on the scale, remains stationary, when it is time, as a rule, to gather the crop.

The oldest scale, that of Baumé, was devised to indicate the specific gravity of liquids, or their weight, as compared with that of water. Later scales give the density of the liquid direct, the density of water being indicated by 0. The glucometer invented by Dr. Guyot is very convenient and is used by the French wine-makers. This scale indicates at once, the degree Baumé, the quantity of sugar in the must per hectoliter,

and the amount of alcohol that will result from the fermentation of the must per hectoliter. The Salleron mustimeter is another very useful instrument, highly regarded by French wine-makers. The instruments mostly used in the United States are Oechsle's must scale and Balling's saccharometer. The must scales are also used during fermentation to determine when the sugar contained in the must has been partially or entirely transformed into alcohol.

**Composition of the Must.**—A very good idea of the qualities of a good, average must may be gained from the following table prepared by Dr. Guyot:

Water.....	78
Grape sugar (glucose).....	20
Free acids (tartaric and tannic, etc.).....	0 25
Bi-tartrate of potash.....	1 50
Mineral salts.....	0 20
Albuminous substances	} 0 05
Essential oils	
Mucilaginous and starchy substances	} 100 00
Total.....	

It should be pointed out that these different ingredients are not always in the same proportion; that some of them may rise to double the average quantity above given, or may fall, in some cases, to one-fourth of it. In brief, the composition of the must varies according to the variety of grape, degree of maturity, kind of soil, climate, etc.

After water, grape sugar or glucose is the most important element of the must. By the agents of fermentation it is transformed principally into alcohol and carbonic acid. This transformation is represented by the following chemical formula:

There remains a very small proportion of glycerine and succinic acid, and matters dissolved in the liquid. According to Pasteur, 100 parts of glucose yield through fermentation: Alcohol, 48.46; carbonic acid, 46.67; glycerine, 3.20; succinic acid, .61, and other substances left, 1.03

The organic acids and acid salts, while they exist in very small proportions, have great influence on the course of fermentation and the quality of the product. The must of grapes picked too soon will contain an excess of acids and a corresponding lack in sugar; while in overripe grapes there will be much sugar but a deficiency in acids. Therefore, wine-makers endeavor to correct such imperfections by watering the must, or by adding sugar, or by adding tannic or tartaric acids, etc. To determine the acidity of must, several instruments, or acidimeters, have been invented. Most of them require considerable skill and knowledge to be properly used, but the Dujardin acidimetric Tube will answer for all practical purposes.

The other substances contained in the must — albuminous matters, etc. — contribute to the formation of extractive matters, after having served to feed the yeast organism.

**Vinification.**—The French word "vinification" is a convenient and common term used to cover the details of wine-making. The special treatments of the must result in different kinds of wines.

Thus, we have two distinct classes: (1) "dry" wines, and (2) sweet wines.

Dry wines are those in which the sugar has been fermented out.

Sweet wines are those which, after their active fermentation, still retain a quantity of sugar. Many of the sweet wines are fortified by the addition of brandy.

Wines are often classed as "still" and "sparkling."

Still wines are those in which the carbonic acid gas has wholly escaped. Sparkling wines are those which hold a greater or less amount of carbonic acid gas.

It is useful and convenient to make two classes, namely (a) red wines, and (b) white wines. Red wines are produced from red or other colored grapes, the color being extracted from the skins during fermentation. The coloring matter is purplish blue, but is changed to red by the acids in the must. White wines are produced from both white and colored grapes. In order to avoid dark color, the must is quickly separated from the skins and other solid parts of the grape. The following is briefly the method of vinification of red wines:

**Crushing.**—The ancient method consisted in tramping the grapes with the bare feet or with heavy boots in a big trough from which the juice ran as it was expressed. While this old-fashioned method still obtains in a few districts in Europe, it has been superseded there and in the United States by machines, which are called "crushers." There are several kind of mechanical crushers, but the type most generally used consists of a hopper beneath which revolve two grooved cylinders.

The grapes when dumped into the hopper are then crushed between the rollers, which only break the skins without crushing the seeds. They next pass into the stemmer.

**Stemming.**—Formerly done by hand, or by a rake over a sieve or screen, the stems are now removed by machines in a very ingenious manner. The grapes after passing through the crusher fall into the stemmer. The stems are carried to one end of the machine, where they are discharged; the seeds, skins, pulp and juice escape through the bottom, and are conveyed by chutes into the fermenting tanks, which are usually on the floor underneath.

Stemming has its advocates and opponents. The advantages claimed for stemming are that it facilitates the free access of air and so helps the fermentation, especially in case of damaged vintages; that stemmed wines have more *finesse* and are more alcoholic than wines from unstemmed grapes. In the south and southwest of France wine-makers seldom stem their grapes. As a rule grapes are stemmed in the leading wineries in our Eastern States and in California.

**Fermenting Tanks or Vats.**—These are generally made of oak, although in California redwood has been generally adopted. The capacities of fermenting tanks vary from 1,000 to 10,000 gallons.

There is a difference of opinion among wine-makers as to whether the must should be fermented in open or in closed vats. For open vats it is claimed that the fermentation is generally more rapid and complete, the wine is

better colored, etc. Against the open vat, it is urged that the exposure to the air transforms the alcohol in the "head" or cap, which is raised to the top by fermentation, into acetic acid and thus injures the wine. An easy way to overcome this objection is by having a false head resting on the cap, and thus keep it submerged during the fermentation. The best practice would seem to be in having a submerged head fermentation.

**Duration of Fermentation.**—This depends on a number of conditions, such as the amount of sugar in the must, the activity of the ferments, the temperature of the vat, etc. It may be completed in two or three days, or it may run on for 15 or 20 days.

Three distinct phases of fermentation will be observed: (1) the first day or two when the ferments are multiplying; (2) the tumultuous fermentation, accompanied by a violent bubbling of the liquid and a rise in temperature, and (3) the active but relatively quiet fermentation.

As a general rule, the more rapid the fermentation the better is the result. In the Southern States and in southern California the process may be completed in one or two days. In the northern or temperate climates the time will run from seven to ten days.

**The Influence of Temperature.**—As we have already indicated, temperature exerts a controlling influence on fermentation. The yeast works best in temperatures ranging from 59° F. to 75° F. Below 59° its action is very feeble and slow; above 75° fermentation becomes retarded and even stops if the temperature passes much above 90°.

Thus, wine-making both in very hot and in very cool climates often presents many difficulties to be overcome. The must frequently becomes what is called "stuck"—that is, fermentation ceases before all the sugar is transformed into alcohol.

If the trouble comes from too low a temperature, the remedies are: (1) To raise the temperature by heating part of the must; (2) to heat up the fermenting room; (3) to increase the activity of the yeast by adding sediment from vats already through fermentation, and (4) to stir up the pomace so as to bring the germs in contact with the air, as the yeast is always "greedy for oxygen."

When the temperature of the must in the vats rises too high, it is necessary to lower the temperature in one way or another. Several methods are employed for cooling the must. Among these we may mention the use of shallow vats, racking off and refrigerating systems. The difficulties of wine-making in our Southern States and in southern California can be overcome only by the adoption of a suitable system for cooling musts.

The success of the wine-maker will always depend on his success in being able to control the progress of fermentation. Therefore, he should be able to control the temperature, which during fermentation has a most important influence (1) on the yield in alcohol, (2) on the qualities of wine, and (3) on the keeping quality of wines.

**Drawing off the Wine.**—Active fermentation can be recognized as being over, by the falling of the temperature, the settling down

of the solid mass or marc, by the clearing of the liquid and the vinous taste and smell. The new wine will show from 0° to 2° by Balling's saccharometer, nearly all the sugar having been transformed into alcohol. It is either run into a large tub and emptied into casks or it is pumped into casks. The drawing off of the new wine leaves in the vat the "marc," which still contains a considerable quantity of material that can be made into an inferior wine.

**The Different Wine Presses.**—It is not necessary to enter into a detailed description of the different forms of wine presses. They work by a screw or by hydraulic pressure and they are operated by hand, steam and electric power. Where grapes are handled on a large scale, as in some sections of France and California, continuous presses of recent invention are used. These are composed of two or more cylinders, worked as crushers, and after passing through these cylinders the grapes are carried by a screw, which forces them in a perforated horizontal cylinder, terminating in an orifice through which the marc in a compact cake is expelled. Even the improved types of presses are not perfect as far as the yield or quantity of wine is concerned. Recent experiments show that the residue of the marc can be exhausted without presses by a process called diffusion.

The first run from the press is of course the best. The second and third pressings are inferior and seldom mixed with the other wine; the last run is used for making brandy or vinegar.

**Utilization of the By-Products.**—From the husks and lees are obtained the following products: "piquettes," brandies and tartar. Second wines are produced by adding water to half the amount of the wine already drawn off, sufficient sugar to give from 6 to 7 per cent of alcohol and tartaric and tannin when acidity is needed. The piquettes are thin, sour wines obtained by adding pure water to the marc, before or after pressing; the cask is filled and closed. In course of time a wine having from 3 to 4 per cent of alcohol is produced, but it will not keep long. This is the cheap but healthful drink so largely consumed by the peasants and working people in France.

**Brandies.**—They are obtained either by distilling the marc direct or by the distillation of a piquette wash. The best kind of brandy of the Cognac type is produced by distillation of a sound, clean wine. This process of distillation requires improved stills and special treatment. The "wash" for brandy spirits is obtained by running water into a tank filled with the marc or pomace; the overflow is allowed to run into a second tank containing pomace, and the overflow from this tank passes into a third tank filled with pomace. It is seldom profitable to distil the wash unless it contains from 5 to 7 per cent alcohol.

**Tartar.**—This is extract from the lees, or deposited as a crust in the vats. It is obtained by causing a mixture of the marc and water to boil slowly for an hour or so; when the boiling liquid is drawn off and cooled the tartar crystallizes out. From the crude product is manufactured "cream of tartar" and tartaric acid.

**Manufacture of White Wine.**—The making of white wine differs from that of red wine

principally in the matter of not having fermentation of the must take place in contact with the skin and solid parts of the grape. Two processes are to be taken into account: (1) the making of white wine from white grapes, and (2) the making of white wine from red or dark-colored grapes. The first-named process is of course the easiest one. Briefly stated, it consists in crushing the grapes, draining them, putting the drained marc in the press and then leaving the juice from both of the operations to ferment. The main thing is to get the liquid free from impurities, as white wine should be perfectly clear. The usual method is to allow the must to settle and the suspended impurities to be deposited. The liquid must, therefore, be kept perfectly still for the required time; in other words, it is kept from starting into fermentation. This is accomplished by the process called "sulphuring." The effect of applying sulphurous acid to the must is to paralyze the action of the ferments or yeasts.

After the must has become clear, it is separated from the deposit and run into the vat to undergo fermentation. During this process the must should be aerated as much as possible in order to drive off all odor of the sulphurous acid, as well as to encourage the activity of the yeast. The fermentation starts slowly and is always less vigorous than in case of red wines. When the fermentation is over, the white wine should be racked and put in casks which have been lightly sulphured and allowed to remain until perfectly cleared.

The manufacture of white wine from red or dark-colored grapes is attended with much more difficulty and labor than in the process of using white grapes. Without going into details, the main points to be observed are: (1) to avoid breaking the skins of the grapes and thus start fermentation before crushing; (2) to proceed rapidly with the work of crushing and pressing; (3) to crush the grapes so as not to free the coloring matter in the skins; (4) to suppress all traces of coloring matter in the must and separate the suspended impurities by the method above described. It is the opinion of expert wine-makers that in order to obtain the best results, white wine should be made from both white and red grapes.

**Sweet Wines.**—The familiar French term for sweet wines is *vins de liqueur*. These wines are the result of special treatment or handling. The best-known types of sweet wines are: Port, Sherry, Tokay, Madeira, Malaga, etc.

**Port Wine.**—Wines of this type are produced by fermenting the must down to 6 or 8 degrees of sugar and then from 8 to 10 per cent of brandy is added to arrest further fermentation. This will give a wine having from 14 to 18 degrees alcoholic strength. In the following spring the wine is racked and from 2 to 3 degrees more of brandy added. Thus, in the course of a year or so Port wine is gradually brought up, or "fortified," to 20 and 22 per cent alcoholic strength. Contributing to the final result is the "blending," whereby improved color, body, flavor, bouquet, etc., are obtained.

**Sherry Wine.**—Our word "Sherry" is derived from the Spanish name Xeres, and this type of wine was originally produced and shipped from the town of Xeres. It is made from several varieties of white grapes grown

province of Andalusia. The former custom was to sprinkle each pressing casks with a certain amount (two or three lbs) of gypsum. This operation, called *ing*, was regarded as favoring fermentation. The must is fermented down to about 8 degrees of sugar and then alcohol is added, raising the wine up to 18 or 20 degrees of alcoholic strength.

A feature of the manufacture of sherry in Spain is the system of *Soleras*. This describes fine old mother wine, and the process consists in blending wines of different ages. Thus, the casks of sherry wine are ranged in groups, piled in tiers and the tiers graded according to quality. When wine is ending or shipment is drawn from the bottom of casks constituting the oldest *solera*, they are refilled with wine from the casks of the next younger *solera*, and these again from the next, and so on down to the last group.

In order to hasten the ageing or maturity of wine, it is baked by natural or artificial means. The casks containing the wine are ranged in a building with the roof and side exposed to the hot sun covered with glass. The temperature in this sherry-house during the day is as high as 140° F. and is maintained at this level by fires. The large producers of sherry in California and elsewhere attain the same end by aging the wine in a specially-built chamber, which is heated by steam or hot air.

**Champagne and Sparkling Wines.**—The "Champagne" was originally very properly applied to wines, whether still or sparkling, in the Champagne district of France. It is as a wider and more special meaning. The most common and popular usage champagne is now given to a type of sparkling wine made by a process of fermentation in the bottle.

Thus, we have not only French champagne but German champagne, Italian champagne, American champagne, etc. Sparkling wines are produced in most wine-making districts of the best known are, Sparkling Burgundy, Sparkling Beaujolais in France; Sparkling Moselle in Germany; Sparkling Catawba, in the United States. There are also "imitation champagnes," which are still wines which have been made clear by having carbonic acid gas forced into them somewhat after the same fashion as in the manufacture of beer.

The manufacture and manipulation of champagne requires considerable skill and knowledge. Some of the steps in the process may be described:

After the wine has gone through its first fermentation, it is racked off into casks and a blend of the juices of different grapes is made. *levée*, as it is called, is generally a blend of new wine with some old wine. Then the wine is bottled and put in a warm place in order to start a second fermentation. After a proper time the bottles are stored in cool vaults where the temperature is 50° F. or lower. The second round and where fermentation proceeds slowly. It is important to keep the vaults at an even temperature, in order to prevent loss from breakage which a sudden change of temperature would cause. This has been remedied by the installation of cold storage plants in champagne cellars in this country and abroad.

At first the bottles are stacked in horizontal layers, and as the wine begins to mature the bottles are placed in A-shaped racks. The bottles are gradually worked neck downward, in order to bring the sediment, which forms during the slow fermentation, down upon the cork. This is done by the workmen giving each bottle a quick shake once or twice a day during a period of four to six weeks. In many of the champagne cellars a machine is used to accomplish the same result in less than half that time.

When the wine is taken to the finishing-room, the sediment down on the cork is "disgorged"—that is, the workman loosens the cork and the lively pressure of the gas in the bottle forces out the sediment, leaving the body of the wine perfectly clear. Champagne in this state is "brut"—almost absolutely "dry." To please the taste and palate of consumers, the wine is sweetened by adding a little liquor or "dosage" as the French call it, composed of rock candy syrup dissolved in old wine or brandy. The final operations comprise putting in a fine cork in the bottle, wiring and capping it, pasting on the label and casing the bottles in boxes for shipment. It has been figured that a bottle of champagne from start to finish is handled about 200 times.

**Handling and Taking Care of Wine.**—It is always necessary to keep casks or barrels of wine in a well-ventilated cool place. When wine is drawn off and when there is loss from evaporation, the barrel should be filled up.

New wine soon begins to clear itself by the deposit of solid matters held in suspension. The thick deposit which forms at the bottom of the cask is called the lees. In order to prevent the lees from mixing with the liquid, wines are "racked" or drawn off several times a year. The sudden changes of temperature in the spring and autumn disturb wines, and so it is the practice to rack them at these periods. When racking it is not desirable to let the wine come in contact with the air. In order to obtain perfectly clear wines it is usually necessary to filter or clarify them.

The following method for clearing red wines, such as claret, etc., may be recommended: Take the whites of five fresh eggs for every 50 gallons of wine, beat them up into a foam. Then put this foam into a gallon of the wine to be fined and after beating it again pour the mixture into the barrel.

Then take a stick and stir the whole barrel of wine until the foam appears at the bung-hole, which should be in about 10 minutes. Leave the bung off over night. The next day fill up the barrel with same kind of wine and drive in the bung. The wine should be bright in from 10 to 15 days; if not, then fill up, and at the end of another week it should be clear.

For clearing white wines, such as Riesling, Hock, Sauterne, etc., take one wineglassful of dissolved isinglass for every 50 gallons of wine. Beat this into a foam with a gallon of the wine to be fined. Pour it back into the cask and follow the directions above given for red wines. Usually the white wines take a little longer time to clarify than do clarets.

**Some Diseases of Wine.**—Wines are subject to many diseases. They often become "sick." Then they need "nursing" and doctoring.

**Acid Wines.**—They are due to the change of alcohol into acetic acid under the action of the air and heat. When wine has become acetic, there is no cure for it. A temporary improvement may be made by racking it into a cask strongly sulphured and clear it with six whites of egg to about 250 bottles. Some try to correct sour wine by mixing it with good, sound new wines or with fresh lees, but the cure is only temporary. Wines so corrected only have their acidity disguised, and must be used soon.

**Greasy Wines.**—When wines turn greasy they cloud and rope like oil. White wines are more subject to this disease than red. Wines weak in alcohol and tannin are subject to the disease. Therefore, the addition of brandy spirits and tannic acid is recommended. Some also use half a pound of alum to a cask, which should be stirred thoroughly and racked off several days afterward.

**Flat or Cloudy Wines.**—This trouble is found in wines poor in alcohol and having an excess of albuminous material. Such wines can be improved by transferring them to a freshly sulphured cask and adding brandy. The wine should be fined and after a few days from 50 to 60 grains of tartaric acid per 50 gallons should be added.

**Bitterness.**—French Burgundy wines have been subject to this disease, which is not common in America. The trouble may be corrected at the start by putting the wine in sulphured cask and adding sufficient alcohol, tannin and tartaric acid.

**Classification of Wines.**—The following is a list of well-known types of wines, arranged according to the countries where produced:

1. FRENCH WINES.—*Claret, Graves, Sauternes, Barsac, Burgundy, Hermitage, Roussillon, Chablis, Frontignac, (Muscat), Champagne, Saumur, etc.*
2. GERMAN WINES.—*Riesling, Gutedel, etc.* The terms *Rhine, Moselle* and *Pfals* are usually applied to the growths in these districts. The word *Hock* is also applied to certain Rhine wines.
3. AUSTRIAN WINES.—*Voslaue, Godeck.* HUNGARIAN WINES.—*Tokay, Ambruk, etc.*
4. ITALIAN WINES.—*Barolo, Barbera, Nebbido, Grignolino, Valtellina, Asti, Chianti, Lacryma Christi, Velltri, Capri, Marsala, Muscat* of Syracuse, etc.
5. SPANISH WINES.—*Sherry, Malaga, Val de Penas, Vinos Tintos* (Spanish Reds).
6. PORTUGUESE WINES.—*Port, Lisbon, Colares, Caravello.*
7. MADEIRA AND CANARY ISLAND WINES.—*Madeira, Malasia, Canary* (sack), *Malmsey.*
8. GREEK AND IONIAN WINES.—*Hymettus, Nousse, Kephissia, Corinth, Patras, Santorin, etc.*
9. SWISS WINES.—*Neuchâtel, Gringet, and Montreux.*
10. TURKISH WINES.—*Candia* (Island of Crete), *Cyprus, Mount Lebanon, etc.*
11. RUSSIAN WINES.—*Crimean, Kabbetion* (Caucasus), *Donski* and *Krimski* Champagnes.
12. AUSTRALIAN WINES.—*Australian Burgundy, Hermitage, Sauterne, Port, etc.*
13. CAPE OF GOOD HOPE WINES.—*Cape Madeira, Constantia.*
14. PERSIAN WINES.—*Saira.*
15. WINES OF THE UNITED STATES.—(a) From native varieties of grapes grown east of the Rocky Mountains were produced, *Scuppernon* (in the Southern States) *Catawba, Delaware, Norton's Conema* and *Ives Claret, Concord, Iona, Champagne, etc.* (b) European or foreign varieties of grapes are grown in California which also produced *Claret, Cabernet, Burgundy, Zinfandel, Riesling, Sauterne, Port, Sherry, etc.*

For convenience we may group some of the leading wines as to color and taste, although it should be remembered that many of them are made in color both red and white, in taste, sweet and dry.

**RED DRY WINES**

- Claret
- Burgundy
- Cabernet
- Hermitage
- Barolo
- Barbera
- Chianti
- Zinfandel
- Norton's
- Ives
- Concord, etc.

**WHITE DRY WINES**

- Graves
- Sauternes
- Chablis
- Montrachet
- Rhine, or
- Riesling
- Moselle
- Catawba
- Delaware, etc.

**RED SWEET WINES**

- Port
- Tokay
- Constantia
- Roussillon
- Tarragona (Port)

**WHITE SWEET WINES**

- Sauternes
- Sherry
- Muscatel
- Angelica
- Lacryma Christi
- Marsala
- Malaga
- Madeira
- Catawba
- Delaware
- Scuppernon, etc.

**Alcoholic Strength, etc., of Wines.**—The figures in the following table have been taken from the various analyses by competent authorities:

	Specific gravity	Average per cent alcoholic strength
Claret	995.0	10.5
Rhine	992.8	10.5
Sauterne	993.7	11.0
Burgundy	991.3	11.5
Champagne	1,010.9	11.0
Sherry (natural)	985.9	16.0
Sherry (fortified)		20.0
Marsala (natural)	995.9	16.0
Marsala (fortified)		20.0
Port (natural)	999.2	16.0
Port (fortified)		22.0

(Specific gravity water = 1,000)

It may here be noted that many chemical analyses of European wines have been made and the data thus obtained have been used for the purpose of arriving at a standard for judging wines. In this way it is possible to determine the purity and quality of any type of wine. The limits of composition and the ratios which have been adopted in European countries for applying analytical results in judging the purity and quality of wines, together with a number of analyses of American wines, have been compiled by Dr. W. D. Bigelow of United States Department of Agriculture. Consult Bureau of Chemistry Bulletin No. 59, 'The Composition of American Wines,' 1900.

The standards which have been adopted for European wines are met in all particulars by the best American wines. This is shown by the chemical analyses of American wines receiving awards at the Paris Exposition of 1900. (Consult Bulletin No. 72, Bureau of Chemistry, United States Department of Agriculture, 1903). According to this report, "the percentage of alcohol in the samples of dry wines conforms to the standards that have been adopted for European wines. The ratio of alcohol to extract and the sum of the alcohol expressed in grams per litre and the total acidity expressed as grams per 100 cubic centimeters conform to the ratios adopted in France for wines to which neither alcohol nor water has been added." It is also stated that the percentage of acid in the samples examined conforms to the standards of the wine-producing countries. These and other facts go to prove that our American wines challenge favorable comparison with

can wines. It is only a few foreign types of excellence which surpass those of the kind that we produce. In all respects—color, taste, bouquet, etc.—the average can wines are better than the average of Europe. Consult Alwood, Wm. B., 'Vineyard Studies' (in Bulletins No. 140 to 145, Bureau of Chemistry, United Department of Agriculture, Washington).

Vance, Lee J., 'Some Characteristics of can Wines' in Original Communications, Eighth International Congress of Applied Chemistry, 1912, Vol. XIV, p. 173; Auchi, S., 'Interpretation of the Results of Wine is' (in Original Communications, Eighth International Congress of Applied Chemistry, VIII, p. 17); consult also various papers Report of the International Congress of Agriculture, at San Francisco, Cal., 1915.

**World Production of Wine.**—The production of every country, and, therefore, of the world, varies greatly from year to year due for the most part to climatic or soil conditions. Thus when the season is favorable and the vines bear light crops, the output falls below normal.

The great European War, which broke out in the summer of 1914, did not have the immediate effect of unduly decreasing the wine production of that year. But in the following year the labor shortage and the consequent neglect of the vineyards, combined with unfavorable weather, resulted in the smallest crop in Europe in the last 50 years.

The following figures, which are compiled from official sources, show the wide fluctuations in the vintages of the leading wine-making countries of the world for three recent years:

Country	1913 gallons	1914 gallons	1915 gallons
France	971,778,000	1,316,849,000	448,819,000
Italy	163,476,000	270,980,000	113,058,000
Spain	1,138,038,000	947,000,000	418,000,000
Germany	360,276,000	355,690,000	222,000,000
Belgium	72,050,000	88,000,000	74,000,000

In 1915 the wine production both in France and Italy has steadily increased; in France it was 760,000,000 gallons in 1916; 840,000,000 gallons in 1917, and 980,000,000 gallons in 1918.

Although the greatest wine-producing country in the world, France imports more wine than it exports. The average Frenchman, according to statistics, drinks 70 times as much wine as the average American. In other words, the per capita consumption of wine in France is 25 gallons; in Italy 25 gallons; in Spain 15 gallons; in Austria, 3.5 gallons; in Germany 1.5 gallons; in Belgium 1.04 gallons; in the United States 0.45 gallon, and in Britain 0.35 gallon. Thus, with a population of about 100,000,000 people the per capita consumption of domestic and imported wines

in the United States has been from 45,000,000 to 50,000,000 gallons per annum.

However, the consumption of wine has slowly increased from year to year in the United States, and this increase would have been much larger if there had been better means of distribution and if there had not been so much unfavorable legislation. Many people still need to be educated to the use of light wine with their meals, such as is the custom in the grape-growing countries of Europe, where almost everyone—men, women and children—drink the wine of their country daily at table with their other food, and they are among the most sober, thrifty, industrious and temperate people of the world.

**The Wine Industry in the United States.**—The wine industry in the United States is of comparatively recent date and growth. In 1850 the total output of wine in the United States was not more than 250,000 gallons. In 1860 it was about 500,000 gallons. In 1870 it had risen to about 5,000,000 gallons. In 1880 the wine yield of the country was about 15,000,000 gallons. In 1890, when the statistics of viticulture were gathered for the first time in the United States, there were 307,000 acres of vineyards and a production of over 24,000,000 gallons of wine. The census of 1900 showed a production of over 30,000,000 gallons of wine. In 1910 it was more than 45,000,000 gallons.

The wine production of the United States during the 10 years 1910-19 averaged about 44,000,000 gallons. There were sharp decreases in production in 1915 and 1918, due almost entirely to excessive war revenue taxation. The vintage of 1916, which was a good one, was made up as follows:

	Gallons
New York	4,000,000
New Jersey	350,000
Ohio	3,500,000
Western States	300,000
California	42,262,000
All other States	500,000
<b>Total</b>	<b>49,112,000</b>

The greatest progress in viticulture and wine-making has been made in California during the past 20 years. That Golden State with its great range of climate and with its variety of soils has an area almost equal to that of France. The production of wine in California began to assume large figures in 1877, when it was 4,000,000 gallons. In 1880 the yield was more than double, or 10,000,000 gallons; in 1890 it was 15,000,000 gallons. In 1900 the wine production had risen to 23,400,000 gallons; and in 1910 it reached 45,486,000 gallons.

The wine production of California in recent years has been as follows:

Year	Dry wines, gallons	Sweet wines, gallons	Total gallons
1913	22,000,000	17,927,812	39,927,812
1914	26,300,000	17,473,353	43,773,353
1915	21,571,000	4,035,240	25,606,240
1916	23,000,000	19,262,475	42,262,475
1917	20,000,000	16,585,908	36,585,908
1918	28,000,000	4,168,240	32,168,240

The figures for the years 1913-14 are taken from the 1915 annual report of the California State Board of Agriculture; those for the years 1915-16-17 and 18 from Bulletin No. 10 and

13 issued by the California Board of State Viticultural Commissioners. In the season of 1918, 6,000 carloads of wine grapes, amounting to about 90,000 tons, were shipped out of the State. The sharp drop in sweet-wine production in 1915 and 1918 was due, as has been mentioned, to new and excessive taxation. At the present writing (1919) the wine industry of the United States is facing a most serious situation, namely, national prohibition. The prohibition of the manufacture and sale of wines strikes at the thousands of vineyard owners whose crops are taken and used by the wine-makers. Thus, of the 350,000 acres of vineyards in California just about one-half, or 170,000 acres, are devoted entirely to "wine grapes," that is, to special varieties of grapes which are not fit or wanted for eating or table purposes, but on account of their vinous qualities these grapes are peculiarly adapted for making wines. It is evident that the enforcement of prohibition will bring heavy loss to the growers and will greatly depreciate the value of their properties.\*

Such legislation is all the more unfortunate in view of the fact that grape and wine growing have been fostered and encouraged for the past 50 years by our State and national governments. Large appropriations have been made from year to year; experts have been engaged to help the vineyardists; experimental grape stations have been established—there are now 14 such stations in California alone--the farmers and growers have put in their labor and capital in the confidence that viticulture, which is such an important branch of agriculture, would not be ruined or destroyed. Few there are who will claim that the grape and wine industries are responsible for the alleged evils which are sought to be remedied by prohibition. Hence it is to be hoped that a great wrong and injustice will not be done by drastic and confiscatory legislation to these two great industries, which give employment to some 60,000 persons and which represent an investment of \$150,000,000 capital.

#### Two Distinct "Types" of American Wines.

The wines produced in the United States are divided into two classes: (1) wines made east of the Rocky Mountains; (2) wines of California and the Pacific Coast States.

This division is due to the fact that there are two entirely different stocks, or kinds, of grapes grown in the United States.

East of the Rocky Mountains, only American or native varieties of grapes are grown.

In California and on the Pacific Coast, practically only European or foreign varieties of grapes are grown.

Therefore, our Eastern wines are of a different "type" from California wines, which for the most part resemble and have the well-known characteristics of their European prototypes.

The leading grape and wine-growing States east of the Rocky Mountains are: North Caro-

lina, Virginia, New Jersey, New York, Ohio, Michigan and Missouri.

Considerable progress in Eastern wine-making has been made in producing a fine quality of champagne by the French process of fermentation in the bottle. A number of brands of American champagne, in color, taste, sparkle and purity, compare very favorably with the best imported kinds. The headquarters of the champagne industry in the United States is in the Lake Keuka region of western New York, which produces about 75 per cent of the output. Considerable champagne is also produced in northern Ohio and a fair amount in California. The total production of American champagne is now estimated at more than 150,000 cases, or 1,800,000 quart bottles per year.

In conclusion, the manufacture of wine and champagne is an infant industry in the United State. But we have in the Eastern States and in California all the opportunities and all the conditions for success. We have here the right climates, the proper soils, the best varieties of grapes, sufficient capital and the most intelligent labor and supervision in the world. Therefore, with all these things and with the growing demand for American wines, the wine industry in this country, if it is not discouraged or forbidden by unfavorable legislation, should have a prosperous future.

**Bibliography.**—The best books on wines and on the technical details of wine-making are in French. The following standard French works may be noted: Coste-Floret, 'Procédés modernes de Vinification,' in 3 parts, (1) Vins rouges, (2) vins blancs, (3) le résidu (1895-1902); Jacquemin, 'Production rationnelle et conservation des vins' (1909); Cazalis, 'Traité pratique de l'art de faire le vin' (1900); consult also a valuable little book by Chancier, 'Le vin' (1910). For making wines in hot climates consult Roos, 'L'industrie vinicole meridionale' (1898). For making sweet wines, Sebastian, 'Les vins de luxe' (1897). For making champagne and sparkling wines, Robert's 'Manuel pratique vins mousseux' (1904); Salteron et Mathieu, 'Etudes sur le vin mousseux' (1895), and Mancau's 'Oenologie Champenoise' (1917).

There are but few really useful books in English of recent date on the practical side of wine-making. We note the following: Thudicum and Dupré, 'Origin, Nature and Varieties of Wine' (1872); Rixford, 'The Wine Press and the Cellar' (1883); Husmann, 'Grape Growing and Wine Making' (1897); Mathews, 'Manual of Alcoholic Fermentation' (1909). Jordan, 'Quality in Dry Wines' (San Francisco, Cal., 1911); Bioletti, F. T., 'The Manufacture of Dry Wines in Hot Countries' (in Bulletin No. 167, University of California, College of Agriculture 1905), and Bulletin No. 177 on 'New Methods of Making Dry Red Wines' (1906). Consult also bulletins issued by the United States Department of Agriculture, the California State Board of Viticulture and special articles in the trade journals.

LEE J. VANCE

Publisher, 'The Beverage News,' New York

WINEBRENNER, win'bren-er. John, American clergyman, founder of the denomination known as the "Church of God"; b. Frederick County, Md., 24 March 1797; d. 12

\* According to latest reports the California vineyardists, far from meeting heavy losses from so-called Prohibition, reaped greater profit than ever. They shipped fresh wine grapes all over the country and to Canada, and to still further points they shipped the grapes in a dried form for wine-making. The demand was created by the fact that the people in 1919 made their own wines. Grape syrup was made in great quantities in 1919. It was hoped that it would supplant maple and molasses syrups, but quantities of it were used in wine-making.

860. He was ordained a minister of the Reformed Church in 1820, and was in the same year to the Salem church, burg, Pa. He retained that charge until his outspoken attitude against slavery traffic in intoxicating drinks led to his being ordered to withdraw, and in 1828 he ceased connection with the Reformed Church. In 1830 he established the denomination the "Church of God," whose members became known as Winebrennerians. He was for some time the *Gospel Publisher*, and the *Church Advocate*, and issued works, including 'A Treatise on Religion'; 'Practical and Doctrinal Sermons'; the 'Church Hymn Book', etc. See **WINEBRENNERIAN**.

**WINEBRENNERIANS.** See **CHURCHES**.

**WINEBRENNER, Enoch Cobb**, American penologist: b. Hanover, N. J., 17 Feb. 1806; d. Cambridge, Mass., 10 Dec. 1879. He was graduated Middlebury College, Vt., in 1827, taught in Philadelphia and Burlington, N. J., entering the Congregationalist ministry in 1828. Held pastorates at Cornwall, Vt., and Easton, L. I. In 1853 he became professor of Penology in Washington College, Pennsylvania, and was appointed president of Saint Louis Penitentiary in 1859. He became secretary of the New York State Prison Association in 1862 and afterward devoted his life to the promotion of reform in the administration of penal law and treatment of criminals. He was president of the National Prison Association in 1872 and was instrumental in securing the attendance of representatives from 26 governments at the International Penitentiary Congress held at Philadelphia on 4 July 1872. Among his writings are 'Two Years and a Half in the Navy' (1832); 'A Trip to China' (1832); 'Hints on Penitentiary Education' (1838); 'Prisons and Reformatories in the United States and Canada' (1840); 'State of Prisons and Child-Saving Societies' (1880).

**WINEBRENNER, Frederick Howard**, American penologist, son of E. C. Wines (q.v.): b. Philadelphia, Pa., 9 April 1838; d. 1912. He was educated at Washington College, Pa., in 1857, and studied at Princeton Theological Seminary; was a chaplain in the Union army, and pastor of the First Presbyterian Church, Springfield, Ill., 1865-69, was secretary of the State Board of Commissioners of Penitentiaries 1869-93, and again 1897-99. He devoted much time to the interests of the work done by the National Conference of Penology and Correction, being its president in 1894 and president of the National Prison Association of which he was president in 1904; and the International Penitentiary Congress. He was assistant director of the United States census in 1899-1902. His writings include 'Defective, Dependent and Pauper Classes in the United States' (10th Census); 'Crime, Pauperism, and Benevolence in the United States' (11th Census); 'Punishment and Reformation' (1895; rev. ed., 1910); 'The Problem in Its Legislative Aspects' (2d ed., 1898); 'Punishment and Reformation' (posthumously, 1919).

**WINEFIELD, Kan.**, city and county-seat of Wine County, on the Walnut River and on

the Atchison, Topeka and Santa Fé (three lines), Missouri Pacific and Frisco railroads, also the Southwestern Interurban. It was settled in 1870 and incorporated in 1871. The chief industrial establishments are butter plant, poultry packing, flour mills, metal manufacturing, stock food plant and cold storage. Plenty of natural gas, at door, for domestic consumption. Winfield has two colleges of Liberal Arts, Southwestern (Methodist Episcopal) and Saint John's Lutheran, also College of Music. The public schools of Winfield are rated first by the State University and the Manual Arts building was erected in 1916 in addition to regular High School and Junior High School. Music and drama are taught and also community extension work emphasized. The Commercial Club is unique in its size and operation and has among its committees one on Child Welfare. Winfield also has the unique distinction of having won the Stubbs-Horner prize in 1915 for being the best second class city in Kansas in which to rear children. The electric lighting and water plant is municipally owned and the water supply for palatability and purity is not outranked in Kansas. The city fire apparatus is all motor driven. Pop. 8,500.

**WING**, an organ of flight. In birds, the wings consist of the bones of the fore limbs, specially modified to form a support and axis, while attached to this skeleton are the muscles moving the limb (see **ORNITHOLOGY**), externally clothed with strong flight-feathers or "wing quills." (See **FLIGHT**). In the bat (q.v.) the wing consists of an expansion of the skin, supported on four of the fingers, which are extremely long. This leather-like membrane, or "patagium," extends from the fore limbs to the hind limbs, and in many cases between the hind limbs and tail as well. In such mammalia as the flying-foxes, flying-squirrels, flying phalangers, and in the lizards known as flying-dragons (q.v.), the wing is a mere expansion of skin, extending along the sides of the body, often connecting hind and fore limbs, and serving as a parachute to sustain the animals in their flying leaps from tree to tree, but in no insect serving as an organ of true flight. In insects (q.v.), the wing is formed of two delicate skin layers, supported on hollow tubes or *nervures*, placed in communication with the respiratory or breathing system. The wings of insects become thus related to respiration, and by their movements probably aid in the diffusion of air through the breathing tubes.

**WINGATE, George Wood**, American lawyer: b. New York, 1 July 1840. He was educated in the public schools, and served with the 22d New York Volunteers during the Civil War. He originated systematic rifle practice for the instruction of the National Guard, and through his efforts the Creedmoor rifle range on Long Island was established. He was president of the National Rifle Association for 25 years, and is the author of 'Wingate's Manual of Rifle Practice' (1872); 'The Great Cholera Riots' (1880); 'On Horseback Through the Yellowstone' (1886); 'History of the 22d Regiment' (1896), also of many articles on military subjects.

**WINGED BULL**, in architecture, a decoration of frequent occurrence in ancient Assyrian

Society, the Manitoba Neglected Children's Society, the Old Folks Home, etc.

**Libraries.**— The Winnipeg city library was erected by the Carnegie Foundation and is maintained by the city council. It cares for the collections of the Manitoba Historical Society. There are several branches throughout the city in which fiction and books of popular circulation are housed for the convenience of readers and borrowers. The Legislative Library is housed in the Provincial Parliament Buildings and is large and complete in its special field. The University and several college libraries are ample and elaborate. There is a valuable law library in the new Courthouse.

**Banks and Banking.**— The banking system is carried on by private companies but under strict supervision by both the provincial and Dominion governments. The Merchants' Bank of Canada began its business in 1872 in Winnipeg. Other banks now operating there are the Bank of Hamilton, the Bank of Nova Scotia, the Bank of Ottawa, the Bank of Toronto, La Banque de Hochelaga, Canadian Bank of Commerce, Crédit Foncier Franco-Canadien, Union Bank of Canada, Home Bank of Canada, Imperial Bank of Canada, Molson's Bank, Royal Bank of Canada and the Winnipeg Financial Corporation.

**Industries.**— Being the outlet of a vast agricultural area to the markets of the world, Winnipeg ranks as one of the great grain centres both of America and Europe. It is also a market centre for horses, cattle and swine from the vast prairie areas. There are large engine, machine and railroad car shops of the three great systems entering the city. There are in addition slaughter-houses, packing establishments, lumber mills, rolling mills, foundries, flour mills, boiler and carriage works and a great number of minor manufacturing establishments. The value of its manufactured products is about \$75,000,000 annually. Ample power facilities are afforded by the Winnipeg River, 60 miles distant. The water-supply system, municipally owned, brings water through a great aqueduct about 100 miles long from Lake of the Woods, the latter being about 100 feet above the level of the city.

**History.**— On the site of the present city in the days of the fur trade there was built Fort Rouge, in 1738, followed by Fort Gibraltar, Fidler's Fort, Fort Douglas and Fort Garry, the last named a post of the Hudson's Bay Company. The fort was dismantled in 1881. The modern city may be said to date from 1871, when there was a settled population of 215. The present city was incorporated in 1874, when the population was between 3,000 and 4,000.

**Government and Population.**— The city's affairs are vested in a mayor, four controllers and a board of 12 aldermen. The Parks Board is appointed by the city council and administers a fixed percentage of the city revenue. Since 1900 the population has increased rapidly. In 1904 it was 67,262 and in 1916 was 163,000. With the suburbs it is at present about 200,000.

(GEORGE BRUCE,

Author of 'Short History of the Canadian People')

**WINNIPEG, Lake, Canada,** is in the province of Manitoba and the district of

Keewatin, and lies at an altitude of 7 above sea-level, between lat. 50° 20' and N. and long. 96° 20' and 99° 15' W. over 250 miles long, from 25 to 70 mile and covers an area of over 8,500 square miles. It contains a number of islands, the largest being Reindeer and Big Island respectively 70 and 60 square miles. It receives the surplus waters of Lakes Winnipegosis and Manitoba and discharges into the Assiniboine River in a northeasterly direction to Hudson Bay. The principal rivers flowing into it are, from the south, Red River; from the west, Dauphin and Saskatchewan rivers; from the east, Winnipeg, Bloodvein, and Poplar rivers. Lake Winnipeg is comparatively shallow, nowhere reaching the depth of 100 feet, a consequence being that frequent storms are often exceedingly dangerous. This feature is augmented by its exposure to the south, which is also very shallow. Fish in abundance are found in its waters, white fish being widely known and valuable on account of their size and flavor.

**WINNEPEG RIVER, Canada,** rises in the Savanne in lat. 48° 47' N. and long. 96° 20' W. and flows in a general westerly direction under the names of Savanne, Seine and Rainy into the Lake of the Woods. After it enters the lake it is known as Winnipeg River. It follows an extremely tortuous and often turbulent course until it finally discharges into Lake Winnipeg. It is navigable for a distance of 208 miles.

**WINNIPEGOOSIS, win'i-pé-goo'sis** is a lake in northwestern Manitoba emptying into Saskatchewan. It lies to the west of Lake Winnipeg (q.v.) and parallel to it, its length is 127 miles, the width 17 miles and its elevation above sea-level 828 feet. It is generally shallow, the greatest depth not over 40 feet. It receives the Red Deer and Swan rivers, and a few other smaller streams, and discharges into Lake Manitoba to the east, through the Water Hen River.

**WINNIPISEOGEE, win-é-pé** is a lake in the east central part of New Brunswick. Its average length is about 25 miles, from one to 10 miles; area, 178 square miles and 475 feet above sea-level. The Winnipiseogee River, which flows into the lake, contains a number of islands, and is abundant with fish. There are many swamps on the islands and along the shores.

**WINNOWER MACHINE,** for winnowing grain by means of a fan and a blower. The grain is usually fed into a hopper at the top of the machine into a hopper, it falls on a sieve or series of sieves rapidly to and fro. Meanwhile a stream of air is sent through the machine and out the chaff at one end. The cleaned grain is then graded by a series of sieves of different mesh and each size led to its proper receptacle. The early type of winnowing machines was operated by hand. The present type is driven by a power-driven threshing machine, in America at least, is merely a modification of the big power-driven threshing machines. Before the introduction of these machines the process of winnowing

**WINNIPEG**

**2 City Hall Square, with Municipal Building, on the left**

orious. It consisted in throwing up the y means of sieves or shovels while an rent, blowing across, carried away the Consequently winnowing was impossible rindless day. When the first machine roduced into Britain, by a farmer in d in 1737, it met strong opposition, as ing with the divine prerogative which ad power over the winds. But the ad- soon overcame the prejudice whose Walter Scott has preserved in 'Old ty'—making Mause Headrigg speak ously to her mistress about "a new- machine for *dighting* the corn frae the us impiously thwarting the will o' Divine ice, by raising wind for your leddy- se by human art, instead of soliciting it er, or patiently waiting for whatever dis- on of wind Providence was pleased to on the shielin-hill."

**WINNSBORO**, S. C., city and county-seat field County, on the Southern Railroad, 4 miles north of Columbia. It is in an ural region, and in the vicinity are large uarries. At one time the city manufac- ill the cotton-gins used in the United The educational institutions are Mount stitute, established in 1878, as a public hool, but chartered as a school in 1777, aded elementary schools. Pop. 1,800.

**WINONA**, wi-no'na, Minn., city and seat of Winona County, on the Missis- iver, and on the Chicago, Milwaukee and Paul, the Chicago, Burlington and the Green Bay and Western, the Chi-reat Western, and the Chicago and estern railroads, about 105 miles south- Saint Paul. The surrounding scenery : picturesque, the peculiar rocks in and e city are of interest. Sugar Loaf and aleau Mountains are remnants of once evations, but are now included with the uffs which border the city. The city mer connection with all the Mississippi ports, and the bridges which span the : this point connect the city with places consin. It is in an agricultural and ising region. The chief manufacturing aments are flour and lumber mills, agrf- implement works, wagon and carriage s, railroad shops, breweries and patent e works. In 1914 the reported com- apital of the manufacturing establish- ounted to \$12,013,000, while the value uction was \$14,304,000. Winona has it transportation facilities and ships an- arge quantities of grain, hay, vegetables, and livestock. The principal public s are the government buildings, the use, municipal buildings, the Winona Hospital, the Margaret Simpson Home, ouse, churches and schools. There are churches, including a Roman Catholic il. The educational institutions are a normal school, established in 1868;

Seminary (Roman Catholic), for women, a public high school, opened in ublic and parish schools, Toland's Busi- niversity, and several private schools. y owns and operates the waterworks. was settled in 1851 and in 1852 was t as a town. In 1857 it received a rter. Its growth has been somewhat

rapid; but it has had no fictitious booms nor serious drawback. Pop. 18,583.

**WINONA**, Miss., town and county-seat of Montgomery County, on the Southern and the Illinois Central railroads, about 85 miles north by east of Jackson. It is in an agricultural region in which cotton and grain are the chief products. It has flour and grist mills, cotton gins and agricultural implement works. The two banks have a combined capital of \$150,000. The high school was established in 1887. Pop. 2,512.

**WINOOSKI**, Vt., village in the town of Colchester (q.v.), in Chittenden County, on the Central Vermont Railroad, two miles north of Burlington. It has an electric railway to Burlington. It is in a fertile agricultural region, and has considerable manufacturing interests. The chief industrial establishments are sash, door and blinds factories, wagon and carriage works, cotton and woolen mills, iron and brass works, machine shops, flour mill and furniture factory. It has a high school, Providence Academy (Roman Catholic), public and parish schools and the Fanny Allen Hospital. Pop. 4,520.

**WINOOSKI**, or **ONION**, a river in Ver- mont, which has its rise in the northeastern part of the State, flows in a southwesterly, then northwesterly direction, breaking through the Green Mountains, and enters Lake Champlain about five miles northwest of Burlington. Total length about 100 miles. In several places it has cut deep picturesque gorges, and it has several falls. The falls at Middlesex and Winooski furnish extensive water power for manufacturing. The valley of the Winooski is noted for its beautiful scenery.

**WINSHIP**, Albert Edward, American editor: b. West Bridgewater, Mass., 24 Feb. 1845. He studied at Andover Theological Seminary, and in 1876-83 was pastor of the Prospect Hill Church, Somerville. Since 1886 he has edited the *Journal of Education*, Boston. He was a member of the Massachusetts Board of Education in 1903-09. He has lectured extensively, and is author of 'Life of Horace Mann' (1896); 'Great American Educators' (1900); 'Our Boys' (1909), etc.

**WINSHIP**, George Parker, American author and librarian: b. Bridgewater, Mass., 1871. He was graduated from Harvard in 1893, and was assistant in history there in 1893-95. He was librarian in charge of the John Carter Brown Library, Providence, R. I., from 1895 to 1915, when he became librarian of the Harry Elkins Widener Collection, in the Widener Memorial Library, Harvard. He has written 'The Coronado Expedition' (1896); 'Geoffrey Chaucer' (1900); 'Cabot Bibliography' (1900), etc., and has edited Wafer's 'Darien' (1903); 'The Letters of Three Rhode Island Children' (1904); 'Boston in 1699' (1905); 'Three Proclamations Concerning the Lottery for Virginia, 1613-21' (1907); 'Fifteenth Century Books in Brown University Libraries' (1910); 'Major Bradford's Letter, 1676' (1914).

**WINSLOW**, winz'ls, Edward, American colonial governor: b. Droitwich, Worcester- shire, England, 19 Oct. 1595; d. at sea, between Santo Domingo and Jamaica, 8 May 1655.

While making a tour of the Continent he became a member of John Robinson's Leyden congregation. He was one of the passengers in the *Mayflower*, and in the first conference with Massasoit offered himself as a hostage, and won the attachment of the Indian chief, which he increased in 1623 by curing him of a severe illness. After the death of his wife during the first winter at Plymouth he married Mrs. Susannah White, mother of Peregrine White, her husband having died in that same winter also, and theirs was the first marriage in New England. In 1623-24 he made two voyages to Europe as agent for the colony, of which he was chosen governor in 1633, 1636 and 1644. While visiting England again in 1635 as agent for the colony, he was imprisoned by Laud in the Fleet prison for 17 weeks on the charges of having taught in the church, although a layman, and of having performed marriage as a magistrate. Another voyage was made by him in 1646 to answer charges against the colonists of religious persecution and intolerance. In 1649 he again visited England, was instrumental in the organization of the society for the propagation of the gospel in New England, and was employed in various public affairs under the Commonwealth. In 1655 Cromwell appointed him one of three commissioners to superintend an expedition against the Spaniards in the West Indies, and he died before its completion. He was the author of several works, mostly controversial writings in defense of New England. The principal are 'Good News from New England' (1624); 'Hypocrisis Unmasked' (1646); 'The Danger of Tolerating Levellers in a Civil State' (1649), and 'Glorious Progress of the Gospell amongst the Indians' (1649). These have been reprinted by the Massachusetts Historical Society.

**WINSLOW, Forbes Benignus**, English alienist: b. London, of a Massachusetts family, August 1810; d. Brighton, Sussex, 3 March 1874. He came to this country in early life, studied medicine in New York, was graduated from the College of Surgeons, London, in 1835, and took his M.D. at Aberdeen. Having after 1830 paid special attention to the study of insanity, he opened a private asylum at Hammer-smith, and later another in London, and came in time to be a supreme authority on all relating to diseases of the brain. He founded and edited the *Quarterly Journal of Psychological Medicine and Mental Pathology* (1848) and the *Medical Critic* (1861), was the juridical and president of the Medical Society of London (1853), and a member of numerous scientific bodies. He published 'The Application of Phrenology to the Elucidation and Cure of Insanity' (1831); 'Anatomy of Suicide' (1840); 'Plea of Insanity in Criminal Cases' (1843); 'Notes on the Lunacy Act' (1845); 'Softening of the Brain' (1849); 'Lethsonian Lectures on Insanity' (1854); 'Obscure Diseases of the Brain and Disorders of the Mind' (1860; 4th ed. 1868); 'Light, its Influence on Life and Health' (1867).

**WINSLOW, Hubbard**, American Presbyterian clergyman: b. Williston, Vt., 30 Oct. 1799; d. there, 13 Aug. 1864. He was graduated from Yale in 1825 and from Yale Theological

Seminary in 1828. He was pastor of the First Church, Dover, N. H., 1828-32, and of the Bowdoin Street Church, Boston, 1832-44, and during the next 10 years was the principal of the Mount Vernon Young Ladies' Institute at Boston. He edited the *Religious Magazine* 1837-40, lectured widely on religious and secular topics, was pastor of the First Presbyterian Church, Geneva, 1857-59, and of the Fiftieth Street Presbyterian Church, New York, 1861-62. He was a voluminous writer, and among his works may be cited 'The Doctrine of the Trinity' (1831); 'Controversial Theology' (1832); 'The Appropriate Sphere of Woman' (1837), republished as 'Woman as She Should be' (1838); 'Elements of Intellectual Philosophy' (1852); 'The Hidden Life' (1863).

**WINSLOW, John**, American soldier: b. Plymouth, Mass., 27 May 1702; d. Hingham, Mass., 17 April 1774. In 1740 he was appointed by the council captain of a company recruited in Boston for the expedition against Cartagena (q.v.); and in June 1754 sailed in the provincial ship *Massachusetts* to build a fort on the Kennebec. This he began on a point half a mile below the Teconick Falls, where it was finished by William Lithgow in the next year. With Scott he was a commander of the 1,800 troops sent by New England in 1755 to remove the French from the posts established on the Bay of Fundy. The French forts at Beauséjour and Gaspereau were taken, and on 11 August Winslow, then with rank of lieutenant-colonel, and in command at Mines, was instructed to remove the Acadians in his vicinity, a task which he described to the French inhabitants as "very disagreeable." He strictly followed his orders, however, as "it is not my business to animadvert." In 1756 he was appointed to command the campaign on Lake Champlain, holding now the grade of major-general, and was stationed at Fort William Henry. He led another expedition to the Kennebec in 1758-59, and subsequently was chief justice of the Court of Common Pleas for Plymouth County and a member of the legislature and the council. He was associated with Samuel Adams in the preparation of documents regarding the Stamp Act troubles.

**WINSLOW, John Ancrum**, American naval officer: b. Wilmington, N. C., 19 Nov. 1811; d. Boston, Mass., 29 Sept. 1873. He was appointed midshipman in the navy in 1827, was promoted lieutenant in 1839, and served in the Mexican War, participating in the expeditions against Tabasco, Tampico and Tuspan. He was made commander in 1855, in 1861 joined the Mississippi flotilla, and in 1862 was commissioned captain. In 1863-64 he was in command of the steamer *Kearsarge*, assigned to the special duty of pursuing the Confederate privateer *Alabama*. On 14 June 1864 he found the *Alabama* off Cherbourg, France, and blockaded her in that harbor until 19 June, when Captain Semmes notified Winslow of his intention to fight. The *Kearsarge* steamed seven miles out from shore in order to be on neutral waters, and then turned to meet the privateer. The *Alabama* fired the first shot, and the battle continued for an hour and a half, the vessels fighting in circles, which brought

them constantly closer until the distance between them was but 600 yards. The *Alabama* then began to sink and raised the white flag. Winslow numbered but three killed and wounded out of his crew of 163 officers and men, and took 65 prisoners. It was the most important sea fight of the war between two ships, and Captain Winslow received a vote of thanks from Congress, and was promoted commodore, his commission dating from the hour of his victory. He was in command of the Gulf squadron in 1866-67, was promoted rear-admiral in 1870, and was commander-in-chief of the Pacific squadron in 1870-72. Consult Ellicott, 'The Life of John Ancrum Winslow' (New York 1902).

**WINSLOW, Josiah**, American colonial governor, son of Edward Winslow (q.v.): b. Marshfield, Mass., 1629; d. there, 18 Dec. 1680. From the command of the Marshfield military company in 1652 he rose to the rank of major and commander-in-chief of the forces of the Plymouth colony in 1658. He was chosen deputy to the general court in 1653, and was one of the commissioners of the united colonies from 1658 to 1672. He was assistant governor of the Plymouth colony for several years prior to 1673, and from that date till his death was its governor, the first native-born governor in New England. During King Philip's War he was ex officio, and, according to rank, general-in-chief of the entire army of the united colonies. He wrote a poem commemorative of Governor Bradford, which may be found in Morton's 'New England Memorial' (1669).

**WINSLOW, Miron**, American missionary: b. Williston, Vt., 11 Dec. 1789; d. Cape of Good Hope, Africa, 22 Oct. 1864. He was graduated from Middlebury College, Vermont, in 1815, and from Andover Theological Seminary in 1818. He went as a missionary of the American Board to Ceylon 1819, and continued in the mission field for 44 years. He founded the Madras mission 1836; was president of the native college at Madras 1840; translated the Bible into Tamil 1835, and published 'A Tamil and English Dictionary' (1862), a great work, containing over 67,000 Tamil words, the most complete of its time.

**WINSLOW, William Copley**, American Egyptologist, son of Hubbard Winslow (q.v.): b. Boston, Mass., 13 Jan. 1840. He was graduated from Hamilton College, Clinton, N. Y., in 1862, and from the General Theological Seminary, New York, in 1865. He took orders in the Episcopal Church, was rector of Saint Luke's Church, Lee, Mass., 1867-70, and in 1883 became secretary of the Free Church Association in the Episcopal Church. He was assistant editor of the *New York World* 1862-63, and of the *Christian Times* 1864-65. He founded the American branch of the Egypt Exploration Fund in 1883, and served until 1903 in some official capacity. He has written 'Israel in Egypt' (1883); 'The Store City of Pithom' (1885); 'A Greek City in Egypt' (1887); 'The Egyptian Collection in Boston' (1890); 'The Pilgrim Fathers in Holland' (1891); 'Governor Edward Winslow,' etc.

**WINSLOW, Me.**, town in Kennebec County, at the confluence of the Kennebec and Sebasticook rivers, 18 miles north of Augusta, on the

Maine Central Railroad. The Block House, built in 1754, is still in excellent condition. There is a high school. Manufactures include woodwork and paper. The town was incorporated in 1771. Pop. about 2,709.

**WINSOR, win'zör, Justin**, American historian and librarian: b. Boston, Mass., 2 Jan. 1831; d. Cambridge, 22 Oct. 1897. He was educated at Harvard, and subsequently studied at Paris and Heidelberg. He was superintendent of the Boston Public Library 1868-77, and librarian of Harvard 1877-97. He published 'History of the Town of Duxbury' (1849); 'Bibliography of Original Quartos and Folios of Shakespeare' (1876); 'Reader's Handbook of the American Revolution' (1880); 'Memorial History of Boston' (edited 1880-82); 'Narrative and Critical History of America' (edited 8 vols., 1884-89), his most scholarly achievement; 'Christopher Columbus' (1891); 'From Cartier to Frontenac' (1894); 'The Mississippi Basin: The Struggle in America between England and France' (1895). He ranked as the highest authority on the early history of North America.

**WINSTED, Conn.**, city, one of the county-seats of Litchfield County, on the Mad and Still rivers, and on the Central New England and the New York, New Haven and Hartford railroads, about 26 miles northwest of Hartford. It is in an agricultural region, and is the commercial and industrial centre for quite an extent of country. The Mad River furnishes considerable water power, which is utilized for manufactories for cutlery, clocks, sheet brass, brass novelties, bolts, chain hoists, spool silk, edge tools, pins, hosiery and undertakers' supplies. The town of Winchester, in which is the city of Winsted, had, in 1914 (government census), 147 manufacturing establishments, capitalized at \$4,233,578, and employing 3,168 wage-earners. The value of the annual products was \$4,131,327. From 1914 to 1919 the manufacturing industries have increased; the number of employees is now about 4,000. The educational institutions are Gilbert (high) school, Saint Margaret of Cortona Academy, public and parish schools and the Memorial and Gilbert School libraries. Located in Winsted are the Litchfield County Hospital of Winchester, and the William L. Gilbert Home for Indigent Children. There are four banks, which in 1918 had deposits amounting to \$4,537,534. Winsted receives considerable water power from Highland Lake, a body of water on the western side of the city; and the water supply comes from Crystal Lake. The place was settled in 1756. The town of Winchester was founded in 1771. Winsted was incorporated as a borough in 1858, and town and borough governments were consolidated in 1915. The town government is vested in a commission of five selectmen. Pop. about 9,000.

**WINSTON, John Anthony**, American politician: b. Madison County, Ala., 4 Sept. 1812; d. Mobile, Ala., 21 Dec. 1871. He was educated at Lagrange College, Alabama, and at the University of Nashville, Tennessee, and subsequently engaged as a cotton planter and commission merchant. He was elected to the State assembly in 1839-40 and in 1842; to the

State senate in 1843, serving until 1852, and was president of that body in 1845-48. At the Baltimore convention of 1848 he was the recognized leader of the Alabama Democracy, and in 1853-56 was governor of his State. He was the first native-born governor of Alabama, and by his refusal to sign certain bills for aiding railroad companies by State loans he gained the title of the "veto governor." His course was sanctioned, however, by the people, as he was re-elected in 1855, and his measures were sustained by the legislature in the following session. He was a delegate to the Charleston convention of 1860 and opposed secession, but later became a colonel in the Confederate army. He commanded a brigade in the Peninsular campaign, and was conspicuous for gallantry at Seven Pines, but his health compelled his retirement from the army soon afterward, and he took no further active part in the war. He was a member of the State constitutional convention in 1865, and in 1866 was elected to the United States Senate, but was refused admission.

**WINSTON, N. C.** See **WINSTON-SALEM**.

**WINSTON-SALEM, N. C.**, twin city, county-seat of Forsyth County, on the Norfolk and Western and the Southern railroads, 115 miles north of Raleigh and 28 miles west of Greensboro. Winston and Salem have independent municipalities, but as they are one commercially and industrially, they are usually called Winston-Salem. The city is the commercial centre of a fertile agricultural region, especially noted for its tobacco. It is a manufacturing city of importance; the tobacco manufacture is the leading industry; there are large tobacco warehouses, and plug and leaf tobacco factories, representing about \$2,000,000 capital invested; other industrial establishments include chemical works (the largest in the South), roller mills, cotton mills, knitting mills, a box factory, machine shops and foundries. The business is mostly concentrated in Winston, while Salem is mainly residential. The streets are broad and well paved, and there is a large park; the city has an electric railway and two systems of waterworks, one under the ownership of the municipal government of Winston. Of the public buildings the courthouse in the central square of Winston and the city hall and armory are the most notable; in 1904 plans were laid out and soon work was begun on the erection of a United States government building. There is an excellent public school system, including a graded school for colored children; and the city is also the seat of the Salem Academy and College; a Moravian school for young women, founded in 1802; the Salem Boys' School (Moravian), and the Slater Industrial and Normal School, a non-sectarian institution for the colored race. Salem was founded in 1766 by Moravians as a church community. For a number of years the town was governed by the church in affairs secular as well as religious. The Moravian bishop, Count Zinzendorf (q.v.), made the plans for the city and for the government which existed during the first years. The government of Salem is now administered under the revised charter of 1891; the government of Winston under the charter of 1899; in both cases the

mayor is elected every two years. Pop. Winston 17,167; pop. Salem 5,533.

**WINT, Peter De.** See **DE WINT, PETER**.

**WINTCHEVSKY, Morris** (*nom de plume* of L. BENEDICT), Yiddish poet: b. Government of Kovno, Russia, 1856. He received a good education, and his verse first appeared in the periodical *Ha-Magid* in 1873. He was connected with Socialistic propaganda work in London in 1879-1906; and in 1906-14 he edited *Die Zukunft*, a Socialistic periodical published in Yiddish, in New York. He ranks among the leading Yiddish poets and is known also for his satirical and philosophical sketches. In English he is author of 'Stories of the Struggle' (1908).

**WINTER, SIR James Spearman**, Canadian statesman: b. Lamaline, Placentia Bay, Newfoundland, 1 Jan. 1845; d. Toronto, 6 Oct. 1911. He was called to the bar in 1867 and was notably successful in his profession. He served in the Newfoundland House of Assembly in 1874-89, was its Speaker in 1877-78, Solicitor-General in 1882-85, and Attorney-General in 1885-89. He was a judge of the Supreme Court of Newfoundland in 1893-96; and in 1897-1900 he was Premier. He represented Newfoundland at the Washington Fisheries Conference in 1887-88; and in 1890 and 1898 he was a delegate to the London conferences in regard to the French Treaties question. He was also a member of the Anglo-American International Conferences at Quebec and at Washington in 1898.

**WINTER, John Strange.** See **STANNARD HENRIETTA**.

**WINTER, William**, American author and dramatic critic: b. Gloucester, Mass., 15 July 1836; d. 30 June 1917. He was graduated from the Harvard Law School in 1857 and admitted to the Suffolk County bar, but never practised, preferring to devote his time to literature. He published in 1854 a book of verse, 'The Convent, and Other Poems'; and was for a time a successful lyceum lecturer. From 1860 he was a contributor to the *Saturday Press* and other New York periodicals; for several years was assistant editor of the *Albion*; and in 1865 became dramatic reviewer for the *New York Tribune* for which he continued to write until 1909. He was at one time also managing editor of the *New York Weekly Review*; and he has been a frequent contributor to leading magazines and reviews. In addition to his criticism, he became known also for his biographical studies, and his sketches of travel abroad and historic foreign localities. His prose style is one of considerable distinction, and his verse is finished in character. He wrote further 'The Queen's Domain, and Other Poems' (1856); 'My Witness' (1858), poems; 'Thistle-down' (1878), poems; 'Poems,' complete edition (1881); 'The Jeffersons' (1881); 'English Rambles' (1884); 'Henry Irving' (1885); 'Stage Life of Mary Anderson' (1886); 'Shakespeare's England' (1888-1910), chapters of travel and historical study; 'The Wanderers' (1889-92); 'Gray Days and Gold' (1889-1911), and 'Old Shrines and Ivy' (1892), essays on England; 'Shadows of the Stage' (1894-95); 'The Life and Art of Edwin Booth' (1893), and 'The Life and Art of Joseph Jefferson'

(1894); 'A Wreath of Laurel' (1898); 'The Theatre and the Public' (1905); 'Over the Border' (1911); 'Vagrant Memories' (1915). He also edited (1881) the works of Fitz-James O'Brien (q.v.), and 'The Shakespearean and Miscellaneous Plays of Edwin Booth' (1899).

**WINTER**, one of the four seasons, the coldest of the year. Astronomically considered, winter begins in northern latitudes when the sun enters the sign of Capricorn, or at the solstice about 21 December, and ends at the equinox in March; but in its ordinary sense it is taken to include the months of December, January and February.

**WINTER-BERRY**. Several members of the genus *Ilex*, of the holly family, are known by this name, including the inkberry (q.v.). They are all native to eastern North America, but the species commonly indicated by the name is the black alder (*I. verticillata*), and abortive shrub, common in swampy places and along the banks of streams, often overhanging the water. The acute, oval leaves turn black in autumn, and the axillary cymes of tiny polygamodiceous, whitish flowers, are succeeded by brilliant scarlet berries, that are as large as a pea, and are so crowded on the bare branches as to appear verticillate. They remain on the shrub all winter, and twigs are often sold by city florists for winter decoration. The bark of the winter-berry is tonic and astringent, and in infusion has been employed as a lotion for dressing ulcers. The smooth winter-berry (*I. laevigata*) is a handsome shrub at all seasons and is similar to the black alder, but has larger stalked drupes, of a more orange tint, less crowded, and ripening earlier.

**WINTER-CHERRY**, a solanaceous herb (*Physalis alkekengi*) of the south of Europe, cultivated for its ornamental fruit. It is a downy perennial, with semi-decumbent stems and broad deltoid leaves. The axillary, solitary flowers have campanulate five-lobed whitish corollas. The calyces are also five-toothed and campanulate, but in fruit become inflated so that they are like miniature membranous balloons surrounding a pulpy, globose, cherry-like berry, which is edible, well flavored and acidulous, serving chiefly for preserves. These fruit-bladders are of a bright scarlet hue, and glow far into the winter. They will even keep their color for some time when cut. The plants are also known as alkekengi, bladder-herb, strawberry-tomato, etc. The Japanese winter-cherry (*Physalis francheti*) is very similar, but larger, having branches perhaps two feet high, with vigorous, soft, green foliage. They are profusely hung with bright orange-colored translucent lanterns, three inches in diameter.

**WINTER CRESS**. See CRESS.

**WINTER FLOUNDER**. See FLOUNDER.

**WINTER WREN**. See WREN.

**WINTERGREEN**, a name applied to several ericaceous plants which retain their foliage over winter. In eastern North America, the aromatic little *Gaultheria procumbens* (see GAULTHERIA) is generally the plant referred to by this name. It is a low shrub, barely six inches high, found in rocky woods, with creeping stems, half hidden, from which arise erect, reddish branches, bearing ovate glossy leathery

leaves. These are serrate with bristly tipped teeth and are gathered in a tuft at the top of the slender stalk, the fleshy, white or pinkish, urn-shaped flowers nodding underneath. The fruits are bright scarlet, mealy, and spicy in flavor; and are really enlarged fleshy calyces which have enclosed the seed-capsules and assumed the form of a berry. They are sometimes called checker-berries, and remain throughout the winter. The whole plant is aromatic in taste, and is frequently eaten, foliage, berries and all. The spiciness is due to the volatile oil of *Gaultheria* (q.v.) which is a stimulant, astringent and diuretic drug, but is chiefly used for flavoring, confectionery or pharmaceutical preparations. It is a commercial product distilled from the wintergreen where it is plentiful, or from the sweet-birch (*Betula lenta*). The various members of the genus *Pyrola* are called wintergreen, such as the round-leaved wintergreen, a common plant with a few orbicular or ovate, long-petioled, coriaceous leaves. The flowers are somewhat like those of the lily of the valley, and are fragrant. The spotted wintergreen (*Chimaphila maculata*) is another plant found in shady woods. It has a decumbent stem, sending up slender branches, which bear a few lanceolate leaves mottled with white, and several white flowers, tinged with purple. Still another wintergreen is the chickweed-wintergreen (*Trientalis americana*) a spring blooming herb, with a dainty white, starry blossom, poised above a whorl of foliage like tiny peach leaves.

**WINTERHALTER**, vîn'tër-häl-tër, Franz, Xavier, German painter: b. Menzenschwand, near Saint Blasien, 20 April 1806; d. Frankfurt-on-the-Main, 8 July 1873. He was educated at the academies of Munich and Carlsruhe, and also studied a while in Italy. In 1834 he established himself in Paris, where he obtained the patronage of Louis Philippe, and of many persons of note. In like manner he was liberally patronized by the English court. His productions were principally portraits with a few fancy pieces and pictures of genre. In France he painted portraits of Louis Philippe and his queen, of all the members of the Orléans family, of Napoleon III and his empress, and of the prince imperial. He was the favorite court painter in England during the life of the prince consort and executed portraits of the Duke of Wellington, Sir Robert Peel, and other distinguished persons for the queen. His fancy pictures have little other merit than as elegantly composed figure pieces. He finished carefully, and imparted a pleasing and well-bred expression to his faces, with little or no character.

**WINTER'S BARK**, the cortex of an evergreen magnoliaceous shrub (*Drimys winteri*) of the mountains of South America. In commerce this bark is quilled or curved, gray outside, brown internally. It has a peculiar aromatic odor, a very pungent and astringent taste, and serves as a tonic, stimulant and anti-scorbutic drug. Paratudo bark is a variety of winter's bark. There are many substitutes for the drug, and much of the winter's bark of commerce is obtained from the West Indian *Cinamodendron corticosum* and *Canella alba*.

**WINTER'S TALE**, The. 'The Winter's Tale,' by William Shakespeare, was probably

composed, and certainly performed, in 1611; is first known to have been published in the First Folio of 1623; and by all evidence belongs, with 'Cymbeline' and 'The Tempest,' to Shakespeare's latest work. In closely packed and elliptical language, and in verse which tends to break down into prose under the strain of its matter, each play of this group exhibits various and contrasting, even incongruous, materials, loosely linked together to produce from an unhappy and unpromising beginning a romantically happy close. From storm and shipwreck and exile, from slander upon women's virtue, from tyrannical usurpation, lust, and rage, from foul-mouthed charges and unmotivated and almost pathological jealousies and conspiracies, from the death or exposure of children, such "dramatic romances" move on through idyllic love-scenes and lucky voyages to the happy marriage of lovers, the reconciliation of enemies, and the restoration of children and of thrones. These closing works of Shakespeare were perhaps the outcome of a golden sunset mood—the mood which Dowden named "On the Heights"; but they are more likely to have been affected by externals—the vogue of Beaumont and Fletcher's dramatic romances in particular, and more generally by the prevalent Alexandrianism of contemporary taste, which preferred a staccato succession of fortuitous events, contrasted, surprising, picturesque and idyllic, to any closely knit dramatic structure or well-marked connection of action with motive, of scene with scene and of cause with effect.

Satisfying this taste there was present in Elizabethan literature a new ingredient, the Greek prose romances, which the Renaissance had made accessible in editions and translations—the 'Æthiopica' of Heliodorus, the 'Clitophon and Leucippe' of Achilles Tatius, and the 'Daphnis and Chloë' of Longus. Matter from one or more of them had been used by Sir Philip Sidney in his 'Arcadia' and by Robert Greene in several prose tales. From one of these—'Pandosto; The Triumph of Time' (1588, 1607, 1609; often afterward reprinted as 'Dorastus and Fawnia'), Shakespeare in turn took nearly the whole plot of 'The Winter's Tale.'

'Pandosto' is certainly compounded of many simples; and nearly all come from one or another of the Greek romances. Heliodorus gives a hint for Greene's jealous king, and supplies outright his trial-scene, oracle, exposure of child with tokens, finding of child, and restoration of child to a father who, not knowing her, is about to condemn her to death; Achilles Tatius gives the imprisonment and brutal wooing of a maiden by a would-be lover; Longus gives rich details of the exposed child's rearing among the shepherds. 'Pandosto' is a réchauffé of Greek fiction, with all its diversity, loose motivation and fortuitousness.

Most of the foregoing material, taken by Greene from the Greek romances, is in 'The Winter's Tale.' The matters which Shakespeare has discarded are all among those which Greene added—the Queen's death, the King's wooing of his own daughter, the King's suicide. Shakespeare saves Hermione to be restored as a statue come to life; and his Leontes does not woo Perdita or kill himself. Such changes

bring the play still nearer to the Greek romance type; other changes, again, substitute genuine motive and causation for the mere coincidences with which Greene was content; while still others make it probable that for pastoral material Shakespeare went behind Greene directly to a Greek romance, viz., Angel Day's English version (1587) of 'Daphnis and Chloë.' The Greek romances thus, both mediately and immediately, are important "sources" of 'The Winter's Tale.' In fact, this play stands as the typical representative of the Greek romance tradition in English drama.

The dramatic structure of 'The Winter's Tale' is what might be expected of such a tradition. Leontes' jealousy, for example, is not only without justification, but—unlike Othello's—without plausible motive or cause. Again, between Act III and Act IV the play breaks in two: in time there is a lapse of 16 years; in place a shift from Sicilia to Bohemia; in action a complete transference of interest to the affairs of the younger generation. And again at the end the scene shifts back to Sicilia; Perdita's "recognition" and her betrothal to Florizel occur off-stage and are only reported; while the chief interest is finally shifted back again to the restoration of Hermione. Sir Philip Sidney's 'Defence of Poesy' gave by anticipation an amusing censure of the type; and even the most liberal of modern dramaturgists—one who is not in the least under the spell of rules or "unities"—is severe upon these shifts. It is as if Shakespeare had set out to exemplify to the full not only "romantic" content but "romantic" structure.

Yet 'The Winter's Tale' is charming—charming just so far as it is not a type of anything, but is mere Shakespeare. For, as usual, Shakespeare has transmuted his tradition and has added fresh delights. His pastoral is an idyll of the world's springtime—its pure gold foiled just enough by Autolycus's roguery; nothing in all the great gallery of Shakespearean character surpasses in finish and reality Autolycus or the loyal Paulina; nothing in the tragedies is grander than the grand emotional play of the statue scene. What we remember of 'The Winter's Tale' is Perdita's daffodils and Autolycus' patter, Paulina's plain speaking, and above all, Hermione, every inch a queen, moving like some celestial luminary through all her noble phases, from ascendancy, past crooked eclipses, back into the main of light.

'The Winter's Tale' was performed in 1611, in 1612–13, 1624 and 1634; but when revived in 1741, "it was announced as not having been played for nearly 100 years." Morgan's version of it, performed in 1754, was superseded in 1756 by Garrick's ('Florizel and Perdita'), which continued to be performed as late as 1796. Kemble revived the original at Drury Lane in 1802, playing Leontes to Mrs. Siddons's Hermione; and Charles Keene gave it in 1856 as a Greek play. Among celebrated Hermines have been Helen Faucit (1847); Mary Anderson (1887), who played the double rôle of Hermione and Perdita; and Ellen Terry (1906).

For the less familiar views offered above consult Thorndike, Ashley H., 'The Influence of Beaumont and Fletcher on Shakespeare'

(New York 1901); Baker, George Pierce, 'The Development of Shakespeare as a Dramatist' (New York 1907); Wolff, Samuel Lee, 'The Greek Romances in Elizabethan Prose Fiction' (New York 1912); Matthews, Brander, 'Shakespeare as a Playwright' (New York 1913).

SAMUEL LEE WOLFF.

**WINTERSET**, Iowa, city and county-seat of Madison County, on the Chicago, Rock Island and Pacific Railroad, about 45 miles southwest of Des Moines. It is in an agricultural region in which the chief products are wheat, corn and hay. In the vicinity are large stone quarries. It has flour mill, creameries, machine shop and coal and stock yards. It has an extensive trade in farm and dairy products. There are several churches, public and private schools and a public library, founded in 1891, Pop. 2,818.

**WINTERTHUR**, Switzerland, town in the canton of Zürich, on the Eulach, 17 miles northeast of Zürich. It has a fine town-house, a number of fine churches, a gymnasium, and a museum of natural history. Its situation among hills, many of which are clothed with vines, is specially pleasant. Cotton-spinning, cotton-printing, dyeing and the manufacture of machinery are actively carried on. Pop. about 25,333.

**WINTHER**, vîn'tër, **Rasmus Villads Christian Ferdinand**, Danish poet: b. Fensmark, Zealand, Denmark, 29 July 1796; d. Paris, 30 Dec. 1876. He was educated at the University of Copenhagen, and became immediately popular on the appearance in 1828 of his first volume of poems. He was one of the truest interpreters of the Danish national character. Some of his numerous publications are 'Sang og Sagn' ('Song and Legend,' 1841); 'Lyriske Digte' ('Lyrical Poems,' 1849); 'Nye Digte' ('New Poems,' 1850); 'Hjortens Flugt' ('The Flight of the Hart,' 1856), a lyric romance of the Danish Middle Ages, his greatest work.

**WINTHROP**, **Beekman**, American government official: b. Orange, N. J., 18 Sept. 1874. He was graduated at Harvard University in 1897 and took the degree of LL.D. there in 1900. He was admitted to the bar in 1899. In 1900 he went to the Philippine Islands as private secretary to the governor, William H. Taft, whom he later served as assistant executive secretary and as acting executive secretary; and in 1903-04 he was a judge of the Court of First Instance. He was governor of Porto Rico in 1904-07; Assistant Secretary of the Treasury in 1907-09; and Assistant Secretary of the Navy in 1909-13. He has since been engaged in banking in New York.

**WINTHROP**, win'thróp, **Fitz-John**, American colonial governor, son of John Winthrop (1606-76) (q.v.): b. Ipswich, Mass., 14 March 1638; d. Boston, Mass., 27 Nov. 1707. He studied at Harvard and afterward in England, where he served in the army of the Protectorate until the Restoration. Returning to Connecticut in 1663 he was elected to the assembly in 1671, served as major in King Philip's War, and in 1686 as a member of the council of Governor Andros. He was a magistrate in 1689, major-general commanding the expedition against Quebec in 1690, Connecticut agent at

London 1693-97, and governor of Connecticut from 1698 till his death.

**WINTHROP**, **James**, American jurist, son of John Winthrop (1714-79) (q.v.): b. Cambridge, Mass., 1752; d. there, 26 Sept. 1821. He was graduated from Harvard in 1769, was librarian there 1772-87, and for several years was chief justice of the Massachusetts Court of Common Pleas, and register of probate. He published 'An Attempt to Translate the Prophetic Part of the Apocalypse into Familiar Language' (1794); 'Systematic Arrangement of Prophecies relating to Antichrist' (1795), etc. His library was bequeathed to Allegheny College, Meadville, Pa.

**WINTHROP**, **John**, American colonial governor: b. Edwardston, near Groton, Suffolk, England (O. S.) 12 Jan. 1606; b. Boston, Mass. (O. S.) 26 March 1649. He studied at Trinity College, Cambridge, was admitted to the law and, according to the testimony of Cotton Mather, was commissioned at 18 a justice of the peace. His earlier years were spent on his estate of Groton Manor, but his Puritan tendencies and the current of his political sympathies presently interested him in plans for colonization in America. When in 1629 a charter was obtained creating a corporation under the name of the "Governor and Company of the Massachusetts Bay in New England," the piety, learning and talents of Winthrop led to his election as governor. Converting his hereditary estate, yielding an annual income of £600 or £700, into money, he set sail in the *Arabella* from Yarmouth in the spring of 1630, with a company of about 900 persons. On the voyage he composed a small treatise, entitled 'A Model of Christian Charity.' On 12 June (O. S.) they arrived at Salem, Mass., and the government was immediately transferred to him by Endicott, who had been the acting governor for two years by authority of the London company, before the transfer of the charter to New England. He was re-elected every year until 1634, when his popularity had somewhat declined, partly on account of his long continuance in office. In 1636, when Sir Henry Vane was elected governor, Winthrop was chosen deputy governor, and during this and the following year occurred the celebrated controversy in regard to Mrs. Hutchinson and her doctrines. In this matter Vane and Winthrop were on opposite sides, and in the election of 1637 the latter was chosen governor over Vane. The inhabitants of Boston, however, were friendly to Vane and Mrs. Hutchinson, and Winthrop was at first slighted by his neighbors. Subsequently he engaged in a controversy with his defeated opponent in regard to the alien law passed by the general court. He was re-elected every year until 1640; and in 1642 the troubled state of the colony induced the settlers to call him again to the head of the government. He was again elected in 1643, in the two following years was made deputy governor, and in 1646 governor again, which office he continued to hold the remainder of his life. In his principles Winthrop was opposed to an unlimited democracy; and when the people of Connecticut were forming a government, he wrote them a letter in which he said that "the best part of a community is always the

least, and of that best part the wiser part is always the lesser." But he was attached to civil liberty, disinterested, pure and conscientious. "It would be erroneous," says Palfrey, in speaking of the Commonwealth of Massachusetts, "to pretend that the principles upon which it was established were an original conception of Winthrop's mind; but undoubtedly it was his policy, more than any other man's, that organized into shape, animated with practical vigor, and prepared for permanency, those primeval sentiments and institutions that have directed the course of thought and action in New England in later times." Winthrop kept a journal containing an account of the transactions in the colony down to the year 1649. The first two books were first published in 1790, and the manuscript of the third, which was for a long time lost, was found in 1816 in the tower of the South Church. The three were published in a revised edition, entitled 'The History of New England from 1630 to 1649' (with notes by James Savage, 1825-26). Consult 'Collections of the Massachusetts Historical Society' (3d series, Vols. IX and X); Earle, A. M., 'Margaret Winthrop' (New York 1895); Twitchell, J. H., 'John Winthrop' (in 'Makers of America Series,' New York 1891); Whitmore, 'Notes on the Winthrop Family and its English Connections' (1864); Winthrop, R. C., 'Life and Letters of John Winthrop' (Boston 1864-67).

**WINTHROP, John**, American colonial governor, son of Gov. John Winthrop, of the Massachusetts Bay Colony: b. Groton Manor, Suffolk, England, 12 Feb. 1606; d. Boston, Mass., 5 April 1676. He was educated at Bury Saint Edmund's Grammar School, at Trinity College, Dublin, and at the Inner Temple, London, where he studied law. He obtained a commission in the army, and served with Buckingham in the expedition for the relief of the Huguenots near La Rochelle, France, in 1627, went in the following year to Turkey as an attaché of the British embassy, traveled in various countries of Europe, in 1631 joined his father in Massachusetts, where he became governor's assistant, and in 1633 settled at Ipswich, of which he was one of the principal founders. Obtaining a commission under a grant to the Earl of Warwick, he founded Saybrook, at mouth of the Connecticut River, in 1635, built there a fort, and was made titular governor. In 1645 he removed his family from Boston to Pequot Harbor, and in the following year founded New London. After the union of Saybrook with Connecticut he became a magistrate of the increased colony (1651), and from 1657 to the end of his life served almost continuously as its governor. He was bearer to Charles II (1662) of a loyal address from the Connecticut government, and received from the king a suitable charter for the colony. Under an equally favorable charter he secured the union of the Connecticut and New Haven colonies. He was one of the commissioners of the United Colonies of New England in 1675. A student of physics and chemistry, through his scientific attainments he became a member of the Royal Society, to whose 'Transactions' he was a contributor. Consult Waters, T. F., 'Sketch of the Life of John Winthrop, the Younger' (Cambridge, Mass., 1899).

**WINTHROP, John**, American physicist, great-grandson of John Winthrop (1588-1649) (q.v.): b. Boston, 19 Dec. 1714; d. Cambridge, Mass., 3 May 1779. He was graduated from Harvard in 1732, and from 1738 until his death was Hollis professor of mathematics and philosophy there. He was one of the most important American scientists of the 18th century and exercised much influence upon the scientific thought of his contemporaries, in particular upon Franklin and Count Rumford (q.v.). He noted the transits of Mercury in 1740 and 1761, going to Newfoundland in the latter year for this purpose in a vessel supplied by the Massachusetts Province. He twice declined the presidency of Harvard, was for some years a judge of probate for Middlesex County, and was a member of the governor's council 1773-74. He was a prominent advocate of political liberty. He published 'Lecture on Earthquakes' (1755), and is sometimes claimed as the founder of the science of seismology. He published 'Answer to Mr. Prince's Letters on Earthquakes' (1756); 'Account of Some Fiery Meteors' (1755); 'Two Letters on the Parallax and Distance of the Sun as deducible from the Transit of Venus' (1769).

**WINTHROP, Robert Charles**, American political leader: b. Boston, Mass., 12 May 1809; d. there, 16 Nov. 1894. He was graduated from Harvard in 1828, studied law with Daniel Webster, and was admitted to the bar in 1831. He soon became active in political life, allying himself with the Whig party, and in 1834 was elected to the Massachusetts legislature, where he served five years, being speaker of the house for three years. In 1840-50 he was a member of Congress, and in 1847-49 speaker of the House of Representatives. In 1850, on Webster's resignation from the Senate, Winthrop was appointed his successor for the unexpired term, but in 1851 failed to secure election to the Senate. In 1851, as Whig candidate for governor, he received a plurality of votes, but the constitution at that time required an absolute majority for election; the election, therefore, went to the legislature, where he was defeated. During his term in Congress he had shown himself a conservative, and, though opposed to the extension of slavery, and to the Mexican War, he had no sympathy with the extreme abolitionists, and desired compromise between North and South. His defeat was due, therefore, to a coalition between the Free-Soilers and the Democrats in the Massachusetts legislature. After the Whig party dissolved, he took no prominent part in political work; he did not join the Republican party, but occasionally spoke in behalf of the Democrats, though not actively affiliated with them. He made frequent public addresses on various national anniversaries and occasions, being the chief speaker at the laying of the cornerstone of the Washington Monument in 1848, and on the completion of the work in 1885. He was president of the Massachusetts Historical Association for 30 years, and had a leading part in the organization and direction of the Peabody Education Fund (q.v.). He wrote 'Life and Letters of John Winthrop' (1864-67); 'Washington, Bowdoin and Franklin' (1876); 'Memoir of Henry Clay' (1880).

lt Winthrop, R. C., Jr., 'Memoir of Winthrop' (Boston 1897).

**WINTHROP, Theodore**, American novelist: b. New Haven, Conn., 22 1828; d. Big Bethel, Va., 10 June 1861, as graduated at Yale in 1848; traveled widely in Central and South America; a lawyer at Saint Louis; was admitted to the New York bar in 1855, and joined the 5th New York regiment in 1861. The *Atlantic Monthly* from June to September of 1862 contained sketches which he had written of early war scenes. He was killed at the head of an assaulting column of Northern soldiers at Big Bethel. He left completed manuscripts for five volumes of novels and essays; 'Dreeme' (1861); 'John Brent' (1862); 'Brother-toft' (1862); 'The Canoe and the Fish' (1862); and 'Life in the Open Air' (1863). These passed through many editions, and were reprinted in the 'Recreation Series,' with the addition of 'Life and Poems,' edited by his sister, Winthrop Johnson (New York 1884).

It also a memoir by George William Currier prefixed to the earlier editions of 'Cecil' (1862).

**WINTHROP, Me.**, town in Kennebec county, on the Maine Central Railroad, 20 miles northeast of Lewiston and 10 miles west of Augusta. It has oil-cloth factories, woolen agricultural implement works, a corn and a grist mill. There are six churches, a school and graded elementary schools, and a State bank. The oil-cloth industry began in Maine, in 1845, by C. M. Bailey of Winthrop. Pop. about 2,114.

**WINTHROP, Mass.**, town in Suffolk county, on Massachusetts Bay and on the Boston and Lynn Railroad, about 15 miles northeast of Boston. It is a popular resort and a favorite residential section of Boston. The town was originally a part of Chelsea, then of Chelsea and later of North Chelsea. In 1852 it was set off and incorporated. It contains many features of historic interest, chief of which is the Dean Winthrop built in 1649. It has also Forts Heath and Winthrop, the Winthrop Shore Reservation, Galls Park, and the Frost Public Library. 12,758.

**WINTHROP NORMAL AND INDUSTRIAL COLLEGE OF SOUTH CAROLINA**, an educational institution for white students, founded at Rockhill, S. C. in 1886. It is a normal and industrial training and is supported by State appropriations, but about half of its property, which is valued at \$1,000,000, has come from other sources State funds. It admits girls of 15 years or over. Tuition fees are low and in case of indigence they are dispensed with, and living expenses are reduced to a very low figure. Combined departments enroll about 1,300 students, and its staff numbers about 100. It includes a summer school. There are 18,000 books in the library. The plant and grounds valued at \$900,000.

**WINTHROP, Pa.**, borough in Lackawanna county, on the Lackawanna River, eight miles east of Scranton, on the Delaware, Lackawanna

and Western and the New York, Ontario and Western railroads. It is chiefly occupied in coal mining. Pop. about 5,280.

**WINTUN** ("people," "Indians"), a group of tribes, which, with the Patwin group, form the Copehan linguistic stock of North American Indians. The habitat of the stock is northern California from Mount Shasta, including the headwaters of the Sacramento and the valley of McCloud River; thence southeastward along the Sacramento Valley to the mouth of Chico Creek, from which point to its mouth the Sacramento forms the southeastern boundary. On the west the Coast range intersects the territory of the Copehan stock, the westernmost limit of which extends almost to the south branch of Trinity River, about lat. 40° 30' N. From the latitude of Cape Mendocino the Coast range forms the western boundary as far as John's Peak, whence it crosses the Coast range line southeastwardly to Sycamore Bay. The tribesmen live largely by hunting, although various roots, nuts, berries, farinaceous seeds and clover blossoms form part of their subsistence. They are fond of water and are constant bathers in the streams that drain their country. Salmon are caught with spears, in the use of which they were exceedingly expert. Their weapons were formerly bows and arrows, and slings. They were indifferent hunters, but were successful in ensnaring deer in traps of their own construction. The population of the score or more of tribes forming the stock is not known, only the Nomlaki and the Wailaki being officially recognized. These are under the Round Valley Agency and are small in number.

**WIRE, Manufacture of.** At the present time all wire is made by the drawing process, and while permitting the production of a much thinner wire than could be obtained from the rolls, it also gives a wire of greater tensile strength, so much so that the smaller the size to which the wire is drawn down, the greater is its ultimate breaking strength per square inch. The breaking strength of English piano wire ranges from 225 pounds for No. 12 music wire, which is 0.029 inch in diameter, to 650 pounds for No. 22, which is 0.052 inch in diameter, indicating an ultimate tensile strength, ranging from 300,000 to 240,000 pounds per square inch. This wire shows a content of carbon, 0.570 per cent; silicon, 0.090 per cent; sulphur, 0.011 per cent; phosphorus, 0.018 per cent; and manganese, 0.425 per cent.

In the past all classes of iron wire were made entirely from wrought iron and required very careful preparation of the raw material to insure toughness and high tensile strength; but, with the discovery of the Bessemer and the open hearth converting processes, and the consequent lowering of the cost of production accompanied by an enormous increase in the strength of the raw material, wrought iron was quickly supplanted by mild steel. The great increase in the strength of steel wire over that of wrought iron may be better appreciated from the following statement of facts: The ultimate tensile strength of the best bright, hard-drawn wrought-iron wire is about 70,000 pounds to the square inch, while that of ordinary Bessemer steel is 80,000 pounds, and that of open-hearth steel is 120,000 pounds to the

square inch. In the special grades of wire manufactured from high carbon, open-hearth steel, the values range from 200,000 pounds to 340,000 pounds per square inch.

A description of the process of manufacture may be begun with the billets. The bulk of the wire of commerce is made from Bessemer steel billets, while open-hearth billets are worked up into rods for the manufacture of chain, for special grades of wire and for various finished products requiring great tensile strength. The reduction of the billets to the rods which are the raw material of the wire-drawer is done by a rolling-mill (q.v.). The billets are generally stored near the continuous heating furnaces located at the upper end of the rod mill. In the larger plants, when the mill is in full operation, four furnaces are continually at work, with a fifth held in reserve. The billets, which are  $4 \times 4$  inches in section, and 36 inches long, are fed into the furnace transversely, one by side, and are pushed through the furnace door by a hydraulic charging machine. After they have been heated to the right temperature for rolling, they are pushed out, one after the other, through the rear door of the furnace on to a conveyor which takes them to the rod mill, where they are passed through the roughing rolls. This mill consists of eight pairs of rolls, and by its operation reduces the billet from its section of  $4 \times 4$  inches to a rod of three-fourths of an inch square and of great ultimate tensile strength. The alternate pairs of rolls are provided with different shaped grooves so as to press the rods into shapes alternately square and oval, oval and round, etc., thus working the metal thoroughly and improving its qualities. In the eighth pair of rolls the grooves are one-fourth of an inch square, and from them the rods are carried to the finishing mill where they are given 10 more passes and brought down to the required dimensions.

The finishing mill lies at right angles to the roughing mill with its 10 pairs of rolls arranged side by side. As the rods issue from one pair of rolls, they are seized with a pair of tongs by workmen who bend them around and feed them into the next pair. The rapid increase in length is accommodated by the increased speed of the successive pairs of rolls, that of the 10th pair being about 1,350 feet per minute, or about 15 miles per hour. The entire operation of rolling down the billet to a finished rod one-fourth inch square and about a quarter of a mile long, is accomplished in one heat. The smallest size of rod produced in the rolling mill is three-sixteenths of an inch in diameter. As the rods issue from the last pair of rolls, their ends are seized and attached to the drums of the reels on which they are wound into coils of convenient size, and then dropped upon a conveyor, by which they are carried to the wire mill. In the wire mill, the coils are thoroughly cleaned of scales, oil and dirt by being placed in wooden tanks containing a weak solution of sulphuric acid. They are then placed in lime, and then in the bakeries and dried thoroughly. Up to this point the product is technically known as "rods," and only after it has been drawn to a smaller diameter, at least to one-fifth of an inch, is it known under the commercial designation of "wire."

The wire-drawing machine consists of a stout bench upon which is mounted a cast-iron drum, around which the wire is wound as it is drawn through the dies. In drawing, the coil of rod is placed on a spool fastened to the floor of the shop near the end of the bench, and the end of the wire having been swaged down, it is inserted in the larger end of the hole in the die-plate, passed through and caught by the tongs attached to the drum which is revolved until the entire coil has been drawn down. The die-plate is a heavy block of cast steel in which are set several dies of various sizes, the latter made of the hardest chrome steel. The hole in the die is conical, the smaller end being the size to which the wire is drawn. In forming the die this opening is made smaller than required and enlarged to the correct size by driving a suitable punch into it—the compression thus exerted increasing the hardness of the drawing surface in the die. The sockets in the die-plate into which the dies are set are slightly conical and as the dies wear to a point at which the wire becomes too large, the dies are driven further into the die-plate, thus reducing the opening and are again sized with the punch. Once started the speed of the drum must be constant or the wire will be of uneven diameter, becoming slightly smaller when the mill is stopped.

Drawing is by the wet or dry process. The latter is used in drawing from No. 6 (B.W.G.) to No. 18, the lubricant employed being tallow and talc. The former is used for the higher numbers, the lubricant being a mixture of meal flour and water. By some wire-drawers the efficacy of stale beer is highly praised. After being drawn through several successively smaller dies the wire becomes hard and has to be annealed before the process can be continued. The annealing is followed by pickling, washing and heating to free it from scale. No. 6 wire can be drawn down to No. 11 in three passes, but from No. 14 down to No. 22 requires seven passes. To reduce the rod one-fifth of an inch in diameter to wire of one-twenty-fifth of an inch in diameter requires 12 drawings and three annealings. The speed at which the wire is drawn through the dies varies with its size and the kind of metal used—from 12 inches to 45 inches per second. Steel wire averages a speed of about 800 feet per minute; iron and brass, 1,000 feet per minute; and copper and silver about 1,200 feet per minute. For the very finest wire the dies are of diamond or ruby.

In drawing wire the centre or core of the metal rod is pulled forward, the outer surface being held back by the friction of the die. The consequence is that a series of strains is set up in the wire which seriously affect its strength and this condition is removed by placing the coils in the annealing pots, where they are carefully sealed with sand to exclude the air, and are then exposed to a steady heat for a period of eight or nine hours. Of the total finished product taken out of the annealing pots, a portion is ready for the market without any further treatment; a portion is galvanized; but a considerable portion is converted into wire-cloth, wire nails and barbed wire. See NAILS.

Not all wire manufacture, however, is as

simple a process as described above. In the making of tungsten wire for electric lamps it is necessary to develop a fibrous condition in the naturally brittle metal. This is accomplished by rolling and hammering rods of the metal while it is red-hot. The operation of drawing also must be done with the hot metal. As tungsten is very hard the dies (of high-speed tool-steel) are quickly worn away. The heat and pressure at which the metal has to be drawn renders the ordinary oily or fatty lubricants of no avail and the only lubricant found effective is fine graphite. This is smeared in paste form over the rod as it passes to the die, and just before it reaches that point a flame heats the rod and its graphite ointment to a red heat, burning in the graphite to a glossy black coating which so adheres that the lubrication lasts for passes through several successive dies. For the finest sizes of tungsten wire the dies are diamonds.

Barbed wire is manufactured in various patterns. The general process may be outlined by a brief description of the machine employed in making what is known as 2-point Glidden barbed wire. Four coils of wire on reels are placed behind the machine. The wire from two of the reels serves to form the strands, while that from the other two is used to form the barbs. The two strand wires, which are larger than the other two, are led between a pair of friction wheels and pulled to a proper tension and then crossed by the other two transversely, one on each side. At fixed intervals of a few inches, according to the desired spacing of the barbs, the two barb wires are caught by a pair of revolving fingers and twisted around one of the strand wires, and at the conclusion of the twist, two pairs of shears cut the ends of the barbs diagonally into sharp points. The wires then pass into a combined winding and twisting machine, by which the two strand wires are twisted around each other, and then to the spool where it is wound up ready for the market. When once started, the operation of wire making is continuous and rapid. The barbed wire used in trench warfare has from two to four times as many barbs as that for fencing cattle and requires additional reels and cutters in its production.

Wire in its several sizes is designated by number according to a scale or "gauge," depending on its diameter. Several different gauges are in vogue in the United States and cause considerable confusion to the uninitiated. The Bureau of Standards at Washington recommends for ordinary steel wire the American Steel and Wire Company's gauge. For piano wire the bureau recommends the same company's "Music Wire Gauge." For copper wire and wire of all metals and alloys other than iron and steel the gauge in commercial use is the Brown and Sharpe wire gauge — also called the "American Wire Gauge." The Birmingham wire gauge (B.W.G.) has been officially adopted by Congress, and is in use by the United States Treasury Department in laying duties on importations. It is almost obsolete in economic practice. Consult Smith, 'Wire: Its Manufacture and Uses' (New York 1891); Allen, H., 'Metallurgical Manual of Iron and Steel' (London 1911); Charnock, G. F., 'Mechanical Technology' (London 1915); Kiudl, F. H., 'Rolling Milling Industry' (Cleveland, Ohio, 1913).

**WIRE AND WIRE DRAWING.** Wire is defined as metal elongated into a long thread-like form of thicknesses varying from one and one-quarter inches to less than 1/1000 of an inch, each size uniform throughout the piece; these threads having usually the cylindrical form, but they may be square, flat, oval or ribbed, in which case they are known as "shaped wire." The process by which wire is formed is known as drawing. Essentially, this consists in forcibly pulling a suitably prepared piece of the metal thus worked through a series of holes made in hardened steel dies set in a draw-plate, and which successively diminish in diameter. In this way the cross section of the wire is gradually reduced to that of the last hole through which it is drawn; its length, meanwhile, being correspondingly and greatly increased. As a consequence, wire can be produced only from such metals as are susceptible in this way of being pulled out or extended by stretching into rods. Such metals are said to be drawable, or to have the property of ductility. This property is not to be confounded with that of malleability, namely, that in virtue of which a metal is laminable, or admits of being hammered or rolled into thin plates; since the same metal is often malleable and ductile in very different degrees. Thus, while gold possesses both these properties in an extreme, and probably in the highest known degree, iron is ductile in a degree far beyond that in which it is malleable, and with tin and lead the reverse is true. Of the familiarly known metals, the most ductile, and in the order named, are gold, silver, platinum, steel, iron, nickel, copper, brass, zinc, and lead; while some of the ordinarily brittle metals when made perfectly pure, as bismuth, are said to possess very high ductility. In early times metals were brought to the filamentous form only by means of beating them under the hammer into thin plates, then dividing these by cutting instruments into narrow strips, and finally rounding with the hammer and file. The earliest known mention of "wire drawers" and "wire millers," as those who produced wire by drawing were variously called, occurs in 1351 and 1360, in the histories respectively of Augsburg and Nuremberg, the previous accounts being only of "wire smiths," or those who fabricated wire with the hammer. The change from the old to the new method was accomplished, or very soon followed, by the introduction of a machine by which wire was successfully produced without direct aid of the hand; this machine, probably the invention of one Rudolf, of Nuremberg, was impelled by water power. The precious metals appear to have been the first subjected to this process — brass and iron not until some time later. White wire, or *blanch* iron wire, is mentioned in a list of articles not to be imported into England in 1463; and in 1484 both iron and latten (fine brass) wire are similarly named. Up to 1565 English iron wire was drawn by hand only, and was of so poor a quality that most of that used in the country, and also wool cards and other articles involving the employment of wire, were imported. As late as 1600 there was no wire mill in England; but in that year patents were granted to manufacture wire in England. In the history of United States industries the first mention of wire drawing occurs in the annals of the town

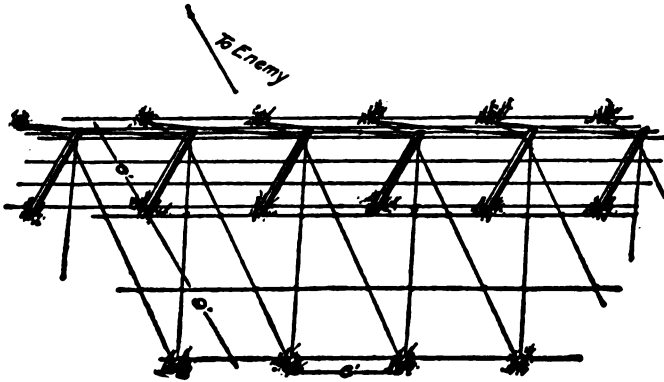

of Lynn, Mass., where it is recorded that in 1666 Nathaniel Robinson, a "wyer-drawer" petitioned the court for aid in carrying on his trade. This was refused at the time, but later the court authorized the purchase of instruments and tools for this industry and granted a bonus for its encouragement. In 1775 a wire factory was established by Nathaniel Niles in Norwich, Conn., and in 1788 a large wire mill was running in Dedham, Mass., making wire for cards and fishhooks. Pittsburgh had a wire factory in 1791. In 1834, however, there were only three wire mills in all the United States, and their total output was 15 tons for that year. It is worthy of note that one of these original three mills—that at Worcester, Mass.—is now the largest wire producing plant in the world.

The 1914 census of manufactures reported that in that year there were 99 establishments drawing wire in the United States; 54 being strictly manufacturers of wire and 45 being

party should consist of 32 workers, if possible exclusive of non-commissioned officers. Form the party in two ranks and number them in threes, both front and rear ranks. The left file is not numbered. For the sake of explanation letters are given to these parties of three as follows:

ooo	ooo	ooo	ooo	ooo
B	D	F	H	K
ooo	ooo	ooo	ooo	ooo
A	C	E	G	I

**Duties of Parties.**—Parties A and B go out almost simultaneously. Party A drives the first row of pickets and so needs a maul. The maul man should be tall. One man mauls, one supplies the pickets, one paces the three yards and holds the pickets for driving. Keeping close up so as not to lose the pickets, comes party B with a coil of barbed wire, a pair of wirecutters and two pairs of hedging gloves. All wire parties carry similar equip-

Double Apron Entanglements.

rolling-mills which drew wire in addition to their other business. Of the entire number 68 drew iron and steel wire; 28, copper wire; 28, brass wire; and 16, wire of other metals. Their equipment totaled 51,181 blocks and their total capacity was 3,852,000 tons of wire per annum. The 1914 output of these mills amounted to 2,435,530 tons of steel and iron wire; 138,924 tons of copper wire; 19,491 tons of brass wire; 106 tons of bronze wire; 375 tons of German silver wire; and 2,981 tons of wire of other metals. The aggregate value of the year's production was \$172,600,546.

The modern system of wire drawing is described under WIRE, MANUFACTURE OF.

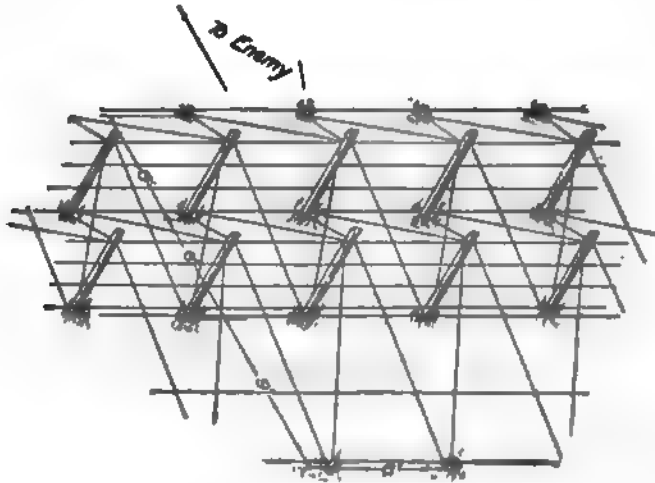

**WIRE CLOTH**, a sieve-like fabric whose woof and weft are of wire, the size of the wire, the shape and sizes of the meshes, being adapted to the uses of the completed screen, sifter, or sieve, or the character of the machine in which it is to be used.

**WIRE ENTANGLEMENTS.** By general consent the barbed wire entanglement has become the standard military obstacle. It was highly developed on the Western front during the European War 1914-18, the principal developments being along the line of simplifying the construction and in the use of artillery fire to open a passage for the artillery troops. In constructing "low wire entanglements," the

Starting at the anchor picket, party B runs out to the first straight wire, one man holding and uncoiling the wire, the other two taking round turns, each taking the turns on alternate pickets. About six yards behind is party C, a picket party which drives the second row of pickets, one man again mauling, one holding and pacing, one supplying pickets. This party measures the position of each picket from the front row by going to each picket in the front row, pacing one and one-half yards along the line, turning at right angles and pacing three yards and then planting the picket; this eliminates cumulative errors. Starting six yards behind C comes party D, which works on the same system as B and puts on the diagonal, keeping behind its own wire. Party E runs out the first loose wire, starting about 12 yards behind D. One man holds the coil and unwinds it. One man places the wire in position on the diagonal. The third man clips the loose wire to the diagonal. Party F comes 13 yards behind E and runs out the second straight wire, Party G drives the third row of pickets, measuring the position of each from those of the second row. Party H starts six yards behind G and puts on the second diagonal. Party I starts 12 yards behind H and runs the second loose wire. Party K starts 13 yards behind I and completes the bay with the third straight wire. The direction is kept by the men of the

left file, who provide themselves with a piece of string or tape, equal in length to the distance from the parapet to the front edge of the wire. They go out with party A. One man places himself at the foot of the parapet with one end of the string in his hand. The other runs the string out until it is taut. The man on the parapet keeps the string always perpendicular to the general line of the parapet. The other man keeps it taut and moves along with party A. Work can be done with parties of two men, but if one is hit the work is disorganized. If there are fewer parties the same party may have to do two or more parts of the work. Thus, if there are only six parties A will also do G's work. B will do H's, C will do I's, D will do K's. The pickets must be driven far enough in the first instance. If they have to be driven after the wire is on, the wire will be too low. Mauls should be muffled with sandbags nailed on.

strand of barbed wire is run along the top of each row of French wire, being fastened to the pickets with a round turn six inches above the French wire. These strands of barbed wire are pulled as taut as possible and are twisted on the French wire with a staple, peg or pair of wire cutters close to each picket and in several places between the pickets. This barbed wire supports the French wire. The two rows of French wire are about two feet apart and tied together by a diagonal strand of barbed wire running from the tops of the pickets of one row to the tops of the pickets of the other row. In addition a strand of barbed wire is run along the front of the front row of French wire and twisted to it. This is partly to hold up people trying to crawl through and partly to hold the French wire together, should it come loose from the fastenings. This wire is usually called the "apron wire." After this more apron wire can be added or loose wires

Double Fence Entanglements.

**French Wire.**—This consists of a continual spiral of plain wire three feet six inches in diameter, each turn of wire being clipped to the turns on both sides in five places. When closed up it looks very much like a coil of plain wire, but when pulled out it makes a cylinder of wire mesh. Each small coil pulls out to the length of 20 yards. A big coil consists of five small coils. The extended coil can be easily crushed down by throwing a weight on the top and must, therefore, be supported by pickets and barbed wire. It is easily carried and quickly put up. It is held in place by iron staples five inches long. The number of men required for a party is 26. Two men keep the direction with a string as for low wire and the remaining 24 are divided into parties of three as for low wire. Two or more rows of French wire make an obstacle. Each small coil is stapled down in five places; that is, at each end, one-fourth, one-half and three-fourths of the way along. Where two coils meet the same staple fastens down both coils. Pickets five feet long are driven into the centre of the coils in five places as for the staple. These pickets should be driven in at least a foot. A

may be inserted between the two rows. Where opposing trench lines are very close together, stakes cannot be driven for the usual form of wire entanglement on account of the noise of driving, which would draw fire. If not too close to the enemy, iron rods with a screw end may be used in lieu of stakes; these may be three-fourths inch in diameter with one or two loops in their length to which to fasten the wire. In ordinary ground such rods can be screwed into a firm hold without noise. When the enemy is too close for this, various forms of portable obstacles in the nature of *chrous de frise* are employed. These are made up at the depots, brought forward through the trenches and tossed out in front by day or by night.

The "high wire entanglement" is a general way to the low entanglement. It is four to six feet in height. It consists of three to five rows of staples of barbed wire. In addition to the staples are wires connecting the tops of the rows and diagonal wires running from the top of one stake to the bottom of all adjacent stakes. The side toward the enemy should

an ordinary wire fence. Slight irregularities in height of stakes and arrangement of wires add to the value of the obstacle. Openings for the passage of troops through wire entanglements are generally about 10 yards wide and are placed so that two belts of wire overlap the openings. The continuity of the obstacle may be observed by using gates or barriers that can be quickly opened and closed.

The best place for the openings is at the flanks of the supporting points, points between the wire entanglements around the supporting points and those in the intervals. If these openings must be placed in the intervals on account of the terrain, they must be covered by the close fire of sections of trench placed immediately in rear. The maintenance of a wire obstacle requires constant care. It should be inspected every night, and a few men should be detailed in each company as a permanent wiring party for the repair and improvement of the obstacle. In addition to barbed wire, a charged electric wire is at some places maintained. The wire is charged in section so that in a case of a ground only the section affected will be out of service instead of the entire wire.

EDWARD S. FARROW,

*Consulting Military and Civil Engineer.*

**WIRE GAUGE**, an instrument or mechanism for measuring the thickness of wire and sheet metals. It is usually a plate of steel having a series of apertures around its edge, each corresponding in width to the diameter of wire of a certain number. Commercially the standard sizes of wire conform to certain recognized gauges of which the Birmingham wire gauge is used in Great Britain and the American wire gauge in the United States. In 1893 a law was passed authorizing a standard gauge for the United States, for plate iron and steel. This gauge is somewhat used for wire and varies from No. 000,000— $\frac{1}{16}$  inch to No. 38— $\frac{1}{16}$  inch. A special gauge has been developed for measuring electrical wires in units which are called circular mils. Consult 'Mechanical Engineer's Pocket Book' (latest issue) and 'Circular No. 31' of the United States Bureau of Standards.'

**WIRE GLASS**, a modern invention used in building construction, being a combination of wire and glass. Wire glass is either ribbed, rough rolled, polished plate or "maze," having wire netting imbedded in its centre during the process of manufacture. The temperature at which the wire is imbedded in the molten glass insures cohesion between the metallic netting and the glass, and the two materials become as one, so that if the glass is broken by shock, by intense heat or from other cause it remains practically intact. It combines the strength of the wire netting and the glass plate, and the wire is so thoroughly covered as to obviate the possibility of rust or corrosion. Wire glass will break, but it will not scatter. It can be fractured, but it will retain its place, and the perils incident to falling glass and the ingress or egress of draft and flame are avoided.

The first attempts to introduce a metallic mesh into the body of the glass were for the purpose of increasing its strength and to pre-

vent its falling apart when broken. In this respect the product has been thoroughly developed, but in addition it has proved to be one of the most remarkable fire retardants available for building purposes, and in view of the exceptional hazard attaching to window and skylight openings in all buildings, its use as a fire retardant is outranking in importance as well as quantity its other values. Many experiments have been made to develop different processes of manufacturing wire glass, but, owing to the

Wire Glass Fire-Proof Window

inherent difficulties of maintaining the homogeneous quality of the glass, preventing damage from excessive heat to the wire and securing a practical central location of the wire in the body of the glass only two methods have proved effective. One of these, known as the Shuman process, from the name of its inventor, Frank Shuman, of Philadelphia, consists of rolling a sheet of glass, laying the wire mesh upon the body of the glass, pressing the same into it instantly and while still plastic, and by a coincident process, smoothing over the slight abrasions made in the surface of the glass so as to secure a true and smooth surface on both sides. The other process known as the Appert process, from its inventor, Leon Appert, of France, involves the rolling of one sheet of glass, laying the wire mesh upon this sheet and immediately and by a simultaneous and continuous process pouring and rolling a second sheet upon the top of the wire so as to completely imbed it and secure at the same time an absolutely solid single sheet of finished glass. Wire glass is now made in all the varieties known to the rolled glass process, including rough or hammered, ribbed and figured glass. Wire glass is also polished like plate glass, giving an entirely clear and transparent glass, and is largely used in fireproof office buildings where there is any external exposure to fire.

The mechanical strength of plate glass is effectively increased by the introduction of the wire mesh, so that it will submit to much

greater strains, and in fact one of its first purposes and effects was to eliminate the necessity for using in skylights one-half inch glass, it having been proved that by using one-quarter inch wire glass all the requirements were met, the breakage risk decreased and a very large factor of weight and expense in structural material eliminated. See GLASS MANUFACTURING IN AMERICA.

**WIRE NAILS.** See NAILS.

**WIRE ROPE,** a variety of ropes of iron or steel wire extensively employed in raising and lowering apparatus in coal mines, as standing rigging for ships, as substitutes for chains in suspension bridges, and for telegraph cables. Endless wire ropes or cables are also used on traction railways, and in transmitting power over long distances where ordinary belting would prove unsuitable. A special type is used for the controls in aeroplanes. Wire ropes were used in 1822 for a suspension bridge at Geneva, and for a similar structure of great span at Freiburg in 1835. Their manufacture, however, is of extreme antiquity, a section of a four-strand wire rope 15 feet in length having been dug up at Pompeii. This rope was of bronze. A variety of machines are in use for making wire rope. The equivalents of round ropes of iron, steel and hemp are here tabulated:

Hemp		Iron		Steel	
Diameter in inches	Weight per foot lbs.	Diameter in inches	Weight per foot lbs.	Diameter in inches	Weight per foot lbs.
1 1/2	1 16	1 1/2	75	1 1/2	.39
2 1/8	2 00	1 3/4	1 40	1 3/4	.62
2 1/2	2 66	1 7/8	1 80	1 7/8	.89
3	3 16	2	2 45	2	1 20
3 1/2	5 66	2 1/8	4 15	2 1/8	2 00

**Dimensions and Durability.**—In the United States the wire rope generally in use is composed of a hemp centre around which are laid six strands of 7, 9, 12 or 19 wires, thus forming a rope of either 42, 54, 72 or 114 wires. Ropes with seven wires to the strand are generally used for elevators of all kinds, standing ropes, guys, transmission of power, etc. Ropes with nine wires are generally used for haulage ropes in mines, on inclines and for transmission of power. Those with 12 wires to the strand are generally used for shiffrugging and 19 wires for hoisting. "Special flexible" rope has six strands of 37 wires each; and "extra flexible" has eight strands of 19 wires each. These ropes are employed in hoisting, on dredges, cranes, etc. The standard haulage rope has six strands with seven wires to the strand. "Running rope" has ordinarily six strands of 12 wires each. Wire rope is as pliable as hemp rope of equal strength and therefore can be operated over sheaves and drums of equivalent sizes and is far more durable and efficient. Durability of wire rope depends principally upon the diameter of the sheaves or drums, the greater the size of the sheaves or drums, the longer the rope will last. The rule commonly followed in wire transmission is that the minimum diameter of the

sheave shall equal 100 rope diameters. Experience has demonstrated that the wear increases with the speed. It is therefore better to increase the load than the speed. One-fifth of the ultimate strength of rope is considered a fair working load. Five grades of wire rope are recognized according as they are made of iron; crucible cast steel; extra strong crucible cast steel; plow steel; and "Monitor" plow steel—an exceptionally high grade. Each of these may in a general way be regarded as 10 per cent stronger than the grade preceding it. The Monitor rope, however, is quite stiff in proportion to its diameter and requires a larger minimum sheave in operation. The following table shows the minimum diameters of the sheaves required for the more commonly used varieties of wire rope, and the safe load which the sizes named will bear in common usage. The table is based on crucible cast steel, as the material generally employed. Wire rope must not be coiled

SIZE, INCHES	Haulage rope		Standard hoisting rope		Special flexible hoisting rope	
	Minimum diameter of sheave	Safe load, pounds	Minimum diameter of sheave	Safe load, pounds	Minimum diameter of sheave	Safe load, pounds

or uncoiled like a hemp rope. When not on a reel, roll on the ground like a wheel or hoop to prevent twisting or untwisting. Galvanized rope should never be used for running rope. To preserve wire rope under water or under ground, add one bushel of fresh slacked lime to a barrel of mineral or pine tar—boil and apply hot. On inclined planes the grooves of the pulleys or idlers should be lined with wood or babbitt metal. It is recommended to use a few idlers as possible. In a great many cases they do more harm than good. For transmission of power the sheaves should be lined with leather or India rubber, to secure increased adhesion and prevent wear. The radius at the pit of the groove should always be greater than that of the rope, so that the latter drives only by friction in the bottom of the groove. The use of cast-steel rope is becoming general because of its lightness, greater strength and durability. To get the best results, steel rope should be made of the best quality of crucible cast steel. Ropes made from low grades of steel are inferior to iron ropes. The use of Bessemer steel in running ropes is not advisable. Ropes should be examined frequently and a new rope ordered before the old one is allowed to wear out. Attention to this will insure safety and prevent serious accidents.

nized Steel Cables are largely used in suspension bridges and are composed of six wires with wire centre.

nized Steel Hawasers are usually 37 wires in the strand and combine great strength and flexibility. The demand for towing a heavily loaded barge, practically in all weather, has called for a wire hawser stronger than any Manila hawser made. The hawsers presented in the table—Cast-steel wire— are made with a hemp centre and consist of 37 wires each, and of six 24-wire and seven hemp cores.

Flattened Strand Ropes.— Instead of being composed of strands of circular form in cross-section, flattened strand ropes are constructed of wires, each of which has one or more flattened surfaces, so that one flattened surface is exposed on the outside of the full length of the rope. The result is that a plurality of wires in the rope must at all times take the wear in the rope there being only one external wire in the rope working in each strand, as is the case with ropes of ordinary construction while in the flattened ropes the wear has greatly advanced and the result is a considerable diminution of strength. As taken place in an ordinary rope, the wear is borne in a very marked manner upon one of the one wire nearest the periphery of the rope in each strand, and in cases where the wire is used it is rapidly worn through, the heavier wire has a tendency to fracture and the abrasion has taken place. Owing to the wear of wires that are at all times exposed in a flattened strand rope for a considerable distance along their respective surfaces—smooth or comparatively smooth surfaced—even while new, and the wear is unevenly light upon any individual wire the tendency to become brittle is minimized.

These ropes are exceedingly flexible and are less liable to the crushing action which frequently takes place in other ropes. They are made up with the wires in the strands and the strands in the rope laid in the same direction or reversely. Owing to the comparatively little wear which takes place in these ropes, so large a margin between working load and breaking strain is not required as in ropes of ordinary construction. Flattened strand ropes are free from all tendency to spin or kink and a considerable saving in wear of pulleys and sheaves is effected by their smooth surface which is shown in the two following illustrations:

New.

Worn.

The end sections show a comparison of the structure and wearing surface of round and flattened strand rope.

A flat or ribbon-like form of this rope is made by laying as many strands as desired side by side, and "sewing" them together with a soft iron wire. The latter wears away and has to be renewed at intervals.

Hercules Wire Rope.— This is a very high grade of rope, the steel for which is specially prepared for it under a patent process and then the wire tempered and drawn by a patent process, producing a steel strong and tough and that is uniform in density, texture, elasticity, elongation and strength, every wire being carefully tested for these points and the tests registered for reference. It is a rope that was evolved originally for use in extrahazardous places and where there is liability for rough usage.

Non-Spinning Rope.— A special hoisting rope of 18 seven-wire strands, six of which are laid around the hemp core to the left and the other 12 outside of them around to the right. This rope will hold a load steady without twisting and spinning.

Aerial Wire Rope Tramways.— Aerial tramways may be used to advantage both in operation and construction for transporting material from one place to another. This is especially true with ores, coal, stone, lime, rock, gravel, earth, sand and cord wood. Packages, lumber, logs, light merchandise and water may also be transported economically. Usually the material is loaded on the cables at one terminal or an intermediate loading station and carried to the opposite terminal where it is discharged.

direction of travel devices can be attained for the transportation of the material, and up to about 100 tons per hour and vertical distances of 1000 feet. The cable is 1000 feet long. Aerial tram lines are run in a similar manner, but a motor is used at one of the terminal points. The arrangement of cables for a tramway for running down, and for that are spanned across a deep canyon, and are sometimes supported by the use of towers, or trestles and supported by cables or beams at the high points. Towers are constructed of steel, concrete or masonry and are built on the ground. The cables are supported by rollers and are turned at right angles and the cable is driven to the upper terminal. An aerial tramway is free from surface traffic and the underlying ground may be used for other purposes. Trams are used for the transportation of material, such as timber, and are sometimes used for passenger traffic and may be operated singly or in pairs.

There are two distinct classes of aerial tramways, namely, single rope systems and double rope systems. The single rope system is the simpler in construction and the limited capacity not exceeding eight tons per hour and an average speed of 100 feet per minute. It is economical in both construction and operation. The system consists of a main cable or rope to which are attached in various manners the carriers, buckets or buckets. The entire line is supported by sheaves placed on towers which are located according to the profile of the ground. At each terminal the cable passes around a horizontal sheave or series of sheaves, generally one of these is provided with grips in its periphery for driving or controlling the tramway. When flexible material is used, mechanical loaders are used and the buckets are arranged so that they discharge automatically. This is all accomplished while the line continues in operation. Loaded material can be loaded and taken away from the carriers, and the tramway continues in motion, going at a low speed. The double rope system is also preferable to a single system, on account of the fact that a separate track rope or cable is used upon which the buckets travel, the other rope being exclusively for hauling. This drum key and divides the strains developed, greatly increasing the life of the cable and plant. The double rope system will fulfill almost any requirements in the tramway line and may be built practically any length. The practicality of long lengths of tramway is fully demonstrated by the tramway built for the North American Copper Company at Encampment, Wyo., which has a total length of over 16 miles and is built in four sections, making it the longest tramway in this country. Another notable cableway is that of the Saline Valley Salt Company at Bishop, Inyo County, Cal. It is 6625 feet long and carries 20 tons of salt per hour from the floor of the valley over the Inyo Mountains 6,330 feet above that level to the line of the Southern Pacific Railroad on the other side. The track cables are 1 1/4 and 1 1/2 inches for the loaded side and 3/4 inch for the returning empty. The traction rope is 3/4 inch in diameter.

The longest cableway in the world is owned by the Argentine Republic and runs from the mining district of Mejicana, 11,500 feet high in

the Department of San Juan at Chile. The length is 27 1/2 miles. The upper cable is 1 1/2 inches in diameter and the lower is 1 inch in diameter. The hauling cable is 1 1/2 inches in diameter. The carriers have a capacity of 1000 pounds each and are spaced 150 feet apart. The line is run at 40 feet per minute. The entire tramway is in eight sections, and is operated on cables supported by five engine plants. The line is operated by means of a motor plant at the lower end. It is accomplished by an aerial cable which runs over the line continuously. The single rope system is capable of carrying capacities as great as 20 tons per hour and is even greater when conditions demand. The double rope system in general consists of two cables, a hauling cable, upon which the loaded and empty carriers travel separately, and a track rope or cable for guiding them. The track cables are stretched at a tension of one and one-half inches, and the other being tensioned to a tension device. All of the cables are supported by towers, which are placed according to the shape of the ground over which the line passes.

In all of the above classes, the traction rope passes around a sheave or a series of sheaves at either terminal, one, however, being generally provided with grips in its periphery for clamping the cable in place to secure the necessary friction for driving or controlling the tramway. In long lines, two or three stations are provided at intervals for driving the tension and take up on the track ropes. Double rope systems may be subdivided into three classes. One in which the carriers are attached and detached to and from the traction rope by means of a friction or compressing grip. The second in which the carriers are permanent fixtures to the traction cable, the loading of same being effected by mechanical loaders while the buckets are automatically tripped at the discharging point. And the third in which the traction cable has permanent fixtures attached to it in the shape of clips or buckets. The buckets in this system are automatically attached and detached to and from the same at either terminal of the line by means of a locking device. This latter system is furthermore designed so that the buckets are automatically discharged at the unloading end without any attendants to look after them. A simple self-operating tramway which is known as a two-bucket tramway may sometimes be used to advantage where the grade is steep and where the capacity is moderate. This is true for short lines. It consists of two cables stretched parallel to each other, upon each being operated a bucket, the two buckets connected to a traction rope which passes around a sheave or series of sheaves at the upper end of the line. When the loaded bucket descends by gravity, it pulls up the empty bucket on the opposite cable and vice versa. This type is sometimes used on level ground or even up-grade simply by applying power to the line for operating. The most suitable system of tramways to be used in any case depends upon the profile of the ground, nature of the material to be transported and terminal requirements and these items should be investigated thoroughly before deciding upon any particular construction.

**ASSET**, Me., town, county-seat of outy, on the Sheepscot River, and Central Railroad, 40 miles northeast

of Portland. It is in a region noted for pic- turesque scenery and is a popular summer re- sort. It has a good harbor and is a port for coasting vessels; some vessels are built here, and the town also contains a shoe factory and large saw-mills. There is a national bank, cap- ital \$100,000, and a savings bank. It has several elementary schools and a public academy (high school) founded in 1877. Pop. about 1,287.

**WISCONSIN**, wis-kön-sin, a north-central State of the United States, popularly called the "Badger State," between lat. 42° 30' and 47° 50' and 92° 54' west. It is bounded on the north by Lake Superior and the upper penin- sula of Michigan, on the east by Lake Michi- gan, on the south by Illinois and on the west by Iowa and Minnesota. The extreme dimensions of the State are about 320 miles from north to south and 295 miles from east to west. The gross area is 56,066 square miles, 810 of which are covered with water. In addition the State has political jurisdiction over 9,878 square miles of water area in the adjoining lakes, Superior and Michigan. The population in 1910 was 2,333,860. Of this total 1,820,000 or 78 per cent were native born and 513,000 or 22 per cent were foreign born. There were 10,142 Indians, 2,900 negroes and 263 Japanese and other races.

**Geography, Climate.**— Wisconsin's position as one of the States of the upper Mississippi Valley, adjoining the Great Lakes, constitutes its chief geographical asset. Located about one-third of the way from the Atlantic to the Pacific, the climate is continental in character, the winters being relatively cold and the sum- mers rather hot. The mean annual temperature is about 43° Fahrenheit. The extreme range is from 110° above to 50° below zero. The daily range is about 18° in summer and 14° in winter. The summer temperature corresponds to that of France, Germany and southeastern England; the winter temperature to northern Sweden and central Russia.

The Wisconsin and Fox rivers, separated by an interval of less than a mile in south central Wisconsin and emptying respectively into the Mississippi River and Green Bay, constitute a great water trough across the State from north- east to southwest. The geographical character- istics of the smaller and southeastern of the two sections into which the State is thus divided differ markedly from those of the larger, northwestern section; these differences have had a marked effect upon the historical devel- opment and present condition of the State. The eastern and northern portions of the State drain into Lakes Michigan and Superior by short streams with rapid courses. The western and southern portions (much greater in area) drain into the Mississippi by a number of large rivers. The portion of the State above the Fox-Wisconsin water-trough was originally heavily wooded and relatively inaccessible. The southern and eastern section was relatively open and comparatively accessible to settlers. Accordingly this region was settled first and is to-day much further advanced industrially than is the northern section. The latter, as late as the admission of Wisconsin to statehood, was commonly regarded as a worthless wilderness, and even to-day retains to a large degree the characteristics of a frontier region.

With 500 miles of Great Lakes coastline, with a western frontage of 250 miles on the Mississippi, with some 2,000 lakes ranging in size downward from Winnebago with 215 square miles of area and with every portion of the State penetrated by rivers, Wisconsin's water resources are of great importance, largely determining the course of agricultural and industrial development of the State. The principal rivers are the Rock, Wisconsin, Chippewa and Saint Croix, tributary to the Mississippi; the Saint Louis, Bois Brulé, Bad and Montreal, tributary to Lake Superior; and the Menominee, Peshtigo, Oconto, Wolf, Fox, Manitowoc, Sheboygan and Milwaukee, tributary to Green Bay and Lake Michigan. The more important lakes are Winnebago, Koshkonong, Green, Mendota, Monona, Waubesa, Kegonsa, Geneva, Court Oreilles, Poygan, Chetac, Puckaway and Big Butte des Morts. The streams and lakes abound in fish and wild fowls, and the woods and waters of Wisconsin constitute one of the great playgrounds of America.

**Geology.**—The State includes a large area of the oldest of rocks, the pre-Cambrian, and a still larger area of Paleozoic rocks, newer than the pre-Cambrian but still very ancient. The Mesozoic formation is not found in Wisconsin, but the State includes rocks belonging to the Cenozoic age. The geological history of the State has included the following epochs: (1) All Wisconsin was mountainous after the pre-Cambrian rocks were deposited and folded; (2) the whole State was a peneplain, with a few isolated hills rising above the general level; (3) all of the State may have been alternately submerged below the level of the ocean and slightly elevated while the Paleozoic rocks were being deposited; (4) again dry land and being fashioned into the present form; (5) all but the southwestern section buried beneath an ice sheet; (6) the ice sheet melted, leaving Wisconsin somewhat as before the Glacial Period, but with important manifestations of topography, soil and drainage. The Glacial Period may have lasted nearly 1,000,000 years; it ended perhaps 35,000 to 50,000 years ago.

**Mineral Resources.**—Although the mineral resources of the State are considerable, Wisconsin ranks relatively low among the mineral-producing States of the country. The chief mineral industries are the mining of ores, such as iron, zinc and lead; the quarrying of stone, such as granite, sandstone and limestone; the digging of clay for making brick, tile, etc.; and the bottling of mineral waters. The most important mineral product is iron, Wisconsin ranking fifth among the ore-producing States of the Union in 1910. In lead and zinc production Wisconsin ranks second among the States. She produces about one-twelfth of the zinc, one-fiftieth of the iron and one-hundredth of the lead of the entire country. Granite, sandstone and limestone comprise more than nine tenths of the rock quarried in the State. Among the granite-producing States Wisconsin ranks fourth or fifth. There are extensive quarries of brown sandstone along the Lake Superior coast; formerly this was eagerly sought and widely marketed, but the change of style in recent years to light-colored stone has practically destroyed the market for the brown. Limestone quarries are numerous and widely

distributed; the stone is little used for constructing buildings, but is of great value for making lime, for foundation and arch work and for use as crushed stone in road making. Clays suitable for brick- and tile-making are widely distributed. In commercial value of mineral waters (about \$1,000,000) Wisconsin ranks first among the States. By far the largest part of its production comes from the springs of Waukesha, which long since attained a nation-wide reputation. In recent years the total reported value of all mineral produced in the State has been about \$20,000,000 annually. The actual value is, doubtless, considerably higher, since because of their widespread distribution much clay and stone are utilized with no record ever made of their value.

**Agriculture, Soils, etc.**—The upper Mississippi Valley, to which Wisconsin belongs, is a region of unusual fertility. In the southern and eastern parts of the State practically the whole area is farm land, ranking in productiveness and value with the best in the United States. In central Wisconsin is a sandy area of much lower productivity; while in northern Wisconsin there are several million acres still awaiting development, being swamp, cut-over, burnt-over and forest-covered land. As yet only 60 per cent of the land is actually in farms; of this area, about 60 per cent, again, is devoted to tillage or the raising of hay. Thus, about two-fifths only of the total land area is actually devoted to field crops. This ratio of improved land is less than half that of such States as Illinois and Iowa, but more than twice that of the United States as a whole. In the northern third of the State less than one-fourth of the land is in farms. In the middle third more than one-half is in farms; and in the southern third more than 90 per cent. The value and adaptability of the northern section to high-grade farming operations has been thoroughly demonstrated, and in this portion of the State lies the greatest field for present and future development. The census of 1910 showed a total of 177,127 farms in the State, with an average size of 119 acres. Almost two-thirds of this number fell between the limits of 50 and 175 acres, while but 10,378 farms exceeded 260 acres. During the eight years ending with 1917 over 770,000 acres were added to the State's area of cultivated crops, involving a considerable increase in the total number of farms. For reasons already pointed out this increase belongs chiefly to the northern half of the State.

The acreage of the leading crops of the State in 1917, as shown by the government report for December, was as follows: tame hay, 2,703,000; oats, 2,250,000; corn, 1,911,000; barley, 600,000; rye, 410,000; potatoes, 307,000; tobacco, 48,300. The yield of these crops was respectively: hay (all kinds), 5,022,000 tons; oats, 99,000,000 bushels; corn, 42,196,000 bushels; barley, 19,300,000 bushels; rye, 7,585,000 bushels; potatoes, 35,000,000 bushels; wheat, 5,327,000 bushels; tobacco, 45,885,000 pounds. The total value and the value per acre of each crop, based on the prices prevailing at the close of the year, was as follows: hay, \$79,500,000, and \$29.41; oats, \$65,340,000, and \$29.04; corn, \$88,780,000, and \$35.86; barley, \$21,800,000, and \$36.68; rye, \$12,820,000, and \$31.26; potatoes, \$31,500,000, and \$102.60; wheat, \$70,760,000, and

Map of the Great Lakes region, showing the five lakes (Superior, Michigan, Huron, Erie, Ontario) and the surrounding landmasses of North America and Europe. The map includes a grid of latitude and longitude, with letters A through S along the top and numbers 1 through 4 along the sides. Major cities and regions are labeled, including Montreal, Toronto, Detroit, and various European cities like London, Paris, and Rome. The map also shows the St. Lawrence River, the Welland Canal, and the Erie Canal. A scale bar is visible in the bottom right corner.

tobacco, \$8,030,000, and \$166.25. The total value of all crops in 1917 was 0,000. This compares with a total value of the preceding year of \$254,000,000, and an annual value for the five-year period of \$183,000,000.

The most striking agricultural development in Wisconsin in recent years has been that of the dairy industry. Within a generation a revolution has taken place in Wisconsin dairy-keeping significant as any in the annals of agriculture.

Until the early 70's Wisconsin was contemptuously quoted on the east-coast as "western grease"; while her milk could be marketed only under the camouflage of eastern trade names. By persistent education, education and agitation, Wisconsin men have lifted the State to its present position of first rank in the country with respect to this industry, supplying one-sixth of the nation's creamery butter and three-fifths of the cheese. In 1917 over 8,500,000,000 pounds of cheese were produced, with an estimated farm value of \$179,135,000, an increase of \$69,000,000 over the year 1915. While there has been a marked increase in dairy products of all kinds in recent years the development of cheese-making has been particularly rapid; in the period 1900 to 1918 the annual output of butter rose from 100,000,000 to 124,000,000 pounds; that of cheese from 144,000,000 to 234,000,000 pounds. On January 1, 1918 the estimated number of horses in the State was 711,000, valued at \$5,000; of milch cows, 1,785,000, valued at \$5,000; of other cattle, 1,394,000, valued at \$4,200,000; of sheep, 651,000, valued at \$100; of swine, 2,019,000, valued at \$45,000. The estimated total value of all livestock was \$316,253,000. Among minor agricultural products Wisconsin is conspicuous for tobacco and cranberries. Both crops are highly valued, tobacco being raised in a few southern counties of the State (principally Dane) on a limestone soil, and cranberries in a group of west central counties that abound in bays. Sugar-beet raising and the manufacture of beet sugar have gained an important position in the State. Although it lies in the latitude as the famous fruit belts of Michigan and New York, Wisconsin shares the fruit-raising advantages of these regions to a limited extent. Those advantages consist of soil, chiefly in their proximity to the Great Lakes (bodies of water large enough to exercise a marked control over the climate of the adjoining regions) and the fact that in this portion of the continent the prevailing winds are from the west. Since Wisconsin lies to the west of the Great Lakes only the northern portions of the State in close proximity to the Superior and Michigan enjoy the influence of the lake winds with which Michigan and these other noted regions are favored.

The Michigan and Superior coast lines, particularly in the Door County Peninsula, fruit-raising has become an important industry with promise of marked development in the future. The estimated value of the cherry crops for 1917 was \$4,277,000, compared with \$2,048,000 in 1909.

**Forest Products.**—Within the memory of the oldest living more than one hundred billion white pine stood in Wisconsin's splendid forests, in addition to great quantities of oak, maple, birch, elm, basswood, spruce, cedar and ash. To-day the white pine forests exist chiefly in memory, and the other timber resources have been squandered with lavish hand. Nevertheless the lumbering industry, until within a decade the State's leading one, still remains important, even in decline. The absolute output of lumber products first assumed large proportions about 1870. It increased by leaps and bounds until 1890, remained at a maximum for a little over a decade, and has since steadily declined. Although the absolute production of lumber was slightly greater in 1890 than in 1900, not until the latter year, with the subsidence of the lumber output of Michigan, did Wisconsin take foremost rank as a lumbering State. This primacy was retained until 1905, when it was yielded to Washington. At the height of the logging industry (1890-1900) the value of the lumber produced annually reached well toward \$70,000,000, more than the average annual value of the gold mined in the entire country. The value of the present output of rough lumber is about \$30,000,000 annually.

**Fisheries.**—The commercial fishing industry of Wisconsin in 1915 produced almost 24,000,000 pounds of fish, valued at about \$850,000. About three-fifths of the total output came from Lake Michigan and Green Bay, and the city of Green Bay is supposed to be the leading fresh water fishing centre in the world. About one-tenth of the State's total output came from Lake Superior, and the remaining three-tenths from the Mississippi River and the interior waters of Wisconsin. The most important fish in the two lake districts are herring and lake trout; in the Mississippi River, carp and buffalo. The indirect returns to the State from the pleasure fishing of the summer tourists is several times as great as the direct value of the commercial fishing industry; for the year 1916 this was estimated by the State Conservation Commission to amount to \$5,000,000.

**Manufactures.**—The centre of population and of manufacturing in the United States has moved westward along the 39th parallel of latitude. Wisconsin lies from 200 to 500 miles north of this line. Moreover the State has no coal deposits; due to its position west of the Great Lakes it is off the main continental routes of traffic from east to west; and the population is still in either the agricultural or the lumbering stage of development. From these facts it might be supposed that manufacturing would have made little headway. However, these disadvantages are counterbalanced by certain factors favorable to the development of manufacturing, so that in 1910 in per capita value of manufactured products Wisconsin outranked every other State west of Ohio. Among the factors contributing to this result may be noted proximity to raw materials, the transportation facilities and water power afforded by the waters and rivers bordering and traversing the State, and finally a progressive and aggressive attitude on the part of the population, leading to a vigorous utilization of the potential resources of the State. Unlike the older eastern communities, manufacturing in Wisconsin is still prevailingly shaped by the State's natural resources. Thus the lumbering and wood products industry far outrank all other branches of

manufacturing in Wisconsin, the decline in value in recent years of the annual output of rough lumber being more than counterbalanced by the increased attention paid to more advanced and specialized manufacture of forest products. In 1914 the total value of the wood products of the State exceeded \$109,000,000, made up of lumber, rough and finished, \$55,000,000; pulp and paper, \$31,000,000; furniture, \$22,000,000.

The foremost manufacturing industry is dairying, already treated in connection with agriculture. The manufacture of foundry and machine-shop products comes next after forest products, having enjoyed a remarkable growth in recent years. The figures for 1914 show an annual output of over \$60,000,000. The chief centre of this industry is Milwaukee and the other cities along the southern coastline of Lake Michigan. Their location on Lake Michigan within easy reach of the network of railroads centring at Chicago affords them superior transportation and marketing advantages. The dairying industry is, of course, widely diffused over the State, although even here a tendency toward centralization is becoming manifest. Next in importance is the manufacture of leather, the output in 1914 being worth over \$42,000,000. The development of the leather industry is due to the abundant supplies of oak and hemlock bark provided by the forests of the State. The tanneries, formerly widely distributed, are now largely centred in a few cities in the eastern part of the State. In output of leather Milwaukee leads all the cities of the United States. Malt liquors closely follow after leather, the output in 1914 being valued at almost \$41,000,000. Flour and grist mill products in 1914 were worth nearly \$29,000,000. In both these industries a high degree of centralization prevails, modified to some extent by the existence of numerous small mills and breweries scattered over the State. Milwaukee produces more beer than all the remainder of the State and ranks as the second brewing centre in the country. Popular opinion to the contrary, however, brewing is not Milwaukee's first or even its second industry in point of importance. Slaughtering and meat packing has grown rapidly in recent years, the industry being centred chiefly at Milwaukee and other nearby cities. The output for 1914 was valued at \$32,000,000. The paper and wood pulp industry is increasing rapidly. In 1914 the output was valued at \$31,000,000, and Wisconsin ranked fourth among the States with respect to this industry. Flour and grist mill products are slowly declining in importance; their value in 1914 was \$28,700,000, about \$3,000,000 less than in 1909. Other important and growing manufacturing industries are those of agricultural implements, in which Wisconsin ranked second in 1914, automobiles and boots and shoes. Over one-third (in value) of the manufactured products of the State are made at Milwaukee, and fully four-fifths of the total in the southeastern quarter of the State. Milwaukee has become one of the chief manufacturing centres of the Union, ranking first in leather, second in liquor and malt, third in foundry and machine-shop products, and tenth in total value of manufactures.

The United States Census Bureau figures for 1914 credited Wisconsin with 9,104 manufacturing establishments, in which over 230,000 per-

sons were engaged. The capital investment was \$754,000,000, salaries and wages paid amounted approximately to \$150,000,000, and the total value added to raw materials through processes of manufacture was estimated at \$277,750,000.

**Banking.**—No subject caused more prolonged discussion at the time the State constitution was adopted than did that of banking. Largely because of the extreme measures with regard to banking contained in the first constitution, that instrument was rejected by the voters. The second constitution drafted therefore, was more liberal toward banks and banking, and a general banking act was passed in 1892. In 1903 a State banking department was created, in charge of a commissioner of banking. Private banks were legislated out of existence, and State banks were required to be twice examined and to make five reports yearly on call to the bank commissioner. At the close of 1916 there were 737 State banks and trust companies as compared with 240 in 1896. There were also 138 national banks at the close of 1916. The following summary exhibits the principal items concerning the banks of the State at that time:

ITEM	National banks, 133	State and saving banks and trust companies, 737
Capital.....	\$18,468,000 00	\$23,672,450 00
Surplus.....	8,137,000 00	7,490,949 51
Undivided profits..	5,058,000 00	5,249,601 80
Resources.....	253,560,000 00	298,617,175 61

During the year 1916 there was an increase in the total banking power of the State of \$82,000,000, an amount almost equal to the total assets of the State banks in 1902.

**Transportation.**—The advantage which the State derives from the transportation facilities afforded by Lakes Michigan and Superior has already been adverted to. On the west the Mississippi borders the State for 250 miles and is navigable throughout the distance. The pioneer hopes of a widely developed system of intrastate water transit have not been realized. Nevertheless the rivers of the State have proved of vast importance as affording a means to float the lumber to market. All four of the State's well-developed manufacturing areas owe their prominence, either directly or indirectly, to the transportation advantages afforded by its river and lake systems. These areas are (1) the Lake Michigan shore line; (2) the Fox River Valley; (3) the Rock River Valley (including Madison); and (4) the upper Wisconsin Valley. Railroad building in the State was begun in 1851, the first line to cross it being laid from Milwaukee to Prairie du Chien in 1851-57. In the early period of railroad development it was believed that the most important routes would run east and west, connecting Lake Michigan with the Mississippi River, and the second line to cross the State was early built from Milwaukee to La Crosse. The decline in importance of river commerce, together with the development of Chicago and Milwaukee near the southern end of Lake Michigan and Saint Paul and Minneapolis on the upper Mississippi, have given a pronounced northwest-southeast trend to the transportation lines of the State. In 1915 the State had a main track mileage of 7,518 over 5,000 miles of this total belonging to the Chicago and Northwestern, the Chicago, Mil-

and Saint Paul, and the Minneapolis, Paul and Sault Sainte Marie systems. In state highway commission was created scientific and far-reaching system of improvements was begun. As yet in many, relatively speaking, by the close of nearly 5,000 miles of improved highway has been constructed at a cost of almost \$18,000,000; work is progressing in accordance with a comprehensive system which will ultimately reach every county-seat in the State and almost every village or town of any considerable importance. Economically, socially and otherwise the system of highways will be second in the State only to that of the railway system.

**Government.**—The constitution under which Wisconsin was admitted into the Union in 1848 is in force, although a number of amendments have been made in the 70 years of its existence. Amendments must originate in the legislature. Upon approval by majority vote of members of each house in two succeeding legislatures they must be submitted to the people, which approves or rejects them by a direct vote. To call a constitutional convention is a question of holding one must be submitted by legislative vote, to the voters at the close of the succeeding legislature and a majority vote must be given in its favor. The executive power is vested in a bicameral legislature consisting of a senate and an assembly. The assembly must never number less than 54 members; the senate must never be more than one-third nor less than one-fourth as many members as the assembly. At the present time the assembly consists of 100 members and the senate of 33. Regular sessions of the legislature are held biennially, in the alternate years. The governor is the chief executive officer of the State, and has a limited power over acts of the legislature. Other executive officers are a lieutenant-governor, secretary of state, treasurer, superintendent of instruction and attorney-general. All executive officers except the lieutenant-governor receive an annual salary of \$5,000. In recent years, due to the progressive movement led by R. M. La Follette (now United States senator for Wisconsin), a number of powerful commissions have been established, and these are quite as important elements of the administrative system of the State as any of the older offices already mentioned.

The more important are the industrial, agricultural and railroad commissions, each consisting of three members with annual salaries of \$5,000. Other important commissions and departments are the free library, conservation, public service and highway commissions, the banking, banking, insurance and agricultural departments, the State board of control, the board of public affairs and the State Historical Society. The judicial power of the State is vested in a Supreme Court, Circuit Courts, courts of probate and justices of the peace. The Supreme Court justices are elected for six-year terms, but in practice sitting justices are usually re-elected, commonly without opposition. Circuit and probate judges are elected for four-year terms, respectively, and justices of the peace for two years. The full right of suffrage is granted to all male citizens of the United States of 21 years of age

and upward and to those of foreign birth who prior to 1 Dec. 1908 declared their intention to become citizens of the United States who have resided in the State one year and in the election district 10 days. Woman suffrage exists as yet only in connection with questions pertaining to schools. Wisconsin was one of the first States to adopt a direct primary law for the nomination of party candidates for office. A comprehensive corrupt practices act eliminates many of the evils attendant upon partisan contests with which the State was formerly familiar. Candidates for office must file at suitable intervals sworn statements of their receipts and expenditures, all political advertisements must be accompanied by a statement concerning their cost and who pays it, and the purposes for which candidates may spend money are limited. Cities are governed by general or specific charters. The commission form is permitted and has been adopted by a number of the cities. It seems not to be gaining ground, however, and one city which operated under it for several years has returned to the old form of government by mayor and council. The towns are governed by officers elected by the voters assembled in annual town meeting. Counties are governed by a county board, composed of representatives from the several towns and by the following administrative officers: clerk, sheriff, treasurer, district attorney, coroner, clerk of Circuit Court, register of deeds, surveyor and superintendent of schools.

**Finance.**—The framers of the State constitution were concerned above all things lest the State be plunged into debt. Stringent safeguards were, therefore, devised to prevent this, and prior to 1918 there was no formal State debt. However, what in effect amounted to one of slightly over \$2,000,000 existed, being the obligation of the State toward its own several educational funds, the principal of which had been devoted to the extraordinary expenditures of the Civil War. In 1915 a beginning was made of paying off this debt at the rate of \$100,000 a year. In March 1918, a law passed authorizing the issuance of \$1,000,000 in State bonds to defray expenses incurred in equipping Wisconsin soldiers for service in the Great War. The chief sources of revenue are taxes on corporations, inheritances and incomes. With respect to the latter form of taxation, Wisconsin is a pioneer among the States of the Union. For the year ending 30 June 1916, the total income tax assessed was \$3,837,370.04. Personal property tax offsets were allowed to the amount of \$1,825,641.62, and the amount of cash actually collected was \$1,906,441.69. Ten per cent of the income tax goes to the State government, the remaining 90 per cent to local governmental units. During the same year the general property tax levy amounted to \$43,365,000, the corporation tax to \$6,517,000, and the inheritance tax to \$502,000, the total taxes paid for all governmental purposes being in excess of \$52,000,000. Of the general property tax, 10 per cent went to the State government, 20 per cent to the counties, 41½ per cent to local governments, and 28¼ per cent to schools.

**Charitable and Correctional Institutions.**—The charitable and correctional institutions are

administered by the State Board of Control. It has supervision, among other things, over the insane, whether in State or county hospitals, over the county tuberculosis sanatoria, poor-houses, police stations and jails; and, subject to the governor's approval, acts as a board of parole. There are two State insane hospitals (at Oshkosh and Mendota) and 35 county hospitals. There is one State tuberculosis sanitarium at Wales and nine county sanatoria. At the State sanitarium were 187 patients in 1916, maintained at a weekly cost of \$11.42 for each. The two State insane hospitals together had 1,262 inmates in 1916 supported at a weekly per capita cost of about \$5. The Wisconsin State Prison at Waupun had 906 inmates whose weekly support cost \$3.80 each. Other State institutions include a home for feeble-minded at Chippewa Falls, a school for the blind at Janesville, school for the deaf at Delavan, a State reformatory at Green Bay, an industrial school for boys at Waukesha, and an industrial home for women at Taycheedah. At the State prison a binder plant is maintained, and convicts are employed in road building. The cost of maintaining the several charitable and correctional institutions of the State for the year ending 30 June 1916 was \$1,294,449. Their total number of inmates at the close of that year was 4,824.

**Population.**—For a rural State the population of Wisconsin represents a high degree of racial intermixture. In 1850, two-thirds of all the Norwegians of the country lived in Wisconsin. They are still one of the most important elements of the population, although Wisconsin is no longer the leading Scandinavian State. From the beginning the German element has been strongly represented, and at the present time after the native Americans, it constitutes the chief racial element of the State. The German element is stronger in Wisconsin than in any other State of the Union, and Milwaukee is probably more strongly Teutonic than any other important American city. There are important Slavonic settlements in Milwaukee and in central Wisconsin, Dutch settlements in Brown, Sheboygan and other counties, and Swiss settlements in Green and adjoining counties. In the latter section dairying has become the dominant industry, and more Swiss cheese is manufactured here than anywhere else in the United States. In 1840 Wisconsin had a population of 30,945. From 1840 to 1850 the population increased 10 fold, and from 1850 to 1860, two and one-half fold (775,881 in 1860). In the 50 years from 1860 to 1910 there was a fairly regular increase of slightly over 300,000 per decade, the population in 1910 being 2,333,869. This absolute rate of increase is supposed to have held for the five-year period ending 1915, the estimated increase during this time being 140,000. Thus, the absolute increase in population per decade has remained practically constant for 75 years (1840-1915), while the ratio of increase to total population has constantly decreased. In 1910 the State had eight cities of 25,000 or over, and 10 more with population in excess of 10,000. Of the total population 1,820,000 or 78 per cent were native born and 513,000 or 22 per cent were foreign born.

**Religion.**—The last census reported 1,000,000

church members in Wisconsin divided among 38 denominational bodies and 4,902 churches. Slightly over half of the total church membership is Roman Catholic. More than one-fourth is Lutheran. Next in numerical order are the Methodists with about 6 per cent, and the Congregationalists with 2½ per cent of the total church membership. No one of the remaining 34 denominations possesses as many as 25,000 members.

**Education.**—Notwithstanding the diverse racial elements and the predominantly rural type of population, the school system of Wisconsin is the chief glory of the State. At its apex stands the University of Wisconsin at Madison, superbly located on Lake Mendota, with grounds stretching for several miles along the shore. It is housed in some 40 main buildings valued at several million dollars. In the year 1916-17 there was a faculty enrollment of 600 and the student enrollment was close to 8,000. With our entrance into the Great War in 1917, however, came a heavy decrease in numbers, both of faculty and students. The university is built around the College of Letters and Science, and includes a graduate school of law, engineering, medical, music, agricultural, library, pharmaceutical and extension divisions and schools. To a greater extent, probably than any other American university, the University of Wisconsin has made its interests identical with those of the people composing the commonwealth. There are nine State normal schools, located at Milwaukee, River Falls, Stevens Point, Whitewater, Platteville, Eau Claire, La Crosse, Superior and Oshkosh. Their administration is entrusted to a single Board of Normal School Regents, corresponding to the Board of Regents of the University; while the State Board of Education correlates, on the business side, the higher educational interests of the State. The more important privately-supported colleges of the State are Lawrence, at Appleton; Ripon, at Ripon; Beloit, at Beloit; Carroll, at Waukesha; Campion, at Prairie du Chien and Milwaukee-Downer (for women) and Marquette University at Milwaukee. There is an excellent system of public, high and graded schools, with suitable provision for State aid and State supervision. In 1915-16 there were 47,000 pupils enrolled in the 353 public high schools, an increase of 74 per cent in 10 years. Since the Catholic population of the State outnumbers that of all other religious denominations combined, there is a large enrolment of pupils in the numerous church schools who would otherwise go to the public schools. The number of ungraded rural schools is decreasing slowly, while the proportion of total school population in attendance upon graded schools is steadily and rapidly increasing. In 1915-16 continuation schools in 29 cities enrolled 36,700 pupils at a per capita cost of \$12.45. In 1915-16, with a total population of school age of 801,995 in the State, 516,900 were enrolled in the several classes of free public schools and about 70,000 (by estimation) in private and parochial schools. For nearly a quarter of a century the State has had an admirably organized system of library supervision and leadership, with the result that the people of Wisconsin probably enjoy more adequate library service than do those of any

state. The traveling libraries sent out by the Library Commission penetrate to every part of the State; while the resources of the Historical Library with its more than 100,000 titles and the University Library with more are at the disposal, under reasonable administrative regulations, of every resident of the State.

History.—The territory now embraced in Wisconsin has belonged successively to Spain, Great Britain and the United States. Spanish rule was theoretical rather than real and need not be dwelt upon in this history.

The French rule dates from the advent of the first explorers on the Upper Lakes, about the middle of the 17th century. The first white man known to have visited Wisconsin was Jean Nicolet, who in 1634 came to the mouth of Green Bay, seeking there the fabled riches and wealth of distant China. Three years later Jesuit missions were established at Ojibwa on Lake Superior and at Depue on Green Bay. In 1673 Joliet and Marquette discovered Wisconsin by the Fox-Wisconsin River in their famous journey of discovery of the lower Mississippi. Thenceforward for 150 years Wisconsin was the haunt of the fur trader and the abode, as in primeval times, of the Indian. As an outpost of New France it shared the economic and political fortunes of the French. As early as the War of the Spanish Succession Frenchmen and Indians from Wisconsin made the long journey to Lower Canada to participate in the war against the British and the English. Wisconsin Indians assisted in the massacre of Braddock's army near the mouth of the Ohio in 1755, and elsewhere throughout the long war with the English. The British domination began upon the overthrow of New France in 1763, nominally lasted until the Treaty of Paris of 1763 or (from another point of view) until the cession of the British possessions in the Northwest in 1796. Actually, however, the English held practically full sway over Wisconsin and French population at least until the latter part of the 18th century.

Under the United States at length definitely asserted its authority by establishing regular posts at Green Bay (Fort Howard) and Milwaukee (Fort Crawford). Nominally, Wisconsin was included in the Ordinance of 1787 as a part of the Northwest Territory, but the admission of Ohio to statehood, as well as the remainder of the original Northwest Territory, Wisconsin became a part of the Indiana Territory. In 1809 it fell under the jurisdiction of Illinois Territory, and with the admission of Illinois to statehood in 1818 was added to Michigan Territory. Here it remained until 1836, when Michigan became a State and Wisconsin Territory itself was organized with boundaries including all of modern Wisconsin and Minnesota and much of North and South Dakota. The greater part of this domain was shorn away by the erection of Iowa Territory from its southern and western portions in 1838, and 10 years later Wisconsin, with its present boundaries, became a State of the Union.

Following the War of 1812, for a time a half-Wisconsin remained dedicated to savagery and the fur trade. The Black Hawk War of 1832, however, broke for ever the Indian domination of the State. The lead mine region of southwestern

Wisconsin was being exploited by hardy miners, chiefly from Illinois, Missouri and Kentucky, and close upon the Black Hawk War came a tide of settlement. Cities sprang up like magic, farming communities were developed almost overnight and an era of hopeful speculation and laborious settlement ensued. In 1830 the census returns showed a white population of slightly over 3,000, wholly confined to the lead mines and the old French settlements of Green Bay and Prairie du Chien. In 1840 there were 30,000 (in round numbers) and in 1850, 300,000. Milwaukee in 1835 contained three families of white affluents; in the summer of 1836 town lots were selling at \$2,000 and more. The wild boom shortly burst, of course, but there are men still living who have witnessed the growth of Milwaukee from a village of 1,000 population to the present city of almost half a million.

Thus in the generation from 1830 to 1860 the Wisconsin wilderness was transformed into a thriving American commonwealth of three-quarters of a million souls. The virgin resources of soil and forest were tapped, the framework of government and society was firmly erected. The frontier State—still a wilderness at the time of South Carolina's nullification ordinance in 1832—in the Civil War poured over 90,000 soldiers into the South to assist the war for the preservation of the Union. When admitted to statehood in 1848 Wisconsin was a typical frontier commonwealth, and the citizens were for the most part ardent Democrats. Despite the existence in southwestern Wisconsin of a strong element of southern origin, the progress of the anti-slavery dispute in a few years broke the power of the Democratic party. In 1854 at Ripon was enacted one of the earliest movements looking to the organization of the new Republican party. In 1856 a Republican governor was elected. Since that date the Republican party has dominated the State electing every governor but three, and carrying every presidential election but one. The outstanding political feature of recent years has been the cleavage in the Republican party brought about during the 90's by reason of the progressive reform movement led by Robert M. La Follette. The forerunner by more than a decade of the national cleavage in the party which culminated in the presidential campaign of 1912, for years was enacted on the Wisconsin political stage the bitter struggle between "Stalwart" and "Half-breed" with which the entire nation became familiar when, in the arena of national politics, the conflict between "stand pat" and "progressive" Republicans was joined. For over a dozen years La Follette dominated the State, serving as governor from 1901 to 1906 and as United States senator from 1906 to the present time. During the earlier years of this period a comprehensive series of progressive measures were adopted looking to the liberalizing of the agencies of government and society, until Wisconsin became a synonym for political experiment and progress. The Presidential campaign of 1912, however, rent in two not only the national Republican party but the La Follette branch of the party in Wisconsin as well. Taking advantage of the factional feuds which had developed in the ranks of their opponents, the conservative Republicans in the election of 1914 once more gained

control of the State administration. Their governor (E. L. Philipp) was re-elected in 1916, although in the same year Senator La Follette was re-elected, receiving in the party primary a heavy majority over his "Stalwart" opponent. The outbreak of war in Europe in 1914 produced a sharp division of sentiment in Wisconsin, with respect to the merits of the contending parties and the attitude of our government and nation toward the war. When the United States entered the contest in April 1917, the people of Wisconsin, with substantial unanimity, came to the support of the government against the national foe. In numerous ways the State set the example to the entire country of enthusiastic and far-sighted support of the war. Her draft returns were reported first of all the States, she originated the State and county councils of defense, and the observance of wheatless and meatless days. The years 1917 and 1918 again demonstrated to the world that the creditable record for patriotism and efficiency made by Wisconsin in the Civil War was more than duplicated in the contest.

GOVERNORS OF WISCONSIN

TERRITORIAL		
Henry Dodge		1836-41
James Duane Doty		1841-44
Nathaniel P. Tallmadge		1844-45
Henry Dodge		1845-48
STATE		
Nelson Dewey	Democrat	1848-52
Leonard J. Farwell	Whig	1852-54
William A. Barstow	Democrat	1854-56
Arthur McArthur (acting)		1856
Coles Bashford	Republican	1856-58
Alexander W. Randall		1858-62
Leus P. Harvey		1862
Edward Salomon		1862-64
James T. Lewis		1864-66
Lacus Fairchild		1866-72
Carlwallader C. Washburn		1872-74
William R. Taylor	Democrat-Greenback	1874-76
Harrison Ludington	Republican	1876-78
William E. Smith		1878-82
Jeremiah M. Rusk		1882-89
William D. Hoar		1889-91
George W. Beck	Democrat	1891-95
William H. Upham	Republican	1895-97
Edward Scfield		1897-1901
Robert M. LaFollette		1901-06
James O. Davidson		1907-11
Francis E. McGovern		1911-15
Emanuel L. Philipp		1915

M. M. QUAIFF,

*Superintendent of the State Historical Society of Wisconsin.*

**WISCONSIN,** a river in the State of Wisconsin. It has its rise in Vieux Desert Lake, on the northern boundary of the State, flows south to Portage City, then southwest and enters the Mississippi four miles below Prairie du Chien. Total length, about 625 miles. It is navigable for 200 miles to Portage City, from which point it is connected with Fox River by a canal.

Shifting sandbars in this river are a hindrance to navigation. There are several waterfalls along its course, the most famous of which are known as The Dalles of Wisconsin and Grandfather Bull Falls. Some of the bluffs which line the picturesque gorges are fully 400 feet high.

**WISCONSIN, University of, the State university** located at Madison, Wis. As early as 1836 the legislature of the Territory then known as Wisconsin passed an act for the establishment of "Wisconsin University" at Belmont, now in the State of Iowa, but the institution was never organized; again in 1838 a law was passed for the establishment of the "University of the Territory of Wisconsin," a board of visitors was appointed and the national endowment of two townships of land received. Nothing further was done, however, until 1848, when the State constitution provided for the establishment of a State university, and the university was incorporated by act of the legislature. A preparatory department was opened in 1849 and the collegiate department in 1850. In 1854 a second grant of two townships of land was made by Congress; but this land as well as that of the first grant was sold at very low prices to attract settlers, and the income derived from the fund was meagre; no State appropriation was made till 1870. In 1858 the university was reorganized, the work of the preparatory department restricted and collegiate department organized in six schools. During the War of Secession a large number of students entered the army, and though the work of the university was not suspended, no commencement was held in 1864. Since the war the progress of the university has been continuous. In 1866 a reorganization was effected. The Federal grant under the "Morrill Act" for the establishment of colleges of agriculture and industrial arts was given to the university. Colleges of agriculture and engineering were then established as integral parts of the university. Women, who had been admitted since 1863 to a "normal" department, were given the opportunity to follow a regular collegiate course. At this time, however, the coeducational system was not complete as the work of the women was kept separate from that of the men; but a few years later complete coeducation was established. In 1873 the legislature appropriated \$10,000 a year to the university; in 1876 an annual 10th of a mill tax was appropriated; in 1883 and 1891 other mill taxes were added; in 1899 all mill taxes were consolidated with a grant of 1 per cent of the railroad licenses into a specific annual grant, which was increased in 1901 and again in 1903. The total income from all sources was \$3,532,305.64 in 1918-19. At the time of the first annual grant of \$10,000 a system of free tuition to graduates of high schools in the State was adopted, which led to the elimination of the preparatory department a few years later. This also resulted in making the university the actual head of the public school system of the State. Since 1892 the university has extended its work in all directions; a number of special courses have been added, particular emphasis has been laid on graduate work and the number of graduate students increased. The uni-

now includes the following colleges and departments: (1) the College of Letters and Science; (2) the College of Mechanics and Engineering; (3) the College of Law; (4) the College of Agriculture; (5) the Graduate School. It also includes a summer school and a university extension department. The College of Letters and Science includes besides the general department of instruction in arts and sciences, the following special departments as follows: The departments in chemistry, commerce, journalism and pharmacy, the School of Music, the Medical Library, the Library School, the School of Education, the normal graduates' course and the Washburn Observatory. The degrees B.S. and Ph.B. (general course) are conferred upon the graduates of the College of Letters and Science, except in the chemistry, journalism and pharmacy courses which lead to the B.S. degree, and the normal graduates' course, leading to the degree of Ph.B. (course for normal-school graduates). For the degree of Ph.B. (general course), special emphasis is placed on mathematics, philosophy and science; for the A.B. degree, the work is largely elective. In the freshman year, an English course is required and during this year the other courses are elected from two groups, (1) languages, (2) mathematics, science and history. A minimum in these groups must be offered, the total covering somewhat less than two years' work. Not later than the beginning of the senior year a major subject in some one field must be elected and the remainder of the work is free electives. A limited amount of elective work may be taken in the colleges of Agriculture and Agriculture, in the School of Education or in the special courses of the College of Letters and Science. A special two years' course is arranged for normal-school graduates, the completion of which the degree of Ph.B. (for normal-school graduates) is conferred. The special courses in pharmacy cover two years, leading to the degree of B.S., or three years, leading to the degree of graduate pharmacy. The College of Engineering was organized in 1870; it offers five four-year courses, leading to the degree of B.S.; these are chemical, civil, electrical, mechanical and mining; engineering. The above courses may be taken as five-year courses with the B.S. degree; this allows more elective work in the colleges. By proper arrangement of electives, students in the College of Letters and Science secure the A.B. degree at the end of four years and the B.S. degree in engineering after two additional years. The College of Agriculture offers a "long course" and a home economics course of four years, leading to the degree of B.S., a short course of two years, and summer dairy courses and a farm-inter course; this college also includes agricultural experiment station and the operation of farmers' institutes. The College of Law was established in 1868; it offers a three years' course, leading to the degree of B.S. The Graduate School received its present organization in 1895. It includes work in the College of Letters and Science, the College of Engineering and the College of Agriculture, especially for graduate work being done in each department of these colleges; the school as a whole is under the control of

a faculty committee. The degrees conferred are A.M., M.S., M.Ph., Ph.D., C.E., E.E., M.E., Ch. E. and Min. E. The Summer School offers courses in the subjects of the general college curriculum, in education, in gymnastics and a special normal course; it also includes a summer school in shop and laboratory work for mechanics. Tuition in the university is free to Wisconsin students. There are 115 scholarships for undergraduates and 15 student loan funds; there are also 43 fellowships, 24 honorary fellowships and 36 graduate scholarships, most of which are in graduate departments in the various colleges of the university. In addition, legislative scholarships are granted to the extent of 8 per cent of the nonresident enrolment of the previous year.

Gymnasium work and military drills are required of men students during part of the course, and gymnasium work of women students. There is also ample provision for athletic sports, which are under the general control of an athletic council, on which faculty, alumni and students are represented. The University of Wisconsin is the only institution of the kind in the West which has a boat crew. The women students have organized an athletic association. The students maintain four men's literary societies and two women's societies; three of the men's societies are in the College of Letters and Science and one is in the College of Agriculture. The men's societies have organized a forensic board which selects debaters for inter-collegiate contests. Two of the men's societies and one women's society were organized in the early days of the university and have always had a prominent part in student life. There are also a science club, Sigma Xi, composed of faculty members and graduate students, four dramatic societies and innumerable other student associations, a Woman's Self-Government Association and chapters of Phi Beta Kappa and Tau Beta Pi (engineering). There are several other honorary and professional fraternities in agriculture, commerce and economics, chemistry, engineering, medicine, debating, law, journalism and home economics. The university campus contains about 450 acres, bordering on the south shore of Lake Mendota; in the eastern part of the grounds the land rises abruptly in two hills, of which the eastern and higher is known as University Hill. On this hill are most of the college buildings; the Washburn Observatory stands on the western hill, which is known as Observatory Hill; farther west is the farm with its barns and buildings; to the east of University Hill is the lower campus, used largely for athletic sports; the State Historical Society Library building, containing the libraries of the society and the university, also stands at the western end of this campus. Among the prominent buildings on and near the University Hill are north hall, south hall, biology building, chemistry building, law building, physics-economics building and university hall, Chadbourne hall, Barnard hall, Lathrop hall, music hall, science hall and the engineering building; on and near Observatory Hill are the Hiram Smith hall (dairy), horticultural building, agricultural hall, home economics-extension building, the infirmary, stock pavilion, soils building, agricultural engineering building, agri-

cultural chemistry building and agronomy building. The university library in 1919 contained 263,000 volumes, in addition to which there are departmental libraries, the State historical library and legislative reference library open to students. Thus there are about 581,000 volumes and 308,000 pamphlets accessible for the purposes of the university. The collection is particularly strong in American and English history, Greek, political and social science, Shakespeare and the publications of American learned societies. The students in 1916-17, the last normal year before the war, numbered 5,318, of whom 3,417 were in the College of Letters and Science, 657 in the College of Engineering and 929 in the College of Agriculture. In 1918-19 there were 4,173 students, with 2,884 in the College of Letters and Science, 599 in the College of Engineering, and 531 in the College of Agriculture. Including the Students' Army Training Corps, the total enrolment was 5,274. The University of Wisconsin ranks among the first of the State universities both in numbers and in standard of scholarship.

M. H. HAERTEL,

*Secretary of the Faculty, University of Wisconsin, Madison, Wis.*

**WISCONSIN PHALANX.** See **RIPON, Wis.**

**WISDOM**, Book of, the name of one of the so-called apocryphal books of the Protestant Bible. See **WISDOM OF SOLOMON**.

**WISDOM OF SOLOMON**, a book regarded by Protestants as apocryphal, but accepted by Roman Catholics as part of the canon of the Old Testament. It purports to be the work of Solomon, but the Protestant view is that it was the composition of a Jew of Alexandria about a century before Christ. The author states that he is a king and the son of a king, that he prayed to God for wisdom, and received both wisdom and riches. God directed him to build a temple on the holy mount. Righteousness and wisdom are commended, unbelievers and idolatry are denounced, and examples are given from the Mosaic writings to show how the judgments of God overtake the worshippers of false gods and the wicked generally. Nor is the author content with indicating earthly penalties for wrongdoers. He points plainly to rewards in a future life for the good, and punishments for the wicked, and without referring to the resurrection of the body, he teaches the immortality of the soul. The book was highly esteemed among the Jews and was evidently well known to Saint Paul, as the epistles to the Romans, the Corinthians and Ephesians indicate. Under the name of 'Wisdom' in the Roman Catholic canon of the Old Testament, the book is in the list recognized by the Council of Trent as inspired Scripture. The Roman Catholic position is that it was truly the work of Solomon, and that the Alexandrian Greek version was a translation from the original Hebrew. See **APOCRYPHA; BIBLE**.

**WISE, Bernhard Ringrose**, Australian statesman and author: b. Sidney, 10 Feb. 1858. He was educated at Rugby and Oxford, where he was several times prizeman, founder of the Amateur Athletic Association of Great Britain, and first president of the Oxford Union and Athletic Club. From 1879 to 1881 he was

amateur mile champion. After graduating in law he went to New South Wales, where he was Attorney-General (1887-1904) and Minister of Justice (1901-04). He was a member of the national committee which framed the constitution of the Commonwealth, and he was very active in promoting industrial law reform and prison reform. He is the author of 'Industrial Freedom' and 'The Commonwealth of Australia.'

**WISE, Daniel**, American Methodist clergyman and author: b. Portsmouth, England, 10 Jan. 1813; d. Englewood, N. J., 1898. He came to the United States in 1832, entered the Methodist ministry, edited the *Sunday School Messenger*, 1838-43, and *Zion Herald*, 1852-56, as well as many Sunday School publications. He published more than 50 books for young people, mostly under the pen-names of 'Francis Forrester' and 'Laurence Lancewood.' Among these are 'Personal Effort' (1841); 'Life of Ulric Zwingli' (1850); 'My Uncle Toby's Library' (12 vols., 1853); 'Vanquished Victors' (1876); 'Heroic Methodists' (1882); 'Boy Travelers in Arabia' (1885); 'Men of Renown' (1886); and 'Some Remarkable Women' (1887).

**WISE, Henry Alexander**, American lawyer and political leader: b. Drummondtown, Accomac County, Va., 3 Dec. 1806; d. Richmond, Va., 12 Sept. 1876. He was graduated from Washington College, Pa., in 1825, was admitted to the bar in 1828 and began the practice of law at Nashville, Tenn. In 1830, however, he returned to Accomac County, where he built up a large practice as a lawyer. He was early active in the Democratic party; was a delegate to the National Convention of 1832 and in the same year was elected to Congress. After the election he fought a duel with his opponent, on the latter's challenge. On the removal of the government deposits from the United States bank, Wise, with other Democrats in the House, joined the Whigs in opposition against President Jackson. He was, however, re-elected to Congress in 1834 and in 1836; and also opposed Van Buren's banks and sub-treasury plan. In 1837 he acted as the second of Graves, of Kentucky, in a duel with Cilley, of Maine, both members of Congress, in which the latter was killed. The occurrence led to much denunciation of Wise, who was, however, ascertained not to be responsible for the affair. In 1840 he was instrumental in securing the nomination of Tyler for the Vice-Presidency, and after Tyler became President exerted an important influence on the administration policy. In 1844 he was appointed Minister to Brazil; and on his return to the United States in 1847 again gave his support to the Democratic party. In 1855 he was Democratic candidate for governor of Virginia, conducted an active campaign, particularly against the Know Nothing party, and was elected by a majority of 10,000. Toward the end of his term as governor occurred the seizure of Harper's Ferry by John Brown and his followers, and the execution of John Brown at Charlestown, 2 Dec. 1859, was one of the last acts of his administration. He was a member of the State convention which met at Richmond in 1861 to consider the relations of Virginia to the Federal government, and one of

committee on Federal relations to whom principal business of the convention was referred. He favored a compromise between North and South, and the avoidance of hostilities, but after Virginia declared for secession he loyally supported the Confederate

Confederate army and occupied the Shenandoah Valley, but was rapidly driven out by General Cox in a series of skirmishes. He returned to serve in western Virginia until he was sent to Roanoke Island, N. C., with orders to defend it. At the time of the attack upon the island by General Burnside, in February 1862, he was ill on the mainland, but a larger part of his brigade, known as the "Iron Legion," took part in the action. He was killed at the battle of Appomattox. After the war he resumed the practice of law in Richmond. He wrote 'Seven Decades of War' (1862). Consult Wise, B. H., 'Life of Henry Der Wise' (1899); Wise, J. S., 'End of the War' (1899).

**Wise, Henry Augustus**, American naval officer. b. Brooklyn, N. Y., 12 May 1819; d. New York, Italy, 2 April 1869. He entered the U. S. Navy as a midshipman in 1834, served on the Pacific Coast during the Seminole War and the Mexican War. He was assistant chief of the Bureau of Lighthouses and Hydrography in 1862, remained in that capacity during the balance of the war. He was promoted captain in 1864. Under the pseudonym of "Harry" he wrote 'Los Gringos; or, An In-View of Mexico and California, with Rings in Peru, Chili, and Polynesia'; 'Tales for the Marines' (1855); 'Savias, from Gibel-Tarek to Stamboul'; 'The Story of the Gray African Parrot' (1859), a book for children, and 'Captain of the Centipede' (1860).

**Wise, Isaac Mayer**, American rabbi and orator. b. Steingrub, Bohemia, 29 March 1811; d. Cincinnati, Ohio, 26 March 1900. He studied at Prague and Vienna, became rabbi in New York in 1846. He was rabbi of a synagogue at Albany, N. Y., where ritual changes that he favored led to a schism in the congregation, and a new temple was organized by his friends. In 1854 he was rabbi of the Congregation B'nai Tesse of Cincinnati, Ohio. In the same year he published 'History of the Israelitish Nation' in German, followed in 1856 by 'Die Deborah'. Throughout his long life of activity he sought in pulpit, press and reform to advance the cause of progressive Judaism and became its practical and popular spokesman to whose efforts were due the Union of American Hebrew Congregations, the Hebrew College and the Central Rabbinical Conference. In the formative period between 1856 and 1863 Rabbi Wise was enabled by means of his publications to reach the Jews of the United States even in the remote places, without inter-bringing not only the news, foreign as well as domestic, but industriously making a foundation for a union of congregations for the purpose of establishing a seminary to educate and train the rabbis who, in turn, were to bring about the liberalization of Judaism and dem-

onstrate that the ancient faith could be adopted to changed conditions without the sacrifice of even the least of its tenets. Wise was active in so many directions, and was so great a power in the history of Judaism in the United States, that it is necessary to treat under distinct headings the various achievements of his long and successful career. He was above all an organizer, and the numerous institutions that he called into being attest to the great influence he wielded during his life. In his later years Rabbi Wise was regarded as the most prominent Jew of his time in the United States. More than any of his contemporaries, it may be said of him that he left the impress of his personality upon the development of Judaism in the United States. Among his published works are 'Essence of Judaism' (1860); 'Judaism, Its Doctrines and Duties' (1862); 'Prayer Book' and 'Hymnal' (1863), which were quickly followed by his 'Origin of Christianity,' 'The Cosmic God,' 'The History of the Hebrews,' 'Second Commonwealth,' 'A Defense of Judaism versus Proselytizing Christianity' and 'Pronaos to Holy Writ.' He was president of the Hebrew Union College from its foundation in 1875 until his death. In 1919 the centenary of his birth was celebrated with great éclat throughout the United States.

**Wise, John**, American colonial clergyman: b. Roxbury, Mass., August 1652; d. Ipswich, Mass., 1725. He was graduated from Harvard in 1673 and 10 years later was settled as minister of the Second Parish Church in Ipswich, in which position he continued until his death. For remonstrating against the violation of charter rights in levying a province tax without authority from the Assembly, he was fined and imprisoned by Governor Andros in 1687. In 1689 he brought a suit against Chief Justice Dudley for denying him the privileges of the habeas corpus act, and in 1690 was chaplain to the expedition to Quebec. He took a decided and successful stand against the attempts of Increase and Cotton Mather to place the Massachusetts churches under the authority of ecclesiastical councils, putting forth two essays on the subject, 'The Churches' Quarrel Espoused' (1710) and 'A Vindication of the Government of New England Churches' (1717). A large edition of both essays was published in 1772 and a fourth edition with historical memoir by J. S. Clark (1860). In the memoir it is stated that several striking passages in the Declaration of Independence are nearly literal transcripts from the 'Vindication.' Consult Tyler, 'History of American Literature' (Vol. II, 1878).

**Wise, John Sergeant**, American lawyer, son of Henry Alexander Wise (q.v.): b. Rio de Janeiro, Brazil, 27 Dec. 1846; d. 12 May 1913. He studied at the Virginia Military Institute at Lexington, which he left in 1864 to join the Confederate army, was graduated from the law department of the University of Virginia in 1867 and began to practise his profession in Richmond. In 1881 he was elected to Congress from Virginia. He was defeated for governor of his State in 1885. He published 'Diomed' (1898); 'The End of an Era' (1899); 'The Lion's Skin' (1905); 'A Treatise on American Citizenship' (1906).

**Wise, Peter Manuel**, American alienist: b. Clarence, Erie County, N. Y., 7 March 1851;

d. 22 Sept. 1907. He was graduated at the medical department of the University of Buffalo in 1872; was president of the New York State Commission in Lunacy 1896-1901; and was professor of psychiatry at the University of Vermont 1891-95. He published 'Text-Book for Training Schools' (1896) and monographs on 'Asylums of Great Britain' (1882); 'Sexual Perversion' (1883), etc.

**WISE, Stephen Samuel**, American Jewish rabbi: b. Budapest, Hungary, 17 March 1872. He studied at the College of the City of New York in 1887-91, was graduated at Columbia University in 1892, and received the degree of Ph.D. there in 1900. He was pastor of the Madison Avenue Synagogue, New York, in 1892-1900; of Beth Israel, Portland, Ore., in 1900-06; and in 1907 he founded the Free Synagogue, New York, of which he has since been pastor. He is noted for his liberal views, his eloquence and for his social welfare work. He is an editorial contributor to the *Survey*, and his sermons at Beth Israel and at the Free Synagogue have been published monthly. He is also author of 'The Ethics of Solomon Ibn Gabirol' (1901); 'How to Face Life' (1917), etc.

**WISE MEN OF THE EAST, The**, the three Magi, who, according to the Gospel of Matthew (ii, 1, 2), followed the guiding star to Bethlehem in order to render homage to the new born King of the Jews. A legend, which can be traced back to the 2d century, calls them kings and later times distinguished them as Melchior, Gaspar and Balthasar. They are honored at the feast of the Epiphany and in art the youngest is portrayed as a Moor. In astral theology they were represented by Orion's three stars. Their bones are said to have been placed in the cathedral of Cologne and hence they are often referred to as the Three Kings of Cologne.

**WISEMAN, wiz'man, Nicholas Patrick Stephen**, English Roman Catholic prelate: b. Seville, Spain, 3 Aug. 1802; d. London, 15 Feb. 1865. He was of Irish parentage, was brought to Waterford, Ireland, at his father's death in 1805 and was educated at the Roman Catholic College, Ushaw, near Durham, and the English College at Rome. He took orders in 1825, became professor of Oriental languages in the Roman University in 1827 and in 1828 rector of the English College. He returned to England in 1835 and there delivered in 1836 at Saint Mary Moorfields, London, a series of lectures on 'The Principal Doctrines and Practices of the Catholic Church,' which attracted much attention. He was consecrated titular bishop of Melipotamos in 1840 and was made archbishop of Westminster and cardinal in 1850. This ecclesiastical appointment caused great excitement among English ultra-Protestants, who termed it a "papal aggression" and resulted in the "Ecclesiastical Titles Act" prohibiting the assumption of local ecclesiastical titles by Roman Catholics, which was not repealed until 1872. In the midst of the excitement Wiseman put forth a temperate address explaining the constitutional rights of Roman Catholics, entitled 'An Appeal to the Reason and Good Feeling of the People on the Subject of the Catholic Hierarchy' (1850), which was very instrumental in bringing about a better

state of feeling. In 1836 he established with O'Connell the *Dublin Review* and was a regular contributor to it. He was the author of 'Lectures on the Connection between Science and Revealed Religion' (1836); 'Letters on Catholic Unity' (1842); 'Papal Supremacy' (1850); 'Fabiola' (1854); 'The Four Last Popes' (1858), etc. Consult Fitzgerald, 'Fifty Years of Catholic Progress' (London 1900); Houghton, 'Monographs' (1875); Thureau-Dangin, Paul, 'English Catholic Revival in the Nineteenth Century' (Eng. trans. by W. Wilberforce, rev. ed., 2 vols., New York 1916); Ward, 'Life and Times of Cardinal Wiseman' (1897; new ed., New York 1900); id., 'Ten Personal Studies' (London 1908); White, G., 'Memoir' (1865).

**WISHAM.** See WUSHKUM.

**WISHART, wish'art, George**, Scottish preacher and agitator: b. Pitarrow, Forfarshire, about 1513; d. Saint Andrew's (burnt), 1 March 1546. Leaving Scotland in 1538 to avoid persecution, he became in 1543 a tutor in Christ Church College, Cambridge, where he led, according to the testimony of one of his pupils, a life of singular abstemiousness, charity and purity. In July 1543 he returned to Scotland with the commissioners sent to negotiate a marriage treaty between Prince Edward and the infant queen of Scots. Under their protection he preached at Montrose, Dundee and other Scottish towns, and his preaching led the people to destroy some convents and Roman Catholic churches. Arrested at Ormiston by the Earl of Bothwell, he was delivered to Cardinal Beaton, who sentenced him to be burned at Saint Andrew's. Consult Foxe, 'Acts and Monuments'; Knox, J., 'History of the Reformation' (in 'Works,' ed. by D. Laing, Edinburgh 1846-64); Rogers, 'Life of George Wishart, the Scottish Martyr' (ib. 1876); 'Dictionary of National Biography' (Vol. LXII)

**WISHART, or WISEHEART, George**, Scottish bishop: b. Yester, East Lothian, 1609; d. Edinburgh, 1671. He is said to have been educated at the University of Edinburgh, and having entered the Episcopal Church, received a charge at Saint Andrew's. In 1639, having refused to take the covenant, he was deposed from the ministry, and during the supremacy of the Presbyterian party was several times imprisoned. He subsequently became chaplain to Montrose, and after that leader's death to Elizabeth, electress palatine and titular queen of Bohemia. He accompanied her to England, and on the Restoration was made rector of Newcastle, and in 1662 was consecrated bishop of Edinburgh. He is chiefly known by his 'History of the Wars of Montrose' (1647), written in elegant Latin. When Montrose (q.v.) was executed in 1650 a copy of this work was hung in derision about his neck. Several English translations of Wishart's work have appeared, the latest in 1819.

**WISHOSKAN**, a linguistic stock of North American Indians, comprising the Patawa: Weevot or Wiyot and Wishosk tribes, occupying the coast of California from a little below the mouth of Eel River to a short distance north of Mad River, including particularly the country about Humboldt Bay. They also extended up the streams named into the mountain passes. Of these tribes little is known, as they

ssed with the "Diggers" on account of habit of living largely on roots. Their is small, being at present less than 200.

**SHRAM.** See WUSHKUM.

**SMAR,** vis'mär, Mecklenburg-Schwerin, ond seaport of the province, situated on ltic, at the head of a bay of the same 20 miles north of Schwerin. It has an t harbor, carries on an active over-sea and has varied manufactures. Of the al walls only four gates remain; but merous quaint old houses are a feature place, and several of the brick churches l as the Fürstenhof, once a ducal reside date from the 14th and 15th centuries. a Hanse town in the 13th century, to Sweden in 1649, was taken by the in 1675, and by the Danes, Prussians and erians in 1712, when its strong fortifi- were destroyed, and in 1803 was pawned eklenburg-Schwerin, which secured it in 1828. Pop. 24,376.

**SSLER,** Clark, American anthropologist: me County, Ind., 18 Sept. 1870. He was ted at Indiana University in 1897 and d the degree of Ph.D. at Columbia Uni- in 1897. He was assistant and later lect- n anthropology at Columbia in 1903-09; also assistant in ethnology at the Ameri- useum of Natural History, New York, in 5, and since 1906 has been curator there. ublished works include 'The Correlation ntal and Physical Tests' (1901); 'North an Indians of the Plains' (1912); 'Eth- of the Blackfoot Indians' (1912); 'The an Indian' (1917).

**SSMANN,** vis'män, Hermann von, Ger- African explorer: b. Frankfort-on-the- 4 Sept. 1853; d. 15 July 1905. He entered rman army, reaching the rank of lieuten- 1874, and crossed the African continent employ of the German African Society 82). He commanded an expedition sent Leopold II in 1884-85, and as imperial n commissioner in 1889-90 he suppressed rab revolt under Bushiri, but failed in g to take two steamers to Lake Vic- ia Nyassa and Tanganyika lakes in 1892. as governor of German East Africa in 5, and president of the Berlin Geographi- ociety in 1897. He published 'In the r of Africa' (3d ed., 1891); 'Under the n Flag across Africa' (1880-83); 'My l Crossing of Equatorial Africa' (1891); a: Descriptions and Advice' (1895), etc. lt Ruhle, 'Hermann von Wissmann' ster 1892).

**STAR,** Caspar, American physician: b. elphia, Pa., 13 Sept. 1761; d. there, 22 318. He attended the medical department University of Pennsylvania in 1782, subtly graduated in medicine at the Uni- of Edinburgh (1786), returning to the States in 1787. He was professor of try and the institutes of medicine at ollege of Philadelphia 1789-92. In the ear that institution was united with the l department of the University of Penn- ia, and he was there adjunct professor tomy, midwifery and surgery 1792-1808; ecoming professor of anatomy and hold- it chair until his death. He was the first

to show that the posterior portion of the ethmoid bone was attached to the triangular bones. He opened his house once a week for meetings of students, travelers, scientists and citizens, and these symposiums continued long after his death, and were known as the Wistar parties. Wistar became a member of the American Philosophical Society in 1787, and succeeded Thomas Jefferson as its president in 1815. The Wistar Institute of Anatomy and Biology at the University of Pennsylvania was named in Wistar's honor, as was also the climbing shrub, popularly known as the "wistaria vine." He wrote 'A System of Anatomy for the Use of Students of Medicine' (1811-14).

**WISTAR,** Isaac Jones, American penologist: b. Philadelphia, Pa., 14 Nov. 1827; d. Claymont, Del., 18 Sept. 1905. He was educated at Haverford College, Pa., and served in the Civil War as brigadier-general of volun- teers, United States army, 1862-65. He was president of the Academy of Natural Sciences of Philadelphia 1892-96, has been inspector of the Eastern Penitentiary of Pennsylvania, was president of the State Board of Charities of Pennsylvania and founded the Wistar Institute of Anatomy and Biology, named in honor of Caspar Wistar (q.v.).

**WISTARIA,** a genus of leguminous climbers, named in honor of Caspar Wistar, an American anatomist (1761-1818), which contains several species, natives of China, Japan and North America. They are high-climbing, hardy shrubs, and have odd pinnate leaves, with entire leaflets and large, terminal, pendulous racemes of papilionaceous flowers. These have large standards and wings freed from the keel, which is incurved and obtuse, and are usually purple or white. The fruits are coriaceous legumes, opening readily. Nearly all of the wistarias are cultivated for covering walls, verandas, trellises, etc. The Chinese wistaria (*W. chinensis*), which was introduced into England about 1816, is perhaps the best. It has profuse dense clusters of pea-shaped flowers, which are about a foot long and bloom in May before the leaves appear and occasionally again in autumn. When grown over a trellis, the blossoms depend in great masses of blue. This vine is a rampant grower, and the flowering wood may be known by its short, jointed, antler-like growth and absence of climbing spines.

Wistaria is a favorite plant of the Japanese, who have a variety (*W. chinensis multijuga*) with racemes a yard long, loosely flowered, and with small blossoms, which are fragrant, however. This plant they train about their houses and over trellises in the greatest profusion. The American wistaria (*W. frutescens*) or kidney-bean tree, is not so vigorous as the Chinese species and has slightly pubescent racemes, only about six inches long. It is found, when wild, climbing over trees at the edges of swamps from Virginia to Florida, and improves with cultivation.

**WISTER,** Annis Lee Furness, American translator: b. Philadelphia, Pa., 9 Oct. 1830; d. Philadelphia, Pa., 15 Nov. 1908. She was married to Dr. Caspar Wister (d. 1888) in 1854. She made many translations of note, among them E. Marlitt's 'The Old Mamselle's Secret' (1868); 'Gold Else' (1868); 'The Countess

Gisela' (1869); 'The Little Moorland Princess' (1873); and 'The Second Wife' (1874); Wilhelmine von Hillern's 'Only a Girl' (1870); Hackländer's 'Enchanting and Enchanted' (1871); Volkhausen's 'Why Did He Not Die' (1871); Von Auer's 'It Is the Fashion' (1872); and Fanny Lewald's 'Hulda; or, The Deliverer' (1874). Her translations were issued in a uniform edition of 30 volumes in 1888. With F. H. Hedge (q.v.) she published 'Metrical Translations and Poems' (1888).

**WISTER, Owen**, American novelist, grandson of Frances Anne Kemble (q.v.): b. Philadelphia, 14 July 1860. He was graduated from Harvard in 1882, studied law and was admitted to the Philadelphia bar in 1889, but from 1891 has devoted his attention to literature. He has been especially successful in his delineation of Western life and character and has published 'The Dragon of Wantley: His Tail' (1892); 'Red Men and White' (1896); 'Lin McLean' (1898); 'The Jimmy John Boss and Other Stories' (1900); 'U. S. Grant, a Biography' (1900); 'The Virginian,' which has been widely popular and has been successfully dramatized (1902); 'Oliver Wendell Holmes' (in 'American Men of Letters' series, 1902); 'Benjamin Franklin' (in 'English Men of Letters' series, 1904); 'Lady Baltimore' (1906); 'Mother' (1907); 'Members of the Family' (1911); 'The Pentecost of Calamity' (1915).

**WITCH, or WYCH, ELM**, the common broad-leaved elm (*Ulmus glabra*) of England and Scotland, which does not grow to so large dimensions as the field elm; nevertheless at Selborne, Gilbert White measured a witch elm which, seven feet from the ground, was eight feet in diameter. It is a tree of picturesque habit, and, unless grown in crowded masses, rarely produces a straight trunk. It has a wide, spreading head, often slanted to one side, and the branches begin near the base. These drooping branches lash neighboring trees unmercifully, and if they chance to rest on the ground readily strike root. The tree is easily increased by layers or by the abundant seeds. The timber of the witch elm is more durable than that of other English elms, but has their fine-grained, tough and elastic qualities. It is very flexible when steamed, and is utilized for bent-wood work, frames in boat-building and bows; in olden times, if the branches were forked, they served as divining-rods, perhaps because of the likeness of the broad, ovate leaves to those of the hazel, which is one of the so-called lightning plants. These plants are sacred to Thor, are considered to be an actual embodiment of lightning, and their forked branches (having, according to mythology, a resemblance to a lightning flash) are used as talismans to point out the hidden stores of gold or subterranean water.

**WITCH-HAZEL**, a tall, sometimes arborescent shrub (*Hamamelis virginiana*) of eastern American woodlands. It has a characteristic horizontal, straggling growth; as Thoreau says: "Its spray, so jointed and angular, is not to be mistaken for any other." Witch-hazel is one of the most difficult shrubs to eradicate from a clearing, as it has many diverging stems, so crooked and springy as to render axe-work unsuccessful. The bark is pale-gray; the leaves,

somewhat resembling the ovate foliage of the hazel-nut, are more or less oblique and undulate-edged, not at all handsome, but turning to a beautiful clear yellow in autumn. No sooner have they fallen off, with the rest of the forest foliage, in October or November, than the witch-hazels reclothe themselves with a luminous vesture of filmy, feathery yellow, which turns out to be the long-delayed blossoms—whether the earliest or the latest flowers of the year botanists cannot decide. Individually, they are not conspicuous, having only four narrow, strap-shaped, golden petals, but are so tufted on the twigs as to gild the bushes. Meanwhile the fruits, little blunt, horned woody capsules that have been slowly ripening since the previous fall, begin to gape, and by elastic fissuring and incurving their walls, shoot their stony-hard, bullet-shaped, polished seeds far and wide. Twigs of this witch-hazel, so unorthodox in its season of blooming, and remotely resembling the hazel-nut in foliage, were chosen as material for the forked divining-rods, which twisting in the hand of the treasure-seeker, or well-digger, pointed downward and disclosed the site of subterranean water or gold. A much more practical use for witch-hazel has been found nowadays. An infusion of the leaves of witch-hazel in alcohol furnishes the familiar slightly astringent and tonic lotion for external inflammations known as "witch-hazel" or "hamamelis." Branches of witch-hazel thrown into the fire exhale the characteristic, peculiar odor of the lotion. Both the foliage and bark moreover, contain much tannin. The witch-elm (q.v.) of England is also called witch-hazel.

**WITCH HILL**, the name of a hill in Salem, Mass., so called because of the executions of witches which took place there in 1692. It is also known as Gallows Hill.

**WITCHCRAFT**, supernatural power which persons were formerly supposed to obtain by entering into a compact with the devil. The compact was sometimes express, whether oral or written, when the witch abjured God and Christ, and dedicated herself wholly to the evil one; or only implied, when she actually engaged in his service, practised infernal arts, and renounced the Sacraments of the Church. The express compact was supposed to be solemnly confirmed at a general meeting, at which the devil presided, and sometimes privately made by the witch signing the articles of agreement with her own blood, or by the devil writing her name in his "black book." The contract was sometimes of indefinite duration, at other times for a certain number of years. The witch was bound to be obedient to the devil in everything, while the other party to the pact delivered to the witch an imp, or familiar spirit to be ready at call and to do whatever was directed. He further engaged that they should want for nothing, and be able to assume whatever shape they pleased to visit and torment their enemies and accomplish their infernal ends. The belief in witchcraft appears to have existed in various forms among ancient nations, including the Hebrews; it prevails to-day among savage and semi-savage races, and is not extinct in civilized countries. It was always condemned by the Church, and in the 14th century the popes believed that they recog-

in sorcery a prevalent and dangerous evil, began to issue bulls against it. In the 15th century the Inquisition took charge of the work of exterminating witches, and the close of that century, and the beginning of the 16th, witnessed thousands of executions in Germany, and other countries. France was slow to enact any general persecution of witches, and not until about the time of the break-up of Rome that the first formal enactment, which declared witchcraft to be a felony in England. From that time on, for more than a century, the burning of witches was kept up in England and Scotland, the statute of 1563 being the first regular enactment against the crime in the latter country.

The Reformation was attended by, or rather coincident with, an increased intensity of the witchcraft superstition, and its resulting horrors. Theologians of all creeds were equally zealous in the reality of compacts with the devil, and regarded the persons who entered into such compacts as unfit to live. It is probable that the religious fervor aroused by controversy over disputed dogmas may have served to bring more vividly to the minds of clergy and laity alike their assumed obligation to the Scriptural injunction against witchcraft, and that, in this way, the Reformation has promoted this form of persecution. In England, the tribunals actively engaged in crushing disbelief in the accepted creeds of their respective states could readily devote any surplussage of energy and zeal to what seemed to them the latest crime of witchcraft. From one end of the rope to the other executions of witches followed daily occurrence, and it is estimated that from the time of the promulgation of the bull of Pope Innocent VIII against sorcery, in 1484, until 1782, when the last judicial victim, a young girl at Glarus, in German Switzerland, was executed, 300,000 women perished on the charge of witchcraft. Some of the victims were probably poisoners, but very many of them were undoubtedly innocent of any wrongdoing whatever. Children of tender years were sometimes among the condemned. In North America witnessed many executions on the charge of witchcraft, and it is stated with credible authority that as late as 20 August, 1692, five alleged witches were burned alive at Salem, Massachusetts. This appears to have been one of the nature of a lynching rather than of execution of a sentence of a competent

tribunal. In England and Scotland, as already stated, the 17th century witnessed hideous scenes of torture and extermination. The last victim in England was Mrs. Hickes and her daughter, nine years of age, executed in 1716, the last in Scotland suffered in 1722. The institution for witchcraft was abolished both in England and in Scotland by George II, which made all persons pretending to be witches punishable by imprisonment. By a subsequent act passed in the reign of George III, witchcraft was made punishable as rogues and vagabonds.

In the American colonies laws against witchcraft similar to those in England at the end of the first there were occasional and executions on that charge. The great witchcraft delusion, with its attendant

tragedies, occurred near the close of the 17th century and was largely due to excitement caused by the teachings and writings of Cotton Mather, the noted Puritan divine, who was a strong believer in the superstition. The Salem witch frenzy broke out in the family of one Samuel Parris, a minister, but for whose instigation the delusion, with its accompanying sacrifice of innocent lives, could not have obtained the headway it did. A company of girls suddenly began to act mysteriously, bark like dogs, and scream at something unseen. An old Indian servant was accused of bewitching them. The excitement spread and impeachments multiplied. A special court was formed to try the accused, and as a result the jails rapidly filled, and many were condemned to death. It was unsafe to express a doubt of a prisoner's guilt. Fifty-five persons suffered torture, and 20 were executed before the delusion ended. Witches were supposed to be able, with the assistance of the devil, not only to foretell events, but to produce mice and vermin, to deprive men and animals, by touching them or merely breathing on them, of their natural powers, and to afflict them with diseases, to raise storms, etc., to change themselves into cats and other beasts, etc. General assemblies of witches, called "Witches' Sabbaths," were held yearly, or oftener, at which they appeared entirely naked, and besmeared with an ointment made from the bodies of unbaptized infants. To these meetings they were supposed to ride from great distances on broomsticks, pokers, goats, hogs, or dogs, the devil taking the chair under the form of a goat. Here they did homage to their master, and offered him sacrifices of young children, etc., and practised all sorts of license till cock-crowing. Neophytes were introduced to the devil at these meetings, and received his mark on their bodies, in token that they had sold their souls to him. As before remarked, the belief in witchcraft still prevails in many parts of the world, and in some countries where pretended sorcerers exert a powerful influence, lives are often sacrificed as a result of their practices and in order that they may continue their nefarious work.

**Bibliography.**—Adams, W. H. **WITENAGEMOT**, wî'ĕ-nâ-gê-môt', or **WITENAGEMOTE**, originally an assemblage of all the freemen of a tribe or state, among the Teutonic conquerors of southern Britain, but which, in the course of events, and without any special law, resolved itself into an assembly of the princes, aldermen, thanes, large land-owners and leading ecclesiastics. The witenagemot met once a year or oftener, and had great power, electing a king in the event of disputed succession, approving the regular succession, if there was no dispute, passing upon the trial and punishment of high offenders, enacting laws, and acting as a grand inquest into public affairs. It passed out of existence with the Norman Conquest, and the subsequent Parliament was a separate growth, and not a continuation of the Witenagemot. Consult Chadwick, H. M., 'Studies on Anglo-Saxon Institutions' (Cambridge 1905); Freeman, E. A., 'History of the Norman Conquest' (5 vols., Oxford 1872-79).

**WITHER**, with'ĕr, or **WITHERS**, George, English poet and pamphleteer: b. Bentworth, near Alton, Hampshire, 11 June 1588; d. London, 2 May 1667. He studied at Magdalen College, Oxford (1604-06), but did not obtain a degree, and a few years later he went to London to study law. He devoted much attention to literature, and proved his skill in satiric verse by being thrown into the Marshalsea for his 'Abuses Stript and Whipt' (1613). While there imprisoned he wrote busily, and is said to have composed there several of his best poems, among them 'The Shepherd's Hunting' (1615), a continuation of 'The Shepherd's Pipe' (1614) of William Browne (q.v.). After his release he entered Lincoln's Inn, in 1615. About this same time he wrote the love elegy 'Fidelia.' In 1621 some official persons thought reflections against the state and leading politicians were to be detected in 'Wither's Motto, Nec Habeo, Nec Careo, Nec Curo' (1621), and again the author was ordered to the Marshalsea, though soon liberated. After 1622 he wrote nothing, save 'Hallelujah' (1641), a collection of religious verse, that in critical estimation attained the rank of earlier work. He became a Puritan, and wrote largely for the furtherance of the political and religious cause with which he was identified. At the revolution, he recruited (1642) a troop of horse for Parliament, and was made captain and the commander of Farnham Castle. When taken by Royalists and in danger of capital punishment, he was released through the interference of Sir John Denham (q.v.), who protested that "so long as Wither lived he (Denham) would not be accounted the worst poet in England." He was promoted major, made a commissioner for the sale of the king's goods, and (1655) became a clerk in the statute-office of the court of chancery. For his 'Vox Vulgi,' a poem dissuading from the restoration which remained in manu-

script until printed by Macray in 'Anecdota Bodleiana' (1880), he was committed to Newgate in 1660 and imprisoned there until released in 1663 under bond for good behavior. 'Fragmenta Poetica' (1666; reprinted as 'Fragmenta Prophetica,' 1669) was his last work. For some time subsequent to his death he was considered a rimer of no merit, was omitted from collections of English poetry, and included in the 'Dunciad' as "wretched Withers." But Ellis praised him in 'Specimens of the Early English Poets' (1790), and others, including Sir S. E. Brydges by various reprints and Lamb by the essay 'The Poetical Works of George Wither' (Lamb's 'Works,' 1818, new ed., New York 1903) obtained for him suitable recognition. His reputation is based chiefly on his earlier work. The greater part of his writings was printed by the Spenser Society (20 vols., 1870-83). Consult besides the books already mentioned Ward's 'English Poets' (Vol. II, 1880); and Sidgwick, F. (ed.), 'The Poetry of George Wither' (London 1902).

**WITHERITE**, a mineral composed of barium carbonate mined extensively near Hexham, Northumberland, England. Usually found in massive condition though orthorhombic crystals do occur; hardness, 3 to 3.75; specific gravity, 4.29 to 4.35; lustre, vitreous; color, white, often yellowish or grayish; streak, white. Used in the manufacture of baryta for sugar refining, in plate-glass making, and in the adulteration of white lead and zinc white.

**WITHERSPOON**, Herbert, American opera singer: b. Buffalo, N. Y., 21 July 1873. He was graduated at Yale University in 1895, meantime studying harmony and the theory of music under Horatio Parker and Macdowell, and singing under M. Treumann and W. J. Hall of New York. He made his debut at New Haven in 1895, and in 1896 he was basso with the New York Symphony Orchestra. He afterward studied singing in London and Paris, and acting in Vienna, and in 1899 he made his operatic debut at Boston with the Castle Square Opera Company. In 1908-16 he was first basso of the Metropolitan Opera House, New York, singing about 25 leading parts.

**WITHERSPOON**, John, American Presbyterian clergyman and college president; b. Yester, Haddingtonshire, Scotland, 5 Feb. 1723; d. near Princeton, N. J., 15 Nov. 1794. He was graduated from the University of Edinburgh in 1742, was licensed to preach the next year and was parish minister of Beith, 1745-57. He led a body of militia to the aid of the Pretender at Glasgow in 1745, and was captured at the battle of Falkirk, but was soon released. He was pastor at Paisley, 1757-68, and then accepted the presidency of the College of New Jersey (now Princeton College) in 1768. He was a delegate for six years from New Jersey to the Continental Congress; and a signer of the Declaration of Independence. He greatly increased the efficiency of the college and was a noteworthy figure in the political as well as the educational affairs of his time. He wrote 'Ecclesiastical Characteristics' (1753); 'Nature and Effects of the Stage' (1757); 'Essays on Important Subjects' (1764); 'Considerations

'Nature and Extent of the Legislative Authority of the British Parliament' (1774). His collected works appeared in nine vols. in 1804. Consult Sanderson, J., 'History of the Signers of the Declaration of Independence' (Philadelphia 1865); Tyler, J., 'Literary History of the American Nation' (Vol. II, 1897); Woods, D. W., 'Witherspoon' (New York 1906).

**WITHERSPOON, John A.**, American physician and educator: b. Columbia, Tenn., c. 1864. He was graduated M.D. at the University of Pennsylvania in 1887, and entered practice at Nashville, Tenn. He was connected with the faculty of Vanderbilt University from 1889, and is now professor of anatomy and clinical medicine there. He was connected with the medical faculty at the University of Tennessee in 1889-94. He was president of the American National Medical Association in 1913-14.

**WITHERINGTON**, with'ing-tón, England, a seafaring town in Lancashire, three miles west of the centre of Manchester, in the seafaring borough in which it is partly included. It contains modern churches and a Lancashire Independent College, a library, and numerous residential houses. Pop. 41,578.

**WITMER, Lightner**, American psychologist and educator: b. Philadelphia, Pa., 28 June 1867. He was graduated at the University of Pennsylvania in 1888 and received the degree of Ph.D. at the University of Leipzig in 1892. He was connected with the faculty at the University of Pennsylvania from 1892, and since 1905 has been director of the psychological laboratory and clinic there, which he organized as a department of the university. He lectured on psychology at Bryn Mawr College in 1901 and gave courses in psychology at the University in 1903-05. He has also been a psychologist at the Pennsylvania Training School for Feeble-Minded Children at Elwyn, Pa., since 1896. In 1907 he founded the *Psychological Clinic*, of which he is the editor. He has written 'Analytical Psychology' (1902); 'The Case' (1915); and edited 'Experimental Studies in Psychology'; 'The Special Problems of Backward Children'; and is a frequent contributor to technical and educational journals on topics in experimental and clinical psychology.

**WITNESS**, in law, a competent person to give testimony, as in a court of law regarding facts in issue. Formerly the witness acted as witnesses, and it was not until the 15th century that the custom was changed. A witness, either in a civil or a criminal case, may be compelled to attend court if required by law. A witness is commonly sworn by a subpoena, and if he does not appear when called without giving sufficient reason, he is liable for damages to the party subpoenaed him. In addition, he may be punished by fine or imprisonment. In some jurisdictions, a prisoner is not allowed to be a witness on his own behalf, but the rule is not

uniformly many objections against the competency of witnesses were allowed, but many have been removed by legislation. A

prisoner cannot be called as a witness for the prosecution to give evidence against himself. Usually a wife is not a competent witness against her husband, or a husband against his wife. A witness is exempt from civil arrest while in attendance at court, but not from arrest on a criminal charge. A witness usually testifies orally in open court, but sometimes his testimony is taken in writing before a commissioner or other legal official.

**WITTE**, vit'té, Emanuel, Dutch painter: b. Alkmaar, Holland, 1607; d. Amsterdam, 1692. He was a pupil of Van Alst, lived at Delft in 1642 to 1649 and in 1650 went to Amsterdam. His earlier paintings were mostly historical or portraits, but later he devoted some attention to interior decorations with which he was very successful. His works are found at the museums of Amsterdam, Rotterdam, Brussels, Berlin, Hamburg and Weimar, also in the National Gallery at London, and in some private English galleries.

**WITTE**, Pietro de, Dutch painter: b. Bruges, 1548; d. Munich, 1628. His general choice of subjects was confined to history, but it is not known under whom he studied in his native country before going to Italy, where he became an intimate friend of Giorgio Vasari, under whom he appears to have formed his style. When Vasari was employed to decorate the Vatican with frescoes De Witte became his favorite assistant, and grew almost completely Italianized in his artistic ideals. He painted equally well in fresco and oils, and was invited to Florence by the Grand Duke of Tuscany, and there executed some important works. His versatility is shown by the fact that when Maximilian, the Elector of Bavaria, required the services of a designer of tapestry De Witte was commissioned to furnish the necessary cartoons. He was one of the Dutch painters of the Renaissance period who gave himself up entirely to the influence of foreign schools and spent but a short part of his life in the Netherlands. His principal works have been engraved by Jan Sadeler and other famous engravers of his day.

**WITTE**, Sergei Yulievitch, Count, Russian statesman: b. Tiflis, 29 July 1849; d. 1915. He was graduated from the New Russian University, Odessa; devoted some time to journalism, and in 1877 entered the governmental railway service. He had charge of transporting troops on the Odessa Railway during the Russo-Turkish War, in 1879 was given a position on the Southwestern Railway, in 1886 became general manager of that road, and two years later chief of the Imperial Railway Department. In 1892 he was made Minister of Finance, and in this capacity he made several commercial treaties with Germany, aided the development of manufacturing industries, made the sale of alcohol a government monopoly and established the gold standard. His policy aroused the opposition of wealthy bankers, and of all conservatives, and in 1903 he was removed from the office of Minister of Finance, but was appointed president of the committee of ministers. In 1905 he, with Baron Rosen, satisfactorily arranged the Treaty of Portsmouth (q.v.), was created a count, on 30 October was appointed Premier, Russia's first Prime Minister, but resigned 2 May 1906 and was

appointed a member of the council. (See *RUSSIA HISTORY*). He wrote 'Principles of Railway Tariffs' (1883); 'Friedrich Liss, the Economist' (1888).

**WITTEKIND**, vit'tè-kind, or **WIDUKIND**, Saxon leader in the struggle with Charlemagne; d. about 807. He came of a noble Westphalian house, and first appears at the head of the Saxon expedition against the Westphalian fortress of Eresburg in 1774. Charlemagne's return from Lombardy drove him across the Weser, and instead of submitting to the emperor at the Diet of Paderborn in 777 like many other Saxon leaders, having renewed the revolt in 776, he fled to Jutland. He returned during Charlemagne's absence in Spain, laid waste the Rhineland and surprised and annihilated the Frankish army on the Sintelgebirge (782). The emperor retaliated by executing 4,500 Saxon prisoners, an action that aroused the entire Saxon race to arms. The battle of Detmold was indecisive (783), but that of Osnabruck forced Wittekind to enter on negotiations; the issue was that in 785 he accepted baptism in the imperial camp at Attigny, in Champagne. The emperor, it is said, made him duke of the Saxons and lord of Engern, and from the castle of Babilonic, near Lübeck, he exercised a benignant sway till he fell in battle with Gerold, the Swabian duke. Various princely houses, as those of Brunswick and Sardinia, claim Wittekind for the founder of their line. The Emperor Charles IV in 1377 placed a monument to him in the parish church at Enger, where he is supposed to have been buried, and in Menden, Westphalia, a monument was erected to him in 1812. Consult Dettmer, J., 'Der Sachsenführer Widukind nach Geschichte und Sage' (Wurzburg 1879); Diekamp, 'Widukind der Sachsenführer, nach Geschichte und Sage' (Münster 1877); Mowbert, 'Charles the Great' (New York 1888).

**WITTENBERG**, wit'en-bèrg (Ger. *vit-tèn-bèrg*), town on the Elbe, 45 miles southeast of Magdelurg. It was the home of the Reformation, and here Luther, while a university professor, nailed his 95 theses to the door of the Schlosskirche. The university in which he was professor was united to Halle in 1817. The principal buildings are the Schlosskirche, in which both Luther and Melancthon are buried; the Stadtkirche, where Luther and Melancthon preached; the remains of the Augustinian monastery, with Luther's apartments; the houses of Melancthon and Cranach; the town-hall, the gymnasium, etc. There are public monuments to Luther and Melancthon. Textiles, hosiery, leather, machinery, pottery, electrical apparatus, bricks, cement, essential oils, etc., are among the manufactures. Pop. 22,419.

**WITTENBERG COLLEGE**, located at Springfield, Ohio. It was founded in 1845 under the auspices of the Lutheran Church in Ohio. Its organization included a Preparatory School, a Collegiate Department, a Theological Seminary, a School of Oratory, a Conservatory of Music and a School of Art. There is also a Summer School, designed chiefly for teachers, giving courses in pedagogical methods. The Collegiate Department confers the single bachelor's degree of A.B. for a four years' course

Women are admitted to all departments. In 1919 the grounds, buildings and endowments were valued at \$1,200,000; the library contained 30,000 volumes. The students numbered 1,120 and the faculty 40.

**WITTHAUS**, wit'how's, Rudolph August, American toxicologist; b. New York, 30 Aug. 1846; d. 23 Dec. 1915. He was graduated from Columbia in 1867 and from the Medical Department of the University of New York in 1875; was professor of toxicology and chemistry at Cornell University and held similar chairs in the universities of New York, Vermont and Buffalo. He became noted as an expert in poisons in connection with many murder cases, and has published 'Essentials of Chemistry' (1879); 'General Medical Chemistry' (1881); 'Manual of Chemistry' (1879; 6th ed., 1908); and 'Laboratory Guide in Urinalysis and Toxicology' (1886). He has edited 'Witthaus and Becker's Medical Jurisprudence' (4 vols., 1906-11), for which he prepared the introduction, and Vol. IV on 'Toxicology.'

**WITWATERSRAND**, vit-và'tèrs-rànd ('White Waters Range,' colloquially 'The Rand'), Transvaal, South Africa, a low range of hills extending 25 miles either side of Johannesburg, since 1886 famous as one of the richest gold-mining districts in the world. See *TRANSVAAL, GOLD-MINING IN THE*.

**WIXOM**, wik'sòm, Emma. See *NEVADA, EMMA*.

**WIYOT**. See *WISHOSKAN*.

**WOAD**, wòd, a cruciferous herb (*Isatis tinctoria*), which has been used for centuries in the countries of temperate Europe, as a dyepiant, yielding an indigo-blue color. The woad has entire foliage, the stem leaves being sagittate, and has large coriaceous pods. Cæsar tells us that the ancient Britons stained their bodies with woad, so as to give themselves a more formidable appearance in battle; and from Pliny we learn that their women, before engaging in certain religious rites, also covered their nude bodies with the dye. The plant was formerly much cultivated in England for the sake of its dye, which was extracted from its crushed and fermented leaves, but the stronger and finer blue produced by the indigo-plant (q.v.) finally superseded it, although at first the latter produced but a crude dye. Those who cultivated woad opposed the introduction of indigo, and the opposition to it became so pronounced that in England and other European countries royal edicts were issued forbidding its importation. They were repealed by the middle of the 18th century. Woad is now mixed in the vats with indigo juice, but is of use chiefly as a convenient material to induce fermentation, although it is said also to improve the color itself.

**WOBURN**, wò'bèrn, Mass., city in Middlesex County, on two lines of the Boston and Maine Railroad, five miles from tidewater and 10 miles northwest of Boston. It is well laid out and has many handsome residences. The chief manufactures are leather, chemicals, machinery, glue and foundry products. The water-works are owned and operated by the city. There are several churches; a high school, established in 1852; public and parish elementary schools and a free public library which con-

bout 50,000 volumes and a fine art col-

There are three banks. The Woburn Savings Bank has deposits amounting nearly \$2,000,000. The government is vested under a charter of 1898 which is for a mayor and a council of 15 members of the members of the council are by wards and eight at large. There is a board of public works, the mayor is *ex officio*. Woburn was settled in 1637 by seven families from Charlestown, Mass. It was first called Charlestown. In 1642 the town was incorporated, and in 1889 chartered as a city. Benjamin Rumford (Count Rumford) was born here in 1727. Pop. 16,410. Consult Hurd, 'History of Woburn' (Philadelphia 1890) and 'History of Woburn' (Boston 1868).

**WODAN, WODEN, or WUOTAN**, Teutod of the winds and storms, who rose to the dignity of the greatest of all gods. See **ODIN**.

**WOFFINGTON**, wŏf'ing-tŏn, **Margaret**; British actress: b. Dublin, Ireland, 1820; d. Teddington, 28 March 1760. She appeared on the stage at 12 as Polly, with several other children, in 'The Opera,' but her first appearance in a part was as Ophelia in Dublin in 1737. From 17 to 20 she played on the Dublin stage in several parts, from Ophelia to Sir Harry; and on 6 Nov. 1740 made her first appearance at Covent Garden as Sylvia in the 'Fighting Officer.' She soon became a great favorite, the exquisite art of her male character especially remarkable. She kept the favor of the public till the tragic close of her career. On 3 May 1757 she broke down during Rosalind, and left the stage forever. Her character appears to advantage in Reade's 'Peg Woffington,' and his play 'Masks and Faces.' Consult Dobson, Austin, 'Introduction to Charles Reade's 'Peg Woffington'' (1899); Molloy, 'Life and Adventures of Margaret Woffington' (New York 1899); Daly, in, 'Woffington: a Tribute to the Actress' (New York 1888).

**WOFFORD COLLEGE**, located at Spartanburg, S. C. It was founded in 1851 under the control of the South Carolina Conference of the Methodist Episcopal Church, South, in accordance with the will of Benjamin Wofford, minister of that Church, who left a legacy of \$100,000 to the conference for establishing a college.

It was opened to students in 1854. The sessions have never been entirely suspended, though during the Civil War the college suffered heavily, the endowment was worthless, and full college work was not possible. Since that time the college has been supported by the Church, and the endowment partially restored, amounting in 1918-200,000. Two preparatory schools have been established in connection with the college, the Wofford College Fitting School at Spartanburg, and the Carlisle Fitting School at Carlisle, S. C. The course in the former is for three years; in the latter, four years. The school is coeducational. The college is arranged in four groups, or courses, the classical, the language-scientific, the scientific, and the Latin or Greek-modern language; the first group includes a certain number of elec-

tives. The degree of A.B. is conferred for the completion of any of these courses. Instruction in methods of teaching and in school organization is included in the curriculum. Gymnasium work is required of all students. There are 24 loan funds and four scholarship funds. The students maintain three literary societies, membership in one of which is compulsory, and a Christian Association which has been in existence over 35 years, and exercises an important influence on student life. The college campus comprises 70 acres; the buildings include the main building, the John B. Cleveland Science Hall, Alumni Hall (a dormitory), residence cottages, the Wilbur E. Burnett gymnasium, Whiteford Smith Library Building and the fitting school. The library in 1919 contained 26,000 volumes; the students at Spartanburg numbered 480, of whom about 175 were in college.

**WOHLGEMUTH**, wŏl'gĕ-moot, **Michael**, German painter: b. Nuremberg, 1434; d. there, 1519. He was an eminent member of the Franconia school of German painting whose most complete representative is Albert Dürer. The latter was indeed his pupil in the large studio or workshop where many branches of art were carried on by the master and a host of pupils and assistants. The occupations of this artistic association comprised altarpieces, consisting of paintings, or wood carvings in high relief ablaze with color and gilt, such as abound in Spanish churches under the name of *retablos*; wood engraving, the blocks being cut from Wohlgemuth's designs, which were of supreme vigor and well adapted to the exigencies of printing from wood and easel paintings of portraits and history. Many paintings have been attributed to him which were evidently executed by the less skilful hands of pupils or assistants, but those whose authenticity is unquestionable are characterized by powerful drawing, rich and harmonious coloring and supreme delicacy of finish. His retable (1465), now in the Munich Gallery, is a remarkable masterpiece, and that which he furnished for the high altar of Saint Mary at Zwickau gained for the painter much applause and the then princely sum of about \$3,558. Another work of the same kind is to be found in Nuremberg Museum, having been originally painted for the churches of the Austin Friars at Nuremberg; his last retable was executed for the church at Schwabach (1508). His fidelity and grace as a portrait painter are acknowledged by critics, who recognize in his realistic vigor and conscientious mastery of detail the best features of contemporary German painting. Two of his paintings, 'Pilate Washing His Hands Before the People' and a 'Descent from the Cross,' are in the Royal Institution Gallery at Liverpool, but few works of this master are to be found elsewhere out of Germany. Consult Dickinson, H., 'German Masters of Art' (New York 1914); Stadler, F. J., 'Michel Wolgemut und der Nürnberger Holzschnitt' (Strassburg 1913); Thode, 'Die Malerschule von Nürnberg' (Frankfurt 1891).

**WOJWODE**, wŏi'wŏd, an old Slavonic name for a general, afterward used as a title of civil rank and authority. The princes of Wallachia and Moldavia were called wojwode and this name was given in Poland to the

governors of the provinces, a title abolished in 1832. In Serbia and Bulgaria the title of *vojvode* still lingers with its original signification of "leader in war."

**WOLCOT**, wul'köt, or **WOLCOTT**, John ("PETER PINDAR"), English poet: b. Dodbrooke, Devonshire, May 1738; d. London, 14 Jan. 1819. He studied medicine and in 1767 went to Jamaica as physician to the governor, Sir William Trelawney. He then took orders in the Church of England and was a curate in Jamaica, 1769-73. After spending the next 12 years as a physician in Cornwall he went to London, where his daring poetical satires involved him in many quarrels and brought him extended fame. So effective were his attacks on King George III that the ministry silenced him with a pension of \$1,500 per annum. His ablest opponent was William Gifford, who attacked him in his 'Epistle to Peter Pindar.' He was an art critic of taste and penetration far beyond his time; his yearly reviews in verse of the Academy exhibitions are much the best of his work, and still instructive. Among his satires are 'Lyric Odes to the Royal Academicians' (1782-86); 'Bozzy and Piozzi' (1786); 'An Epistle to the Reviewers'; 'Peeps at St. James'; 'Royal Visits,' and 'The Lousiad' (1785-95). Consult Reitter, 'Leben und Werke Peter Pindars' (Vienna 1900).

**WOLCOTT**, Edward Oliver, American lawyer and politician: b. Longmeadow, Hampden County, Mass., 26 March 1848; d. Monte Carlo, Italy, 28 Feb. 1905. In 1862 he went to Cleveland, Ohio, with his family, and during the Civil War was enlisted with the 105th Ohio regiment for a few months. He entered Yale in 1866, but did not complete his course; and was graduated from the Harvard Law School in 1871. He then went to Colorado, where he established a law office in Georgetown, Clear Creek County; in 1876 was elected district attorney for the first judicial district of the State, and before the expiration of his term cleared the docket of all criminal cases. In 1878 he was elected to the State senate, where he became the Republican leader. In 1879 he was made attorney for the Denver and Rio Grande Railroad; settled in Denver, where he built up a large private practice; and in 1884 was appointed general counsel of the same road. In 1888 he was elected to the United States Senate, and re-elected in 1894. There he was known as an earnest advocate of bimetalism; in 1896 however, he refused to support the free-silver platform of the Democratic party, continued his affiliation with the Republican party, and in 1900 was president of the National Convention. In 1897 he was chairman of a commission appointed by President McKinley to investigate the attitude of the leading European governments toward international bimetalism. In 1903 he was again a candidate for election to the United States Senate, but was defeated by H. M. Teller.

**WOLCOTT**, Oliver, American statesman and signer of the Declaration of Independence, son of Roger Wolcott (1679-1767) (q.v.): b. Windsor, Conn., 26 Nov. 1720; d. Litchfield, 1 Dec. 1797. He was graduated at Yale College in 1747 and in the same year received a captain's commission from the governor of New York, and raised a company for the de-

fense of the northern frontier, where he remained until the peace of Aix la Chapelle. In 1751 he was appointed sheriff of Litchfield County, Conn., and in 1774 a member of the State council. He was also chief judge of the Court of Common Pleas, a judge of the Probate Court and a major-general of militia. In 1775 he was appointed one of the commissioners of Indian affairs for the Northern Department, whose duty was to secure the neutrality of the Indians. In 1776 he commanded the 14 Connecticut regiments raised to act with the army in New York, and in the same year took his seat in Congress. After the Declaration was signed he returned to the army, and was present at the battle of Saratoga, but continued to serve in Congress at intervals till 1783. He was lieutenant-governor of Connecticut, 1780-90, when he was elected governor, which office he held at the time of his death. Consult Sanderson, John, 'Biographies of the Signers' (Vol. III, rev. ed., Philadelphia 1865).

**WOLCOTT**, Oliver, American politician, son of the preceding: b. Litchfield, Conn., 11 Jan. 1760; d. New York, 1 June 1833. He was graduated from Yale in 1778, and for a short time served as volunteer aide to his father in the Revolutionary War. After his admission to the bar in 1781 he was for several years in the employ of the financial department of the government of Connecticut and assisted Oliver Ellsworth in 1784 in settling the accounts between his State and the United States. In 1788-89 he was comptroller of the United States public accounts, auditor of the United States treasury 1789-91, comptroller 1791-95, and Secretary of the National Treasury 1795-1800, in succession to Alexander Hamilton. He was a judge of the United States Circuit Court, 1801-02, and then removed to New York and was in mercantile business there till 1812. He aided his brother Frederick in building extensive factories at Wolcottville, Conn., and was governor of Connecticut 1818-27. His later years were spent in New York. He published several political pamphlets and in 1846 his papers were edited by Gibbs with the title 'Memoirs of the Administrations of Washington and John Adams' (New York 1846).

**WOLCOTT**, Roger, American colonial governor: b. Windsor, Conn., 4 Jan. 1679; d. East Windsor, Conn., 17 May 1767. At 12 he was apprenticed to a weaver, but by private study secured an education, and in 1711 was appointed commissary of the Connecticut colonial forces in the attack on Canada. In the subsequent French wars he was successively promoted till he attained the rank of major-general at the siege of Louisburg in 1745. He was governor of the colony of Connecticut 1751-54 and had previously been a member of the assembly and of the council, judge of the County Court and of the Superior Court and deputy governor. He published in 1725 'Poetical Meditations, Being the Improvement of Some Vacant Hours'; and wrote a poem of 1,500 lines entitled 'A Brief Account of the Agency of the Honorable John Winthrop, Esq., in the Court of King Charles II. A.D. 1662,' in which he gives a description of the Pequot War. The latter was first printed in the collections of the Massachusetts Histor-

ciety, and the original is among the manuscripts of the Connecticut Historical Society.

**WOLCOTT, Roger**, American lawyer and orator: b. Boston, 13 July 1847; d. there, 21 Jan. 1901. Graduated from Harvard University in 1870 and from the law-school of the University in 1874, he was admitted to the bar, but subsequently practised little. From 1877-79 he was a member of the common council of Boston, and in 1882-85 of the Massachusetts House of Representatives, where he had a considerable reputation by his oratory and activity in constructive politics and the management of good government. He was sent as delegate to the State Republican Convention in 1885, in 1887-89 was again a member of the Boston common council, and in 1891 was the first president of the newly-organized Republican Club of Massachusetts, in which he rendered valuable service to his party. He was recognized by his nomination as lieutenant-governor. He was elected in 1892, and by re-election until 1896, and upon the death of Gov. F. T. Greenhalge in the latter year became acting governor. In November 1896 he was elected governor by the largest majority ever given in the State to a candidate for the office. In 1897 and 1898 he was re-elected. He declined the position as member of the Philippine Commission, and also the ambassadorship to Italy in 1899. Consult *Law-Words*, 'Roger Wolcott' (Boston 1902).

**WOLF, Emma**, American novelist: b. San Francisco, Cal., 15 June 1865. She was educated in the schools of her native city, and early dedicated herself to authorship. She has published 'Other Things Being Equal' (1892); 'Loyal in Love' (1894); 'Joy of Life' (1895); 'Heirs of Yesterday' (1900); 'Fulfillment' (1916).

**WOLF, völf, Ferdinand**, Austrian romance writer: b. Vienna, 8 Dec. 1796; d. there, 18 Aug. 1866. He studied philosophy and jurisprudence at Gratz; received a position in the Library at Vienna in 1827 and took an active part in the foundation of the Academy of Sciences, of which he became secretary. Among his many publications, all characterized by clear and critical acumen, are 'Collected Modern Castilian Rhymes' (2 vols., 'Historical Studies of Spanish and Portuguese National Literature' (1859); 'History of Brazilian Literature' (1863), etc. With Hermann he edited a collection of the oldest German romances and contributed frequently to the *Vienna Jahrbücher der Litteratur*.

**WOLF, Friedrich August**, German classical scholar: b. Haynrode, near Nordhausen, a, 15 Feb. 1759; d. Marseilles, France, 18 Oct. 1824. He was educated at the gymnasium of Nordhausen and the University of Göttingen, and in 1782 was appointed rector of the Normal School at Osterode in the Harz. There he was called as professor of philosophy and paediatrics to Halle, where he labored many years with the highest enthusiasm for the cause of education. In 1795 appeared his edition of 'Homer's Iliad' (3d and 4th eds., 1872-75). In this he contended that the 'Iliad' and 'Odyssey' were not the work of a single man, but of several Homeric rhapsodists (or hearing minstrels). The work in which he endeavored to maintain this statement created a

profound sensation and has had the effect of permanently modifying the opinions of Homeric scholars as to the manner of the composition of the 'Iliad' and 'Odyssey.' (See HOMER). From a literary point of view his labor has been of immense service. The University of Halle was suppressed in 1807, in the storm of the French invasion, and Wolf then removed to Berlin, where he entered the Ministry of Public Instruction, but soon resigned that he might give himself to the work of academic teaching, which disappointment and ill-health compelled him to give up in 1824 when he went south on a voyage for the sake of his health, but did not long survive his arrival at Marseilles. Wolf's great work was the invention, or at least the bringing into prominence, of a new instrument of education, namely, philology, which he defined as no meagre study of the forms of language but "a knowledge of human nature as exhibited in antiquity." Locke and Rousseau had founded a school of educational theory which they considered to be more in accordance with common sense and modern needs than the classical culture of the Renaissance. Wolf revived the mental discipline and scientific aim implied in the prosecution of classical studies. Consult Arnoldt, 'Friedrich August Wolf in seinem Verhältnisse zum Schulwesen und zur Pädagogik' (Brunswick 1861-62); Pattison, Mark, 'Essays' (Oxford 1889); Wolf, 'Prolegomena ad Homerum' (Halle 1795); Hüller, 'Homerische Vorschule' (1836); Lachmann, 'Betrachtungen über Homers Ilias' (1865); Sandys, J. E., 'A History of Classical Scholarship' (Vol. III, Cambridge 1908); Volkmann, 'Geschichte und Kritik der Wolf'schen Prolegomena' (1874); also the Homeric writings of Gladstone, Blackie, Paley, Heyman and Geddes.

**WOLF, wülf, Henry**, American engraver: b. Eckwersheim, Alsace, 3 Aug. 1852; d. 18 March 1916. His artistic training was completed at Strassburg, and when he came to New York, in 1871, his ability soon made itself known. He exhibited at the Paris Salon in 1888 and 1895, winning a gold medal in the latter year; at the World's Columbian Exposition of 1893; the Paris expositions of 1889 and 1900; Saint Louis in 1904 and at the Panama-Pacific Exposition, San Francisco in 1915, winning a grand prize. His chief works are 'Engravings Illustrating American Artist Series' and 'Gilbert Stuart Series of Women and Men' in the *Century Magazine*.

**WOLF, Hieronymus**, German classical scholar: b. Göttingen, 13 Aug. 1516; d. 8 Oct. 1580. From 1557 until his death he was director of a school at Augsburg. He was one of the foremost Greek scholars of his century and is held in remembrance for his carefully annotated editions, with Latin translations, of Isocrates (1570) and Demosthenes, as well as for editions of Byzantine historians and many other classical labors.

**WOLF, Hugo**, Austrian composer: b. Windischgraz, Styria, 13 March 1860; d. Vienna, 22 Feb. 1903. He received his early instruction on the piano and violin from his father, who was in the leather trade, but was deeply interested in music. He studied at the Vienna Conservatory in 1875-77, but was then dismissed for his supposed implication in a practical joke, and from this time had only self-instruction.

For some years he gave piano lessons and with some slight assistance from his father gained a bare subsistence. In 1884-87 he was musical critic on the *Salonblatt*. He ardently championed the music of Wagner and as bitterly attacked that of Brahms, with the result that he made many enemies, and in 1887 after the publication of 12 of his songs he abandoned his work on the *Salonblatt* to devote himself entirely to composition. His production was irregular, his highly emotional temperament, already foreshadowing the insanity that was to overtake him, spurring him at times to incessant work and again he lapsed into utter inactivity, at which periods he was subject to profound depression. His work, despite his dark moods and mad haste in production, maintained a steady high level that kept a devoted circle of friends, mainly critics and singers, about him; but his irritability hindered his material success despite their efforts. His work was never financially successful and he lived in cheap lodgings until 1896 when his friends bought a house for him and installed him in it. He enjoyed it only a year before insanity overtook him and he was placed in an asylum. A temporary improvement caused his release some months later, but after attempting suicide by drowning he asked to be returned to the asylum, where he died four years later. His fame rests securely upon his songs, of which he wrote 266, and which give him rank as one of the greatest of song-writers. His success was due not alone to his mastery of the art of composition but to a broad knowledge and love of literature. Superbly original, gifted with rare poetic insight and a high dramatic sense, his music invariably expresses the meaning of the poem set to it, as fully as if words and music were evolved simultaneously from his own brain. He scorned the art which made the words of a song a mere vehicle to carry the music, but while faithfully interpreting the sense of the verse he developed a breadth of style and intense dramatic power that leave him unrivaled among song-writers. His work as a composer was practically at an end in 1891. His works include 'Mörke Lieder' (43 songs); 'Eichendorff Lieder' (20 songs); 'Goethe Lieder' (51 songs); 'Spanisches Liederspiel' (44 songs); 'Italienisches Liederbuch' (1st part 22 songs; 2d part 24 songs); he wrote also settings for 13 lyrics by different authors, several choral works and orchestral pieces, and the opera 'Der Corregidor,' which was successfully produced in 1895. Consult Deesey, E., 'Hugo Wolf' (4 vols., 1903-06); Von Hellmer, E., 'Hugo Wolf' (1912); Heckel, K., 'Hugo Wolf in seinem Verhältniss zu Richard Wagner' (Munich 1905); Batka and Werner, 'Hugo Wolf's musikalische Kritiken' (Leipzig 1911); Newman, 'Hugo Wolf' (London 1907); Schmitz, E., 'Hugo Wolf' (Leipzig 1907).

**WOLF, Rudolf**, Swiss astronomer: b. Fällanden, near Zurich, 7 July 1816; d. Zurich, 6 Dec. 1893. He was teacher of mathematics and physics in the realschule at Berne, 1839-55, and director of the observatory there in 1847. He was also professor of astronomy in the Berne University in 1853; professor of astronomy in the Polytechnikum and director of the observatory at Zurich in 1855, and later professor of mathematics and astronomy in the university there. He was famous for his investigations

concerning the periodicity of sun spots and the accompanying magnetic variations, and wrote extensively on the history of science, especially astronomy. His 'Astronomical Miscellany' (1856-93) is a well-known series of papers, and his 'History of Astronomy' (1877) is a standard work of reference.

**WOLF, wulf, Simon**, American lawyer and communal worker: b. Hinzweiler, Bavaria, 28 Oct. 1836. He was graduated from the Ohio Law College, Cleveland, Ohio, in 1861, and served as recorder of deeds for the District of Columbia, 1869-78. He was judge of the Municipal Court for the District of Columbia, 1878-81, and in 1881-82 United States Minister to Egypt. While prominent in social and benevolent circles in Washington, he is identified with Jewish progress in America, was a founder of the B'nai B'rith Orphan Asylum at Atlanta, Ga., and for many years president of the Board of Delegates on Civil and Religious Rights of the Union of American Hebrew Congregations. In addition to various monographs, he has published 'The American Jew as Soldier, Patriot and Citizen' (1898); 'Biography of M. M. Noah' (1898); 'The Presidents I Have Known' (1917).

**WOLF**, a river in Wisconsin; rises in the northeastern part of the State, flows generally south, passes through Pewaungan Lake and enters the Fox River. Wolf River has been of great benefit in the development of the lumber industry in the northeastern part of the State. It is navigable for small steamers for about 150 miles.

**WOLF**, a typical wild species of the dog family (*Canidae*). So closely related are wolves to the domestic and other true dogs (q.v.) that zoologists have been unable to find any satisfactory structural differences. As the distinctions are purely specific and largely founded upon the habits and character of the fur, all of the wolves are customarily placed in the extensive genus *Canis* along with the dogs and jackals. Excepting some of the domesticated varieties of dogs, wolves are the largest members of the family, and normally they howl and do not bark as do the dogs and jackals. Their natural range is throughout North America and Eurasia, but no true wolves are found in the Southern hemisphere, where they are replaced by the smaller carrion-eating jackals and fox-dogs. As they inhabit indifferently mountain-tops, plains and swamps, and are equally at home on the frozen Arctic shores and the tropical swamps of Mexico and India, they exhibit, as might be expected, a great range of variation. Generally they increase in size, vigor and courage northward, and the fur becomes more shaggy and thicker. The species and varieties have never been very satisfactorily discriminated and many zoologists consider that the large northern woodland wolf of both continents is a single wide-ranging variable species. Certainly these active animals are free to cross between the Old and New Worlds at the winter on the ice by way of Greenland or Alaska.

The American gray or timber wolf (*C. occidentalis*) when full-grown measures five and one-half feet in length, whereof 18 inches belong to the tail; its height is 33 inches, and its weight over 100 pounds. The general aspect

t of a large dog, and, indeed, domestic of the Indians were partly derived from ecies and some of the European varieties the native wolf. They are lank, long-creatures with erect ears and drooping, bushy tails; the hair of the neck is gen- more or less elongated and erectile. The s very variable, the prevailing tone being more or less marked with black; and he- paler in winter and more reddish in sum- Southward the colors deepen, leading to ack wolf (*C. ater*) of Florida, the red (*C. rufus*) of Texas and the dusky wolf (*ibilus*) of the central plains, while in the orth the Arctic wolf (*C. albus*) is nearly white with a black tail-tip. The gray was formerly very abundant and trouble- n most parts of North America, but has rapidly and completely succumbed to the of civilization here than in Europe, and ince disappeared from even the forest- ortions of the Eastern States. At the t time wolves are practically extinct in ntury east of the Mississippi River, but am in large packs in the northern and n Canadian forests and wooded swamps, e especially large and plentiful in New- and and the Hudson Bay region. Owing ir activity and restless wandering habits parties are likely to appear in the winter ces where none have been known for

As the habits of all large wolves are ally similar the following account of the an wolf (*C. lupus*), which has remained more generally plentiful and troublesome urs, will answer for the whole group:

olves inhabit a great variety of country, ill and plain, especially thick forests and ground, with alternate morasses and tches, and in the South the steppes. They in woods, marshes, canebrakes and fields, roaming over wide areas, often ly appearing where none have been seen ars, and as quickly vanishing—nor is onderful when it is remembered that they ver from 25 to 40 miles in a single night.

In the neighborhood of dwellings they only ap- pter twilight, but in secluded places carry ir hunting all day. Their food varies ag- g to the season, consisting in summer

exclusively of wild animals—foxes, ogs, mice, birds, reptiles and even vege- of larger animals, elk and deer, while are soon exterminated where wolves

l. While readily associating and inter- ng with large domestic dogs which have ild, they frequently attack and devour ogs and even weak or injured members ir own species. They follow herds of gs in their migrations, and will devour r with avidity; but they do not appear

ack man unless in large numbers or d by hunger. Accounts of such attacks

latter part of winter are frequent in the an press and are occasionally reported the woods of Minnesota, Michigan and adas. In winter they approach nearer

nan habitations, doing much damage to of sheep and poultry. When in packs ill attack horses and cattle. In the chase lf exhibits all the cunning of the fox,

addition courage and the capability of g in packs. These will even divide in , one following the trail of the quarry,

the other endeavoring to intercept its retreat. In mental qualities the wolf is in every respect the equal of the fox; his caution is so great that he regards every unfamiliar object with suspicion, will not pass through a door if he can leap over the wall, and will not, unless famished, attack a tethered animal lest it should be the bait of a trap. When he sees himself captured his courage and ferocity at once for- sake him.

In spring and summer wolves are solitary or in pairs, in the autumn in families and in the winter in packs. The pairing season is in December and January, when the males fight savagely together; those who are fortunate enough to secure a mate remain with her till the young are well grown. The young are born in burrows usually excavated by the wolves themselves, and during her confinement the female is fed by the male. The period of gestation is 63 days, and from three to nine (usually four to six) cubs are found in a litter; these are blind for 21 days, and are suckled for two months, but at the end of one month are able to eat half-digested flesh disgorged by the mother. They quit the parents in Novem- ber or December, but many remain together six or eight months longer; they are full grown in three years, and live from 12 to 15 years. Wolves can readily be tamed when taken young, and then exhibit many of the characteristics of domestic dogs.

Notwithstanding the spread of civilization, the wolf is still widely distributed. Excluding thickly populated regions, it extends over almost the whole of Europe; but Russia and Scandinavia are the only parts where it now occurs in any large numbers. In Asia it is spread over all the continent to the borders of India and the plains of China.

Besides the American forms already men- tioned many wolves inhabiting Europe and Asia has been described as species more or less dis- tinct from *C. lupus*. Among these are *C. niger* and *C. langifer* of Tibet, *C. pallipes* of India, *C. hodophylax* of Japan and *C. mexicanus* of Mexico. The Indian wolf (*C. pallipes*) is smaller and slighter than the typical form, with little or no under-fur; but undoubted ex- amples of *C. lupus* differ as much from each other as this does from them. It inhabits the plains south of the Himalayas, but is rare west of the Indus. It does not hunt in large packs, but in numbers of six or eight at most. The superstition of the people prevents its destruc- tion, for they imagine that its blood will dim- ish the fertility of the fields. It is seldom heard, not howling like the European wolf. It is remarkable even among wolves for speed and endurance.

A second well-marked species of *Canis* found in North America is the prairie wolf (*C. latrans*). See COYOTE.

In Africa and South America several species of hunting dogs belonging to *Canis* and re- lated genera are known locally as wolves, but the name is not properly applicable. Still less should it be applied to the "native wolf" of the Tasmanians, which is a true marsupial (*Thylacinus cynocephalus*) of carnivorous habits and canine aspect. Consult Mivart, 'Monograph of the Canidæ' (London 1890); Merriam, 'Revision of the Coyotes,' 'Proceed- ings,' Biological Society of Washington (1897);

Audubon and Bachman, 'Quadrupeds of North America' (New York 1847); Seton, 'Northern Mammals' (New York 1909), and books of travel and sport.

**WOLF-FERRARI, Ermanno**, Italian composer: b. Venice, 12 Jan. 1876. He studied under Rhineberger at Munich in 1893-95, and in 1902-09 he was director of the Liceo Benedetto Marcello, Venice. For some years after 1909 he lived at Munich, devoting himself to composition, chiefly operas, and later he lived in Venice. His operas are highly successful and are characterized by excellent technique and much charm of manner. He has composed several piano pieces, a large choral work, violin sonatas, and other works besides his operas, among which are 'La Sulamita' (1898); 'Cenerentola' (1900); 'Le Donne Curiose' (1903); 'Die vier Groliane' (1906); 'Il Segreto di Susanna' (1909); 'I Gioielli della Madonna,' 'Jewels of the Madonna' (1911); 'L'Amore Medico' (1913).

**WOLF-FISH**, a large voracious sea-fish (*Anarrhichas lupus*), allied to the blenny and named from the wolfish appearance given it by its great interlocking front teeth, and from its disposition to fight hard for its life when caught. It may attain a length of four or five feet. The color is an olive green above, marbled with brown on the head especially. The fish feeds on echinoderms, mollusks and crustaceans. The flesh tastes like that of cod. Several other species are known in various parts of the world constituting the family *Anarrhichidae*.

**WOLFBORO, N. H.**, town in Carroll County, on Lake Winnepesaukee, and on the Boston and Maine Railroad, about 43 miles northeast of Concord. It contains five villages. It has marble and granite works, boot and shoe factories, woolen mills, carriage and wagon works, flour mills and lumber works. The town has several churches, graded schools, Brewster Academy and a public library. Pop. about 2,224.

**WOLFE**, wülf, Catharine Lorillard, American philanthropist: b. New York, 28 March 1828; d. there, 4 April 1887. She inherited from her parents and grandparents a fortune of about \$10,000,000, and expended a large portion of her income in benevolent works. Among her benefactions during her lifetime were liberal gifts to Saint Luke's Hospital, New York; \$100,000 to Union College; the site and money gifts to the Fordham Home for Incurables; \$65,000 to Saint Johnland, Long Island; a proselytizing Italian mission in New York, costing \$50,000; a newsboys lodging house, costing with its endowment \$170,000; \$250,000 to Grace Church, New York; and generous contributions to the American chapels in Rome and in Paris, as well as to many schools and churches in the United States. She financed Dr. W. H. Ward's archaeological expedition to Asia Minor in 1884. Through her will she left an endowment of \$350,000 to Grace Church; and to the Metropolitan Museum, New York, she left her collection of paintings, together with an endowment fund of \$200,000 for maintenance and enlargement.

**WOLFE, Charles**, Irish poet: b. Dublin, 14 Dec. 1791; d. Cove of Cork (now

Queenstown), 21 Feb. 1823. He was graduated at Trinity College, Dublin, in 1814, was tutor there the next year, took orders in the English Church in 1817 and was curate of Donoughmore, Ireland. The poem which has secured his fame, 'Ode on the Burial of Sir John Moore,' was published in the *Newry Telegraph* (1816). Wolfe was also the author of several other poems, and his 'Remains,' with a 'Brief Memoir,' by John A. Russell, were published in 1825.

**WOLFE, James**, English general: b. Westerham, Kent, 2 Jan. 1727; d. Quebec, Canada, 13 Sept. 1759. He was educated at Westerham and Greenwich, and in 1741 received an ensign's commission in a foot regiment. In 1743 he took part in the famous battle of Dettingen; in 1744 obtained his captaincy; and in 1745-46 was present at the battles of Falkirk and Culloden. In 1747 he was wounded, though not seriously, at the battle of Lawfeldt, and from 1749 to 1757 was engaged in garrison duty in Scotland and England. In the mismanaged expedition against Rochefort (1757) Wolfe acted as quartermaster-general and the only creditable movement in the affair was a night reconnaissance conducted by him which penetrated two miles into the enemy's country. His recommendation in favor of an immediate attack and his offer to take the place with 500 men and three ships were unheeded; but Pitt, becoming acquainted with the facts of the case, kept the young officer in view for some future enterprise. This occurred in the following year, when Wolfe was ordered to accompany the expedition under Amherst to Cape Breton, with the rank of brigadier-general. A brilliant success was obtained in the capture of the strong fortress of Louisburg, after a seven weeks' siege, and he became popularly known as the "Hero of Louisburg." Pitt was then planning the overthrow of the French dominion in North America by the capture of their chief stronghold, Quebec, and with the instinct of genius singled out Wolfe as the most promising young officer in the army, to command the expedition notwithstanding many older officers might by virtue of seniority have claimed the honor. Wolfe was accordingly created a major-general, and in 26 June 1759 landed his forces on the Isle of Orleans, opposite Quebec. The system of defense adopted by his adversary, Montcalm, was such as to offer no point of advantage. The season during which operations could be continued rapidly advanced, but at last having dropped down the river and scaled the precipitous cliffs known as the Heights of Abraham at a point insufficiently guarded at daybreak of 13 September, Wolfe found himself on the Plains of Abraham, where his supplies thus cut off, Montcalm had no choice but to give battle. After a short struggle the French were driven from the field in complete rout; Montcalm was one of the 500 killed; the capitulation of Quebec followed five days after, and its fall decided the fate of Canada. Wolfe died in the hour of victory. In person he led the right, till thrice wounded, he was carried to the rear. He lived to hear the cry, "They run, see how they run!" and expired with the words, "Now God be praised, I will die in peace." His body was taken to England and buried in Greenwich Church, and a monument was

l to him in Westminster Abbey. Consult 1, 'Memoir of Wolfe' (in 'Twelve Eng-oliers Series'); Bradley, 'Wolfe' (in sh Men of Action Series, 1895); in, H. R., 'Wolfe and Montcalm' nto 1905); Parkman, F., 'Montcalm and ' (in 'France and England in North ca,' 2 vols., Boston 1898); Willson, B., Life and Letters of James Wolfe' (Lon-09); Wright, R., 'The Life of Major l Wolfe' (ib. 1864).

**WOLFE, Theodore Frelinghuysen,** Amer-ithor: b. Kenil, N. J., 1847; d. 1915. He aduated from the medical department of ia in 1868, and for several years prac-icis profession in Jersey City, N. J. He blished 'Literary Shrines of American rs' (1895); 'A Literary Pilgrimage g Haunts of British Authors' (1896); ary Haunts and Homes of American Au- (1898); 'Literary Rambles at Home and d' (1900).

**WOLFE ISLAND,** Canada, at the north-nd of Lake Ontario, bisects the outlet of int Lawrence River, and is about 18 miles with a maximum width of seven miles, n area of 34,806 acres. It belongs to nac County, Ontario, is the largest of mous Thousand Islands and is opposite Vincent, New York State. Its coast is ed with picturesque bays, it is well- d and the surrounding waters abound sh. Pop. about 2,000.

**WOLFENBÜTTEL,** völf'ën-büt-tël, Ger-a town of Brunswick, on the Ocker, miles south of Brunswick. One of the t churches contains many of the tombs : princes of Brunswick. The old castle commodates a seminary for teachers and re. The library opposite, built in 1723 in rm of the Pantheon at Rome, became s for its literary wealth and for the fact essing (q.v.) was its librarian. It was g who edited the "Wolfenbüttel Frag-<sup>d</sup>" professedly from anonymous manu- under his charge, but really from the f his friend Reimarus (q.v.), which d the theological world of Germany. The on building had become so rickety and ous that it had to be taken down, being ed in 1887 by a handsome new edifice, houses 300,000 volumes and 10,000 manu- . There are in the town manufactures chines, copper goods, flax, cloth, corks, ; preserves, tobacco, etc. The place is ucient, and dates from 1046; it was d and taken in 1193 and 1542; and dur- : Thirty Years' War a battle was fought i 1641. Pop. 17,916.

**WOLFF, völf, Albert,** German sculptor: b. litz, Mecklenburg, 14 Nov. 1814; d. Ber- June 1892. In 1831 he entered Rauch's in Berlin, and in 1844 was sent to Car- ) execute the sculptures for the terraces Sans Souci Palace. Upon his return sojourn in Italy of nearly two years, he l Rauch in the completion of the latter's ick the Great memorial for Berlin. In : became a member of the Berlin Acad- n 1858 professor there, and in 1866 a r of its senate. He was three times tor in competition for equestrian statues

—in 1861 for that of King Ernest August (Hanover), in 1875 for that of King Fred-erick William III (Berlin), and in 1885 for that of General Artigas (Montevideo). Among his further works are busts of German notabili- ties, including von Moltke; a decorative bronze group, 'The Lion-tamer,' for the Berlin Mu- seum building; colossal statues of the 'Four Evangelists' for the Schlosskirche, Neustrelitz; one of Frederick William IV in Königsberg, and other portrait and ideal productions.

**WOLFF, Albert,** French journalist: b. Col-ogne, Germany, 31 Dec. 1835; d. Paris, 22 Dec. 1891. He studied at the University of Bonn, settled in Paris in 1857, where he became secretary to Alexandre Dumas, Père, and in 1859 began to contribute to the *Gaulois Figaro*, *Charivari*, etc. Some of these arti- cles, collected in book form, were afterward published as 'Memoirs of the Boulevard' (1866); 'The Two Emperors' (1871); 'Vic- torien Sardou and Uncle Sam' (1873), etc. He wrote also several novels and farces.

**WOLFF, Christian,** German philosopher and mathematician: b. Breslau, 24 Jan. 1679; d. Halle, 9 April 1754. He studied at Jena theology, mathematics and philosophy, paying particular attention to the writings of Descartes and Tschirnhausen, and writing an elucidatory commentary on the 'Medicina Mentis' of the latter, which circumstance was the occasion of an intimacy between him and Leibnitz. In 1707 he was called to Halle as professor of mathe- matics. By his rationalistic views he here in- curred the hostility of certain theologians who denounced him and by an order from the gov- ernment of Frederick William I he was com- manded (1723) to resign his office, leave Halle in 24 hours and the Prussian States in two days. But he was ultimately vindicated, and in 1740 appointed by Frederick II vice-chancellor and professor in the University of Halle. Three years later he was made chancellor of that uni- versity. The principal service rendered by Wolff to the progress of learning consisted in his persistent application of mathematical meth- ods to the investigations of physical science. The decided rationalism which charaterized his philosophical doctrine resulted in a popular- ization of the Leibnitzian teaching. While ap- propriating many of the conceptions of Leib- nitz he controverted his monadology, and re- garded the theory of pre-existent harmonies as a mere hypothesis, while he asserted the pos- sible interaction of body and soul. Like Wolff, Kant in his 'Critique of Pure Reason' divides philosophy into Ontology, Cosmology, Rational Psychology and Natural Theology. His col- lected works make up 22 volumes. Consult Arnspurger, 'Christian Wolff's Verhältniss zu Leibnitz' (1897); Lewes, 'Biographical His- tory of Philosophy'; Pichler, 'Ueber C. Wolff's Ontologie' (1910); Piur, 'Studien zur sprach- lichen Würdigung C. Wolff's' (1903); Watcke, 'Wolff's eigene Lebensbeschreibung' (Leipzig 1841).

**WOLFF, Emil,** German sculptor: b. Ber- lin, 2 March 1802; d. Rome, Italy 29 Sept. 1879. He was a pupil of his uncle, Gottfried Schadow, and having gained a prize at the Royal Acad- emy of Arts went to Italy in 1822 as a pen- sioner of Frederic William III, and ever after

resided in Rome. Here he came under the influence of Thorwaldsen, and in 1871 was appointed director of the Academy of Saint Luke. He held high rank among German sculptors and executed many Greek mythological and genre statues which have been greatly admired. In portraiture, busts of Niebuhr, Thorwaldsen, Winckelmann and Buusen are among his masterpieces. Among his noteworthy productions are 'The Fisherboy' (1833); 'Victory Teaching Youth History' (1846); 'Circe' (in the National Gallery at Berlin).

**WOLFF**, wülf (Ger. *wölf*), **Joseph**, Anglo-German missionary: b. Weilersbach, near Bamberg, Germany, 1795; d. Isle Brewers, Somerset, 2 May 1862. He was the son of a rabbi, but became a Christian, taught Hebrew for a time at Frankfurt and Halle, studied at Munich, Weimar and Vienna, and in 1815 went to Rome. He entered first the Collegio Romano, and in 1817 the College of the Propaganda, intending to become a missionary. Dismissed for heresy in 1818, he went to England, joined the English Church, spent two years at Cambridge, studying Oriental languages, preparatory to going as a missionary to the Jews in Palestine, and in April 1821 embarked for Gibraltar. After an extensive tour in the East he returned to England in 1826. In 1827, he married Lady Georgiana Walpole, a daughter of the Earl of Orford, and in April of the same year set out on another missionary tour, and at Jerusalem was poisoned by some bigoted Jews and narrowly escaped death. On his recovery he set out for Bokhara by way of Persia, and on the journey encountered the plague, was repeatedly robbed, was taken prisoner and sold as a slave, but finally reached Bokhara. He spent some time in Abyssinia, acquired the Amharic language and returned to England in 1834. In January 1836 he again visited Abyssinia, where he was worshipped by the natives as their new aboona or patriarch, visited the Rechabites of Yemen, met a party of Wahabees in the mountains of Arabia, who horsewhipped him because they could find nothing in the Arabic Bibles he had given them about Mohammed, and in August 1837 came to New York. Here he received deacon's orders in the Protestant Episcopal Church, visited the principal cities, preached before Congress and in January 1838 returned to England. He next visited Dublin, received priest's orders, and held several curacies in England. He went again to Bokhara in 1843 in the employ of the English government to obtain the release of Colonel Stoddart and Captain Connolly, but was imprisoned and saved from death only by the effort of the Persian Ambassador. He then returned to England in 1845, and after this eventful career spent the rest of his life in charge of the secluded parish of Isle Brewers, Somerset. He published 'Researches and Missionary Labors among Jews and Mohammedans' (1835); 'Journal of Missionary Labors' (1839); 'A Narrative of a Mission to Bokhara' (1845); 'Travels and Adventures,' an autobiography (2 vols., London 1860).

**WOLFF**, **Julius**, German poet and novelist: b. Quecklinburg, in the Harz Mountains, 16 Sept. 1834; d. 1910. He studied literature and philosophy at Berlin, then entered the

manufacturing business of his father, but later withdrew, and in 1869 founded the *Harz News*. In 1870-71 served in the German army and won the Iron Cross. After this he settled in Berlin and devoted himself to literary work. His chief works are 'Aus dem Felde,' war poems (1871; 1907); 'Tyll Eulenspiegel redivivus' (1874; 23d ed., 1896); 'The Rat-catcher of Hameln' (1876); 'The Wild Huntsman' (1877); 'Tannhauser' (1880); 'Lurlei' (1886); 'Der fahrende Schüler' (1900); while among his novels may be cited 'Der Sulfmeister' (1883); 'Der Rauhgraf' (1884); 'Die Hohenkönigsburg' (1902). Consult Ruhemann, 'Julius Wolff und seine Dichtungen' (Leipzig 1886).

**WOLFF**, **Oskar Ludwig Bernhard**, German improvisator and novelist: b. Altona, 2 July 1799; d. Jena, 16 Sept. 1851. He studied medicine in Berlin and subsequently history and philosophy. He became professor of modern languages at Weimar, in 1826, and of modern languages and literature at Jena, in 1832. He published 'Pictures and Songs' (1840); 'Natural History of the German Student' (1841). 'Bubbles and Dreams' (1844); 'The Minor Ills of Human Life' (1846); 'History of the Novel' (2d ed., 1850), etc.; and edited 'Treasury of National Poetry' (4th ed., 1853); 'Treasury of German Prose' (11th ed., 1875); 'The German People's Treasury of Poetry' (28th ed., 1884), etc.

**WOLFF AGENCY**, the most powerful news agency in Germany, ranks with Reuters of London and Havas of Paris. Before the outbreak of the European War in 1914, the Wolff Agency was a private concern doing its greatest business in Germany and Austria, the Norse countries and Russia, though its news service reached all parts of the world. In 1917 the control of the Wolff Agency passed into a syndicate of militarists representing the German government. This increased its influence and power in the German-speaking countries. See PRESS ASSOCIATIONS.

**WOLFHOUND**, a dog kept and trained for the pursuit of wolves. The ancient Irish wolfhound, now extinct, was of two kinds. One was a tall, shaggy, swift-running dog, somewhat like the modern Scottish deerhound; the other more nearly resembled a mastiff, and similar dogs have been known in Spain under the name of wolf dogs. The modern Russian wolfhound is the beautiful borzoi (q.v.).

**WOLFRAM VON ESCHENBACH**, medieval German epic poet: b. Eschenbach, near Ansbach, Middle Franconia, Bavaria, about 1170; d. perhaps at the same place, about 1219 (?). He was of noble Bavarian family, and served various powerful overlords, such as the counts of Wertheim, the Landgraf Hermann von Thüringen (at whose court he lived about 1203, and who provided him with the material for Wolfram's 'Willehalm,' namely, the *chanson de geste*, 'Bataille d'Aliscans'). After the death of Hermann in 1217 he is said to have retired to his native province, perhaps to Wildenberg (Wehlenberg); his remains are reported to have been interred in the church of Our Lady at Eschenbach. Of all the epic poets who wrote in Middle High German, Wolfram has the strongest personality, the

original artistry and the most mature and religious feeling. Although in point of passion he is excelled by Gott-von Strassburg, he stands alone in the German literature in the realism of observation, the depth of his psychology, and originality of his views and a toleration and sense of humor. Eight and three epics are the sum of his work, as it has been preserved. The greatest is the epic 'Parzival' (finished 1208, in 15 complete manuscripts), based on the 'Percival' in 'Li contes du Chevalier de Troyes (q.v.); but Wolfram's another authority 'Kyot, den er wolbekant.' In this long biography, in lines of verse, Wolfram presents a picture of tolerant spiritual knighthood, as distinguished from the traditional ideals of the Middle Ages, such as his profoundly generous and ideal nature would evolve it. Thus, he finds the calm happiness of the state of wedded life opposed to the conventional intrigue and exaggeration of the minnesingers and their sentimental romantic affection. Again, in the epic 'Sigune und Schionatulander' (also 'Titurel'), he decries the unnatural etiquette of the courts and their knightly *minne*. In the incomplete epic 'Willehalm' the underlying principle is the Christian toleration of the pagan opponents. Editions of the Middle High German text have been published by Karl Lachmann (Berlin 1891); Martin, E., (Halle 1900); Mann, A. (Halle 1902); modern German editions by K. Simrock (Stuttgart 1883); (Stuttgart 1906). Consult San Marte, 'Valstudien' (3 vols., Halle 1861); Marten, 'Zur Gralsage' (Strassburg 1880); and 'Wolfram von Eschenbach und die Dichtung' (Leipzig 1897).

JACOB WITTMER HARTMANN.

**WOLFRAMITE**, a native tungstate of iron and manganese in varying proportions, with the formula  $(\text{Fe}, \text{Mn})\text{WO}_4$ . It occurs in monoclinic crystals, with eminent cleavage parallel with the clinopinacoid. It is brittle, hardness of 5 to 5.5 and a specific gravity of 7.5, or about that of iron. It has a metallic lustre, while it is almost or quite black and its color and streak are black or dark brown. It is thus distinguished from the related mineral hübnerite. It usually occurs in quartz veins, frequently associated with magnetite or scheelite. It is of considerable commercial importance as a source of tungsten, ferro-tungsten used in making tungsten being derived from it. Its best-known localities have been in Bohemia, Saxony and England but the recent increased demand for it has brought other localities into prominence, such as those of New South Wales, Virginia and Connecticut. Much so-called wolframite is really hübnerite.

**WOLFRAM-BANE**. See ACONITE.

**WOLGAST**, vól'gäst, Prussia, town of Pomerania, on the left bank of the Peene, about a half mile from its influx into the Baltic and 40 miles southeast of Stralsund by its harbor is shallow and larger vessels cannot unload on the Ruden, an island at the mouth. Wolgast has the remains of an old town, the ancestral seat of the Dukes of Pom-

erania. Its industries are weaving, boat building and the manufacture of leather and tobacco. It has also an active trade in ships' stores. Wolgast, which was strongly fortified early in the 12th century, was destroyed in 1628 by Wallenstein, in 1630 by the Swedes, in 1637 by the Imperialists and in 1638 again by the Swedes. In 1675 it was taken by the Great Elector, was plundered by the Russians in 1713, and by the Swedes again in 1715. But small remains now exist of its former fortifications. Pop. about 10,000. Consult Heberlein, B., 'Beiträge zur Geschichte der Burg und Stadt Wolgast' (Wolgast 1892).

**WOLLASTON**, wúl'as-tón, William Hyde, English chemist; b. East Dereham, Norfolk; 6 April 1766; d. London, 22 Dec. 1828. He was educated at Cambridge and was graduated in medicine in 1793. He practised as a physician in Bury Saint Edmunds, and then removed to London, where he presently devoted himself to scientific research, becoming secretary of the Royal Society in 1806, and its president in 1820. He was the inventor of the camera lucida (q.v.), and also the goniometer, an instrument for measuring the angles of crystals, and the discoverer of palladium and rhodium, in 1803, and the malleability of platinum, for which latter discovery he received the medal of the Royal Society in 1820, and which brought him \$150,000. Wollaston was a member also of the Geological Society of London, to which he bequeathed a sum providing for the Wollaston medal. This award which is bestowed in recognition of "researches concerning the mineral structure of the earth" is the highest honor the society confers. Many of his papers on research work were published in 'Philosophical Transactions' and others in 'Annals of Philosophy.'

**WOLLASTON LAKE**, Canada, a lake of Athabasca, in the Northwest territory. It is about 50 miles long and has its outlet in the Mackenzie River.

**WOLLASTON LAND**, Canada, a region of Franklin territory, lying west of Victoria Land, in the Arctic Ocean.

**WOLLASTONITE**, one of the pyroxene group of minerals, crystallizing, therefore, in the monoclinic system. Its crystals are usually tabular, to which fact its name "tabular spar" is due. Crystals are, however, rather rare, the common occurrences being compact or in aggregates of brittle fibres, having a splintery fracture. Its hardness is 4.5 to 5, and specific gravity 2.85. Its lustre is vitreous to pearly and its usual color is white or gray. Some localities yield specimens which show excellent triboluminescence. It is a calcium metasilicate,  $\text{CaSiO}_3$ . Its most important American localities are in northern New York. It was named in honor of the eminent English chemist, W. H. Wollaston.

**WOLLE**, John Frederick, American musician; b. Bethlehem, Pa., 4 April 1863. He studied under Wood at Philadelphia in 1883-84; under Rhineberger at Munich in 1884-85; and later studied the organ under S. P. Warren in New York. He was organist at the Moravian Church at Bethlehem in 1885-1905 and also of the Packer Memorial Church at Lehigh Uni-

versity in 1887-1905. In 1905-12 he was professor of music at the University of California; and in 1912 he resumed his former positions at Bethlehem. He established the annual Bethlehem Bach Festivals in 1898; the Choral Society at Harrisburg, Pa., in 1914; the Oratorio Society at York, Pa., in 1914; and the Oratorio Society at Lancaster, Pa., in 1916. He received the degree of Mus. Doc. from Moravian College in 1904. From 1916 he was organist of Trinity Church, Bethlehem. He is considered one of the leading organists in America.

**WOLLIN**, wöl-lén', Germany, an island of Prussia at the mouth of the Oder; on the north side of the Great Haff; length, 20 miles; breadth from 3 to 10 miles. Fishing and cattle-rearing are the chief occupations. Pop. 14,000.

**WOLLSTONECRAFT**, wül'stón-kráft, Mary. See GODWIN, MARY WOLLSTONECRAFT.

**WOLSELEY**, wülz'li, SIR Garnet Joseph, 1st Viscount, British soldier: b. near Dublin, 4 June 1833; d. 1913. He entered the army in 1852 as an ensign, served in the Burmese War of 1852-53, went through the Crimean campaign and was severely wounded before Sebastopol. For his services here he was made a member of the Legion of Honor, and in 1855 was advanced to the rank of captain. He saw active service in India during the Mutiny, from 1858 to 1860 was attached to the Bengal command, took part in the brief China War of 1860, and in 1865 attained the rank of colonel. He was assistant quartermaster-general and deputy quartermaster-general in Canada 1867-70, and in the latter year led the successful Red River expedition against Louis Riel. On leaving Canada he received the appointment of assistant adjutant-general at headquarters, a post which he held until 1873. In the Ashanti War in 1873-74 his admirably planned march resulted in the capture of Kumasi, the native capital, and led to the securing of British authority on the Gold Coast. In 1875 he went to Natal as imperial commissioner, in 1878 was promoted to the rank of lieutenant-general, and went to Cyprus in the capacity of high commissioner and commander-in-chief. Leaving Cyprus next year he was again sent to South Africa, this time as governor and high commissioner of Natal and the Transvaal in order to finish the Zulu War and check the advance of Secocoeni. On returning home in 1880 he was appointed quartermaster-general of the army, a post which he held till 1882, when he was advanced to the rank of adjutant-general, and as commander-in-chief conducted the campaign in Egypt against Arabi Pasha, which ended in the utter defeat of the latter at Tel-el-Kebir. For this he was raised to the peerage as Baron Wolseley of Cairo and of Wolseley, in the county of Stafford. He commanded the Nile expedition of 1884-85, which was sent too late to relieve General Gordon in Khartum, nevertheless because of his efficient service he was created Viscount Wolseley of Wolseley on his return, and made a Knight of the Order of Saint Patrick. In 1890 he was appointed to the command of the forces in Ireland, becoming at the same time privy councillor of Ireland, and in 1895 succeeded the Duke of Cambridge in the post of commander-in-chief in the United Kingdom. He was succeeded in the latter post by Lord Roberts on his return

from South Africa in 1900. He has published 'Narrative of the War with China in 1860' (1862); 'The Soldier's Pocket-Book for Field Service' (1869; 1882); 'The Life of John Churchill, Duke of Marlborough, to the Accession of Queen Anne' (1894); 'The Decline and Fall of Napoleon' (1895); 'The Story of a Soldier's Life' (1903). Consult Low, 'Memoir of Sir Joseph Garnet Wolseley' (1878).

**WOLSEY**, wül'zi, Thomas, English statesman and cardinal: b. Ipswich, Suffolk, March 1471 (according to others about 1475); d. Leicester, 29 Nov. 1530. He was the son of a butcher and was sent to Magdalen College, Oxford, of which he became a bachelor at 15 and was elected Fellow. Being appointed master of a grammar-school dependent on the college, he had three sons of the Marquis of Dorset under his care, which led that nobleman to present him to the living of Limington, in Somerset. He was afterward chaplain to the archbishop of Canterbury, then to one of the governors of Calais and finally was recommended to Henry VII, who made him one of his own chaplains. Under Henry VIII his progress in advancement was very rapid. In 1509 he was made dean of Lincoln; in 1510 became rector of Torrington; in 1511, canon of Windsor, registrar of the order of the Garter and privy councillor; in 1513 dean of York and bishop of Tournay (being then in France); in 1514, bishop of Lincoln and then archbishop of York. In 1515 Pope Leo X elevated him to the dignity of cardinal, and in the end of the same year Henry made him lord-chancellor. His nomination in 1518 to be the Pope's legate *a latere* completed his ecclesiastical dignities, by exalting him above the archbishop of Canterbury. At the time when the rivalry between the Emperor Charles V and Francis I rendered the friendship of Henry of great importance Wolseley was treated with the greatest respect by both sovereigns, receiving pensions from each, as well as a third from the Pope. He ultimately, however, favored the side of Charles, who settled upon him the revenues of two bishoprics in Spain and flattered him with hopes of the Papal chair, which induced him to involve Henry in a war with France. Insatiable in the pursuit of ecclesiastical emolument, in 1519 he gained the administration of the see of Bath and Wells, and the temporalities of the abbey of Saint Albans, his revenues now nearly equaling those of the Crown. Part of them he expended in pomp and ostentation and part in laudable munificence for the advancement of learning. His love of splendor was signally displayed on the Field of the Cloth of Gold in June 1520; his love of learning in his foundation of several lectures, as well as the college of Christ Church at Oxford, and of a collegiate school at Ipswich. He built a palace for himself at Hampton Court, but this he in the end presented to the king. In 1522, on the death of Leo X and again in 1525, on the death of Adrian VI, he failed to secure elevation to the papacy, and on both occasions attributed his failure to Charles V, to whom he ever afterward entertained a strong aversion. The critical affair of the divorce of Queen Catherine was one of the first steps to his fall. With Cardinal Campeggio he was appointed to determine the legitimacy of Henry's marriage

er, and lost the favor of the king by giving himself to the suspicion of causing the settlement of the question. He fell more into disfavor by advising the king against marrying Anne Boleyn, and aroused the hostility of Anne herself and her friends. Leading nobles deeming this a good occasion for contriving his ruin, caused him to be accused of having in the exercise of his duties of papal legate violated the statute of Praemunire (1529), and he was convicted. Dukes of Norfolk and Suffolk were sent to receive the great seal from him, he was ordered to quit York Palace, his palace in London, and retire to Esher, in the diocese of Winchester, and his lands, goods and chattels were declared forfeited. Henry still assured him of his protection. Part of his revenues were restored to him and he was even retained in the diocese of York. But Henry did not continue his protection long. Toward the end of the year 1530 he was arrested at his manor of Cawood, in the diocese of York, where he had retired, and was ordered to be brought to London on a charge of high treason. Illness and mental distress obliged him to stop at Leicester, where he was well received at the abbey and where he died a few days afterward. Shortly before his death he is reported to have exclaimed to the officer appointed to execute him: "Had I but served God as diligently as I have served my king, he would not have taken my life over in my gray hairs." There is a considerable disposition in later writers to indicate the character of this minister; and it must not be forgotten that, in the reign of Henry VIII, who had broken his heart; of the daughter of the much-injured Catholic and of Elizabeth, whose mother (Anne Boleyn) was the chief instrument of his downfall, justice could be expected to be rendered to the better traits of his mixed character. If he was loose in his morals, grasping, ambitious and rapacious, he was liberal and profuse toward his dependents, and a patronage of letters. He was enlightened beyond the period in which he lived. As a statesman it is very difficult to say whether his policies or industry were the most remarkable; it is to him that England is indebted for the first notion of a vigorous police and a regular system in the administration of justice.

Consult 'Life' by Cavendish (1641); 'Lives' by G. Howard (1824); C. Martin; Brewer, J. S., 'Reign of Henry VIII' (1884); Creighton, M., 'Cardinal Wolsey' (1888; new ed., 1903); Gardiner, J., 'Fall of Cardinal Wolsey' (in 'Transactions of the Royal Historical Society,' 1904); Gasquet, 'The Eve of the Reformation'; Law, E., 'England's First Great War' (London 1918); Taunton, E. L., 'Cardinal Wolsey' (London 1900); Williams, 'The English Cardinals' (1868).

**WOLVERHAMPTON**, wul-vér-hämp'ton, a manufacturing town, the "metropolis of the Black Country," is built on an eminence in the network of railways and canals, 13 miles west of Birmingham and 126 northwest of London. The town stands on the western slope of the great coal and iron mining district of Staffordshire, so that the vicinity on the north and east is covered with collieries,

ironstone mines, blast furnaces, forges, iron foundries and rolling mills, while on the north and west there is pleasant green country. It was first called "Hamton" and then "Wulfrunishamton," after Wulfruna, King Edgar's sister, had founded in 906 Saint Peter's Church, which continued collegiate till 1846. It was rebuilt during the 13th, 14th and 15th centuries and enlarged and elaborately restored. The church is a fine cruciform Gothic edifice, with several notable features and monuments. The other public buildings are all modern and include the town-hall, corn exchange, market-hall, agricultural hall, hospitals, postoffice, art gallery, drill-hall, etc. The free grammar-school, founded in 1512, occupies handsome new buildings of 1876; and there are also a blue-coat school (1710) and an orphanage (1850). In 1757 Wolverhampton was described as "a great manufacturing town in all sorts of toys, and particularly of locks in the greatest perfection"; locks—some 2,000,000 yearly—are still its specialty. The other manufactures include tin plate, japanned goods, enameled hollow wares, edge tools, gas and water tubes, electro-plate, papier-maché, chemicals, etc. Pop. 95,333.

**WOLVERINE, GLUTTON, or CARCAJOU**, a carnivorous mammal (*Gulo luscus*), of the weasel family (*Mustelidae*), but differing greatly in appearance from the light and slender weasels typical of that family. The wolverine is a short, thick, heavily-built animal about two and one-half feet long, whose short legs, sub-plantigrade feet and short, bushy tail add to a decidedly bear-like aspect of body. On the body and especially on the tail the hair is long, coarse and rough, blackish-brown with a pair of yellowish lateral bands meeting at the root of the tail above. The teeth are 38 in number and the molars are remarkable for their massiveness. The wolverine is a northern animal entering the United States only along the Canadian border, and even there very rare.

Apparently there is no distinction between the glutton of northern Europe and Asia and the American wolverine, and in both Old and New Worlds this brute is hated alike by woodsmen and trappers for its voracity, native meanness and cunning. It has the reputation of being the most powerful mammal of its size in existence, and in dogged courage is said to have no equal. Those who have had experience with it place it ahead of even the coyote in craftiness and the ingenuity which it exhibits in finding and robbing the stores of man and beast. It systematically follows the lines of traps set by fur hunters and robs them of both baits and captured animals; but is itself one of the most difficult of animals to take, and succeeds in repeatedly springing and robbing traps set for it, even when most cunningly concealed. Nor is its thieving confined to things edible; sometimes every portable article in a camp equipment will be carried away and hidden by a wolverine. It devours enormous quantities of food and its European name indicates that it is the type of greedy voracity. It lives on hares, squirrels, beaver, mice, foxes, all kinds of ground birds and their eggs, reptiles, insects, and even such large game as reindeer, which it is enabled to secure by its perseverance, great strength and cunning. The wolverine finds its most con-

genial home in the great northern forests, but its range extends beyond the tree line to the Arctic shores. Early spring is the mating season, and four or five young are born in June or July in a nest at the bottom of a burrow. The savage courage with which the female will defend her young is almost proverbial among trappers, who dread few animals so much as a mother wolverine with her family. Consult Coues, 'Fur-bearing Animals' (Washington 1877); Seton, E. T., 'Life Histories of Northern Animals' (New York 1909).

**WOLVERINE STATE**, a popular name for the State of Michigan, so called for its abounding in early days with wolverines.

**WOMAN, Education of.** See EDUCATION OF WOMEN.

**WOMAN SUFFRAGE.** All political revolutions have had for their primary object the desire of the revolutionists for a voice in their own government. Men for obvious reasons have taken the largest part in them, but women have assisted in all and yet when a voice in the government has been obtained men have claimed the right to speak for women as well as themselves. Women in the mass, living in isolated homes, in early days absorbed in all engrossing household duties, without education, pecuniary independence or organization, bound by social customs and the traditions of ages, have submitted to this usurpation of authority. There are preserved in history, however, enough instances to show that individual women did protest by voice, by pen and by petition. In Italy, where the universities were open to women in the 14th and 15th centuries; they demanded equality of rights. In England, which was the cradle of representative government, the records show that in 1499 women signed a petition for the right to a vote, and this was followed by others.

Mistress Margaret Brent brought this spirit with her to the American colony of Maryland, where in 1647, as heir of Lord Calvert, a brother of Lord Baltimore, and executor of the estates of both in the colony, she demanded "place and voice" in its assembly, or legislature. Representation in England was based on property and this with other English laws was established in the American colonies. Although the demand of Mistress Brent was refused, the records show that some women property-owners voted in Virginia, and that in Massachusetts under the Old Province Charter women property-holders voted from 1691 to 1780. When a constitution was adopted they were excluded from a vote for governor and legislature but retained it for other officials. Under the close restrictions not one-fourth of the men could vote. Doubtless the hard conditions of domestic life for women in those days precluded any desire or attempt to take part in public affairs.

The American Revolution, based on the fundamental principle of "no taxation without representation," could not fail to rouse in women a sense that they were entitled equally with men to representation. That it did so is evidenced by the famous letter of Abigail Adams to her husband, John Adams, while he was sitting in the Continental Congress: "I long to hear that you have declared an independency,

and, by the way, in the new code of laws, which I suppose it will be necessary for you to make, I desire you would remember the ladies and be more generous and favorable to them than were your ancestors. Do not put such unlimited power into the hands of husbands. Remember all men would be tyrants if they could. If particular care and attention are not paid to the ladies we are determined to foment a rebellion and will not hold ourselves bound to obey any laws in which we have no voice or representation." As Mrs. Adams used the plural "we" she undoubtedly spoke also for Mrs. Mercy Otis Warren, Mrs. Hannah Lee Corbin and other women of influence closely associated with the leading men of the Revolution. In 1778 Mrs. Corbin, sister of Richard Henry Lee, of Virginia, presented her own petition for the right to vote.

It is not likely that Mary Wollstonecraft heard of these protests, but in 1790 she published in London her remarkable book, 'Vindication of the Rights of Women.' In the French Revolution of 1793 Condorcet and other leaders proposed conferring political rights on women. During the preceding four centuries and doubtless in far earlier times treatises were written by men in various countries calling for the education, development and emancipation of women. [Plato in his 'Republic,' 5th century a.c.] Old manuscripts on the rights of women are in existence dated through the 16th and 17th centuries, but all of these were only individual protests made at long intervals.

In the 18th century the idea and the hope of political liberty were everywhere permeating the minds of men and found practical expression through the American Revolution. The Declaration of Independence was written as a guide for all countries, and with this and the Constitution of the United States, framed 1787-89, was begun the greatest experiment ever made in representative government, even though the makers of these documents did not contemplate giving to women a voice in this government. The Constitution did not in fact confer the suffrage on any one but left those who already possessed it entirely free, under the jurisdiction of the State governments, to grant it to or withhold it from any class of citizens. The religious qualifications had practically ended with the colonies. Some of the new States made property or educational requirements and others imposed both; all of them restricted voting to male citizens except New Jersey, whose constitution gave the franchise to "all inhabitants worth \$250, etc." In 1790 a revision of the Election Law used the words "he or she," thus emphasizing the inclusion of women in the electorate. Enough women voted to gain the enmity of the politicians and in 1807 the legislature passed an arbitrary act limiting the suffrage to "white male citizens." This was clearly illegal, as the constitution could be changed only by action of the voters.

In the third decade of the new government most of the States, influenced by Jackson, Jefferson and others of democratic tendencies, removed the restrictions which barred the working men from the electorate, and this made the discrimination against women still more apparent. In 1826 a talented and wealthy young Scotchwoman, Frances Wright, having heard

g accounts of this kind of individual came here and associated herself with Dale Owen, then making some advanced experiments, in the publication of his paper. She was greatly surprised to learn that she had no part in the government and for a year in the paper and on the platform urged the enfranchisement of women. She was the first to bring the question before the public. She was followed in 1836 by Ernestine Rose, daughter of a rabbi in Poland, who had been banished because of her progressiveness. She was only 26, handsome and eloquent and her lectures on the science of government were largely attended. She, too, was dissatisfied at the subordinate position of women and not only advocated their full enfranchisement but also the repeal of the unjust laws which they suffered. In the winter of 1837 she herself circulated a petition in New York, for a law to enable a married woman to hold property, and, although she got only five signatures, she carried these to the legislature and addressed that body. She continued this work, which soon attracted attention, by 1840 she had associated with her Elizabeth Cady Stanton and Paulina Wright, two brilliant young married women, and Lucretia Mott, a well-known social reformer in New York. In many localities there began to be a great awakening on the part of women. Margaret Fuller, one of a coterie of thinkers in Boston, in her writings and semi-public addresses in 1840 demanded political rights for women and published her book, 'The Great First Cause, Man vs. Women.' Meanwhile larger forces were moving for the development of women and the extension of rights. The anti-slavery question was becoming more momentous. In 1828 Sarah and Ann Grimké, of South Carolina, emancipated their slaves, came North and by their inspired speeches aroused public sentiment. As soon as they entered the contest and the American Anti-Slavery Society was formed, the beginning women were prominently associated with this movement and the first woman's Anti-Slavery Convention was held in New York in 1837. The names of Lucretia Lydia Maria Child, Maria Weston Chapman, Abby Kelly, Abby Hopper Gibbons and others soon became widely known. The question of human rights was thoroughly understood and women then began to recognize their own and to take part in the business meetings and public debates of the society. This drew violent opposition and in 1839 the society was rent in twain on this point. The half recognizing the rights of women comprised Ann Phillips, Pierpont, Pillsbury, Thompson, Stanton, Gerrit Smith—nearly all of whom eventually carried the abolition movement to success. Thenceforth these men were the champions of women's rights, in that of the ballot, and the women added their appeals for the slaves others for their own and political liberty.

The question of woman's right to take part in this movement was carried to the American Anti-Slavery Convention in London, in 1840, which refused to recognize the women delegates from the United States, included Lucretia Mott and Mrs. Wendell Phillips. It was at this time that Mrs. Mott

and Mrs. Stanton, a Quaker, whose husband, Henry B. Stanton, was a delegate, decided that on their return to the United States they would organize a movement especially for the rights of women. Mrs. Mott remained several months lecturing in England and Scotland and found considerable sentiment in favor of permitting women to vote, especially among the Friends and Quakers. In 1847 Lucy Stone, recently graduated from Oberlin College, began speaking for the rights of women.

A wave of reform swept over Europe about the middle of the 19th century and reached the shores of the United States. It carried the desire for liberty of thought, speech and action and for the redress of wrongs to humanity. This nation was seething with the discussion of temperance and slavery. Such temperance laws as had existed had been repealed and there was no regulation of the liquor business. The question of slavery had become acute by the admission of Texas into the Union as a slave State and intensified by the Fugitive Slave Law. Women were as vitally interested in these questions as were men and they could no longer remain silent and inactive. Their first timid attempts at speaking in public and taking part in conventions were made in the temperance movement and here they met with a determined attempt by the men to suppress them. In the 'History of Woman Suffrage' may be found detailed accounts of the way they were literally silenced at temperance conventions, excluded from committees and forced to hold separate meetings. Their treatment by a part of the leaders in the anti-slavery movement has been referred to.

The Society of Friends, or Quakers, had divided on the slavery question and as this sect had always recognized equality of rights their women especially resented the discriminations that were being made. In 1848 during the yearly meeting of the liberal branch in Waterloo, N. Y., Elizabeth Cady Stanton went over from her home in the neighboring village of Seneca Falls to be with Lucretia Mott at the home of a mutual friend, Mary Ann McClintock. Mrs. Mott's sister, Martha C. Wright, came from Auburn. The four women talked over the situation and Mrs. Mott and Mrs. Stanton decided to put into effect the resolution they had made in London eight years before to call a convention for a public discussion of the rights of women. So here in the McClintock home on a Sunday morning in June these four issued a "Call" for the first woman's rights convention in all history and published it, unsigned, in a local paper. They then prepared a declaration of rights modeled after the Declaration of Independence and a set of resolutions which demanded practically every right that women are enjoying at the present day including suffrage. The convention met in Seneca Falls, 19, 20 July, in the Wesleyan Methodist Church, and James Mott, of Philadelphia, the husband of Lucretia, and one of the most prominent Friends in the country, presided. As many as the church would hold were present; the declaration and resolutions were discussed and adopted, and here began the movement for woman suffrage which has continued without cessation.\*

\* Consult 'History of Woman Suffrage' (Vol. I, p. 67) for full account.

So much attention was aroused that the convention adjourned to meet 2 August in Rochester, the nearest city. The newspapers gave wide publicity and in a short time press, pulpit and platform were denouncing the women. A spark was struck in the breasts of women throughout the country, who were beginning to rebel against the subordinate position they were forced to occupy, their lack of opportunity for education, the unjust laws and the efforts to bar them out from the great reform movements of the day. The women anti-slavery speakers were sowing the seed and in April 1850 a women's rights convention was held in the Second Baptist Church of Salem, Ohio, and a memorial was adopted calling upon the convention which was about to make a new constitution to put in a clause for woman suffrage. In 1850 the constitution of Indiana was revised and under the leadership of Robert Dale Owen the laws for women were liberalized beyond any then existing. In October 1851 a woman's rights convention was held in Dublin, Ind., and one appointed to meet in Richmond the next year. A woman's rights convention was held in West Chester, Pa., in June 1852, with prominent speakers from New York and Massachusetts, and one appointed for Philadelphia the next year.

The women in New York had continued to besiege the legislature until, in April 1848, for the first time in any State the common law was changed to allow wives to hold property. Then they devoted themselves to securing equal guardianship of children for mothers and juster divorce laws and to work along many lines leading ultimately to woman suffrage, which was their goal from the beginning. By this time the women in other States were carrying forward the same reforms.

In May 1850, during an anti-slavery convention in Boston, a few women in attendance decided to call a convention, national in character, to discuss exclusively the rights of women, and the time and place were fixed for 23, 24 October in Worcester, Mass. The arrangements were made principally by Lucy Stone and Mrs. Paulina Wright Davis. Nine States were represented by speakers and among these were Garrison, Phillips, Pillsbury, Foster, Burleigh, Douglass, Channing, Mrs. Mott, Mrs. Rose, Abby Kelly, Lucy Stone, Antoinette Brown, Dr. Harriot K. Hunt and many more of note, and letters were read from Emerson, Alcott, Whittier, Gerrit Smith, Joshua R. Giddings, Mrs. Swisshelm, Elizur Wright, Mrs. Stanton and others. Mrs. Davis presided. A national committee was formed, under whose management conventions were held annually in various cities, while the question was always thereafter a leading one in Massachusetts.

In May 1851, Miss Susan B. Anthony, who had been teaching in the academy at Canajoharie in eastern New York and had returned to her home in Rochester, met Mrs. Stanton for the first time. It was the commencement of 50 years' continuous friendship and effort under their leadership to obtain equality of rights for women. Their first conventions were held in the interest of temperance but they became convinced almost at once that women must have a vote in order to do effective work. In 1852

a woman's rights convention was held in Syracuse with delegates from eight States and Canada. From this time such conventions took place in various parts of the country and the movement for the rights of women had many strong supporters but it had to combat the traditions, customs and prejudices of the ages. Life for the vast majority of people ran in narrow grooves. The Bible was accepted literally as placing women in an inferior position. The Church spoke with much authority and for the most part commanded women to remain in the limited sphere supposed to be fixed for them by divine decree. They had been deprived of education and business experience. Women almost as a whole accepted this position without protest. The mass of men could see only disadvantage to themselves in granting more rights to women. Those who were connected in any way with matters toward which reform movements were directed were bitterly hostile to giving power to women. The political party leaders were as adamant against it. A large class of conservative men were opposed to any change; another class wanted to maintain their authority over women; another feared the effect on the home, the children, the family life; another regarded women as angels, goddesses, queens, to be kept on a cloud, a pedestal or a throne.

Notwithstanding an opposition which in volume and complexity was never faced by any other reform, the movement for woman suffrage was slowly gaining ground when the breaking out of the Civil War banished all other questions from the public thought. After the war was ended and the women again took up their cause they met the vast complication of the rights of the emancipated negroes and were compelled even by those who had been their strongest supporters to yield their claims to those of negro men. The civil, legal and political results of the 14th and 15th Amendments to the National Constitution tended still further to hinder the effort to obtain the franchise for women.

Before the Civil War women knew of no way except to have the word "male" taken out of the constitution of every State by consent of a majority of the voters, but these amendments showed them that there was a speedier and easier way. An Equal Rights Association had been formed to promote the interests of both negroes and white women, but in 1869 the latter were forced to recognize the necessity for a separate organization if they were not to be entirely sacrificed. At the close of a meeting of this association in New York, women who had come from 19 States to attend it met at the Woman's Bureau in East 23d street, where now the Metropolitan Life building stands, 15 May 1869, and formed a National Woman Suffrage Association, whose object should be to secure a 16th Amendment to the Federal Constitution which would enfranchise women. Mrs. Stanton was made president and Miss Anthony chairman of the executive committee. As there was some division of sentiment at this time, a "Call" was issued by Lucy Stone, Julia Ward Howe and others for a convention to meet in Cleveland, Ohio, the following November, and here the American

n Suffrage Association was formed, with Ward Beecher, president, and Lucy chairman of the executive committee. rked principally to obtain the suffrage g amendments to State constitutions. ocieties held national conventions every hereafter.

1890 the two bodies united under the National American Woman Suffrage As- on and both methods of work were fol-

In 1914 tional Woman Suffrage Publishing Com- Inc., was formed and took charge of the re department. Miss Alice Stone Black- was recording secretary 20 years and r five years.

representatives of the National Association hearing before the committees of every ess from 1869 to 1919. A remarkable of women was developed in the last f the 19th century—as soon as women oportunities. The first woman physician, eth Blackwell, was graduated in 1848, and st woman minister, Antoinette L. Brown (well), was ordained in 1853. Among others were Harriet Hosmer, Maria ell, Harriet Beecher Stowe, Mary A. nore, Julia Ward Howe, Lucy Stone, Barton, Frances E. Willard, May Wright , Jane Addams, Mrs. Stanton, Miss ny, Dr. Shaw, Mrs. Catt—all pronounced sts.

e leaders soon became convinced that they not hope for action by Congress until periment of woman suffrage had been by some of the States, and, therefore, irected the work along the two lines. irst Territorial legislature of Wyoming 9 had given suffrage to women and that h had done so in 1870. Wyoming came re Union as a State in 1890 with this in onstitution. In 1893 the electors of do by a majority vote granted woman ge. In 1895 Utah adopted a constitution atehood containing equal suffrage by a of over 10 to 1. In 1896 in Idaho an

amendment to the State constitution to en- franchise women received a large majority.

After this gain of four States in six years by the suffragists the opponents took active measures to prevent the submission of the ques- tion in other States. In the few cases where this was done the combination of corporations, liquor interests and party "machines" was im- possible to overcome. The domination of politics by these forces was so complete that there was no chance for any moral questions, and nothing was left but the slow process of educating public sentiment to demand that the voice of women should be heard in this wilder- ness. There have been altogether 56 campaigns for amending State constitutions and a volume would be required for the story of their hard- ships and disappointments, of the times when a victory was unquestionably won but by con- sent of both parties women were deprived of it. It is the record of a struggle which never has been equalled in other reforms.

At length came the great political "in- surgent" movement in the Western States, and, as the direct result, the submitting of a woman suffrage amendment in 1910 by almost unan- imous vote of the Washington legislature. The women made a thorough campaign and it was carried in every county in the State and received a majority of nearly three to one. California had been swept clean of its corrupt political forces by the great wave of insur- gency and the legislature submitted a number of reform amendments, all of which were adopted at the fall election of 1911, including the one for women suffrage. This was the greatest victory it had ever won, as California was an old, thickly populated and wealthy State, having commercial relations with, and known in, all parts of the world. It may be said that with this triumph the movement passed the crisis. In 1910 the National Ameri- can Association presented to Congress a petition of about half a million names for a Federal amendment.

In 1912 the legislature of Kansas submitted an amendment for woman suffrage. Those of Oregon and Arizona refused, but under the Initiative and Referendum Law the women secured enough signatures of voters to compel the submission. The amendment was adopted by the three States in November 1912. In Arizona every county gave a majority with a favorable vote of about two to one. In Oregon there was a majority of 4,161 in a vote of 128,369; in Kansas 16,079 in a vote of 334,473.

A Territorial legislature has power to confer the suffrage without a referendum to the elec- tors, and Alaska gave it in full to women by unanimous vote as soon as its first legislature met in the spring of 1913.

The enfranchisement of women in Nevada and Montana at the November elections of 1914 made all of the Western States white on the suffrage map except New Mexico. The amendments were submitted by almost unan- imous votes of the legislatures. Victory at the polls, however, was by no means so easy, as in no States did the opposition ever put forth stronger effort and in none were the physical hardships of campaigning so great, owing to the high mountains, vast distances and scattered population, the voters having to be

reached on far away ranches and in isolated mining camps. Montana cast 52 per cent of the whole vote in favor and Nevada 60 per cent.

When in 1914 the number of equal suffrage States had reached 11 and favorable public sentiment was rapidly increasing, the opposition concentrated its full force on every State where an amendment to its constitution was submitted and no further successes were recorded until there came the great victory in New York in 1917. Although the first movement for woman suffrage in the world had begun in this State in 1848 and never had ceased, and although it had been the first ever to have presented to its legislature a petition to submit an amendment to the voters, this request had been annually refused by every one beginning with that of 1854. The women at last became so strongly organized that by 1915 it could not longer be withheld, but it was defeated in November by 95,000. The women went directly to the legislatures of 1916 and 1917 and demanded its resubmission, which was granted in both, by votes not far from unanimous.

The suffragists then built up the largest State organization of women ever known, approximately half a million in New York City and an equal number in the rest of the State. Although they were immersed in the vast work of the European War they made a record campaign, one feature of which was the securing of a petition for the vote by 1,015,000 women in the State over 21 years of age. On 7 Nov. 1917, the amendment received 675,389 affirmative votes, later increased to 703,129 by those of the soldiers, who voted two to one in favor; 600,776 negative votes were cast; carried by 102,353.

The success in this influential State gave great prestige to the movement. Three more important victories quickly followed when, on 5 Nov. 1918, the electors of Michigan, South Dakota and Oklahoma enfranchised women. In Michigan the amendment received 229,790 ayes; 195,284 noes, a favorable majority of 34,506; in South Dakota it was adopted by 49,213 ayes to 28,885 noes, a majority of 20,328. Oklahoma made the unparalleled record of carrying an amendment with the handicap of a constitutional requirement that it must receive not only a majority of the votes cast on it but a majority of the highest number cast at the election. On the amendment were cast 107,609 ayes; 81,481 noes, a favorable majority of 25,528. The highest number of votes cast at the election was 194,435 for governor; the amendment received apparently a majority of 9791 of the total, but this is probably an underestimate. It was one of the most remarkable victories ever achieved for woman suffrage. Each of these campaigns required a vast amount of money and work by the women.

**Primary Suffrage.**—As the constitution of Arkansas is difficult to amend, its legislature took advantage of the authority it had under the Primary Election Law and in 1917 granted to women the same vote as possessed by men at all primaries, including those for Presidential electors. This was the first State suffrage granted in the South and as there is practically but one party the primary is really the election

In 1918 the Texas legislature gave this same primary franchise to women.

**Presidential Suffrage.**—The Presidential election of 1916 aroused nation-wide interest in the question of votes for women, as it was generally accepted that it had been decided by the equal-suffrage States. The injustice was widely recognized of permitting the women of one section of the country to help choose the President of the United States and denying this privilege to those of other sections, so the National Association decided that the time was ripe for pushing its long-cherished plan to obtain so-called Presidential suffrage for women. The Federal Constitution empowers every legislature to determine the manner in which the Presidential electors of the State shall be chosen and it is the universal custom to have this done by popular vote. In many States when the legislatures assembled in January 1917 they found themselves confronted by a request from the women that a law should be enacted giving them the right to vote for these Presidential electors, which could be done by a simple majority of the legislatures. They had granted this in Illinois in 1913; the women had voted at the election of 1916 and their votes had been accepted in the Electoral College without question.

By April this Presidential vote had been conferred by the legislatures of North Dakota, Nebraska, Indiana, Ohio, Michigan and Rhode Island. The first three added municipal and county suffrage as Illinois had done. The Vermont legislature in March passed a bill giving only municipal suffrage to women. Tennessee included it with Presidential suffrage in 1919.

The Supreme Court of Indiana declared that the legislature could not constitutionally grant the municipal and county franchise and as the Presidential was included in the law it also was ruled out. Ohio by means of an initiative petition, which was clearly unconstitutional, submitted the law to the voters and they defeated it. The same attempt was made in Nebraska, but the court found the petitions so fraudulent that it refused to permit a referendum and declared the law to be in effect. Michigan nullified it by giving full suffrage. In the winter of 1919 the legislature of Indiana reenacted the law for Presidential suffrage and it was granted during the winter and spring by the legislatures of Vermont, Wisconsin, Maine, Minnesota, Missouri, Tennessee, Iowa and in July again by Ohio.

The women of 30 States, two less than two-thirds, now have the right to vote for 300 of the 531 Presidential electors. Sixty senators and 154 representatives are elected partly by votes of women. The number of women 21 years of age in the States where they have Presidential suffrage only is estimated at 8,000,000. There are approximately 7,500,000 women of voting age in the 15 equal-suffrage States. The total number of women of this age in the entire United States is about 27,000,000.

All the suffrage now possessed by the women of the United States has been gained through the efforts of the National American Association and its State branches, by strictly non-partisan, constitutional methods.

Not in any State has the legislature power to confer the full suffrage on women, but this must be done by amending State constitutions.

requires submission to the voters. The States can grant the above-mentioned franchise and also a fragmentary vote, varying in amount in the States, on school matters, issuing of special taxation, etc., which has been done by over half of them.

Although the National American Association has done so large a work in obtaining woman suffrage in the States it has regarded this as but preliminary to securing a Federal Amendment, as a means for bringing pressure to bear on Congress. From 1869 it paused only long enough to have a thorough test made of women's ability to vote under the 14th Amendment. In 1872 two women tried to vote in various parts of the country, Susan B. Anthony among them. They were arrested, tried and fined. Mrs. Vir- L. Minor, of Saint Louis, was refused admission and carried her case to the United States Supreme Court (*Minor v. Happersett*).<sup>\*</sup> A reverse decision was rendered in 1875 and the Association then returned to its original work.

Hearings before committees of Senate and House were held from 1869. Senator A. A. Sargent, of California, presented in 1878 the amendment which thereafter was introduced into Congress: "The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex." The appeals and arguments were

generally treated by the committees in a purely academic spirit and it was difficult to secure any kind of a report. From 1878 to 1896 there were six favorable majority reports from Senate committees and two from House committees; and four adverse. Thereafter none of importance was made until 1913—after the victories in Kansas, Arizona and Oregon.

The movement for woman suffrage at this time entered upon a new era and began to be taken seriously by politicians. Only once before had an amendment been brought to a vote in Congress—25 Jan. 1887, through the efforts of Senator Henry W. Blair, of New Hampshire. The vote resulted in 16 yeas, all Republicans; 11 yeas, 11 Republicans and 23 Democrats, 6 absent. The second vote was taken 19 Jan. 1914; yeas, 35; yeas, 34, lacking 11 of a necessary two-thirds majority. One Progressive, 4 Democrats and 20 Republicans voted in favor; 2 Democrats and 12 Republicans voted no. The Federal amendment for woman suffrage has been discussed in the House of Representatives. After a long contest it was finally passed and brought to a vote 12 Jan. 1915. The debate lasted 10 hours and the vote stood yeas, 86 Democrats, 75 Republicans, 12 yeas, 1 Independent; 204 yeas, 33 yeas, 1 Independent and 171 Democrats.

In 1916 a nation-wide campaign was made to secure from the Presidential nominating convention an endorsement of the Federal Suffrage Amendment, an effort which had been made unsuccessfully every four years since 1872. Dr. Howard Shaw, honorary president, and Carrie Chapman Catt, president of the National Association, were present at the National Convention in Chicago and the Democratic Convention in Saint Louis, with many other women. Both conventions failed to endorse the amendment but put a plank in the plat-

form declaring in favor of woman suffrage by action of the States. It had long found a place in those of the minority parties and received a strong impetus from its advocacy by the Progressive party in 1912.

The first of December the National American Association opened large, handsome branch headquarters in Washington for the special work of getting the Federal amendment through Congress. It was here that the Association's Council of One Hundred was summoned by Mrs. Catt to meet 23, 24 Feb. 1917 when the entrance of the United States into the European War seemed at hand and pledged to the government the services of the association with its millions of members. The following April Dr. Shaw was selected by President Wilson and the Council of National Defense as chairman of the Women's Committee to organize and direct the war work of the women of the nation.

A Federal Woman's Equality Association was organized in 1890 with the Rev. Olympia Brown, president, and Mrs. Clara Bewick Colby, corresponding secretary. It held that Congress, by a majority vote of both houses, could empower women to vote in all elections for members of the House of Representatives, and for United States Senators after the National Constitution provided that they should be elected by popular vote. It had many hearings before committees of Congress but the question was never brought before either house. Mrs. Belva A. Lockwood, of the District of Columbia, and Miss Laura Clay and Mrs. Sallie Clay Bennett, of Kentucky, were among the prominent women who supported this measure.

An organization formed in 1913 called first the Congressional Union and later the National Woman's party, also had headquarters in Washington to work for the amendment and used partisan, militant methods, "picketed" the White House, burned President Wilson's speeches, etc.

It was exceedingly difficult to get a report even "without recommendation" from the Judiciary Committee of the lower House, to which the measure was always referred, and the effort frequently made to secure a committee on woman suffrage, such as existed in the Senate, finally succeeded in September 1917. Both Democrats and Republicans now admitted that a Federal Amendment was inevitable and the opponents realized that all they could hope for was to postpone it as long as possible. After much opposition the measure was put on the calendar for 10 Jan. 1918. The evening before the vote was to be taken President Wilson urged his party to support it. After a long discussion the vote stood 274 yeas, 136 yeas; Republicans, 165 for, 33 against; Democrats, 104 for, 102 against; 2 Independents, 1 Progressive, 1 Socialist, 1 Prohibitionist for; 1 Progressive (Louisiana) against. The amendment received one more than the two-thirds necessary to carry it, but Speaker Champ Clark (Democrat), of Missouri, had promised to vote in favor if there should be a tie. Fifty-six of the affirmative votes were from Southern States.

The contest was now carried into the Senate. The committee unanimously reported it and in a short time promises were secured for the needed two-thirds, lacking only three or four. Then occurred an unprecedented misfortune in

<sup>\*</sup>alt 'History of Woman Suffrage' (Vol. II, p. 734).

The first step in the process of securing the Federal amendment was the introduction of the bill in the House of Representatives on March 3, 1878. It was introduced by Charles Sumner, a Republican from Massachusetts. The bill passed the House on June 4, 1878, by a vote of 285 to 128. It then went to the Senate, where it was introduced by Charles Sumner on July 18, 1878. The Senate passed the bill on August 3, 1878, by a vote of 23 to 21. The bill then went to the President, who signed it on August 4, 1878. The amendment was then ratified by the States on August 26, 1878.

Before the Federal amendment could become effective it would have to be ratified by the legislatures of 28 States, three-fourths of the whole number. The large majority of them met in session in the eleven years and had adjourned before June 1, but several were still in recess. On June 1, Illinois, Wisconsin and Michigan met in a few days; Pennsylvania and Maryland a little later. Mrs. Catt, president of the National Association, at once began telegraphing to the governors of many States a request that they would call special

elections for the purpose of ratification, and other influential persons exerted pressure. This was a very important step in the political history of the country and it must be compared to the action of the States in the early history of the Republic. The first special session of the National Association was held in Alfred, Vermont, on June 10, 1878. The special session was held in Alfred, Vermont, on June 10, 1878.

The first session of the National Association was held in Alfred, Vermont, on June 10, 1878. The second session was held in Kansas City, Missouri, on June 10, 1878. The third session was held in Chicago, Illinois, on June 10, 1878. The fourth session was held in New York City, New York, on June 10, 1878. The fifth session was held in Philadelphia, Pennsylvania, on June 10, 1878. The sixth session was held in Boston, Massachusetts, on June 10, 1878. The seventh session was held in Washington, D. C., on June 10, 1878. The eighth session was held in New Orleans, Louisiana, on June 10, 1878. The ninth session was held in St. Louis, Missouri, on June 10, 1878. The tenth session was held in Cincinnati, Ohio, on June 10, 1878.

There is strong probability that 30 ratifications will be obtained and the Secretary of State will declare the amendment a part of the National Constitution before November 1900 when the general election takes place. This will give the Federal suffrage to the women of the United States on the same terms as exercised by men and equality of all races.

**In Other Countries.**—The suffrage movement in the United States and Great Britain has been in parallel lines since their beginning in each country about 1830. The Worcester Mass. convention of 1850 was reported in the New York Tribune and attracted the attention of Mrs. John Stuart Mill who wrote an article about it which appeared in the Westminster Review in 1851. That year Mr. Mill began his powerful writing in the subject. When a member of Parliament he proposed it in an amendment to the Reform Bill of 1867 and presented a petition of 1,000 names headed by Harriet Martineau, Florence Nightingale, Frances Power Cobbe, Josephine Butler and Mary Stowe. It was lost by 73 to 196. The women then organized societies in Edinburgh, Bristol, Birmingham, Manchester and London, and later a National Association was formed, including Ireland. As president of the London branch, Mrs. Henry Fawcett began her 52 of continuous service in this cause. In the Parliament granted the municipal franchise to women taxpayers. Jacob Bright introduced the first separate bill for woman suffrage in 1870 but its progress was blocked by the Government. There was a good prospect that women would be included in the Reform Bill of 1884, which enfranchised agricultural laborers, but they were kept out by the Government.

From 1866 the movement for woman suffrage in Great Britain and Ireland never ceased and it was supported always by the most eminent men and women. Petitions for it were signed by hundreds of thousands. In 1886 there was always a majority in favor

in the House of Commons but the government, whether Liberal or Conservative, systematically prevented the bills from reaching final vote. While many minor objections were made, the fundamental reason for the delay was the fear of each party that it would lose and the other gain by the enfranchisement of women. Through the years were collateral gains, as in the United States.

The laws relating to wives and widows were improved; local franchises were extended to women; a vote and eligibility for school boards; municipal suffrage; a vote in county councils; they were admitted to various official positions; the universities were opened to them. In 1907 they were made eligible as mayors and members of city and county councils.

In the early '90's Mrs. Emmeline Pankhurst and her daughter Christabel organized a revolt in which many women joined. Their society, the Women's Social and Political Union, used militant methods, which grew more violent; their treatment by the government became more rigorous, but not the slightest progress was made in obtaining woman suffrage from Parliament. The opponents simply had an answer for their opposition which did not exist.

The situation was at its worst when the European War broke out in 1914. The Women's Social Political Union closed its headquarters and disintegrated. Mrs. Pankhurst, personally devoting herself to the recruitment of soldiers. The old National Association, led by Mrs. Fawcett had for many years been president, immediately placed its large organized and well-trained forces at the service of the government and carried on for four and a half years what was probably the largest organized work of women during the war. By the autumn of 1916, the long-time demand for reform in the franchise laws could no longer be deferred and a conference of members of Parliament from all parties was appointed to consider the new measure. There was scarcely any opposition as to the inclusion of women. Prime Minister Asquith, who had been their most formidable opponent, sanctioned and promoted it.

George Bernard Shaw urged it. The conference reconvened in February 1917, and the Representation of the People's Bill conferred the complete franchise on all women who were on the local government rate list; on the wives of all men who were on the rate list and on all women holding a university degree, but they must be 30 years old. This was Ireland. The reason given for fixing the age was that 2,000,000 men voters would be added to the electorate and the addition of 300,000 women was all that could be under-

stood. This was very unsatisfactory to the suffragists but they accepted it as an ultimatum at that time.

There were many Parliamentary delays and it was not until December that the bill came to the House of Commons for final reading. The suffrage clause was carried by a vote of more than two to one and the bill sent to the House of Lords. Here also it passed by a vote of more than two to one; the final vote was taken 6 February 1918 and it immediately received the signature of King George V. Men can vote at 21 and women also at all local elections, and they are now making a vigorous effort to have the age lowered or the Parliamentary vote removed.

In granting the franchise to women Great Britain followed all her colonies except India and South Africa. The South African Parliament in 1919 voted its approval of woman suffrage and is likely soon to enact a law for it. There is a considerable demand for it among the educated women of India. In New Zealand, Australia and Canada women had the school and municipal franchise at an early date. The Parliament of New Zealand gave the complete suffrage in 1893; that of South Australia in 1895; of West Australia in 1900. In 1901 the six states federated and in June 1902, the National Parliament gave the women of the entire commonwealth the vote and eligibility for that body. The Parliament of New South Wales granted the state suffrage in 1902; that of Tasmania in 1903; that of Queensland in 1905 and that of Victoria in 1908.

There had long been a movement in Canada for the full enfranchisement of women, led at first by the National Suffrage Association and later also by the National Council of Women. The patriotism and efficiency of the women during the European War increased public sentiment in its favor and accelerated the action of the state governments. Full suffrage was granted by the legislatures of Manitoba, Alberta, Saskatchewan, and by popular vote in British Columbia, in 1916; by the legislatures of Ontario in 1917; of Nova Scotia and New Brunswick in 1918; by the council of the Yukon in 1919. Quebec and Prince Edward Island have not given the state suffrage. In 1918 the Dominion Parliament conferred the national suffrage on all women. The bill contained some war time provisions which it is now thought best to remove. The government has introduced a bill codifying all the franchise laws (1919). Women suffrage will undoubtedly be retained.

At the beginning of the present century, there was very little suffrage for women anywhere in the world outside of the United States and Great Britain and her colonies. In various parts of Europe women property-holders could vote by male proxy at local elections and in a few countries at Parliamentary elections. In Russia, among the peasant classes, women voted almost as freely as men at village elections, either as owner of property or proxy for the husband. Sweden in 1862 gave women ratepayers a vote for all officials except members of Parliament — more than women possessed anywhere else in the world at that time. Widows and spinsters in Finland had local voting rights in 1865. Iceland gave women taxpayers the municipal vote in 1882. The ancient little kingdom of the Isle of Man, with its independent government and its laws requiring only the sanction of the ruler of Great Britain, gave full suffrage to women property-owners in 1880 and to women ratepayers in 1892.

In 1906 the newly-formed government of Finland gave equal and universal woman suffrage. In 1901 Norway gave the municipal and in 1907 the full suffrage to women with a very small taxpaying qualification, which in 1913 was entirely removed. In 1913 Iceland gave the full suffrage. Denmark granted the municipal franchise in 1907 and adopted a new constitution with universal and equal suffrage in 1915.

The International Woman Suffrage Alliance was formed in 1904. The International Council of Women organized in 1888 made woman suffrage a part of its work in 1904. These two great associations, with millions of members, through their congresses and propaganda spread the doctrine among the women of all nations and a movement for enfranchisement was making progress in many of them at the time the European War began in 1914. It was supposed this would delay it for years but it had just the contrary effect, largely because of the loyalty, work and sacrifices of women during the long contest. This has been referred to in the case of Great Britain, Canada and the United States. Universal suffrage was the first result of the Revolution in Russia.

As the determination to have self-government spread among the central countries—Hungary, Austria, Bulgaria, Rumania and Germany—women were included in the electorate by common consent, and this was true of the smaller nations on gaining independence. The new Constitution of Germany, which went into effect in August 1919, gave universal suffrage to women. The fear of an uprising in Sweden caused the conservative upper house of its Parliament, which long had blocked the way to woman suffrage, to yield to the inevitable and it was granted in full in 1919. The Parliament of the Netherlands, fearing a revolution, hastened to enfranchise women as a conservative and stable element in 1919. The Belgian Parliament, gathered together after the country was restored to its people, gave the municipal and communal suffrage to women in 1919. A bill giving complete, universal suffrage to women on the same terms as exercised by men has passed the lower house in the Parliaments of France and Italy almost unanimously but has not yet come before the Senate. The question is under consideration by the national and cantonal legislative bodies in Switzerland. Even in the Orient it is seriously discussed. Probably within a few years women will have the vote in all countries possessing any measure of civilization.

**WOMAN'S BENEFIT ASSOCIATION OF THE MACCABEES, The.** A fraternal benefit society composed entirely of women and officered and managed by women. It exists solely for the benefit of its members and not for profit, having a lodge system with ritualistic work and a representative government, and grants life and disability protection upon satisfactory medical examination. It has members in every part of the world and is firmly established in 55 States, Territories and provinces of this continent with 2814 local bodies doing business therein. The Woman's Benefit Association was formerly known as "The Ladies of the Maccabees of the World" but at the meeting of its legislative body in 1915 adopted the present name, as being more representative of its aims and objects.

**Founder.** The founder was Miss Bina M West, who is now Supreme Commander (president). At the organization of the Association

Supreme Record Keeper, which office she held until July 1911, when she became the Commander. She personally introduced the Association in the original 16 States jurisdiction, revised and developed its domestic work, assisted in combining the separate jurisdictions under one central government, and instituted and perfected the system of general management. The success of the Order has been due primarily to the efforts and executive ability of this great leader. Miss West was born in Saint Clair County, Mich., daughter of Alfred J. and Elizabeth Conant, a direct descendant of Roger Conant, Governor of the Massachusetts Colony. She became identified in 1890 with the woman's society of the Maccabee Order, then organized in Michigan, and in 1891 was so successful as State Organizer that she was elected Lieutenant-Commander (corresponding president) for Michigan and was thereby a member of the executive committee and connected with the management and growth of the Order of the Association. In 1892, mainly through her efforts, a national body called "The Great Hive of the Ladies of the Maccabees of the World" was established with a view to bringing under one central organization the separate groups of women then doing business in various States under the name of "Ladies of the Maccabees," and of carrying the Order to other States. Miss West was thus the founder and has been the real manager and leader of the Association since its inception. Her unselfish and indefatigable services to the Association and her wonderful qualities of leadership have made it the greatest fraternal benefit society composed and officered by women. Every one of the certificates issued, amounting to \$155,404,138.26, bears Miss West's signature, and she has with her hand signed warrants disbursing over \$1,000,000 in benefits.

**History.**—The Woman's Benefit Association was established on 1 Oct. 1892, being organized to provide a central government for the Order already established in Michigan, New York and Ohio (The Michigan branch, however never affiliated completely with the Supreme Body and continued a separate organization, thus permitting the Woman's Benefit Association to enter Michigan the same as in other States. The Order in Ohio came under the jurisdiction in 1898 and that of New York in 1899). The first review in New York was organized at Grand Island, 11 March in Ohio at Cleveland, 15 July 1892. The review organized directly under the jurisdiction of the National body was at Pittsburgh, Oct. 1892.

During the first two years of the Association's existence 203 reviews were organized in New York. Of these 55 were organized by Miss West's personal efforts. The total of reviews in New York number 2,555. The growth of the Order has been rapid and steady and its membership has grown in 27 years to 216,290, making it the largest fraternal benefit society in the world, and led wholly by women and for women. The Association is also one of the strongest organizations in the fraternal world, having received in hand of over \$12,000,000 carefully invested in municipal bonds, the interest alone on

these bonds amounting annually to more than \$550,000.

**Government.**—The government is purely representative, every member in the Association having a share in its management through the election of delegates to State and National conventions. The National Convention is called the Supreme Review and is held once in four years for the purpose of enacting laws, electing officers and transacting any other necessary business of the Association. In the interim between meetings of the Supreme Review the Association is managed by the Supreme Board of Trustees, consisting of the Supreme Commander (president), Supreme Record-Keeper (secretary) and three other members elected by the Supreme Review. Each State has State supervision and the local reviews are conducted with a full set of officers and handle their own business direct with the headquarters of the Association at Port Huron, Mich.

The Association was first incorporated on 6 March 1897 and is an independent corporation, making its own laws, transacting its own business, collecting rates and paying benefits according to its laws. The sums collected and paid out in the 27 years of the Order's existence amount to \$18,500,000 and not one dollar has ever been lost through unwise investment or defalcation, or in any other way, and receipts and bills are now on file carefully audited by the Board of Supreme Auditors for every penny that has been expended. Annual reports of all business transacted are made to State insurance departments and the Association has since 1904 made annual valuation of its certificates to determine its exact condition and reserves for paying promised benefits.

**Headquarters.**—The Association was established in Port Huron, Mich., in 1892 and still maintains its headquarters there. It has in the best section of that city a Home Office Building which cost \$250,000 and which is one of the most modern and best equipped office buildings in the country. It is two stories high, of stone and reinforced concrete, and is fire-proof throughout, with every provision for carrying on the immense volume of the Order's business, for the comfort of its office force of 100 young women and with private offices and meeting rooms for the Supreme Boards of the Association. It has rooms also for the use of local reviews in the city.

**Social and Welfare Work.**—The Woman's Benefit Association, besides providing death benefits at cost for the protection of home and little ones, gives burial benefits and benefits for members totally disabled. More than this, it provides by general contribution a fund from which hospital service and medical care are given free to needy members. Contracts are in force between the Association and 84 hospitals located in all the large centres of membership in which this free service is given. Since its establishment in August 1915, 5,719 suffering members have been cared for in this way, who would otherwise have been unable to secure the necessary medical attention.

**Auxiliary to the Woman's Benefit Association** is "The Order of the Rose," a society for girls up to 16 years of age. The ritual of this Order is most inspiring, and through its courts,

as the local bodies are known, welfare work for children is being organized throughout the country, under the auspices of the local reviews of the Order. It is planned in this way to give vocational training to hundreds of children and it is hoped that its scope will in time be enlarged to embrace general welfare work for children of those not members of the Woman's Benefit Association as well as for the daughters and sisters of members.

**Statistics.**—On 1 Oct. 1919 there were 216,290 members of the Woman's Benefit Association and 2,555 reviews in 55 States, Territories and provinces. The Association had on that date paid out in benefits a total of \$18,379,122.27, with \$220,867.25 additional expended for free hospital service. The reserve fund amounted to \$11,780,904.87, bearing interest of more than \$550,000 annually. The total in all funds was \$12,695,473.21. The present executive officers are Miss Bina M. West, Supreme Commander, Miss Frances D. Partridge, Supreme Record-Keeper, both with offices at Port Huron, Mich., Mrs. M. Louise Hinrichs, Supreme Finance-Keeper and Mrs. Grace Meredith, Miss Nellie E. Lounsbury and Mrs. Nellie C. V. Heppert, Supreme Trustees. Dr. Ella J. Fifield is Supreme Medical Examiner for the Association.

BINA M. WEST,  
Supreme Commander.

**WOMAN'S CHRISTIAN TEMPERANCE UNION**, a reform organization founded at Cleveland, Ohio, in 1874; it was the outcome of a woman's crusade against the liquor traffic in the Middle States from 1870 to 1873. The "W. C. T. U." as the organization is popularly called, had regular associations in every State and Territory, with a total membership of about 500,000. An international association was founded in 1883 largely through the efforts of Frances E. Willard and now has auxiliaries in over 40 countries and provinces. The headquarters of the American association are at Evanston, Ill. The white ribbon is the general badge of the organization. The union has upward of 50 distinct departments of work, presided over by women experts in various lines. Its greatest work perhaps was securing the passage of laws requiring the study of physiology and hygiene in the public schools. Official organs are the *Union Signal* and *The Young Crusader*, both of which are published at Evanston, Ill. The State branches publish monthly papers.

**WOMAN'S COLLEGE OF BALTIMORE.** See GOUCHER COLLEGE.

**WOMAN'S COLLEGE OF DUE WEST**, a Reformed Presbyterian institution of higher education at Due West, S. C., founded in 1859. Its faculty numbers 14; the average annual attendance of students is 150; the tuition fees are \$50, the living expenses, board, etc., \$135, the total income, including tuition and incidental charges is \$22,881. The college colors are garnet and gray. The library contains over 3,200 volumes. The number of graduates since organization is over 1,000.

**WOMAN'S RELIEF CORPS**, an organization created in 1863 by the mothers, wives, daughters and sisters of Union soldiers of the Civil War of 1861-65, for the purpose of aid-

ing and assisting the Grand Army of the Republic, and to "perpetuate the memory of their heroic dead," to "extend needful aid to the widows and orphans," to "cherish and emulate the deeds of our army nurses." There are at present about 3,000 corps (local divisions) and 150,000 members. Over \$2,000,000 have been expended in relief by the organization.

### WOMB, The, AND ITS DISEASES.

The womb or uterus is one of the generative organs of the female. In its cavity the impregnated ovum is received, retained and supported during the development of the fetus, and from this cavity the child is expelled at the time of parturition. In the virgin, the womb is pear-shaped, flattened from before backward, and is about three inches in length. It is divided into body and neck. The fundus or upper extremity of the body is broad and convex, and is directed forward. From this portion the body gradually narrows to the neck, the lower rounded and constricted portion of the womb, which is directed downward and backward in the line of the axis of the inlet of the pelvis and around its circumference is attached to the upper end of the vagina.

The womb is situated in the cavity of the pelvis, between the bladder and the rectum, and is retained in position by ligaments, which in a normal condition of the parts also allow free movements of the womb during respiration, muscular exercise and change of posture. The ligaments are the two lateral or broad ligaments which pass from the sides of the womb to the lateral walls of the pelvis; the two round ligaments which are attached at the upper angles of the womb, one on each side, and pass out through the internal abdominal rings to end in the labia majora; the two anterior ligaments or folds of peritonæum between the neck of the womb and the bladder; and the two posterior ligaments or folds between the womb and the rectum. The womb is a muscular organ, consisting of bundles of unstripped muscular fibres, arranged in layers intermixed with areolar tissue, blood-vessels, lymphatics, and nerves. A serous coat derived from the peritonæum covers the posterior surface of the body of the womb and the upper three-fourths of its anterior surface. The cavity of the womb is triangular and flattened from before backward, its base being toward the fundus, and is lined with mucous membrane, having ciliated epithelium at its upper portion. This mucous coat contains the uterine glands, and is continuous with the mucous membrane lining the vagina, and connects with the peritonæum through the orifices of the Fallopian tubes or oviducts, one orifice at each superior angle of the uterine cavity. The two Fallopian tubes (q.v.) are appendages of the uterus attached to its superior angles and convey the ova from the ovaries (attached to the broad ligaments) to the cavity of the womb. At the inferior angle of this cavity is a small constricted opening, the internal orifice, which leads into the cavity of the cervix. At the vaginal extremity of the uterus is a transverse aperture, the os uteri or external orifice.

The womb is subject to cancerous, fibroid, fibrous and cystic tumors and polypa, to inflammatory affections of the mucous lining and

enchyma, such as endometritis and me-  
 of the neck or body of the uterus; to  
 ion of the os and cervix uteri, and to  
 erment (prolapsus or falling of the  
 , versions and flexions. The causes of  
 tritis are direct injuries (as from pes-  
 chemical irritants, etc.), inflammation  
 vagina, interference with the men-  
 flow, etc.; of metritis, mechanical and  
 njuries, sudden suppression of the men-  
 flow, endometritis and morbid growths.  
 ion is usually a complication of endo-  
 s. Among the causes are uterine dis-  
 ents causing friction against the cervix,  
 of sexual intercourse, vaginal or uterine  
 hœa, the use of pessaries, and injuries  
 ritation. Displacements of the uterus are  
 ommon and among their causes are:  
 crease in weight of the uterus from  
 ation or congestion, tumors, pregnancy,  
 tained in the cavity, etc.; (2) weaken-  
 the uterine supports from rupture of  
 rinæum, loss of tone of vaginal walls,  
 of uterine ligaments and degeneration of  
 tissue; (3) influences pressing the  
 out of place, such as tight clothing at  
 ist, the weight of heavy clothing on the  
 n, muscular efforts, such as lifting and  
 ig, abdominal tumors, distended bladder,  
 traction on the uterus, from deposits  
 ph in pelvic areolar tissue, cicatrices in  
 walls, shortening of uterine ligaments,  
 lexions of the uterus are bendings of  
 ard, backward, or to either side, known  
 ersion, retroversion, etc. A prolapsus  
 illing or descent of the uterus into the  
 cavity, or the prolapsed organ may pro-  
 the body at the vulvar orifice. The  
 orm is known as incomplete prolapsus,  
 ter as complete prolapsus. The symp-  
 of uterine diseases include leucorrhœa,  
 t the small of the back, dragging sen-  
 a feeling of weight and heaviness, in-  
 nce with the functions of the bladder  
 ctum, dyspepsia and despondency. See  
 OLOGY; MENSTRUATION; OBSTETRICS;  
 ; and consult Kelly and Noble, 'Gyne-  
 and Abdominal Surgery' (Philadelphia

**WOMBAT**, a burrowing marsupial of the  
 ger family and genus *Phascolomys*, na-  
 of Australia and Tasmania. The species  
 ommonly known (*P. wombat*) is two to  
 eet long, with a very short tail, clumsy  
 stout limbs, blunt muzzle and rough  
 variable tint. In their general form  
 ions the wombats resemble small bears,  
 a similar shuffling plantigrade walk;  
 ey are even shorter in the legs and  
 in the back than those animals. The  
 n resembles that of rodents. They  
 the ground and in burrows or holes  
 rocks, feeding on roots, grass and  
 egetable substances. They sleep in the  
 king their food at night, and are usually  
 n their habits, though their large chisel-  
 isors enable them to bite strongly if  
 d. Wombats exhibit small intelligence,  
 gentle, and capable of domestication to  
 d extent. They are hunted for their  
 hich is highly esteemed, and is said to  
 e pork. Several species exist, besides

the one above mentioned. *P. ursinus* is brown-  
 ish gray, like the third species, the hairy-nosed  
 wombat (*P. latifrons*), which differs from the  
 other two in having smooth silky fur, a hairy  
 muzzle, and large pointed ears. It inhabits  
 southern Australia. The largest living wom-  
 bat (*P. platyrhinus*) is about three feet long,  
 but remains of a large extinct genus (*Phas-  
 colonus*), which must have been nearly as large  
 as a tapir, have been found in Queensland.  
 Consult authorities mentioned under MARSU-  
 PIALS.

**WOMBWELL**, woom'wēl, England, a town  
 in the West Riding of Yorkshire, about five  
 miles southeast of Barnsley, with extensive  
 coal mines in the neighborhood. Pop. 17,536.

**WOMEN, Education of.** See EDUCATION  
 OF WOMEN.

**WOMEN, Legal Rights of.** During the  
 earliest times of which we have records, the  
 legal rights of women were narrowly circum-  
 scribed. By the Mosaic law the rights of the  
 wife were quite subordinate to those of the  
 husband, and daughters could inherit only where  
 there were no sons. Under early Roman law  
 (3d century B.C. and later), the husband could  
 condemn his wife to death for adultery and  
 without public trial. Owing to abuses the  
 law later took away the power of the husband  
 to condemn his wife to death, but provided  
 that the father might put to death a daughter  
 taken in adultery, with the important proviso  
 that her paramour be killed at the same time.  
 Usually a daughter could be forced into mar-  
 riage by the father, while he had no such  
 power over a son. However, with the rise of  
 Christianity the rigor of the law in relation  
 to women was greatly abated, and in certain  
 particulars they were shown more leniency than  
 men. For instance, ignorance of the law if  
 the offense did not involve good morals was  
 accepted as a valid defense for women because  
 of the weakness of the sex. Further, a wife  
 could not be convicted in a criminal action for  
 theft from her husband—a provision which  
 persists in a slightly modified form in the law  
 of the United States and other countries to the  
 present day. The power of initiative in divorce  
 —previously held by the husband only—be-  
 came the privilege also of the wife and she was  
 empowered to send her husband a divorce when-  
 ever the circumstances warranted such action.  
 Women, whether married, unmarried, or wid-  
 owed, could legally dispose of property by will  
 the same as men, and daughters were allowed to  
 inherit equally with sons. In ancient Greece,  
 the legal rights of women were subordinate to  
 the men as in the early Roman law. The Ger-  
 manic and other laws of this period were in  
 many particulars equally severe. From an early  
 date in England unmarried women could legally  
 make a contract or a will, could sue or be sued,  
 and needed no guardian as in Roman law. For-  
 merly in England criminal laws against women  
 were very severe and rigorously enforced, death  
 being the penalty for bigamy and manslaughter  
 and even for larceny. One anomaly of the  
 English law to-day working to the prejudice of  
 women is that which provides that a husband may  
 obtain a divorce on proving infidelity on the  
 part of his wife, but which denies her a divorce  
 on proving his infidelity unless she further

proves his commission of one of certain other enumerated serious offenses. Mild chastisement of a wife by a husband, however, once sanctioned by law, is now prohibited. In 1885 by the Criminal Law Amendment Act, the age of consent of females in England was raised to 16, thus eliminating an abuse of long standing. The right of primogeniture, now almost totally superseded on the Continent, in the English-speaking British Colonies, and in the United States, still persists in the law of the United Kingdom and works hardship to female heirs. The law of Scotland is in most respects similar to that of England, but testamentary capacity is given to females by Scotch law at a much earlier age than by English law. In many of the Eastern countries even to-day the law has made very few advances from olden times, and women are almost universally treated as the inferior of men, with only slight indications of any amelioration of this deplorable condition.

In the early history of the United States women suffered from the rigor of the law. As late as toward the close of the 17th century women were refused any rights to an education, were punished for speaking in public, and occasionally old women were burned as witches. It was not until a century later that women were given the right to a few months' education a year in primary schools, and not until 1819 did the government give any systematic financial aid toward the education of women. Statutory modifications of the severities of the common law with regard to married women began in the United States in 1848, New York taking the initiative. The other States followed rapidly, and within a comparatively short time most of the legal disabilities of married women were swept away. (See CURTESY; DOWER; HUSBAND AND WIFE). Under the Constitution of the United States or at the common law women have no legal right to practise law. By statute, however, they may now do so in the Supreme Court of the United States, and also in the highest courts of nearly all the States. It has been held in a number of State courts, in the absence of statutory or constitutional provisions to the contrary, that women may practise law in the entire absence of statutes authorizing it. Other decisions, however, hold to the contrary. By statute some States provide that no persons shall be precluded from practising any profession or employment (except military) by reason of sex; others by legislation or by constitutional restriction provide that women shall not be permitted to work in certain industries, as coal mining, a regulation manifestly for their own protection. By statute in a number of States, a married woman may act as a guardian, administratrix, or executrix. Up to 1915 a large majority of the States regulated by law the hours which women were permitted to labor in most industries, usually 8 to 10 hours a day, with restrictions on night work. Minimum wage laws for women have been passed in a number of States, and these have been held constitutional by the Supreme Court. (See LABOR LEGISLATION) During the early history of the United States the age of consent of females was nearly everywhere deplorably low, but legislation has raised this age so that in many States it is now (1919) 18 years, with a general average of about 16. In the case of wills of personal property, testamentary capacity in the various

States is often fixed at a lower age for females than for males. For example, in New York State the age for females is 16 years while it is 18 for males. (See TESTAMENT). In 1911 the first widows' pension law was passed (Missouri) and within eight years more than half of the remaining States had adopted this form of remedial legislation. (See PENSIONS). In a number of States to-day statutes expressly exempt women from arrest in all civil actions. The rigor of the early criminal law in the United States in its treatment of women has almost entirely disappeared. The tendency is decidedly toward leniency. With the recent extension of the franchise to women, the favorable indications for even wider extension soon, and the corresponding increase in their political power, together with the growing number of women legislators, it is safe to predict that women will add considerably in the near future to the legal advantages they have already secured. See WOMAN SUFFRAGE.

**WOMEN, Medical Education of.** See MEDICAL EDUCATION IN THE UNITED STATES.

**WOMEN IN INDUSTRY.** Through all the variations and complexities of modern industry there runs the simple motive of primitive human activity, viz., the need of food, clothing, housing and ethical expression. In such activity women have always had a part, though that part has varied with countries and with centuries.

In the United States, before the development of modern industry, women were concerned chiefly with the preparation of food and clothing. Women practically monopolized the spinning of cotton and woolen yarns, the making of hosiery, the manufacture of women's clothing; they made all the bread and pastries, and were the nation's canners. With men, women shared the weaving of cotton before the development of modern industry, the manufacture of men's clothing and the slaughtering and curing of meats.

During this period in America's history men were the chief makers of boots and shoes and the principal weavers of wool. They were almost exclusively concerned with the manufacture of flour and grist-mill products, wood and wood products, clay, glass and stone manufactures, and in the production of fuels.

There are no statistics showing the exact number of men and women that were engaged in the home occupations, but the compilations made by such men as Alexander Hamilton, Tench Coxe and by other early American historians, together with many State documents, afford ample evidence that although there were some interesting exceptions, broadly speaking the work of providing food, clothing and housing was divided in the manner described between men and women before the development of modern factory system.

Although the industrial eras, referred to as "before" and "after" the development of modern industry, are not abruptly demarked, but merge almost imperceptibly one into the other, there is no difficulty in determining the periods if a transition zone of sufficient width is marked off between the old and new orders in each industry or group of industries. For example, the first stocking mills of any im-

were established in the United States 20. Before this time, and for a goodly forward, hosiery was a household manu- in the hands of women. They held n in spite of the factory until the ap- of power to the looms in 1832. This r inventions put wings to the factory . Forty years after the introduction of er loom, stockings were practically a product, and women, who monopolized c when it was a home industry, consti- out 55 per cent of the employees in the mills of 1870. The transition period bout 40 years, but there is no question ut the complete monopolization of the

the mills, factories and mechanical establish- ments, and the immense field of employment dependent upon these industries, viz., the whole- sale and retail stores and other distributing agencies and offices. Twelve million women, however, are the approximate total number of women earning their own living in part or in whole, usually by wage-payments or profits from independent business or services. They include domestic servants and women who go from house to house to sew, to wash, to clean; they include teachers and actresses, doctors and nurses and lawyers and women in independent business. They include women working their own farms and women helping on their own or

TABLE I.

COMPARISON OF NUMBER AND PER CENT OF INCREASE OVER 1870 OF BREAD-WINNING WOMEN, WITH TOTAL FEMALE POPULATION 10 YEARS OF AGE AND OVER, AND COMPARISON OF THEIR INCREASE IN INDUSTRIES, PROFESSIONS AND OTHER OCCUPATIONS IN SPECIFIED DECENNIAL PERIODS.

industrial classifications adopted by the census vary widely in the successive decennial years. For the purpose of comparison, however, the 1900 census of occupations made the necessary rearrangement for the three previous decennial years these have been used in the accompanying table. The classifications for 1910 used in the table are those adopted in the 1900 census. In some minor occupations the figures did not permit of the necessary rearrangement. If they had, the trend shown in the table would have been accentuated. The policy of adopting the 1900 census classification wherever the figures would permit, two exceptions were made, the first being that of trained nurses who were classed with "Domestic and Personal Service" in 1900 and with "Professional" in 1910. The figures would permit the transfer of the 76,000 trained nurses back to the domestic and personal service group and the 5,000 women photographers to the group of manufacturing industries. Such a change would reduce the percentage of bread-winning women in professions from 9.1 per cent of all bread-winning women, as shown on the table, to approximately 8.2 per cent. But this reduction would be at least partially offset by the changes referred to which could not be made. The percentage of bread-winning women in professions would have increased the per cent in the professional group. Trained nurses were left among the professions because the requirements have, during the last 20 years, raised the whole occupation from the level of domestic and personal service to that of a profession. This was true, perhaps, in large measure in 1900, but the census of that year specified "nurses, untrained" without giving the figures separately. Since trained nursing has become a recognized profession, the women reported therein were left in the professional group. The claim of the photographers may not be quite so strong as it certainly seems, however, to belong more properly among professions in view of the artistic requirements of modern times, than among the group of women in manufacturing industries, where they were in the 1900 census. The number of photographers involved, however, would change the percentages but a small fraction of one per cent. Therefore, the classification of trained nurses and photographers, as belonging to the professional group, was accepted, though the effect of them to the 1900 classifications would not materially affect the trend shown by the table.

structure by the factories, nor about its home industry and in the hands of the women at least before 1820.

World War effected at least a temporary revival of home knitting. The relative importance of the home product, however, was significant even in war time, as it is not surprising that the home knitter will become a peacetime competitor of the factory

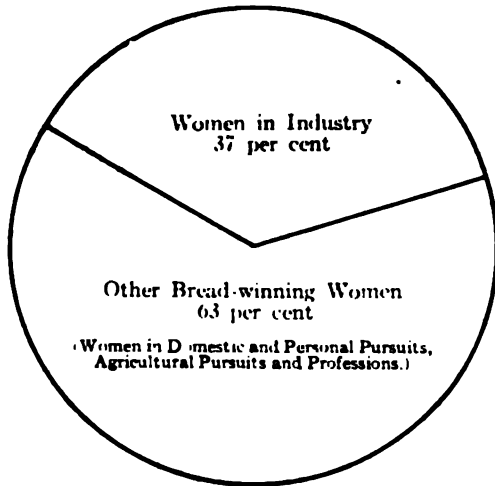

When discussing in detail the entrance of women into industry, it is necessary to clear up a common misconception which may cloud the meaning of the term "women in industry" as used here. It is not uncommon to hear about "five million women in industry." This is a very imprecise term, and one which, if taken literally, would imply that five million women workers are commonly and simultaneously supposed to have "invaded"

others' farms without wages or payment in kind. Such women are not usually thought of as "women in industry" and many of them are obviously not properly described by the term.

Just what proportion the women in stores, mills and factories—or the women usually in mind when the term "women in industry" is used—are of the whole number of bread-winning women is best shown by the circle on the following page, which has been divided to illustrate the relative proportion of "women in industry" and other "bread-winning women" according to the occupation census of 1910.

This circle throws into bold relief the fact that of the millions of women who are earning their own bread, scarcely 37 per cent are earning it in stores, mills, factories and other mechanical establishments or in offices. These

women have "invaded" the great domain of modern industry. The other 63 per cent are earning their living in the professions, in agriculture, and in domestic service, or they are winning their bread as waitresses, boarding and lodging-house keepers, nurse maids, etc.

While bread-winners in all pursuits as compared with the total female population 10 years of age and over have been steadily increasing during the last half century, the rate of increase in the proportion of women entering factories, mills and stores since 1870 is much greater than the rate of increase in the proportion of women entering all bread-winning pursuits. This is clearly seen in Table I.

**Women in Manufacturing and Mechanical Industries.**—Mechanical invention, the development of the factory system, the consequent decline of production and increase of unemployment in the home, forced many needy women into factory and mill environment. The skill acquired in the home industries exerted a controlling influence on the choice of industries into which women went for a livelihood. Indeed, this early influence is apparent even at present. The largest number of women employed in factories in 1914 were making personal apparel; a slightly lesser number were spinning yarn and weaving it into cloth. Almost 200,000 were preparing food products for our consumption.

Table II showing the largest women-employing industries in the United States, therefore, gains in instructive interest when the industries represented therein are compared with the division of work as described at the beginning of the article between men and women before the development of the modern factory system.

Such a comparison brings out clearly the fact that women "invaded" principally the mills and factories producing commodities which were once woman's chief, if not exclusive, concern, when such commodities were of household origin.

**Women in Mercantile and Clerical Pursuits.** The rate of increase in the number of women going into mercantile and clerical pursuits and professions since 1870 outstrips not

only the rate of increase in the numbers of all bread-winning women, but exceeds the rate at which the total female population over 10 years

TABLE II.  
PER CENT WHICH SIX INDUSTRIAL GROUPS EMPLOY OF THE TOTAL 1,539,190 WOMEN EMPLOYED IN ALL MANUFACTURING INDUSTRIES IN THE UNITED STATES IN 1914.

INDUSTRIAL GROUP	Number employed	Per cent of total
Textiles (including cotton, linen, silk, felt, worsted and woolen goods)...	305,125	19.8
Personal apparel (including men's and women's clothing, hats, millinery, shirts, corsets and buttons).....	356,999	23.2
Hosiery and knit goods (including suspenders and elastic woven goods)...	113,995	7.4
Hand and foot wear (Including leather and rubber boots and shoes, cut stock and findings, leather gloves and mittens).....	87,721	5.7
Tobacco manufactures.....	98,241	6.4
Food products.....	198,817	12.9
Total.....	1,160,898	75.4

This 75.4 per cent includes 63 of the 342 divisions into which the census of manufactures of 1914 has separated all industries. The remaining 24.6 per cent of women are employed in the other 279 industries.

of age has increased. This is shown by the table on page 459.

The women in mercantile and clerical pursuits are concentrated, as might be expected, in a very few occupations. The five occupations of saleswoman, stenographer and typewriter, bookkeeper and accountant, clerk and telephone and telegraph operator claim nearly 90 per cent of all women engaged in mercantile and clerical pursuits according to the occupation census of 1910.

Table III illustrates the pressure which the stream of women entering mercantile and clerical pursuits put upon the five occupational groups named.

**Women in Professions.**—Until shortly before the war school teachers in public and private institutions constituted an overwhelming majority of the "Women in Professions." Even in 1910 the teaching profession furnished nearly 500,000 of the total number of the approximately 750,000 reported in the occupation census of 1910. Beginning in the latter part of the last century, however, the number of women in other professions began to increase with great rapidity. While there were fewer than 2,500 women physicians and surgeons in this country in 1880, there were nearly 14,000 in 1910.<sup>b</sup> The same contrast is afforded by the number of "literary and scientific persons." The 1910 census of occupations shows but 579 chemists, assayers and metallurgists, but there are ample evidences that these and many other technical occupations were attracting large numbers of women even before the war.

The profession of law is drawing thousands of women, not all of them engaging in general practice by any means. Many are taking courses in law and securing admission to the bar in order to qualify for positions in legal departments of large corporations, civic and educational organizations and institutions, and frequently in various departments of the State and Federal governments.

**WOMEN IN INDUSTRY**

Copyright, Underwood & Underwood, New York

**1** A woman operating a vertical milling machine in the railway motor department of a big electric locomotive factory at Erie, Pa.  
**2** Women engaged at gun making in United States arsenal

Service" is rapidly reaching the level of a standardized profession, with definite regulations, though as yet it has not legislative sanction. It has the professions of law, teaching, medicine, including trained nursing.\* There are evidences that social service and similar activities are making heavy inroads on the profession and holding out alluring prospects to women in the better grades of positions.

Regarding discussion and Table III state the facts concerning the entrance of women into industry and the professions, and shed light on the causes of the concentration of women in industries of a certain character.

**Causes Determining the Direction of Women into Industry.—**Although the annihilation of unskilled male labor in various industries will in all probability continue because there will continue to be changes in the character of mechanical equipment. Nevertheless, the fact that preference is given to inventions which make it possible to employ cheap labor with profit will tend to keep women in demand in manufacturing and mechanical pursuits.

Second.—This fluctuation in the numbers of women in various industries will in all probability continue because there will continue to be changes in the character of mechanical equipment. Nevertheless, the fact that preference is given to inventions which make it possible to employ cheap labor with profit will tend to keep women in demand in manufacturing and mechanical pursuits.

Third.—Unskilled male labor from foreign countries, physically more able to operate heavy running machines, offered before the World War effective competition to female labor in a number of industries once dominated by women.

Fourth.—The possibilities of mechanical invention as affecting human labor are more limited in the trade and transportation group

TABLE III.

**NUMBER AND PER CENT OF WOMEN IN FIVE LEADING OCCUPATIONS IN TRADE AND TRANSPORTATION. (a)**

These occupations represent 89 per cent of all female employees and 37.5 per cent of the total number of employees in 100 occupations listed separately under "Trade and Transportation" in the 1910 census of occupations. (92-94).

(Figures taken from 1900 occupation census and 1910 occupation census).

Occupation	Bookkeepers and accountants		Clerks		Saleswomen		Stenographers and typewriters		Telephone and telegraph operators

\* For women 10 years of age and over.  
 \* Includes bookkeepers and accountants in stores only, all others are combined with clerks.  
 \* Includes cashiers.  
 \* Includes as "clerks in stores."  
 \* Includes all employees of telegraph company.  
 \* Includes officials and employees of telegraph and telephone company. (The fact that all employees are included in both the 1900 and 1910 censuses and "Officials and Employees" in 1880 materially affects the proportion in these two censuses, though the number actually involved is not considerable. The real importance lies in the increase in the numbers of adult women since 1890 when the numbers are both large and comparable).  
 \* Includes total number of workers in occupation.

In some industries by mechanical invention and application of power to machines and development of the factory system are not of dispute, and although there is as yet no argument that this annihilation of unskilled male labor in various industries is responsible for the influx of women into industrial fields where their own industry could count, yet the fact that women are working before the recent war in some of these industries is easily determined. A few salient points, however, can be pointed out.

Successive mechanical inventions, and the growth of factories and manufacturing, have checked the increase in the numbers of women in some industries and have accelerated the rate of increase in others. It has had both effects upon the same industry at different periods. The effect depends, upon the adaptability of the workers to the physical abilities of the various occupations.

of industries into which women have entered in such large numbers. The influence of invention has been felt most in more or less moderately skilled clerical work, which has been enormously facilitated by the typewriter, the various adding and computing machines, letter presses, filing systems, etc. It has not had, and reasonably cannot have, any effect upon saleswomen and women in secretarial positions.

Fifth.—The lighter demands for muscular exertion and physical endurance made by mercantile pursuits render the physical weaknesses of women less of a handicap in these occupations than in manufacturing and mechanical industries.

Sixth.—Occupations of the mercantile and clerical order do not require the women to handle materials or work in surroundings which soil the hands or the clothes. The workers can do their work in their "good clothes." This is not a negligible factor by any means with men in their choice of occupations but it is unquestionably a telling factor in determining the choice of an occupation by a woman, when any choice is open to her.

\* Discussion of trained nursing as a profession in connection with Table on page 459.

Seventh.—This group of occupations requires more academic training than the manufacturing and mechanical industries. Even the sales girl must be able to express herself fairly well, must write her sales checks legibly and compute her sales correctly. The clerk and stenographer must do better than the sales girl. The services of newly arrived immigrants or of the illiterate native born are, therefore, not available. The labor supply is confined to the graduates who are coming in rapidly increasing numbers from the common schools, the high schools, the business colleges and other schools of higher education.

Eighth.—This fundamental requirement of academic and technical training has resulted in confining the source of labor supply for the mercantile and clerical occupations to the families sufficiently ambitious and well circumstanced to afford their daughters the needed education. In other words, the demand for training has raised the pursuit in the "social scale."

Ninth.—What is true of the allurements of the mercantile and clerical pursuits as compared with the manufacturing and mechanical occupations applies even more closely but to a more limited number of women who have it in their power to enter professional pursuits.

The factor described in paragraph five of the foregoing summary particularly should not be overlooked, for while the desire to better or maintain her social position usually outweighs other factors in determining a woman's choice of an occupation, it is nevertheless true that the greater muscular exertion ordinarily required by manufacturing and mechanical industries shuts out from these activities many women of less than average physical endurance and makes it necessary for them to earn a living in occupations making lighter physical demands.

**The Influence of the World War on the Entrance of Women into Industry.**—In peace time the overwhelming majority of workers in all lines are engaged in supplying or distributing the normal demands of individual and family life. In war time the paramount demand upon industry is for means to destroy life—for guns, shells, powder and other explosives and for the necessary man power and equipment to make these effective against the enemy. The simultaneous shifting of stress from peace to war production and the drafting of the man power from industry to military and naval service inevitably changes the current of woman labor. How permanent the changes are only the results of succeeding censuses will show, but there are many evidences that the war emergency has materially checked the momentum of the movement of women into the old women-employing industries and familiar professions. For example, the records of the United States Employment Service for the period of the war showed a growing demand for women workers from employers in iron and steel and other metal industries; from lumber and timber mills and from the oil refineries. Without question the number of women bookkeepers and accountants has increased in a marked degree. Occupations in the banking business which were practically closed to women before the war drew large numbers

of women to offset the shortage of men. Trade and business schools during the war threw open to women courses in banking and other responsible commercial positions which were not open to women before the war.

Finally the Federal government which, before the war, had offered opportunities to women chiefly in clerical, stenographic and other positions demanding little or no executive or technical training called women during the war into service requiring technical knowledge and executive ability and administrative experience of no mean order.

Of course, this war draft of women from homes into industry, and from accustomed occupations requiring little skill to unaccustomed positions of responsibility, did not proceed to the extent that it did in England. This was due, in the first place, to the longer duration of the war period in England and the consequent longer and greater drain on her man power; and, in the second place, to the fact that England entered the war at the outset with a preponderance of women over men, whereas the United States entered the war with a preponderance of men over women. It was not until the second draft had been made in this country that the demand for women to take the places of men began to make itself felt. The first draft served only to "take up the slack in male labor" notwithstanding the fact that the country's mills and factories had been supplying the allied nations with enormous quantities of war materials.

It would seem, therefore, that the demobilization of the American military and naval forces would have resulted in a corresponding reduction in the number of women drawn into industry. Evidences, however, do not sustain this conclusion. War conditions shut off the normal labor supply from immigration. Not only so, but conditions in Slavic countries set in motion a flow of emigration especially of the Slavic foreign born which made its influence felt on the general labor supply. In addition, the increasing demand for reconstruction materials and the revival of peace time requirements have made demands which readily absorbed labor rendered available by demobilization and also kept the war acquisition of woman labor busy in large measure.

On the whole, unquestionably the war has enlarged the opportunities of profitable employment for women, though as stated before, just in what measure and how permanent the enlargements are, only succeeding national censuses will determine.

**The Economic Status of Women in Industry.**—The influence of the war upon the wages of women need not be discussed in an article of this nature, as the war wages of women, like the war wages of men, are determined by war conditions which involve factors not included in the general problem of "securing to the worker an equitable share of the products of his work."

Obviously, the fundamental conditions determining the economic status of women in industry are wages, working conditions and cost of living. To one or more of these three all the problems of social and industrial unrest are related, for the cost of living involves the standard of living; working conditions involve

ing hours and industrial hygiene; both in the health and earning power of the r. Wages are entangled with industrial duration of employment and labor supply.

es.—The steady increase in the numbers of women entering industry even though numbers of men may be increasing at a rapid rate in some lines, renders an equitable wage a matter of growing importance, not only to the industries and workers directly, but to society as a whole. The sharp demand is for a living wage as the minimum limit, for though the terms "living wage" and "minimum wage" may be used synonymously, there is never any question about

minimum wage laws definitely stipulate only the cost of living as the factor to be considered in fixing the wage, for even in these cases provision for apprenticeship wages are made by commissions.

**Amounts Paid in Wages to Women as Compared with Men.**—The year 1905 is the last in which the United States census gives the total amount of money paid to women as compared with the amounts paid to men and children. If the industries shown in Table II on page 460 were arranged in the order of those showing the greatest proportions of female labor, hosiery and knit goods would lead, as 66.4 per cent of the total number of wage-earners

PROPORTION OF WOMEN AND PROPORTION OF ALL WAGE MONEY PAID THEM DURING 1905 IN 10 INDUSTRIES WHICH IN 1910 EMPLOYED 57.7 PER CENT OF ALL WOMEN IN MANUFACTURING INDUSTRIES.

Proportion of women employed.  
Proportion of wages received.

support of the demands. It is always an effort to secure a living wage.

On the other hand, we are brought abruptly to the question of the standard of skill prevalent in industries which are large employers of women. In industry, skill is but another name for value contributed to manufacture or commercial progress by the individual. This is a question which cannot be even intelligently discussed from the standpoint of the worker.

It is a problem which must be approached also from the side of industrial adaptation.

In any case it is certain that the factor of efficiency crops up continually in the attempt to secure a living wage, though some of the mini-

were women 16 years of age and over. However, these women received not 66.4 per cent of the total amount of money paid in wages in 1905, but approximately 61.4 per cent. Of the total number of wage-earners engaged in the manufacture of women's clothing, adult women constituted in 1905 about 62.4 per cent, but they received 48.2 per cent of the amount paid in wages. In men's clothing, where they constituted 59.7 per cent of the total number of wage-earners they received 43.5 per cent of the yearly wage expenditure. The accompanying arrangement of black and white parallel bars shows that this discrepancy, between the proportion of adult women and the proportion of the total wages they receive, prevails throughout the

industries which are such conspicuous employers of women.

Whatever the cause of these discrepancies they should not be charged to the influence of children's wages, because they have been excluded from the comparison.

Sharp emphasis should be placed upon the fact that these discrepancies do not in themselves signify any inequitable division of the money paid in wages. One hundred dollars might be paid to five men for a given piece of work. The quality or grade of work done by two of the five might fairly call for a payment of \$50 of the \$100 to these two. In other words, it might be an entirely equitable arrangement for two-fifths of the workers to receive one-half of the wage money. A charge of unfairness in division of wage investment between men and women could be lodged only in case such division was not governed by the relative quality or grade of service rendered.

The significance of the paralleled bars lies in the alternative which they present, viz.: That women are either not rendering as high a quality of service or performing as high a grade of work as men in the same industries, or they are not possessed of equal bargaining power and are not, therefore, commanding equal pay for equal work. This alternative becomes a subject for serious thought in view of the fact that these industries not only employ the majority of women in manufacture, but they are the industries with whose fundamental processes women are by training and tradition acquainted. They are the industries which, with one exception, were once the chief domain of women, or were shared equally with men, and in which their skill was sufficient to be regarded as an asset by the pioneers in building up manufacturing industries in this country.

The encroachments which successive mechanical inventions have made upon the domain of skilled labor should not bear more heavily upon skilled women than upon skilled men. On the contrary if men of skill cost more than women of equal skill the factor of economy would tend to reduce the proportion of skilled male labor whenever superior physical strength is not required by the mechanical inventions.

There are ample data to show the extent to which men and women are performing the same occupations, but that does not measure the extent to which an equal degree of skill is required. Men and women may be performing the same occupations, but may be working on material of entirely different quality—one being much more difficult to handle and, therefore, requiring more skill and judgment. On the other hand, there are industries where the division of work is very marked, but this division does not mean necessarily that the sum of skill, speed and endurance required by one group of occupations is not equal to that required by another. For example, men and women do not perform the same occupations in pea canning, but it is a question whether the keen observation, the long concentration and quick decision demanded of a woman looking for pin point leaks in filled cans which pass her at the rate of 50 to 80 a minute do not call for as much skill as is exhibited by the male "tipper" who deftly seals the line of cans before they pass under *her* inspection.

The census does not furnish corresponding figures concerning the amounts paid men and women in mercantile and clerical pursuits. But there are many evidences, strengthened by the results of sporadic investigations, that of same conditions prevail in the wage scale of these occupations.

During the war the government agencies, notably the National War Labor Board, stimulated the efforts to equalize the wage scales of men and women by issuing official pronouncements in favor of "equal pay for equal work," but the records of awards by the board do not furnish evidence of effective application of the principle. The principle was also endorsed by the women in industry service of the United States Department of Labor, which was established by the Secretary of Labor during the war to set up standards of working conditions.

**Organization among Women Wage-earners.**—Because of the comparative brevity of the industrial life of the average woman wage-earner, organization among them for the improvement of working conditions proceeds much more slowly than among men. The short stay in industry which in turn limits the stability creates an apathy toward organization whose purpose is the permanent improvement in a field of activity in which the majority of wage-earning women do not expect to remain. It leads to a high turn-over in the membership of organizations which have succeeded in establishing themselves in spite of the disadvantage under which they labor. This turn-over limits the opportunity of developing stable leadership from the ranks. But in spite of this handicap, able leaders have been developed through the trade unions and through the National Women's Trade Union League.

**Legislation Regulating Conditions of Labor for Women.**—Practically all the legislation regulating the hours, wages and working conditions for women in industry is restricted to women in stores, mills and factories and kindred establishments. The legislation has been enacted and judicially sustained upon the doctrine that the State has a peculiar stake in the health of its women as the mothers of its future citizens. Such legislation has been promoted unquestionably because of the weaker bargaining power of the wage-earning women. This weaker bargaining power is itself explained in large part by their short stay in industry and the consequences just described as flowing therefrom. While the laws for women in industry have always included provisions for minors, restrictive legislation for children has outstripped the laws guarding the working conditions of adult women.

At the time of the passage of the Federal Child Labor Law in 1916, barring children under 14 and restricting the hours of those between 14 and 16 to eight hours a day, there were but four States and the District of Columbia which had eight-hour laws for women. When the Federal law was annulled in 1918, the States on the products of establishments which children had the same purpose. Laws barring women and children from dangerous employment and children from dangerous employment of children than they do in the restrictions laid upon the employment of children. In the framing of minimum wage laws

noticeable effort to discourage the employment of children by giving officials power to set minimum wages which would render employment of children unprofitable. These industrial improvement laws for both wage-earning women and for minors are going constant modification and extensions. State legislatures and efforts to secure such action were only suspended by the demand of the war. But through all these efforts to improve the wages, hours and working conditions of women and minors in industry is developing a clearer and more effective recognition of the fundamental difference in the roles which must dominate legislation for men and those which shape the legislation for women and children.

In a word, the aim of restrictive legislation for women wage-earners, unlike that for men workers, is not their elimination from industry, but is improvement in the conditions in which their rapidly increasing numbers are working. This difference throws much light on the greater difficulties in the way of securing effective protection through legislation for wage-earning women, and upon its slow progress when compared with similar legislation for men and children. It makes clear the double burden of responsibility resting upon the promoters of such legislation, the necessity of protecting not only the wage-earning woman without regard to imperiling her rightful place in the world of adult wage-earners. It is not a simple and easy task, for the obligation to protect and to secure the woman's place in industry as well as to advance her carries with it the necessity of framing legislation which will not cripple industry and deprive the adult woman's chances of earning a livelihood therein, but will only prevent industry from crippling or otherwise injuring its adult workers.

Director of Industrial Survey and Information Service, Washington, D. C.

**WOMEN'S CLUBS**, associations of women organized for purposes of study, recreation, or for the promotion of certain philanthropic or political ends. Organization among women in the United States has grown to enormous proportions. It is impossible to compute with any degree of accuracy the membership of women's clubs, outside the federated bodies. The number probably reaches 3,000,000. Though it is generally said that women's clubs did not exist until the 19th century, there were clubs during the 18th century in the colonies. A "female club" was flourishing in New York in 1747 and there was an earlier one in 1735. The tea-table undoubtedly was responsible for social meetings in which the germ of the woman's club may be found. Reading circles and sewing societies, church societies and philanthropic societies existed throughout the country; but they were not organized. One of these early clubs was the Sharon Literary Club founded in January 1779, in Sharon, Conn., with the Rev. Cotton M. Smith chairman and John C. Smith secretary. The purpose was "to promote a taste for the study of *belles lettres* and of logic and to gain some skill in the useful Freeman's Art of Debate." The club published a magazine called *The Clo*.

The club movement did not begin until the 19th century. There was a Female Society for the Relief and Employment of the Poor in 1798; in 1834 the American Female Guardian Society was established, and in 1840-50 the Daughters of Temperance came into existence. During the Civil War a great number of organizations were formed, such as the Sanitary Commission, Women's Loyal Legion, Freedman's Bureau, to say nothing of the many philanthropic bodies, the outcome of the conditions. After the Civil War there was a demand for co-operation and popular education, and Sorosis and similar clubs were founded. Undoubtedly a great deal of impetus came from the suffrage organizations.

**Suffrage Organizations.**—In 1848 Elizabeth Cady Stanton and Lucretia Mott issued the first call for a national suffrage association. These two women presided and organized the association. It had been a disputed question whether any woman could, or would, be able to fill this important position, the decision ultimately being given in the affirmative, by the famous negro orator—Frederick Douglass. Susan B. Anthony immediately joined the other two women, and from their united efforts, "Individual Clubs" were formed. Their aim

as expressed in their platform being to "promote the educational, intellectual, legal and political equality of women, especially the right of suffrage."

From authentic records it has been proved that in 1859 Miss Constance Faunt Lee Roy founded the Minerva, a Woman's Literary Club at New Harmony, Ind., and Friends in Council, a reading club, founded in Quincy, Ill., in 1866. The "Sorosis" (q.v.), the first permanent woman's club organized, is still in existence.

The first associated work of women was religious and philanthropic. During the first 10 years of the 19th century a number of religious societies of women were organized to create funds and aid in church mission work, such as the "Cent" societies of 1801 and 1804. There were also women's auxiliaries to the Board of Foreign Missions. In 1839 there were 680 of these societies but their limited character prevented them from being productive, and they were nearly extinct by 1900. In 1864 the first independent union of women missionary societies was formed in New York by Mrs. Doremus and soon afterward every Protestant denomination had its organized Woman's Auxiliary to the American Board of Home and Foreign Missions. The oldest purely women societies in America were started for missionary and church work, and the first on the list of these was the Female Charitable Society of Baldwinsville, N. Y. Another early organization was the Piqua Ohio Female Bible Society, founded in 1818 with nine women. Toward the end of the century the society numbered 900.

"The early half of the century was marked," writes Mrs. Croly, one of the founders of Sorosis, in her 'History of the Woman's Club Movement,' "by a crusade for the cause of the better education of women. Simultaneous with this were two other movements—the anti-slavery agitation, inspired by the new enthusiasm for human rights and carried on largely by Quakers of both sexes, and the Woman's Rights Movement. The Woman's Rights Movement was the natural outgrowth of the individual sovereignty idea which the German philosophers had planted and of which Mary Wollstonecraft was the first great woman exponent. The keynote of the educational advance was struck by Emma Willard in 1821.

"The woman's club was not an echo, it was not the mere banding together for social and economic purpose like the clubs of men. It became at once, without deliberate intention or concerted action, a light-giving and seed-sowing centre of purely altruistic and democratic activity. It had no leaders. It brought together qualities rather than personages; and, by a representation of all interests, moral, intellectual and social, created an ideal basis of organization, where every one has an equal right to whatever comes to the common centre."

Sorosis was founded in 1868. In 1867 the Press Club of New York gave a dinner to Charles Dickens. A number of women who were either actively engaged in literary work, or connected with it in some manner, asked if they could be present at the dinner. It was ruled that they could not, although eventually a compromise was arranged and a few women attended the dinner—in some irregular way, probably as spectators in the gallery. The fol-

lowing year these same women met at the residence of Mrs. Charlotte Wilbour. All expressed their indignation regarding the Dickens Dinner incident, and the question—"Why cannot we have a club of our own?" came up and led to an organization formed by women, to which the name Sorosis was given.

The first meeting took place in March 1868 at the residence of Mrs. Croly. Alice Cary was made president; Mrs. Jennie C. Croly, vice-president; Kate Field, corresponding secretary; and Mrs. Charlotte B. Wilbour, recording secretary and treasurer.

Simultaneously with Sorosis the New England Woman's Club was organized in Boston by Mrs. Caroline M. Severance, and the first public meeting took place 30 May 1868 at Chickering Hall. Mrs. Julia Ward Howe, Mrs. Ednah D. Cheney, John Weiss, O. B. Frothingham, James Freeman Clarke and Ralph Waldo Emerson were present, for this club had the co-operation of men.

The Woman's Club of Brooklyn was founded in 1869-70 by Mrs. Celia Burleigh, who was made president. The Fortnightly of Chicago was founded in 1873, mainly through the efforts of Mrs. Kate Newell Doggett. Jane Addams and Mrs. Ellen M. Henrotin were members of this club. In 1876 the Chicago Woman's Club was founded by Mrs. Caroline M. Brown. In 1893 the Civic Club of Philadelphia was organized, the first of its kind. As early as 1853 the Laurel Hill Village Improvement Association was founded by Miss Mary G. Hopkins (Mrs. Goodrich) and Miss Sarah Yorke to improve Stockbridge, Mass. In 1886 the Woman's Health Protective Association of New York was organized.

Sorosis sent in 1873 "a little messenger" to prominent women throughout the whole world, calling together a "congress of women." This act received the commendation of thousands of women, including nearly all the reigning queens. This congress was held in New York at the Union Square Theatre, and formed an "Association for the Advancement of Women," which held congresses annually in various parts of the country, until it was superseded by the General Federation of Women's Clubs.

**General Federation of Women's Clubs.**—This organization was formed at a meeting called by Sorosis in New York, March 1889. On that date Sorosis reached its majority and celebrated its 21st birthday. The Federation was designed to bring in closer touch clubs from all over the country.

Soon after the formation of the General Federation, the different States began to agitate the question of State federations. The first State to organize was Maine, 4 Sept. 1892. The other States rapidly fell into line.

The board of directors of the General Federation of Women's Clubs consists of forty-nine women. The committees represent art, civics, civil service reform, conservation, education, home economics, industrial and social conditions, legislation, literature and library extension, music, public health and National Education Association, school patrons' department.

The New England section: Maine, 157 clubs; membership, 6,000; New Hampshire, 116 clubs, membership, 9,340; Vermont, 60 clubs, membership, 5,539; Massachusetts, 301 clubs, member-

0,577; Rhode Island, 42 clubs, membership 888; Connecticut, 87 clubs, membership,

ntic States section: New York, 444 membership, 350,000; New Jersey, 200 membership, 22,000; Delaware, 31 clubs, ship, 2,381; Pennsylvania, 373 clubs, ship, 60,000; Maryland, 82 clubs, membership, 12,000; District of Columbia, 27 clubs, rship, 7,000; Virginia, 59 clubs, membership, 15,000; West Virginia, 67 clubs, membership, 754; North Carolina, 156 clubs, membership, 300; South Carolina, 135 clubs, membership, 600; Georgia, 365 clubs, membership, Florida, 159 clubs, membership, 9,150.

le States section: Ohio, 479 clubs, ship, 60,000; Indiana, 502 clubs, membership, 23,340; Illinois, 559 clubs, membership, Kentucky, 175 clubs, membership, 45,000; see, 162 clubs, membership, 7,000; Michigan, 3 clubs, membership, 29,564; Wisconsin, bs, membership 13,000; Minnesota, 450 membership, 30,000; Iowa, 668 clubs, ship, 20,000; Missouri, 282 clubs, membership, 25,000; Arkansas, 225 clubs, membership,

States section: Alabama, 217 clubs, ship, about 7,000; Mississippi, 123 clubs, ship, 5,000; Louisiana, 124 clubs, membership, 15,250; Texas, 528 clubs, membership,

tern States section: North Dakota, 182 membership, 4,262; South Dakota, 130 membership, 4,366; Nebraska, 222 clubs, ship, 10,343; Kansas, 370 clubs, membership, 10,240; Oklahoma, 278 clubs, membership, about 7,000; Montana, 87 clubs, ship, 5,000; Idaho (no data); Colorado, bs, membership, 10,500; New Mexico, bs, membership, 1,827; Wyoming, 39 membership, 1,500; Utah, 58 clubs, membership, 3,000; Nevada, 32 clubs, membership, Arizona, 40 clubs, membership, 2,035.

fic States section: Alaska, 7 clubs, membership, 284; Washington, 208 clubs, membership, 600; Oregon, 120 clubs, membership, California, 472 clubs, membership, 37,000. In the above it will be seen that there are 60 clubs and 2,500,000 women represented in federated clubs, and this does not include a large number of unfederated clubs and patriotic and civic, industrial and social organizations.

Another body is the National Council of the United States of America. The committee are child welfare, community, music, and federal co-operation, immigration, status of women, Pan-American, permanence, prison reform, public health, publication committee and suffrage.

International Council of Women embraces 28 organizations of women.

Women's clubs are usually incorporated and self-governing and self-supporting. They are supplied with every branch of human activity.

Those educational in purpose devote attention to art, history, literature, music, and travel and give readings, lectures and discussions; the social clubs give teas and receptions for celebrities, card parties and entertainments; the clubs of practical origin and aid all kinds of philanthropic movements for the betterment of their village or State, aiding schools, libraries,

healthful sanitation, municipal or county improvement forestry, parks, tree-planting, vacation schools, manual training, kindergartens, child welfare, factory inspection, tenement houses, vocation schools, scholarships for women, laws for the betterment of working-women and children, police matrons, condition of prisons, etc. There are also health protective clubs that work with the board of health in their respective cities and towns. There are also clubs that take up cooking and industrial arts of all kinds, and clubs devoted to the study of home economics.

Men at first slow to give their sanction to the idea now work enthusiastically with auxiliary women corporations. In his preface to Mrs. Blatch's book, 'Mobilizing Woman-Power,' Theodore Roosevelt says: "No man who is not blind can fail to see that we have entered a new day in the great epic march of the ages. For good or for evil the old days have passed; and it rests with us, the men and women now alive, to decide whether in the new days the world is to be a better or a worse place to live in for our descendants.

"In this new world women are to stand on an equal footing with men, in ways and to an extent never hitherto dreamed of. In this country they are on the eve of securing, and in much of the country have already secured, their full political rights. . . . If they show under the new conditions the will to develop strength and the high idealism and the iron resolution which under less favorable circumstances were shown by the women of the Revolution and of the Civil War, then our nation has before it a career of greatness never hitherto equaled."

The work accomplished by these intelligent bodies of women has been marvelous. For instance the club in Saint Paul, Minn., known as the Territorial Pioneers secured a State park or forest reserve of 12,000 acres and 200,000 acres of pine land to be cut under forestry regulations; also a yearly appropriation from the State for a State art society; also an appropriation of \$6,000 yearly for a State traveling library. The activities of national societies, such as the Colonial Dames, of the Daughters of the American Revolution, etc.; include the acquisition and protection of historical spots and the erection of monuments; the encouragement of historical research; the preservation of documents and relics, and the celebration of patriotic anniversaries.

Alumnæ associations, formed from the graduates of colleges, institutes, academies and seminaries, "To unite graduates for their mutual benefit, to preserve the pleasant relations formed during college life, and advance the cause of education among women" come under the head of women's clubs. Kindergarten clubs have furthered good work. Library clubs have built up free libraries. In the South and West traveling libraries have accomplished useful work toward free education. Professional clubs include many associations of teachers, nurses, lawyers and women of other professions. Press clubs, for members of the literary profession in all large cities exist. The Professional Woman's League of New York, one of the strongest clubs of this class, was organized in December 1892 for the benefit of members of the dramatic, musical and literary professions.

It is a distinctive society in that it loans money to its members when sickness or sudden calamity overtakes them. To this class belong the educational and industrial unions. The Woman's Christian Temperance Union is a large active body, doing the work its name implies.

The International Sunshine Society, founded by Mrs. Cynthia Westover Alden, 1896, and incorporated 8 March 1900 has for its object: "To incite its members to the performance of kind and helpful deeds, and to thus bring the sunshine of happiness into the greatest possible number of hearts and homes." This is the largest individual club in the country, although it might be classed in the line of federations, as it has branches all over the United States and a few in other parts of the world. The estimated membership is 250,000.

The National Association of Colored Women was organized in 1894. Its motto is "Lifting as we Climb."

Mere mention of all the important organizations of women would require a large volume. Many of these bodies are federated with branches, or chapters, or units, in every State. One of the largest of the patriotic societies is the Daughters of American Revolution (D. A. R.), founded in 1890, with headquarters at Memorial Continental Hall, Washington. This numbers 140,853 members with chapters in all the States. The Daughters of the Revolution, founded in 1891, also has chapters in all the States. The National Society of Colonial Dames, founded in 1892, comprises 9,000 members. Its council meets in Washington every two years. Each State has its independent society and all are presided over by the national society. The Colonial Dames of America, founded in 1892, has also a large membership. In addition to these there are the Society of Daughters of Holland Dames; National Society of United States Daughters of 1812, 3,500 members; Pocahontas Memorial Association, 3,200 members; United Daughters of the Confederacy, 1894, 100,000 members; Daughters of the Cincinnati, incorporated 1894, the purpose of which is to educate a daughter of a naval or army officer with a view to self-support in teachers' college; Imperial Order Daughters of the British Empire in the United States; Mount Vernon Ladies' Association of the Union, founded in 1853, to care for Washington's home on the Potomac, 34 members; National Society of New England Women; National Society of Ohio Women; Society of Illinois Women; National Congress of Mothers and Parent Teachers' Associations, 1897, 100,000 members; National Women's Life Saving League, 1911, 2,000 members, to teach women and children swimming; American Nurses' Association, 3,500 members; Women's University Club, 1891, 1,200 members; New York Women's League for Animals, free hospital and dispensary, 1910, 1,500 members; Women's Municipal League, New York, 1,500 members; Women Lawyers' Association, New York, 1899, 250 members; College Women's Clubs; Association of Women Painters and Sculptors; National League for Women's Service, 1917, over 300,000 members, organizations of women volunteers doing economic and social emergency service; Vassar Students, 1889, 1,225 members; Camp Fire Girls, 1912, 100,000 mem-

bers; Girl Scouts, 60,000 members; and the Needlework Guild in America, established in 1885 and incorporated in 1896, office in Philadelphia with 500 branches, the object of which is to furnish garments and household linen annually to hospitals, homes and other charities and special contributions in times of disaster.

**Organization in Great Britain.**—The principal London clubs are: Albemarle, established 1874, 1,100 members; Alexandra, 1884, 800 members; Automobile, 1903, 450 members; Empress, 1897, 2,500 members; Hakyon, 1911, 800 members; International, 1911, unlimited; Ladies' Army and Navy, 1902, 3,000 members; Ladies' Athenæum, 1904, 910 members; Ladies' Empire, 1902, 1,200 members; Ladies' Imperial, 1906, 2,300 members; Ladies' Park, 1905, 1,400 members; Lyceum, 1904, 2,400 members; New Century, 1899, 3,000 members; New Victorian, 1896, 800 members; Pioneer, 1892, 700 members; Sesame, 1895, 950 members; Three Arts, 1911, 1,200 members; University, 1887, no limit; Victoria, 1894, 450 members, and Writers', 1891, 400 members.

There are also in Great Britain the Woman's Liberal Federation; the Women's National Liberal Association; the Scottish Women's Liberal Association; Association of Women Clerks and Secretaries; Women's Imperial Health Association; Society for Promoting the Employment of Women; and National Union of Women Workers of Great Britain and Ireland, the governing body of which is the National Council of Women.

Many new organizations of women were founded in England during the war. The V. A. D. of the British Red Cross and the Order of Saint John of Jerusalem extended its work and many hospitals were opened in various parts of the country. The work on the Continent was also enormous.

The Women's Royal Naval Service, organized in 1917, has become a valuable society. The service consists of "mobile" and "immobile" women. The first could be sent anywhere; the second remained at home. The service is strict and exceedingly efficient. There are officers, chief section leaders, section leaders and ratings. The uniform is dark blue.

During the war the Women's Army Auxiliary Corps, 14,000 women, worked in direct connection with the fighting force and an additional 10,000 was called out each month. This, from its initials, was known as the "Waacs." In 1918 this Woman's Army Auxiliary Corps changed its name to Queen Mary's Army Auxiliary Corps, with the queen at the head. Large numbers were engaged in work in France. Their work consisted of every kind of employment undertaken by a soldier except actual fighting. The large majority are skilled workers. One duty is caring for the graves of those fallen in France. The Q.M.A.A.C. wears a khaki uniform. Some of its women have lost their lives in service.

The Navy, Army and Canteen Board also wears a khaki uniform. The Woman's Royal Flying Corps is an important organization. The members do not fly, but release men for duty. One section of the corps is that of motor bicycles. The Woman's Legion is expert in motor driving, which is one of its branches of work.

The Women's Land Army produced during

much of the home-grown food and r stock and barn-yard produce. Workers of the Royal Mail were also he new corps of women workers called the war. The women police have also increased. These bodies of women are nized and properly governed. Among nt societies are the Women's Service Women's Farm and Garden Union; s Reserve Ambulance Corps; and of Munition Workers' Committee.

**working-women's Clubs.**—The working-working-women's, clubs are organiza- rmed by industrial women and girls "to y co-operation means of self-improve- pportunities for social intercourse and elopment of higher, nobler aims." the most important of these are the of Associations of Women's Clubs and onal Women's Trade Union League.

**working-girls' clubs** arose out of prac- ds. They began in London. The Soho d the House of 180, the Club and Work- s' House and the Saint Giles's Evening Working Girls were among the earliest. se members many pleasures and excur- ere provided. In 1883 the movement o this country and began with the Indus- ty of Hoboken, N. J., and the Work- s' Society of 38th Street, New York, ter became the Irene Club. This move- on extended throughout the country. : cases the clubs were formed by the mselves; in others by noted club lead- church-workers. The National League en Workers, formed in Philadelphia, by the Irene Club of New York, the al Society of Hoboken, the New Cen- ld and the Saint James Guild of Phila- and the Shawmut Club of Boston, is a instance of rapid growth. In 1916 ced 120 clubs and had 15,000 members. ial publication is *The Club Worker*.

iany was early in the field with such tions. In 1865 the Berliner Lette was founded for the improvement of istrial efficiency of girls of the upper and the Universal German Women's was for the improvement of women's n and the conditions of working-w- n 1888 the Union of Progressive Wo- nions was organized, which by 1910 had ches, with 2,000 members and a paper, *Arbeiterbewegung*. In 1889 the Union of

Employees was founded, which by d 150,000 members conducting a labor loan bureau and giving free legal aid. the society *Jugendschutz* was estab- with a hygienic and an ethical propa- nd maintaining a home for working- Working-women have organized in Ger- to Socialistic Trade-Unions. Two im- ational societies were in existence at inning of the World War: one was tic and the other aristocratic. The is *Bund deutscher Frauenverein*, Dr.

Baumer its president. The member- sists of half a million women. The sec- er *Vaterländische Frauenverein* with ranches, evangelical and military, was re *Armée der Kaiser*. At the beginning var the dissemination of all instruction en in war economics was delegated to

the League of Women's Domestic Science Clubs.

In France feminism and socialism were classed together in the Revolution of 1848. The woman movement did not take root until the Second Empire, when Maria Desraisnes and Léon Richer founded in 1876 the *Société pour l'amélioration du sort de la femme*. This society was supported by Dumas fils, Victor Hugo and other men of note. In 1880 *La ligue pour le droit des femmes* was founded; in 1890 *L'Union universelle des femmes*; in 1891 *La Solidarité*; and in 1896 *Le féminisme Chrétien*. In 1909 the French Woman's Suffrage Society was organized. An organization of a different order is *L'Œuvre de la Chaussée du Maine*, founded in 1871 by Madame de Presensé to assist child victims of the war of 1871. This has developed into a vast centre of activity in all branches of child-welfare. Among other organizations are *L'Accueil Française* devoted to the children of the invalided districts; *Pupilles de la Guerre* and *Veuves de la Guerre*, which were federated during the war into one society called *L'assistance de la mère et l'enfant*. The National Council of French-women and *L'Œuvre Parisienne*, the latter founded and directed by Madame Brunds- vicq, accomplished prodigious results. The *Association des Surintendantes d'Usines* and *Infirmières visiteuses* were also organizations of far-reaching service during the war.

Among the first French women to mobilize were the members of the *Croix Rouge* (Red Cross), comprising the three great societies: *Secours aux Blessés Militaires*; *L'Union des Femmes de France*; and *L'Association des Dames Françaises*. The *Conseil National des Femmes* and the Women's suffrage unions—*Fédération Nationale*, *Alliance Nationale* and *L'Union Française*—also entered into war-work. These societies held a great meeting in the Sorbonne in 1915 and planned their work.

Conspicuous among women's organizations during the war was the Woman's Peace Party of America, which became the American Branch of the International Committee of Women for Permanent Peace. This was organized in 1 Jan. 1915, Jane Addams, chairman. During 1917 this organization maintained 200 local branches throughout the United States.

The scheme of the International Congress of Women was formulated at a small conference of women held in Amsterdam in February 1915. The result was that the Dutch women formed a committee, for an International Congress of Women to meet at The Hague. Fifteen hundred women convened there 1 May 1915, and conferred on international questions. The United States sent 47 members; Sweden, 12; Norway, 12; Italy, 1; Hungary, 9; Germany, 28; Denmark, 6; Canada, 2; Belgium, 5; Austria, 6; Great Britain, 3 and Holland 1,000. The president of the International Committee of the Congress was Jane Addams of Chicago.

The American women came forward magnificently to aid in war work. The Red Cross with its 5,000,000 members and 3,000 units produced chapter work-rooms, each of which was a little organism contributing to the whole. The National League for Woman's Service in six months drew to itself 300,000 members.

The Women's Committee of the Council of National Defense held a meeting in Washington, 1 June 1917, at which 200 national organizations of women met and outlined plans for work and service. The War Work Council of the Young Women's Christian Association; the Division of Women's War Work of the Committee on Public Information; the Stage Women's War Relief; the Council of Jewish Women; the League of Catholic Women; the Women's Land Army; the Hadessah Women's Zionist Organization for Relief Work in Palestine and the Mayor's Committee of Women in many cities and towns are among the most conspicuous of the societies produced by the war. The most important and perhaps the latest society of importance is the Woman's Council, League of Nations Association.

ESTHER SINGLETON,

Author of 'Social New York Under the Georges', 'Furniture of Our Forefathers'; 'Guide to Modern Operas'; 'A Daughter of the Revolution', etc.

**WOMEN'S CLUBS, General Federation** of, an organization incorporated in the United States, in 1892, and within a few years was composed of over 2,675 women's clubs, having a membership of 155,000 women in the United States and foreign countries. The purpose of the federation was declared in its articles of incorporation to be "to bring into communication with one another the various women's clubs throughout the world, that they may compare methods of work and become mutually helpful. Constitutions of clubs applying for membership should show that no sectarianism or political test is required, and, while the distinctively humanitarian movements may be recognized, their chief purpose is not philanthropic nor technical, but social, literary, artistic or scientific culture." Meetings of the federation are held biennially. There are now federations in all of the United States and some of the territories, and allied organizations exist throughout the civilized communities of the world. The federation in New York State is far the largest, including nearly 500 clubs and over a quarter of a million individual members. See WOMEN'S CLUBS.

**WOMEN'S HOME MISSIONARY SOCIETY.** See METHODIST CHURCHES OF THE WORLD.

**WOMEN'S RIGHTS** is the term applied to the claims, made on behalf of women, to a legal, political, educational and social status equal to that of men. The modern movement in this direction dates from about 1848, having begun in the United States. Notwithstanding the ridicule which assailed its early advocates, the claims of women have been largely recognized. As the crusade advanced, it assumed form in the Woman Suffrage (q.v.) movement.

**WONDER-WORKING MAGICIAN, The** ('*El Mágico Prodigioso*'). The superficial resemblance between Calderon's play and Goethe's 'Faust' has made this one of the best known of Spanish dramas. Goethe, who was ignorant of Calderon's play when he wrote the first part of 'Faust,' but jealous of the Spanish playwright's extraordinary popularity during the early decades of the 19th century, said with much truth and some bitterness, "it is the subject of Doctor Faust treated with incredible vulgarity" (1812). In Calderon's work, 'Cipriano,' a passionate young gentleman is distracted from the pursuit of love by his studies, but upon seeing beautiful Justina, he becomes enamored and makes a pact with the devil in order to win her. He is inspired by no yearning for knowledge or power over natural forces, but becomes simply one more of the countless victims of unbridled passion found in Spanish literature of the golden age, the immediate prototype being in the present instance Friar Giles of Mira de Mesqua's 'El Esclavo del Demonio' (1612). In 'Faust,' on the other hand, we have an old man who has lost faith in science and divine power, and makes a pact with the devil in order to obtain rejuvenation. Only the incriminating charter is common to the two plays. Calderon wrote his drama for a religious celebration in the town of Yepes, 1637. For his plot he had recourse to the legend of Saint Ciprianus and Saint Justina of Antioch, who suffered martyrdom in the early centuries of the Christian era. The

ical element is slight; and, although inclined to tell a pious tale, the play soon detaches, after the spirited opening scenes familiar to English readers by Shelley's edited rendering into a typical Spanish play of intrigue, with unpardonable concessions by way of irrelevant buffoonery to the ears of Yepes, for whose benefit, likewise, the author adopted a humbler style than when writing for the palace. Like other plays of the time, notably Calderon's 'La Vida es Sueño' and 'El Condenado por Desconfiado,' the doubtful authorship, it offered a defense of the doctrine of free will, the only weapon which no one and Iustina used successfully against the other. There are editions by Morel-Heilbronn, 1877, and by Krenkel, Leipzig, 1885. For translations see article on *Don Juan*.

MILTON A. BUCHANAN.

**WONSAN**, or **GENSAN**, Korea, one of the most important ports of the east coast, on Broughton's Bay, midway between Vladivostok and Fusan, connected by railway with Seoul and by steamers with ports in Japan, Siberia and America. It is never closed in winter. Its harbor is deep and spacious. Its superb scenery and climate make Wousan a favorite summer resort for foreigners. Gold and copper mines in the neighborhood and the agricultural products, reaching an annual value of 2,000,000, are exported through Wousan. 20,000, one-fourth being Japanese.

**WU-CHANG**, China. See **WU-CHANG**.

**WOOD, wüd, Alexander**, Scottish physician: b. Cupar, Fifeshire, 10 Dec. 1817; d. Edinburgh, 26 Feb. 1884. He was graduated from Edinburgh University with the degree of M.D. in 1841; and shortly afterward became one of the principal medical officers at the Royal College of Physicians in Edinburgh. He was one of the most eminent members of the Royal College of Physicians and Surgeons there, being president of the organization in 1858-61 and representing it in the general medical college in London. His most important contribution to the practice of medicine was the introduction and use of the hypodermic syringe for administering drugs; this he first brought into use by the publication of a pamphlet in 1855, entitled 'New Method of Treating Neuralgia: Direct Application of Opium to the Painful Points.' In addition to the pamphlet mentioned he wrote 'What is Mesmerism?' (1860); 'Smallpox in Scotland' (1860); 'Pre-ventive Education' (1868).

**WOOD, Anthony**, English antiquary and traveler: b. Oxford, 17 Dec. 1632; d. there, 17 Nov. 1695. He was educated at Merton College, Oxford, and gave his life mainly to research connected with the history of the university. His researches resulted in his 'Historical Antiquities of the University of Oxford' (1674). It was written in English; but it was thought proper that it should appear in French for the information of foreigners, and was translated into that language under the direction of Dr. Fell, dean of Christ Church, and published at the Oxford Press, as 'Historia Antiquitates Universitatis Oxoniensis.' The 'Survey of the Antiquities of the City of Oxford' was edited by Clark in 1889-99.

In 1691-92 appeared his 'Athenæ Oxonienses,' an account in English of the writers and bishops educated at Oxford from 1500 to 1690, but for his criticisms of the Earl of Clarendon in this work he was expelled from Oxford. The English edition of his first work, first published by John Gutch, appeared as 'History and Antiquities of the Colleges and Halls in the University of Oxford' (1786-90) and 'History and Antiquities of the University of Oxford' (1792-96). The Oxford Historical Society published an edition of his autobiography and diaries by Andrew Clark in 1891-1901. Many of Wood's original manuscripts, his diaries and much of his correspondence are to be found in the Bodleian Library.

**WOOD, De Volson**, American engineer: b. Smyrna, N. Y., 1 June 1832; d. Hoboken, N. J., 27 June 1897. He was graduated from the Rensselaer Polytechnic Institute, Troy, N. Y., in 1857, was professor of civil engineering in the University of Michigan 1857-72, professor of mathematics in the Stevens Institute of Technology at Hoboken 1872-85 and from the last-named date professor of engineering there. Among valuable inventions by him may be mentioned a steam pump, pneumatic rock drill and an air compressor. He published 'Resistance of Materials' (1871; 7th ed. 1897); 'Bridges and Roofs' (1873; 2d ed. 1880); 'Co-ordinate Geometry' (1879); 'Reaction Motors'; 'Thermodynamics' (1887; rev. ed. 1905); 'Turbines, Theoretical and Practical' (1896).

**WOOD, Edmund Burke**, Canadian jurist and legislator: b. near Fort Erie, Ontario, 13 Feb. 1820; d. Winnipeg, 7 Oct. 1882. He was graduated at Oberlin College in 1848 and was called to the bar of Upper Canada in 1853. He served in the legislative assembly in 1863-67, and after the Canadian confederation he served in both the Ontario legislature and the Canadian House of Commons, a dual representation being then permitted. He was Provincial Treasurer in the Macdonald administration in 1867-71. He resigned his seat in the Ontario legislature in 1873 and was returned to the Canadian House of Commons. In 1874-82 he was chief justice of Manitoba.

**WOOD, Edward Stickney**, American chemist: b. Cambridge, Mass., 28 April 1846; d. Pocasset, Mass., 11 July 1905. He was graduated from Harvard in 1867 and obtained his medical degree in 1871. He was assistant professor of chemistry in the Merical School 1871-76, and full professor there from 1876. He published a translation of Neubauer and Vogel's 'Analysis of Urine' (1879); and was an expert on all matters relating to poisons. After 1873 he was chemist of the Massachusetts General Hospital. In 1880 he was a member of the Committee of Revision of the United States Pharmacopœia.

**WOOD, Eleazer Derby**, American soldier: b. New York, 1783; d. Fort Erie, Ont., 13 Sept. 1814. He was graduated from West Point in 1806 and in the second war with England conducted the defense of Fort Meigs in 1813, and was brevetted major for gallantry. He participated in the battle of Niagara or Lundy's Lane, 26 July 1814, and was brevetted lieutenant-colonel. In the sortie of 13 September he fell

at the head of his command. A monument to his memory was erected at West Point.

**WOOD, Ellen Price**, English novelist, best known as Mrs. HENRY WOOD: b. Worcester, 17 Jan. 1814; d. London, 10 Feb. 1887. In 1836 she married Henry Wood, a member of a banking and shipping firm, and from then till 1856 lived in France. She began her literary career by contributing to *Bentley's Miscellany* and the *New Monthly Magazine*, and in the ingenuity of her plots excelled all her English contemporaries. In 1867 she became editor and proprietor of the *Argosy* magazine. Her books are not sensational, in the ordinary acceptance of the term, and display beside remarkable constructive skill, not a little keen character drawing and descriptive power. They have been widely circulated both in this country and England, and among them are 'East Lynne' (1861), which has had an enormous success both as a book and a drama, and still continues to be popular; 'Mrs. Halliburton's Troubles' (1862); 'The Channings,' which is a most entertaining study of schoolboy life (1862); 'The Shadow of Ashlydyat' (1863); 'A Life's Secret' (1867); 'Roland Yorke' (1869), a continuation of 'The Channings'; 'Dene Hollow' (1871); 'Within the Maze' (1872); 'Edina' (1876); 'Pomeroy Abbey' (1878); 'Court Netherleigh' (1881); 'The House of Halliwell' (1890); and the 'Johnnie Ludlow Stories' (1874-80). Consult 'Memorials' by her son (1894).

**WOOD, Sir Evelyn**, English general: b. Cressing, Essex, 9 Feb. 1838; d. 2 Dec. 1919. He was educated at Marlborough College and joined the navy in 1852. During the Crimean War he served in the Naval Brigade and was severely wounded while carrying a scaling ladder to the Redan. In 1855 he entered the army as coronet, in 1858 served in India as a brigade-major and received the Victoria Cross for conspicuous valor, December 1859. In 1873 he served in the Ashantee War, and on his return from this campaign was called to the bar at the Middle Temple (1874). He served in the Zulu War of 1879 and was promoted to the rank of brigadier-general after his victory at Kambula. He was second in command of the British forces in the brief Transvaal War of 1881, and in 1882 went to Egypt as commander-in-chief or sirdar. In 1893 he became quartermaster-general to the forces, and held that position until his appointment in 1897 to the office of adjutant-general. He published 'The Crimea in 1854' (1894); 'Cavalry at Waterloo' (1896); 'Cavalry Achievements' (1906); 'The Revolt in Hindustan' (1908); 'Our Fighting Services' (1916); 'Winnowed Memories' (1917). Consult 'Life' by Williams (1892).

**WOOD, Fernando**, American politician: b. Philadelphia, 14 June 1812; d. Washington, D. C., 14 Feb. 1881. In 1820 he removed to New York, where he was educated, and entered business as a shipping merchant. He early became identified with political organizations and was active as campaign writer and orator. He was elected to Congress in 1840 on the Democratic ticket, serving one term. In 1850 he retired from business and in that year was the Tammany candidate for mayor of New York, but was defeated. As candidate of the

same organization in 1854 he was elected mayor of New York; introduced various reforms and was re-elected in 1856 almost without opposition. Discussion in the organization led him and his followers to form a rival body called Mozart Hall. He was the unsuccessful candidate for mayor of this organization in 1858, but in 1860 was a third time elected mayor in opposition to both Republican and Tammany candidates. In 1861, when secession was under discussion, he recommended that New York should secede and become an independent city. He served in Congress in 1863-65 and 1867-77.

**WOOD, Francis Carter**, American pathologist: b. Columbus, Ohio, 30 Dec. 1869. He was graduated at the Ohio State University in 1891, at the College of Physicians and Surgeons, Columbia University, in 1894, and later studied at the universities of Berlin and Vienna. He established himself in practice in New York and became pathologist and attending physician at Saint Luke's Hospital. He was professor of clinical medicine at Columbia University in 1906-12; and since 1912 he has been professor and director of cancer research under the George Crocker Special Research Fund at Columbia. He is also connected with the leading New York hospitals. Besides many medical papers he is author of 'Clinical Diagnosis' (1899); 'Chemical and Microscopical Diagnosis' (1905).

**WOOD, George Bacon**, American physician: b. Greenwich, N. J., 13 March 1797; d. Philadelphia, Pa., 30 March 1879. He was graduated from the University of Pennsylvania in 1815 and from its medical department in 1818, and was professor of chemistry at the Philadelphia College of Pharmacy 1822-31, and of materia medica there 1831-35. He held the chair of materia medica at the University of Pennsylvania 1835-50, and of the theory and practice of medicine there 1850-60, endowing an auxiliary faculty of medicine in the university in 1865. He published 'Treatise on the Practice of Medicine' (1847); 'Therapeutics and Pharmacology' (1856); and with Franklin Bache prepared 'The Dispensatory of the United States' (1833; 17th ed. 1894).

**WOOD, Mrs. Henry**. See WOOD, ELLEN PRICE.

**WOOD, Henry A. (Alexander) Wise**, American inventor, son of Fernando Wood (q.v.): b. New York, 1 March 1866. He made a large number of inventions of use in the printing trade, most important of which is the autophote, a machine for making plates for newspaper use, which formerly were made by hand. He has the record of taking out more patents on printing press machinery than any other inventor and is president of the Wood Newspaper Machinery Corporation. He early interested himself in aeronautical engineering, was vice-president of the Aero Club of America, and president of the American Society of Aeronautical Engineers. In 1915 he was appointed to the Naval Consulting Board, but later resigned. He was chairman of the conference committee on National Preparedness, and a supporter of Roosevelt for the presidential nomination in 1916. He is editor of *Flying*, and author of 'Fancies,' poems (1903); 'The Book of Symbols,' poems (1904); 'The Money Hunger' (1908).

**WOOD, Horatio Curtis**, American physiologist. Philadelphia, Pa., 13 Jan. 1841. He graduated in medicine from the University of Pennsylvania in 1862, and was professor of anatomy there 1866-76, and clinical professor of anatomy of the nervous system from 1875 to 1897, and professor of therapeutics 1876-1907, and later emeritus professor of therapeutics. In addition to many professional papers he is the author of 'Thermic Fever' (1872); 'Materia Medica and Therapeutics' (1874); 11th to 13th editions rev. with son, Horatio Charles Wood, 'Therapeutics, Its Principles and Practice,' (1875); 'A Study of Fever' (1875); 'Nervous Diseases and their Diagnosis' (1887); 'Syphilis and its Nervous System' (1889).

**WOOD, Irving Francis**, American bibliographer and educator: b. Walton, N. Y., 27 Feb. 1861. He was graduated at Hamilton College in 1885, at Yale University in 1892, and received the degree of Ph.D. at the University of Chicago in 1902. He taught at Jaffna College, Ceylon, in 1885-89; was appointed professor of English and biblical literature at Smith College, Northampton, Mass., and now holds the chair of biblical criticism and comparative religion there. He is the author of 'The Bible Story' (5 vols., 1885); 'The Days of the Kings of Israel' (1887); 'The Bible as Literature' (1914); and of 'The Spirit of God in Biblical Literature—A Study in the History of Religion' (1911); 'Adult Class Study' (1911).

**WOOD, James Frederick**, American Roman Catholic prelate: b. Philadelphia, Pa., 27 Feb. 1813; d. there, 20 June 1883. He was educated in England and on returning to the United States entered the banking business. In 1838 he went to Rome to study for the priesthood after his ordination in 1844 became an assistant rector of the cathedral at Cincinnati, and afterward pastor of Saint Patrick's Church, Philadelphia. He became bishop of Philadelphia, where he completed the magnificent cathedral in Logan Square. He also established at Overbrook the parish of Saint Charles Borromeo. He was elevated to archbishop in 1875. He was especially noted for the introduction of political issues from other countries to the United States.

**WOOD, John George**, English naturalist and Anglican clergyman: b. London, 21 July 1811. Coventry, Warwickshire, 3 March 1889. He was graduated from Merton College, Oxford in 1848, and took orders in the English Church. In 1856-62 he was chaplain to Saint Thomas's Hospital, in 1858-63 a reader at the Church, Newgate Street, and for seven years from 1869 conducted the festivals of the Diocesan Choral Union. During his life he delivered numerous lectures on natural history in Great Britain and America. His numerous works contributed very greatly to popularize natural history. Among them are 'Illustrated Natural History' (1851); 'The History of the Earth' (1853); 'Common Objects of the Sea' (1857); 'Common Objects of the Countryside' (1858); Routledge's 'Illustrated Natural History' (1859-63), his most important work; 'Common Objects of the Microscope' (1861); 'Garden Friends and Foes' (1863); 'The Sea Without Hands' (1864-65); 'Common Objects of the Sea-Shore' (1865); 'Fresh and Salt Water Aquarium' (1868); 'Natural History of Man' (1868-70); 'Bible Animals'

(1869-71); 'Insects at Home' (1871-72); 'Insects Abroad' (1874); 'Man and Beast: Here and Hereafter' (1874); 'Field Naturalist's Handbook' (1879-80); 'Half-Hours in Field and Forest' (1884); 'Half-Hours with a Naturalist' (1885); 'Romance of Animal Life' (1887). Consult 'Life' by his son the Rev. T. Wood (London 1890).

**WOOD, John Seymour**, American lawyer: b. Utica, N. Y., 1 Oct. 1853. He was graduated at Yale in 1874 and at Columbia Law School, 1876. He was editor of the *Bachelor of Arts Magazine* (1896-98), and has published 'Gramercy Park: A Story of New York' (1892); 'A Daughter of Venice' (1892); 'College Days' (1895); 'A Coign of Vantage' (1896); 'Yale Yarns' (1897); 'An Old Beau, and Other Stories'; 'A Nippon Garden' (1915)

**WOOD, Leonard**, American soldier and administrator: b. Winchester, N. H., 9 Oct. 1860. He was graduated at the Harvard Medical School in 1884, and in 1885 became a contract-surgeon in the United States army. In 1886, as first lieutenant and assistant surgeon, he served in the campaign against Geronimo and was awarded a medal of honor for his services. In 1898, when the war with Spain began, he received authority to raise and was commissioned as colonel of the first volunteer cavalry, commonly known as the "Rough Riders." Theodore Roosevelt was lieutenant-colonel of this regiment and succeeded to its command on General Wood's promotion. Colonel Wood commanded the regiment at Las Guasimas and the second cavalry brigade consisting of the first volunteer cavalry (Rough Riders) and the first and tenth regular regiments of cavalry at San Juan Hill. On 8 July 1898, he was, on the recommendation of his superiors, appointed brigadier-general of volunteers for services at San Juan and Las Guasimas. On the surrender of the city of Santiago, he was appointed governor of the captured city and later, on the relief of General Lawton, he was made governor of all the captured territory embracing the eastern portion of Cuba, including the province of Puerto Principe and Santiago. On 7 Dec. 1898, he was appointed a major-general of volunteers in recognition of his services as governor of the captured territory. On 13 April 1899 he was mustered out as major-general of volunteers and reappointed on the same day as brigadier-general of volunteers and continued in this grade until 5 Dec. 1899, when he was again appointed as major-general of volunteers and designated to relieve Maj.-Gen. John R. Brooke as military governor of Cuba. General Wood continued in this capacity until his transfer as an organized republic to the duly elected Cuban government through its representative, Thomas Estrada Palma, the duly elected president.

During this period of reorganization school laws were written, sanitary regulations were enforced throughout the island, laws of public works and charities were revised and rewritten, an entirely new railroad law was prepared and put in force and most extensive judicial reforms accomplished. Especially great attention was given to sanitation, schools and courts. It was under General Wood's supervision that Maj. Walter Reed and his assistants, Doctors Carroll and Lazear of the medical department, conducted the great work which led to the dis-

covery of the means of transmitting yellow fever and consequently of its control. The death rate of the island was greatly reduced and the system of public education established proved to be admirable.

On 4 Feb. 1901, General Wood was appointed a brigadier-general of the regular army. During his incumbency of the office of military governor of Cuba, the post-office cases occurred which led to the indictment, trial and conviction of Rathbone and others and incidentally, through their friends, resulted in an effort to defeat General Wood's confirmation as major-general. He was, however, confirmed by an overwhelming majority, 8 Aug. 1903. In the fall of 1902 he was one of the representatives of the United States government at the Imperial German manoeuvres. In March 1903, at his own request, he was detailed for duty in the Philippine Islands and continued in foreign service until November 1908. While there, he was in command of the Department of Mindanou and the first civil governor of the newly organized Moro province, which included the Mohammedan section of the Philippine Islands. After numerous campaigns he was successful in quelling the organized opposition to occupation by the United States. He later received the assignment of commanding general of the Philippine division, which position he held until relieved from duty in the islands. On his return to the United States, he was assigned to the command of the Eastern Department, which command he exercised until his detail as chief of staff, United States army, 22 April 1910. In the same year, he was designated special Ambassador of the United States to the Argentine Republic, on the occasion of the celebration of the 100th anniversary of that country's independence. Upon completion of his duties as chief of staff (1914), he was reassigned to the command of the Eastern Department, which he held until 1917, when he was appointed in command of the southeastern department, a subdivision of his old command. In 1908 General Wood began his vigorous work on preparedness and pushed it through the length and breadth of the land on all possible occasions. The work was advanced with increasing vigor from year to year and reached its climax in 1913, with the establishment of the training camps of Plattsburgh. While in command of the Southeastern Department, General Wood selected 12 of the National army cantonments for the training of the National army.

While at Camp Funston General Wood organized and trained the 89th division and later on the 10th regular division, with a number of pioneer regiments and special organizations. He was sent overseas on a tour of observation, was quite seriously wounded, was in a French military hospital for some weeks and returned to the front and completed his tour of observation. When the 89th division was ordered to the front General Wood accompanied it to the sea and was there relieved and sent back to Camp Funston, where he organized and trained the 10th regular division and was in command of it at the time of the armistice.

The degree of LL.D. was given General Wood by Harvard University (1899); Williams College (1902); Pennsylvania (1903); Princeton (1916); University of the South and University of Georgia (1917); University of Michi-

gan (1918); Union College, New York, and Wesleyan, Connecticut (1919). He received the degree of Doctor of Military Science from Norwich University and from Pennsylvania Military College (1912). General Wood holds a Congressional Medal of Honor (Geronimo campaign); is fellow of the Royal Geographical Society; member of the Society of the Cincinnati; the Society of Colonial Wars, Sons of the Revolution, Foreign Wars, Indian Wars, and of the Spanish-American War. He is fellow of the Academy of Sciences of Havana and Governor-General of the Mayflower Society of the United States. When he represented the United States at the German manoeuvres in 1902 and the French and German manoeuvres in 1908, he was named Grand Officer of the Legion of Honor, permission to accept which distinction was withheld by the United States. Authority to wear this decoration was granted subsequently in the general order which authorized American officers to wear foreign decorations. Besides numerous magazine articles on preparedness, General Wood is the author of 'The Military Obligation of Citizenship' (1915); 'Our Military History' (1916); 'National Defense' (1917); and 'Universal Military Training' (1917). Consult Bangs, J. K., 'United States Trustee'; 'Cuba: Civil Report of General Wood' (1901); 'The Military Government of Cuba' (in 'Annals of the American Academy of Political and Social Science', Vol. XXI, No. 2, 1903); Baker, 'General Leonard Wood' (in *McClure's*, Vol. XIV, pp. 308-79, 1900); 'The Case of General Wood' (in *the Outlook*, 2 Jan. 1904); 'The Amazing Case of General Wood' (in *Scientific American*, 15 June 1918); 'The Removal of Maj.-Gen. Leonard Wood' (ib. 14 April 1917); 'Comment over the Treatment of General Leonard Wood' (*Current Opinion*, July 1918); and Marcasson, T. F., 'Leonard Wood, Prophet of Preparedness' (1917); 'The Career of Leonard Wood' (1919).

**WOOD, Robert Williams**, American physicist. b. Concord, Mass., 2 May 1868. He was graduated at Harvard University in 1891, studied at Johns Hopkins University in 1891-92, and at the University of Berlin in 1892-94. He was connected with the faculty of the University of Wisconsin in 1897-1901; and since 1901 has been professor of experimental physics at Johns Hopkins University. He was appointed major in the Officers' Reserve Corps in August 1917, and was later engaged in scientific service in France. He was the originator in 1898 of the electrical method of thawing frozen water mains and service pipes; has made important researches in the theory of light, for which he was awarded the Rumford medal of the American Academy of Arts and Sciences; and for his work in color photography he received medals from the London Society of Arts in 1904, the Franklin Institute in 1907, and the Dresden International Exhibition in 1909. He is joint author with A. C. Train of 'The Man Who Rocked the Earth' (1915); and author of 'Physical Optics' (1905; rev. ed., 1915); and of two books of humorous verse, 'How to Tell the Birds from the Flowers' (1907); 'Animal Analogues' (1908).

**WOOD, Thomas John**, American soldier. b. Munfordville, Ky., 25 Sept. 1823; d. Day-

MAJOR-GENERAL LEONARD WOOD

), 25 Feb. 1906. He was graduated at West Point in 1845, served under General Taylor in the Mexican War and was on frontier duty in Texas 1849-55. At the outbreak of the Civil War he was promoted lieutenant-colonel in the Federal army and later brigadier-general of volunteers. He commanded a division at Vicksburg and Corinth and also at Chickasaw and Missionary Ridge, and for gallantry at the latter engagement was brevetted brigadier-general. He commanded the Fourth corps at Vicksburg and for his services there was promoted major-general in 1865. In June 1868 he retired from the service.

**WOOD, Thomas Waterman**, American painter: b. Montpelier, Vt., 12 Nov. 1823; d. New York, N. Y., 1903. He studied art in Boston in 1841, afterward continuing his studies in Europe. In 1845 at Düsseldorf he was the pupil of Hans Schinkel. He was well known as a portrait painter and for several years traveled about the country. He finally settled in New York City in 1850. After removing to New York Mr. Wood devoted himself almost entirely to genre painting in which he chose familiar subjects from daily life. He became a member of the National Academy in 1871, and from 1878-87 was president of the American Water Color Society.

He was president of the National Academy of Design from 1891 to 1899. He also was one of the founders of the New York Club, and was a regular contributor to art exhibitions, most of his etching being of his own paintings. Three of Mr. Wood's paintings, 'The Contraband,' 'Recruit' and 'The Soldier,' exhibited at the Academy of Design in 1867, now are among the pictures at the Metropolitan Museum of Art. Many of his paintings are in the Chamber of Commerce collection. During the last decade of his life Mr. Wood visited Europe three times, copying the works of masters in London, Paris, Saint Petersburg and Rome, giving especial attention to Rembrandt and Murillo. With these copies and original works of his own he founded the Metropolitan Museum in his native town.

**WOOD, Walter**, English author: b. Bradbury, Wiltshire, 10 March 1806. He was for 10 years attached to the staff of the *Daily Observer* and has published 'The Battle of Waterloo' (1819); 'Famous Battles and Their Commanders' (1821); 'With the Flag at Sea' (1821); 'Wellington's Campaigns' (1822); 'The Roar of the Cannon at the Corner of Spain'; 'In Line of

Court in 1636, and afterward (1637) at Sandwich, of which he became town-clerk. In 1634 he published in London 'New England's Prospect,' the first printed account of Massachusetts. The perfect copies extant contain a map of the region. The prose narrative is interspersed with rime descriptions of natural history. This curious work was reprinted in 1764 (Boston) and 1865 (also Boston; Prince Society).

**WOOD, William Charles Henry**, Canadian historian: b. Quebec, 7 June 1864. He was educated in England and in Germany, entered the Canadian militia in 1887, and in 1907 became lieutenant-colonel of the Eighth regiment, Royal Rifles. In 1917 he was appointed coordinating officer of the Canadian Special Mission at the Naval and Military Fronts, with rank of lieutenant-colonel in the Officers' Reserve. He has written 'The Fight for Canada' (1904); 'Logs of the Conquest of Canada' (1909); 'One Sea, One Fleet and Canada' (1910); 'Wolfe' (1912); 'In the Heart of Old Canada' (1913); 'The Passing of New France' (1914); 'Select British Documents of the War of 1812' (3 vols., 1915); 'Laurenciana: Lands and Waters of the Maritime Saint Lawrence' (1918).

**WOOD.** Wood is a more or less compact tissue which constitutes the part of the trunks, branches and roots of arborescent vegetable growth, lying between the bark and the soft sapwood next the bark, and the pith at the centre. The word "wood" is derived from the Anglo-Saxon *wudu*, a tree. The outer layers, or sapwood, are called the alburnum. The inner solid wood is called the duramen. Timber is wood large enough for architectural uses, such as boards, planks, beams. The term hardwood is applied to such woods as mahogany and oak where the cells have thick walls and are closely packed together. Soft wood has large cells and thin cell walls, such as white pine, cedar, poplar. It would seem in this century that wood is losing its importance as a material of construction. For framing, iron and steel seem to have dethroned wood; and even in furniture, iron has taken the place of wood in certain parts. The wooden stagings and centrings with which the stone and iron structures are erected are almost as interesting as the structures themselves. Wood is elastic, comes back into place and is easily worked. Wood is not imperishable, neither is iron. One reason why wood is being used so little in construction is because it is not employed in a natural way; instead of leaving it natural, it is covered with plaster; often wood is used green when it should be seasoned. A practical way of getting at the quality of wood is to find its price in the market. For example, oak which would sell at a low price would be good enough for the best floor, while oak for furniture would be sold for half as much more.

The principal countries where wood has been generally used as building material are the United States, Switzerland, Norway and Japan. The chalets of Switzerland with their big overhanging roofs and flat balustrades with jigsawed patterns, are well known. The wooden construction of Norway and Sweden has some resemblance to these. The Japanese wooden houses and temples are unique and show their artistic development. Vitruvius describes the woodwork of ancient Rome, but nearly all

**WOOD, Walter Abbot**, American inventor: b. Wrentham, N. H., 23 Oct. 1815; d. Hoosick, N. Y., 15 Jan. 1892. Having early given attention to the improvement of farming machines, he in 1850 introduced the Mauney mowing machine with original improvements. He succeeded in improving mowers and reapers and 384 disposed of 48,300 machines. His designs were covered by about 30 patents, and he was awarded first prizes at the World's Fair in Paris in 1867, in Vienna in 1873, in Philadelphia in 1876 and in Paris in 1878.

**WOOD, William**, English colonist in America: b. Sandwich, Mass., 1639. He came to America in 1629, returned to England in 1633, but not long after again sailed for Massachusetts, where he settled first at Sandwich, which he represented in the General

traces of it have disappeared. Caesar's bridge is well known to all students. The huge concrete and stone buildings of the Roman empire were built on wooden centring, which was as carefully constructed as if it were to be permanent itself. The half-timber work of the Middle Ages where the framing was made of heavy timbers was filled in between with plaster, making a very solid permanent construction. The ceilings of the churches of the Middle Ages were frequently worked out in timber, and many of the Gothic churches had timber roofs, which followed out the feeling of the Gothic style. The shingle architecture of the modern American country house, the old colonial buildings and the still earlier log cabins

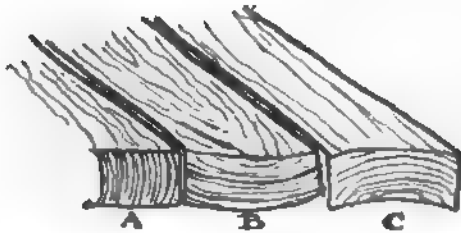

FIG. 1

are good examples of what can be done with wood construction. The defects of timber are caused by splitting, knots, rot, sap-wood and warping. Timber should have a straight grain, should be well seasoned, and if not weather-seasoned, should be kiln-dried.

The development of the modern system of wood framing resembles strikingly the still more recent American methods of steel construction, as both are a veneer on a simple framework. Neither the country house nor the office building expresses its constructive features on the exterior. This, of course, has an economic cause: it is much easier to start the rough carpentry with the sill when the mason has completed his wall and carry out all the rough framing and boarding with the knowledge that none will show as finished work; all the effort will tend to rapidity and strength. The exterior is then covered with shingles or clapboards, and the interior with lathing and plastering, leaving a finished plaster surface. Then follows the "joiner" or carpenter for the finished interior work, which is put in after the plastering is dry, and therefore is entirely separate in time and character from the rough framing.

**Defects in Timber.**—It is very important to remove the sap-wood with care, for it constitutes a soft, spongy mass, containing fermentable sap and allowing dampness to penetrate very easily; rot develops and worms appear, and from the sap-wood, go through the whole substance. Lumber is piled or "stuck" after it is sawed with small sticks of wood between the pieces to allow a circulation of air, and allowed to remain for several months. For interior finish, the wood is generally seasoned by artificial means, that is, "kiln-dried." The pieces are put in a room heated by steam to a temperature of about 150° F. and allowed to remain for several days or weeks until thoroughly dry.

**Preservation of Timber.**—Up to the present time the greatest attention has been given to

the preservation of railroad ties. The principal processes are those where either creosote or zinc chloride is used. Sometimes a combination is employed. All French and English ties use the creosote process, which gives them a life of 20 to 25 years. A recommended combination is 38 per cent dead oil of coal tar, 60 per cent resin melted, 2 per cent formaldehyde. Inject this after raising the timber to 250° F.

**Quarter-sawing.**—This term is applied to a log cut lengthwise into quarters, so that the quarters can be cut into boards parallel to the radius of 45 degrees between these cuts. These sections are so nearly in the plane of the medullary rays that they show the best grain, especially in oak, and boards cut in this way are less likely to warp and show little shrinkage. Often the grain of wood which renders it weak will give a good effect for paneling or veneering. In Fig. 1, plank A is quarter-sawn and will lie flat and will not splinter; plank B is poorly cut, being taken from one side of the log, as in Fig. 2, A. If the first board were

FIG. 2

taken directly through the centre of the log and the others parallel or perpendicular to it the grain would lie nearly parallel with the medullary rays as shown at B (Fig. 2). In Fig. 1, plank B is poorly laid and would stand much better if laid with the heart or hollow side down, as in Fig. 1, C.

**Framing.**—From the period of the first settlement of America, the cheapness of wood has made it the popular building material. The log-cabin was built of the logs cut when the early settlers cleared the land. Two sides were adzed off and the ends of the logs were notched so as to fit closely at the corners. The cracks were filled in with mud and the roof framed with small roughly-worked rafters which were covered with split shingles. The advent of the saw-mill soon brought into use "dimension" lumber, rectangular in section, to be set so that its broadest side would take the strain. For example, two-inch by eight-inch floorings 12 inches or 16 inches apart and strongly braced or "bridged" by small pieces nailed in between took the place of 10-inch by 10-inch timbers which spanned the same space at greater intervals but necessitated the use of much more timber on account of their own size and also because of the larger amount of timber necessary for filling in between. This evolution has brought us to two methods of wood construction, the "full frame" and "balloon framing," the latter being used for small buildings, such as ordinary dwelling-houses only.

**Northern Pine (rare)** (*Pinus sylvestris*) is also called Norway pine and Scotch fir, and is known in Great Britain as red or yellow deal. It is found in the northern parts of Europe, especially in Scandinavia on the mountains where there are large forests of these trees. Its color is warm with reddish tones. When first cut it is very resinous. It is one of the

COURTESY, THE U.S. FOREST SERVICE

**TYPICAL GRAINS**

US WOODS

ful pine woods and is strong, durable and easily worked. Its timber, which is used in civil and naval architecture, is exported to Norway, Sweden, Prussia and Russia.

**Red Pine** (*Pinus resinosa*).—This is sometimes called Norway pine. It is the name of red pine from the color of the bark. The trees are found throughout the United States but the best red pine is found in the northern parts of Wisconsin and Minnesota. The trees are sometimes 140 feet high. It is tough, and has but few knots. It is used in the construction of all kinds, flooring, pil-

**White Pine** (*Pinus strobus*).—Also called white pine after Lord Weymouth, who introduced it first in England in 1703. The trees are found in large forests in Canada and in the northern parts of the United States. The wood is soft and easily worked, of a straight grain, of a light color and has but few knots. The tree is very tall and impressive, reaching sometimes 200 feet in height. It was formerly the most extensively used soft wood in America.

**Short Pine** (*Pinus mitis*) is also called short pine, to distinguish it from the long pine of Georgia. It is a native of the southern and Southern States. West of the Mississippi its hard fine grained wood is made into lumber, but the timber is not so large as the Georgia pine.

**Georgia Pine** (*Pinus palustris*), known as Georgia pine and as the turpentine tree. Its wood is coarse and owing to the presence of so much resin it is extremely difficult to work.

The wood is used for coarse lumber, heavy timber, and for obtaining turpentine.

**White Spruce** (*Picea excelsa*) is a tree of great height, often growing as high as 150 feet, and is a native of the northern parts of Europe and Asia. Its branches grow close to the ground as do all firs. This is a very hard wood, which makes it difficult to cut. It is used nevertheless for posts, spars, boards, etc. Large quantities are imported from Russian ports and some of the stock comes from Christiania.

**Black Spruce** (*Picea nigra*), or black spruce, resembles the Norway spruce except in its color is grayer and colder. It grows from 50 to 70 feet in height and is found in America and northern parts of the States. Its wood is light and strong and is much used in shipbuilding, and general framing.

**Cedar**, an evergreen tree of the coniferous class, its wood is soft and of a reddish brown color and sometimes has a very fragrant odor. It is used for chests and cigar boxes. There are several known species of cedar. The cedar of Lebanon is noted, of which there still remains a grove of some 400 trees.

**Yellow Wood** (*Tilia americana*).—This wood is the American Linden or lime tree; it is also called yellow wood. It is a yellow ochre in color and is easily grained. It does not wear very well and is polished easily.

**Whitewood** (*Liriodendron tulipifera*)—the whitish timber of the tulip tree, the American basswood and Guiana plum trees, in the Middle States. Its wood is of a gray color, very soft and of a smooth grain. It is used largely for sheathing. It is native to New York and Philadelphia.

**Birch American** (*Betula lutea*), called also yellow birch. This tree has a smooth outer bark, close grain, moderately hard wood and is used for making furniture, for fuel and other purposes. The oil from its bark is used to give Russia leather its odor.

**Ebony** (*Diospyros ebenacea*) is the name given to a wood of a very dark color. It is very hard and heavy and often jet black and sinks if put into water. It takes a fine polish and is much used for high class cabinets, toilet sets, inlaying, making flutes, etc. It is a native of the flat parts of Ceylon. Its usual color is black, but the variety in Jamaica is green.

**Beech** (*Fagus*) is a large straight tree with beautiful thick foliage. Its height is from 50 to 70 feet. The bark has a smooth, hard surface and is blue gray in color. Beech is not much used for building work, for it is not durable except when very wet or very dry. It warps but little and its hardness makes it well fitted for making a great variety of tools and for cabinet work.

**Oregon Pine** (*Pseudotsuga taxifolia*), known also as Oregon fir, Nootka fir and Douglas pine. Large forests of these trees grow in the western part of the United States and Alaska.

The following are the various kinds of lumber which are used for different purposes:

**Piles**.—Oak, elm, beech, spruce. Posts set in the ground, hemlock, acacia.

**Strong Construction**.—Oak, teak, yellow or Georgia pine. Available in damp situations, oak, beech, elm, acacia, alder, chestnut. For large timbers, Oregon pine, Georgia pine, oak, bay mahogany, chestnut.

**Floors**.—Oak, maple, birch, beech and rift sawn Georgia pine are the best floors for hard wear; North Carolina pine for cheaper floors, and spruce floors where they are to be covered or painted. Oak, hard pine, teak will wear the longest.

**Interior Finish and Panels**.—Cypress, North Carolina pine, oak, mahogany, sycamore.

**Window Sills**.—Oak, white pine, mahogany.

**Stair Treads**.—Oak, hard pine, teak. For school interior finish, ash, hard pine, North Carolina pine.

The wood products of American forests, as shown in the last United States Industrial Census were worth \$715,310,333.

Architect, Boston, Mass.

**WOOD ALCOHOL, WOOD NAPHTHA, WOOD SPIRIT,** etc. See ALCOHOL.

**WOOD-BORING BEETLES,** beetles which lay their eggs in or upon wood, into which the larvæ begin to bore immediately after hatching and from which they derive their sole sustenance. Living upon this innutritious substance their growth is generally slow, and by the end of the several years spent in the larval condition they have often excavated extensive galleries which increase in diameter as the larvæ grow. The larvæ of many beetles feed upon dead or decaying wood only, and many of these may be considered useful to man, as they assist in reducing stumps and fallen limbs to a condition of vegetable mold. Others confine their attacks to the bark and are seldom serious pests. Many species bore into sound wood either in the standing growing tree, in the dressed lumber, or even in the finished house or article of furniture. Such often commit incalculable damage. The families *Cerambycidae* and *Buprestidae* are notorious as comprising species almost exclusively of wood-boring habits, and those whose larvæ do not excavate wood burrow into roots or soft plant tissues. The *Cerambycidae* (q.v.), or longicorn beetles, include one of our largest beetles, the broad-necked prionus (*Prionus laticollis*), which reaches a length of nearly two inches and is unusually robust for the family; it is of a deep brown-black color, and the jaws are exceedingly stout. The great white larvæ are two or three inches long and bore into the roots of forest and orchard trees and blackberry plants. The latter are quickly killed and even large trees will succumb if the borers are abundant. They live three years. The apple-tree borer (*Saperda candida*) in the beetle state is brown with a conspicuous white stripe running the entire length of the body on each side above. It flies mostly at night during the early summer months and lays its eggs on the trunks of apple, quince and pear trees near the ground. The larva is cylindrical and very strongly annulated and when fully grown is an inch long. It lives three years, the first one being spent in the sap-wood, the others in the interior of the trunk. Its attacks are frequently fatal and the only effective measures are preventives. A strip of tin or wire gauge nailed to the tree trunk from the ground to a height of two feet will prevent most of the females from depositing their eggs. Another exceedingly serious pest is the locust-tree borer (*Cylleus robiniae*) which has habits similar to the last and which often riddles the trunks of locust-trees with its burrows, killing them in a few years. The beetles are very pretty, being dark velvety brown, with angulated cross-lines of yellow. They abound during the early autumn and feed upon the pollen of the goldenrods. Numerous closely related species attack other hardwood trees. A peculiar habit is possessed by the twig-girdler (*Oncideres cingulatus*) which in order to provide its larvæ with the dead wood upon which they feed cuts a deep circular trench around the twigs of hickory and other forest trees below the point at which its eggs have been deposited. The twig dies, falls to the ground and the larva completes its span of life in security.

The species of *Buprestidae* (q.v.) differ

greatly in appearance from the longicornus, but have similar habits. The larvæ are distinguishable by the greatly expanded prothoracic ring immediately following the head, which is very small and retractile. They are always footless. Although the buprestids nearly equal the longicornus in number of species, and exceed them in variety of forms those in our fauna are smaller and because of their plainer colors, much less conspicuous. Many of the tropical species, however, are of great size and brilliant colors and some of their larvæ, which may exceed four inches in length, are eaten. A species very injurious to pear orchards is the sinuate borer (*Agrius sinuatus*) whose extensive winding galleries in the cambium layer often almost completely sever the bark from the wood and kill the tree. The beetle is about half an inch long and both it and the larvæ are slender. Blackberry canes are often infested by another species (*Agrius ruficollis*), the larvæ of which excavate irregular passages and cause the formation of gall-like enlargements. The species of *Chrysobothris* form excavations beneath the bark and in the sap-wood of various forest trees, and one species (*C. femorata*) is an orchard pest and another (*C. harrisii*) injures the white pine.

The true bark-borers mostly belong to a family, the *Scolytidae*, closely related to the weevils (q.v.). They form most elaborate burrows on the inner-surface of the bark, consisting of numerous galleries radiating in all directions from a central chamber. See BARK-BEETLES.

In combating wood-boring beetles the method must be suited to the habits of the particular species, but in general all infected wood should be burned or the larvæ picked out and destroyed. Egg laying should be prevented as far as possible by painting the tree trunks with soap-suds, kerosene emulsion, or similar repellents. Woodpeckers perform a valuable service in the destruction of these larvæ.

Consult Harris and Flint, 'Insects Injurious to Vegetation' (New York 1884); Packard, 'Insects Injurious to Forest and Shade Trees' (Washington 1890); Lecoute and Horn, 'Coleoptera of North America' (Washington 1883); Thompson, 'Systema Cerambycidarum' (Paris 1865).

**WOOD CARVING,** sculpture in wood, either in low relief or in the round. On the whole the grain and structure of wood make it more suitable for carving in relief than for large statues; some woods without much distinct grain can be carved almost as marble or stone; in other woods the artist must carefully adapt his design to the grain of the wood. Wood used for carving must be carefully seasoned and specially prepared; one method of seasoning it is to soak it, when newly cut, in running water, thus washing away all the sap, and then to dry out the water; an ancient method was to smoke it with wood smoke; still another method is to dry the wood in hot rooms, after pieces of paper have been glued on the ends to prevent the sap from drying out at the ends too rapidly. The woods most commonly used for carving are oak, chestnut, walnut; cedar in ancient times; sandalwood and other perfumed woods in the East; pine, fir and similar soft woods; the last mentioned being especially fitted for carving on a large scale.

—Wood carving has occupied a place in the early development of the most nations; although it was almost unknown in Babylonia, Assyria and Persia, it was in vogue in Egypt in early times, in India, and in Japan; and is now practised by savage and semi-savage races. The Pacific Maori and Polynesian races use the art of wood carving, not only on the carvings of their dwellings, but also on masks, weapons, etc. Their representations of gods and men are usually grotesque, and they carve complicated geometrical figures, etc., of real beauty and freedom.

The oldest example of wood carving now preserved is Egyptian, a life-size of a man known as the Sheikh-el-Bekri, dating from 4,000 B.C., which gives evidence of marked technical skill; several other specimens of Egyptian carving are also preserved.

No specimens of Greek and Roman wood carving have been preserved, but the authorities leave no doubt that wood carving was in its early days of art in both Greece and Rome, and many of the sacred statues were carved of this material. Wood carving reached its highest development in the Middle Ages.

The best early specimens of mediæval wood carving are found in the Scandinavian coniferous church doorways, dating from the 13th centuries; these are carved with designs consist mostly of interlaced work, combined with figures. The art reached its highest point in France, Germany, and Italy in the 14th and 15th centuries. The best examples are found in the carvings of churches, the pulpits, choir stalls, desks, etc. The most careful attention is given to the artistic combination of figure and scroll work, combined with design, mark the best mediæval wood carving. Wood was used for the images of saints and for effigies on tombs; and also for the carvings of roofs, such as gables and other edifices, often richly decorated with figures or foliage designs. In the late mediæval period wood carving was lavishly used in church decoration, choir stalls, desks and pulpits; in Italy ceilings were elaborately carved; but the designs, when they departed from the simple and skilfully worked out, lose the dignity of the mediæval art and tend to indicate a low ebb of taste. In the times of the art of wood carving has lost its former importance. It is best preserved among workmen in the towns of France. In Switzerland it is still used for clocks, small articles of furniture, etc. In England and the United States wood carving has recently been revived to some extent as a valuable part of the general manual training.

(Paris 1893); Ferrari, 'Il legno nell' arte italiana' (Milan); Rowe, Eleanor, 'Practical Wood Carving' (London 1907); Williams, 'History of the Art of Sculpture in Wood' (1835).

**WOOD-CHARCOAL**, most important, though not the purest, kind of charcoal. Wood consists of carbon, hydrogen and oxygen, the last two being in the proportion to form water. When heated in the open air, it burns completely away, except a small white ash; but if the supply of air be limited, only the more volatile matters burn away and most of the carbon remains. This is the principle of the process of charcoal-burning in countries where wood is abundant. A number of billets of wood are built up vertically in two or three rows into a large conical heap, which is covered over with turf or moistened charcoal-ash, holes being left at the bottom for the air to enter. A hollow space also is left in the middle of the heap to serve as a flue for the gaseous matters which are evolved. The heap is set on fire by throwing burning pieces of wood into the central opening near the top of which a kind of grate made of billets of wood is placed to prevent the burning fuel from falling at once to the bottom. The combustion then proceeds gradually from the top to the bottom, and from the centre to the outside of the heap; and as the central portions burn away, fresh wood is continually thrown in at the top, so as to keep the heap quite full. The appearance of the smoke shows how the combustion is proceeding: When it is going on properly, the smoke is thick and white; if it becomes thin, and especially if a blue flame appears, it is a sign that the wood is burning away too fast and the combustion must then be checked by partially stopping up the holes at the bottom, or by heaping fresh ashes on the top and sides and pressing them down well, so as to diminish the draught. As soon as the combustion is completed, the heap is entirely covered with turf or ashes and left to cool for two or three days. It is then taken to pieces and the portions still hot are cooled by throwing water or sand on them. One hundred parts of wood yield on the average 61 to 65 parts by measure, or 24 parts by weight, of charcoal. (Consult Watts, 'Dictionary of Chemistry.') The charcoal thus prepared is the best suited for fuel. In England a large quantity of charcoal is obtained in the dry distillation of wood in cast-iron cylinders for the preparation of crude acetic acid; the charcoal thus prepared is preferable for making gunpowder, but inferior for other purposes. A peculiar kind of charcoal of reddish-brown color, hence termed *charbon roux*, is prepared in France for manufacture of the gunpowder used in sporting, by subjecting wood in iron cylinders to the action of superheated steam under a pressure of two atmospheres; powder made with this charcoal absorbs moisture more rapidly than ordinary gunpowder.

The general properties of wood-charcoal are that it is black and brittle and retains the form of the wood from which it was derived; it is insoluble in water, infusible and non-volatile in the most intense heat; has power of condensing gases and, from its power of destroying bad odors, it has been regarded as possessing considerable antiseptic properties. It is

frequently stated that charcoal is a poor conductor of heat, but a good conductor of electricity; these properties depend on the nature of the charcoal, the lighter wood, such as willow, yielding a porous charcoal, with little power of conducting heat or electricity; while boxwood yields a very compact charcoal which is a good conductor of heat and electricity. Charcoal never consists entirely of pure carbon, the degree of purity varying directly with the temperature: thus, charcoal charred at 480° contains 65 per cent carbon, while that charred at 750° contains 80, and that charred at 2730° contains 96; but the loss of charcoal occasioned by these high temperatures is very great, the three percentages of charcoal corresponding to these temperatures being 50, 20 and 15.

The uses of wood-charcoal are numerous and extensive. It is very largely used as a fuel, taking in many countries the place of coal. From its being proof against all ordinary chemical agencies, a superficial charring is frequently resorted to for protecting wood from decay, as in the case of piles driven into mud or into the beds of rivers to serve as foundations. For the same purpose, it is a common practice to char the interior of tubs and casks destined to hold liquids. In a finely-divided state it is commonly regarded as an antiseptic; and there is no doubt that the offensive effluvia from animal matter in an advanced stage of putrefaction disappear when the putrefying substance is covered with a layer of charcoal; but in reality the decay goes on without emission of any odor until at length the whole of the carbon is dissipated as carbonic acid gas, and the hydrogen as water, while the nitrogen remains as nitric acid. It has been shown that the action consists in a rapid process of oxidation, dependent on the power which finely divided charcoal possesses of condensing oxygen. In a finely divided state, charcoal not only condenses gases to a marvelous extent, but has the power of absorbing coloring matters, bitter principles, etc.; hence it is of extensive use in the laboratory. From the rapidity of its absorbing action, Stenhouse has proposed to use a respirator filled with charcoal to protect the mouth and nostrils in an infected atmosphere; and the employment of trays of powdered wood-charcoal in dissecting-rooms, in the wards of hospitals and in situations where putrescent animal matter is present, is found to exert a most beneficial influence in sweetening the atmosphere by absorbing and decomposing the offensive gases. These properties render charcoal a valuable material in the construction of filters, not only for decolorizing, but likewise for purifying water for domestic use. It is employed successfully to prevent the escape of noxious vapors at the ventilating openings of sewers, as it allows free passage of air, but condenses the offensive effluvia in its pores where they are destroyed by a process of oxidation. Besides its use in the manufacture of gunpowder it has many applications in the arts. In medicine it is at present used chiefly to destroy fetor, for which purpose it is applied in the form of powder or poultice to gangrenous sores, phagedenic ulcers, etc.; it is also largely employed in tooth-powders, as by its mechanical action it removes incrustations, while by its chemical action it destroys fetor of the breath. In indigestion, accompanied by much flatulence, it may be given in doses of two or three tea-

spoonfuls suspended in water, or may be administered in the form of charcoal-biscuits. Very finely divided poplar charcoal is regarded as the best for medicinal uses.

**WOOD DUCK, or SUMMER DUCK,** the most beautiful of American ducks (*Anas sponsa*). The bill is very high at the base, shorter than the head; nail very large and much hooked; head crested; tail short, wedge-shaped. The head and crest are metallic green, glossed on the sides with purple; line through the eye; two bars on side of head meeting under the chin, and upper throat, white; lower neck and sides of tail purple, the former with triangular spots of white; lower parts white; sides yellowish banded with black and posteriorly with white; speculum bluish green, tipped with white; primaries silver white externally at tip; back uniform, with bronzed and green reflections; a white crescent in front of wings bordered with black; scapulae and inner tertials velvet black with violet gloss. In the female the back is more purplish, the sides of head and neck ashy, about the bill white, and lower neck brownish; the eyes are red. It is 19 inches long and 29 in alar extent. In most parts the plumage is iridescent with changing metallic reflections.

Formerly the wood duck, one of the most characteristic birds of our fauna, was abundant and widely distributed through the wooded and watered portions of the United States and southern Canada, but as a result of an unholy warfare it has become practically extinct over large areas. It is confined to fresh water, especially secluded ponds in woods. The flight is noiseless, very rapid, graceful and as easy among the branches of trees as that of the wild pigeon. It breeds from April to June, according to latitude, the nest being made in the hollow of a tree, or in the deserted excavations of the woodpecker or squirrel, and usually in deep swamps, though often in the vicinity of houses, for they are not shy birds. The eggs are 6 to 15, 2 by 1½ inches, pale buff and greenish smooth and laid on dried plants and feathers. They are much attached to the breeding places. The young leap down, or are conveyed to the ground or water by their parents. The adults are excellent divers and feed on acorns, nuts, grapes, berries, rice, insects, snails, tadpoles and small fry. The chief enemies of the adults are minks, raccoons and snakes, and many of the young are destroyed by snapping turtles, alligators and predaceous fishes. It is easily domesticated and readily breeds in captivity. The only other species of the genus is the famous mandarin duck (q.v.) of China. Consult Grinnell, 'American Duck Shooting' (New York 1902).

**WOOD ENGRAVING.** The art of wood engraving is also known as *xylography*, a distinctly modern term derived from the Greek words *xylos* — wood, and *grapho* — to write, to inscribe. It is the art of producing in relief a reverse or negative of a picture on wood which when inked and impressed on paper or other surface will make a positive of the picture.

If to the art of printing we owe an incalculable debt for bringing to us the record of the thought and history of all times, to the kindred and older art of the wood engraver we owe almost equal obligations. It gave to the com-

mon people the pictures by which they could be made to understand the purport of written and printed words.

Saint Christopher, the earliest wood engraving, size of original 11½x8½. Date 1423

**Technique.**—While the recent inventions of "process engraving," using photography, labor-saving tools, etc., make the technique of working complicated, the great works of the great masters of wood engraving were done in the very simplest manner. A block of close grained wood (boxwood only is used these days) receives on one side a perfectly smooth and polished surface. Its thickness is .918 of an inch, known as "type-high," or the height of the type along with which it may go into the "form" for the press. The smooth side is next covered with a layer of white chalk (this is known as "grounding") which is better to draw on than the smooth wood surface. On this the drawing is made in negative (the reverse of what is desired in the impression), any lettering, therefore, must read backwards. The work is now done direct on the block by photography, necessitating a sensitized surface instead of the above-mentioned grounding. From the artist or photographer the block goes to the wood engraver, who, using formerly a draw-knife but now a burin, cuts away cleanly to a certain depth all that the artist has left untouched, so that after the work is finished only the drawing remains on the upper surface, and it is in relief. If the finished woodcut be covered with printers' ink and pressed on paper or similar material it gives the imprint of the original drawing. Over and beyond manual dexterity, won by long practice, the wood engraver must also possess a certain degree of artistic temperament as well as being an expert draftsman, even when it is only a ques-

tion of reproducing the drawing. But, as is the case with many illustrated sheets, there are frequently no lines, but the drawing is in water colors or stumpwork. In such cases the engraver must translate the soft tones of the paintbrush either with his own technique or imitate them exactly (facsimile or tone cut). This latter art is the modern technique of American wood engravers, they being the inventors of it. So great is the difference between the old and the modern methods of producing wood engraving it is necessary to devote a few words to these differences in technique. From the 15th to the 18th centuries and even later the blocks were plank cut, that is to say the upper surface ran with the grain. Pear-tree or apple-tree wood was generally used and it was engraved with the draw-knife. The modern technique uses the cross-cut surface and boxwood exclusively, because it has the most regular texture or fibre. The knife has given way to the burin, used as on copper-plate engraving; the burins are of several forms used each for its separate purpose, whether for engraving outlines, or cross-hatching, or tone effects, etc. Again for a series of straight parallel or curved parallel lines and for the backgrounds of landscapes and portraits special machines have been invented which produce lines or stippling of more refinement and accuracy than is attainable by hand, at the same time greatly increasing the speed of execution. By changes in the process of treatment several new styles of wood engraving have come into being which will be treated of later, such as the *criblé*, *chiaroscuro*, "color" styles. An original woodcut permits the taking off of from 6,000 to 10,000 impressions, but to increase its efficiency in the number of prints possible the process of electric deposition of metals has been called into practice and *clichés* reproduce, in metallic relief, the surface engraved on the wood. As there is no limit to the number of *clichés* which can be taken from a single wood block, the number of impressions possible also becomes infinite.

The Grief of Hannah, from the Cologne Bible, about 1475

**History.**—The date of the actual origin of printing from engravings on wood is still in doubt; it is an involved question. In India stamps engraved on wood have been in use for printing colors on fabrics from a very distant past. Already in the 10th century the Chinese were acquainted with books printed from tablets of wood; and the illuminators of the Middle Ages used wooden embossed stamps for

impressing the outlines of colored initials on manuscripts. The earliest known examples of wood engraving date from the early part of the 15th century when in various parts of northern Europe, notably in Germany and the Netherlands, there existed various rude prints representing scenes from Scripture and the lives of the saints, evidently made from woodcuts. They were printed in a pale brown ink apparently by rubbing on the back of the paper with some blunt edged instrument and were generally colored either by hand or with the use of a stencil.

The Fall of Lucifer, from the *Speculum Humane Salvationis*

One of the most noted of these and the earliest dated print from a wood block is the famous Saint Christopher of 1423 found pasted in the cover of a manuscript discovered in the library of a convent in Buxheim, Swabia. It represents Saint Christopher wading across a stream with the infant Jesus on his shoulder. On the right bank a hermit is kneeling before his cell holding a lantern in his hand, on the left a peasant is climbing a steep hill on the way to his home. It is a rude cut without any regard for perspective, but the figure of Saint Christopher possesses a certain dignity and the pictorial effect is such as would appeal to a primitive people. Many similar cuts were produced in the 15th and 16th centuries in the cities of Augsburg, Nuremberg, Ulm, Cologne and the Flemish cities. Conventional in design and often repeating again and again the same subjects, they were yet expressive of the mediæval religious conceptions and were no doubt highly effective in giving particular and comprehensible value to the biblical lessons they were intended to convey.

It has been contended by some authorities that wood engraving really began with the invention of playing cards, but no authentic records are available of their having been printed before 1423, the date of the Saint Christopher, and they appear to have been made with a stencil. The making of sacred prints very soon

developed into a large business, and by the middle of the 15th century wood engraving was an established and widely familiar art. Common before the invention of the printing press, when books in manuscript only were the treasured possessions of the great monasteries, these prints were of inestimable value in the cause of popular religious education. From the very first wood engraving has been an art for the people. In the beginning serving religious purposes only it soon became a means of satire and comment upon the abuses of the clergy and a record of the manners and customs of the times.

In the early part of the 15th century many minds were striving toward the invention of a way to print from movable types. The idea came no doubt from the so-called block books. Many of the early prints bore the name of a saint or a short legend which was evidently cut on the block with the picture. From these legends it was a natural step to extend the text and add whole columns of text. The date and place of the earliest of these block books is a matter for conjecture, but they were known in the early part of the 15th century. One of the most widely discussed of these is the '*Biblia Pauperum*,' or Poor Preacher's Bible, several editions of which are known. It is a small folio containing 40 pages printed on one side only in a pale brownish ink by means of rubbing on the back. Each page is divided into five compartments separated by pillars, suggesting the idea of church windows. The central panel shows a scene from the Gospels and on the sides are illustrations from the Old Testament bearing on the central design. There are also texts and Latin verses. Another block book that has given rise to much speculation is the '*Speculum Humane Salvationis*,' or 'The Mirror of Human Salvation.' In this the text appears to have been printed from movable type in black ink on a press. It is, therefore, the oldest extant typographical illustrated work known. Other famous block books are the '*Apocalypsis Sancti Johannis*,' Visions of Saint John; '*Ars Moriendi*,' The Art of Dying; '*Canticum Cantectorum*,' or a History of the Virgin professed in the Song of Solomon. All of these are curiously and often grotesquely mediæval, full of the symbolism and mysticism of primitive humanity. Rude as they are, though, they were preparing the way for something better.

Other noted block books extant are '*Liber Regum*,' Book of Kings; '*Temptationis Demonis*,' Temptations of a Demon; '*Enderis*,' the only copy known is in the Spencer Library; '*De Generatione Christi*,' of the genealogy of Christ; '*Mirabilia Rome*,' The Wonder of Rome; '*Confessionale*,' of the Confessional; '*Symbolum Apostolicum*,' Symbols of the Apostles.

These German and Netherlands block books were issued in numerous editions and had quite a large foreign circulation. '*Ars Moriendi*,' was issued in Latin, German, French, Italian and English, the texts varying. Some of these block books were cut up later and pieced together in different combinations in later editions. It must be noted, however, that the engravings done in the Netherlands were, almost invariably, of a more artistic character than those emanating from German hands.

With the advent of printing the block book

were superseded and wood engraving became a handmaid of the greater art. Illustrations are to be found in many of the books of the early printers. The earliest wood engravings in a printed book with an authentic date appear in the Psalter of Faust (or Fust) and Peter Scheffer (or Schaeffer) published at Mayence in 1457. From Cologne, Mayence, Nuremberg, Ulm, Augsburg, Strassburg and Basel came many printed books illustrated with wood engravings.

The Bible was the book on which the early printers spent most of their energies. Numerous editions were published with illustrations. The most important of these was the famous Cologne Bible which appeared before 1475. Its 109 designs were, after the block books, the first illustrations of Scripture, and they showed more originality and invention than anything that had gone before. Many of the decorative borders of this Bible are in curious contrast to the sacred text.

The tendency of the early printers to trade cuts is made clear by the fact that the Nuremberg Bible, published in 1482, contains woodcuts from the Cologne Bible, published between 1470 and 1475. The Augsburg Bible, published about 1475, is a most elaborately illustrated work; Gunther Zainer is said to have been the publisher. With the exception of two, all the 73 woodcuts are placed in combination with initial letters and absorb a full column of space.

Next to the Bibles in interest in the study of wood engraving are the numerous 'Chronicles' and histories. These are records of legends and imaginary events and are illustrated with woodcuts dealing with the lives of the saints and the great happenings in local history. One of the best known of these chronicles is the one published at Nuremberg in 1493. Hartmann Schedel, a Nuremberg physician, compiled the work and it was printed by Anthony Koburger. It has over 2,000 cuts, views of cities, saints, portraits, etc., and is supposed to have been supervised by William Pleydenwurff and Michael Wohlgemuth, the latter a master of the great Durer. The chief distinction of the Nuremberg Chronicle lies in the fact that in it for the first time woodcuts were printed in simple black and white. They were modern in this respect and in the use of cross-hatching by which grays and blacks of varying intensity were obtained by engraving lines that crossed each other at different intervals.

Another peculiar feature is the fact that the same single cut is used to represent a number of different poets, etc., or one cut suffices to depict views of several cities, etc. This economical method of multiplying the usefulness of a woodcut occurs frequently in contemporary works.

An old style of book of the 15th century also is the figure alphabet, in which the pages are devoted to forming initial letters from figures of all kinds posed in attitudes conforming to the outlines of the capital letters. All these early 15th century books were printed by a rubbing process, either some form of burnisher or roller pressed the paper over the block. The book printing press was not invented till the latter half of the century.

In France wood engraving was early identified with printing. Religious books contained

many curious and often beautiful illustrations. Those known as the 'Livres d'Heures,' Books of Hours, often contained many fine examples of carefully executed blocks in imitation of miniatures. Many of these early woodcuts served simply as an outline for the colorist, who often overlaid them with an entirely different design. The first really effective artistic use of the decorative border may be seen in these 'Livres d'Heures,' and some of them are notably quaint

The Ploughman, from the Dance of Death, by Holbein

embodiments of scriptural ideas combined with others that are certainly not to be found in the sacred Book.

At Lyons several books with woodcuts were published about 1476, but the engraving is of the same coarse German grade, till, in 1493, an edition of Terence was issued with illustrations of a more artistic nature. In Paris we find among the publishers of the above-mentioned books of devotion ('Hours'), history, romance and poetry, such names as Jehan Du Pré, Guyot Marchand, Pierre Le Rouge ('La Mer des Histoires,' 1488), Pierre Le Caron, Antoine Verard, etc. Those engravings done by Jean Fouquet and Jean Perrelet showed ambitious art work that needed no pigments for embellishment. The books from these publishers found a wide foreign circulation in their Flemish, English and Italian versions. Guyot Marchand's 'Danse Macabre,' Dance of Death (1485), shows most merit in its illustrations. The French brought out a new style, termed by us 'criblé,' in which the delineation is composed of dots; Renouvier says it was the goldsmiths' manner of engraving and may have been impressed, in some cases, from metal.

England lagged behind other countries in her art development, and wood engraving was little known there before the publication of Caxton's 'Game and Playe of the Chesse' published in 1476 and it is thought that the cuts in this were imported from Germany, and they are too crude for the English to dispute the claim. In Italy the earliest wood engravings were either importations from Germany or were suggested by German originals. The most noted example of early Italian wood engraving is the 'Hypnerotomachia Poliphili,' or Dream of Poliphilo,

written by a Venetian monk in 1467 and printed by the famous Aldus, in Venice, 1499. It contains 192 woodcuts on such subjects as mythology, ancient history, processions, etc. The Italians developed a method of engraving in *chiaroscuro*, in imitation of painting, by the use of several blocks, each printed in a different color. The Germans also employed the same methods, but in a much cruder form.

With the advent of Albrecht Dürer (1471-1528), of Nuremberg, wood engraving reached its highest attainment. First of all he was a great designer with a far-reaching and powerful imagination and a mind full of the new learning and spirit of the coming Reformation. He was the first fully to realize the great possi-

The Savages of Calicut, from the 'Triumphal Procession' by Burgkmair

bilities of wood engraving, and by his influence it was raised to the dignity of a fine art. He is known chiefly by four great works. The first of them the 15 large drawings illustrating the Apocalypse of Saint John (1498). Others are the 'Larger Passion of Our Lord' (1509-11), 12 cuts, 'The Life of the Virgin,' 20 cuts, and the 'Smaller Passion of Our Lord,' 36 cuts. Among Dürer's other famous works are the 'Car and Gate of Triumph' made for the Emperor Maximilian. Another great work celebrating the emperor's fame was by Hans Burgkmair (Augsburg, 1472-1531) the magnificent 'Triumphal Procession,' etc. The colossal work entitled 'The Triumph of Maximilian' was made by command of that emperor and consisted of three sets of designs: 'The Triumphal Procession,' 'The Triumphal Arch,' and 'The Triumphal Car.' Its size is enormous, the "arch" composed of 92 blocks, when displayed in their correct relative position, is 10½ feet high by 9½ feet wide. While the designs were by Dürer and Burgkmair the execution of the work was by highly talented and enthusiastic wood engravers with Jerome of Nuremberg and Jost de Negker or Dienecker at the head of the list.

Dürer's masterly activity in wood engraving gave rise to a school (some of the members were pupils) of decorative designers of great

talent who put their conceptions into engravings, forming them into sets, books, etc. These artists are known as the "Little Masters," and their fine work created a general renaissance in the arts of decoration; the jeweler, the potter, the cabinet-maker, all artisans incorporated in their work beautiful decoration taken from the popular designs published and widely circulated all over Europe in these engravings. The best known of these 'little masters' are Beham, Baldung, Aldegrever, Amman, Virgil Solis, etc.

Hans Holbein (1497-1543) ranks among the really great artists and wood engraving owes to him a still further advance. Holbein indeed might be well called the father of modern illustration. Among the first books he illustrated were the 'Utopia' of Sir Thomas Moore and the biblical translations of Luther. He is best known, however, for his remarkable series of designs known as the 'Dance of Death' (1538), a popular subject of mediæval times. In each of the 41 designs is a scene from common daily life expressed with a grim dramatic power and truth of drawing that are remarkable in a very high degree. Death spares neither the king nor the peasant, the praying nun nor the priest in the pulpit. Much of their success was due to the wonderfully accurate wood engraving of Hans Lützelburger, for in the hands of a less skilful engraver the originals would have lost much of their power. Holbein's 86 designs for the Old Testament, generally known as 'Holbein's Bible Cuts,' were also remarkable in many aspects, but they were more conventional in conception. After Holbein, wood engraving as an art steadily declined.

Early in the 16th century either Jost de Negker, German, or Ugo de Carpi, Italian (disputed claims) invented the so-called "*chiaroscuro*" process by which color effects are gained by using a series of wood blocks each impressed over the other, a separate color being produced by each successive addition. Carpi reproduced several of Raphael's designs by this method, and in Germany were reproduced sheets from the designs of J. Wechtlin, Burgkmair, Cranach, Baldung and others.

A revival, in a modern sense, began with the work of Thomas Bewick (1753-1828) in England. To him we owe the great principle of the white line which did away with much of the old drudgery and gave the engravers more freedom in handling. In the old way, where black lines crossed, the little white lozenges between had to be laboriously cut away, Bewick simply gouged out with his graver a line and by varying the width and number obtained his gradation of light and shade. He was the first also to use boxwood and the burin. Bewick is best known by the drawings and engravings in his 'British Quadrupeds' and 'History of British Birds.' He was the founder of the modern British school which held for many years a distinguished place in modern illustrative art. Bewick's pupils, Charlton Nesbit and Luke Clennell; Robert Branston, John Thompson, the Dalzels, William Harvey and W. J. Linton engraved the work of many distinguished English artists. In France and Germany wood engraving has maintained a distinct place in spite of process work and some of it has been and still is of a very high order of merit. In France a pupil of Bewick's, Charles Thomassin, intro-

and brought together a school of wood-ers using the refinements of the English . In Germany, where the art of wood ing was in an expiring condition from iddle of the 18th century, new life was ped early in the 19th century by the two s and recent methods of treatment aided putations of Gubitz in Berlin and Blasius in Vienna. Adolf Menzel trained for the ctions of his illustrations the engravers nann, A. and O. Vogel, H. Müller and hmar. In France the leading names of engravers include Leloir, Regnier, Laccate, re, Porret, Count Laborde, Gérard, Ber-Bréval, Chauchoin, Lepère, Pannemaker Baude, Thiriart, Huyot, Grenier, etc.

s to America, however, that we must look e greatest achievement in wood engraving. rtists have carried it to a degree of per- unparalleled anywhere else in the world. have taken it out of the domain of a r mechanical handicraft and given it al- he individuality that belongs to creative he first American wood engraver of dis- n, Dr. Alexander Anderson, was a fol- of Bewick. Closson, Wolf, Thomas Cole, Thomas Johnson, ge Kingsley, Gustav Kruell, William and others are names identified with the t attainment of American wood engraving. other countries we find admirable ex- n of wood engraving done by such artists Brown and his school at The Hague and rp, with Vermorken, Pannemaker (father) losquet prominent; in Italy Fabris and must be mentioned.

h the advent of process work (see PHOT- ING) the demand for wood engraving eatly diminished and its employment as a ctive art is constantly decreasing. It eautiful art as exemplified by the best

practitioners, remarkable for its brilliancy of effect in pure black and white, requiring the most delicate skill in its manual execution and a feeling and invention with respect to the correct interpretation of values and textures of a very high order.

With the passing of the men of to-day who have given wood engraving a place among the fine arts, it is likely that it may cease to be a field for further endeavor. There are no longer incentives for its study and the time and artistic training necessary for any real accomplishment can be put to much better profit in other directions. Prints by famous wood engravers are already much sought by collectors and the future historian of the art will probably end his record with the close of the 19th century and the beginning of the 20th.

More than to any other of the graphic arts are we indebted to wood engraving. It led the way to the invention of printing and has been the means of putting before the world a record of the progress of the greater arts of drawing and painting. See also ENGRAVINGS.

CLEMENT W. COUMBE.

**WOOD-FROG.** See FROG.

**WOOD-IBIS,** a kind of stork (q.v.).

**WOOD-LARK,** a European lark (*Lullula arborea*) closely allied to the sky-lark (q.v.), but distinguished by its smaller size, shorter tail, a distinct light streak over the eyes and ears and more distinct markings on the breast. It perches upon trees, and is found chiefly in fields near the borders of woods. Its flight is much less extensive and powerful than that of the sky-lark. The wood-lark often sings during the night, and on this account has been mistaken for the nightingale. "Its song" is described as "sweet and flute-like, more melancholy than that of the sky-lark, and is generally uttered from the top of some tree or else when the bird is on the wing. It rises to some height before commencing, then ascends, singing, higher and higher, throwing itself from side to side, hovers and floats in the air, and when the song is ended drops with closed wings to the ground again." It bears confinement well, singing sweetly in the cage, and even breeding easily there or in an aviary; hence it is constantly caught and kept. The nest is generally built under bushes. The eggs are five in number, of a dusky color, spotted with deep-brown spots.

**WOOD-LOUSE,** one of the little isopod crustaceans (see ISOPODA) of the family *Oniscidae*, which abound underneath logs and in decaying stumps in the woods, and which, when touched, curl up for protection like armadillos. They are numerous and hardy, the sexes are distinct, and the young are hatched from the eggs in their full form, passing through no metamorphoses. The names pill bug, armadillo and sow bug are sometimes applied to the wood-louse.

**WOOD-MOUSE,** the red-backed mouse (q.v.). In England the long-tailed field-mouse (*Mus sylvaticus*) is so called.

**WOOD NYMPH,** a minor pagan divinity supposed to live in trees and woods. This is the common name, also, of the beautiful lepidopterous insects comprising the genus *Eudryas* which are very common in the United States. It is one of the chief enemies of the grapevine. Its front wings are of a creamy white with a purple-brown border. The eggs are laid on vines in mid-summer and the caterpillars develop black and orange lines and feed on the vines until September, after which they hibernate as chrysalises. Arsenate of lead sprayed on the vines is a most effective remedy against this pest of the vineyard.

**WOOD OIL,** the name given in commerce to a resinous juice which exudes from various trees of eastern Asia. It has a fine aromatic odor, and is used for a great variety of purposes; in medicine as a substitute for copaiba balsam; by sailors for paying the seams of a ship instead of tar; by painters as a varnish; also in the making of lithographic ink, etc. It is an excellent preservative of timber against the attacks of white-ants. It is strictly an oleo-resin, and is also known as gurjun balsam.

**WOOD-PEWEE.** See PEWEE.

**WOOD-PULP,** wood that is reduced to a mass of pulp and mixed with water—the fundamental process in making paper from wood. There are three kinds of wood pulp—ground wood, soda-process wood and sulphite-process wood; the latter two are not wood in either physical or chemical properties, but cellulose, similar to cotton fibre in appearance and nature. (See PAPER; PAPER INDUSTRY IN AMERICA). The name of wood-pulp is generally understood as designating mechanically ground pulp as distinguished from chemical pulp, or cellulose. In the manufacture of mechanical wood-pulp a block of wood is held against the surface of a rapidly revolving grindstone by hydraulic or other pressure, a stream of water pouring down upon the stone carrying away the disintegrated fibres into a stuff-chest, where they are mixed with a percentage of sulphite or other cellulose, and are then ready to go on the paper machine to be converted into paper. Spruce principally, but also poplar and other soft woods are used in the manufacture of this pulp.

Ground wood was developed in Germany in 1847 by Keller and perfected and patented by Henry Voelter, who constructed a machine which is in general use to-day. Mr. Albrecht Pagenstecher, of New York, bought and controlled the Voelter patent and introduced this industry into the United States in 1867-68, importing two machines, which were set up in Curtisville, Mass.

The introduction of this new process marked a new era in the manufacture of paper. It furnished a cheap and abundant raw material, simplified the former complicated methods of preparing stock for paper machines, and improved the quality of the paper made, besides cheapening the cost of production. Without wood-pulp it would be impossible to supply the demand for paper at the present day.

Wood-pulp was first sold at eight cents per pound, but finally dropped to less than one cent per pound, and brought the price of newspaper from 14 cents in 1868 down to less than two cents per pound in 1890 to 1900, making the one-cent newspaper possible.

The introduction of ground wood-pulp printing paper into rolls completely revolutionized modern methods of journalism. The absorbent quality of this wood-pulp paper made the modern rapid printing press practicable, eliminating the allowance for drying and limiting the printing speed only by the mechanical possibilities of the press, which were in no way dependent, as in the case of rag paper, upon the drying of each sheet. Such an improvement caused immediate changes in the making and printing of the newspaper, and as soon as the results of this new process became commercially practicable, the entire system of news gathering changed as well.

The output of wood-pulp, which in 1868 was less than one ton per day from the only mill then in existence, increased by 1900 to over 5,000 tons per day in 188 mills, requiring in its manufacture nearly 2,000,000 cords of wood annually. About this date the wood-pulp industry of Canada became important, and in 1910 there were used by Canadian mills 1,764,912 cords of

the value of \$13,104,458. For other statistics, see PAPER.

The introduction of this new process was made under many difficulties, the greatest of which was to overcome the prejudice of paper-makers, who believed that rags were the only fit substance to make paper of, and considered wood-pulp as an adulteration or shoddy. At present every newspaper is composed largely of ground wood-pulp, with a small percentage of chemical fibre. Many book, wrapping and other papers also contain a large percentage of ground wood-pulp.

**WOOD-QUAIL**, or **ROULROUL**. See QUAIL.

**WOOD-RAT**, a large rat-like wild mouse of the genus *Neotoma*, of which two species dwell in the forests of the southern half of the United States. The body is eight or nine inches long, and the tail nearly as long. The form resembles that of the white-footed mouse (*Microtus*), the animal being more slender and squirrel-like than are the true or house rats, from which this may always be distinguished by his hairy tail, softer fur and much larger ears. The best known species is the Alleghany wood-rat (*N. pennsylvanica*), which is lead-colored above, sprinkled with black hairs, which lightens to yellowish on the flanks and becomes pure white on the abdomen and feet. Consult Goldman, E. A., 'Revision of the Wood Rats of the Genus *Neotoma*' (in United States Bureau of Biological Survey, 'North American Fauna, No. 31,' Washington, D. C., 1910), and Stone and Cram, 'American Animals' (New York 1902).

**WOOD-ROBIN**, the wood-thrush (q.v.).

**WOOD-THRUSH**, or **WOOD-ROBIN**, the most familiar of North American spotted thrushes (*Hylochichla mustelina*), famous for the rich four-parted melody of its spring song. It is numerous in warm weather throughout the Eastern States and Canada, inhabiting the wild spaces as well as confidently approaching the house and roadside. Its nest is often built in a village shade-tree, or even in a garden bush, but more frequently among the forking twigs of an apple tree; and it is to be distinguished from that of the robin by the absence of mud and the presence of many dead leaves, which always form the principal part of its foundation. The eggs are deep blue, smaller and less greenish than those of the robin. It soon becomes unsuspecting of the persons whom it is accustomed to see about the place and who do not disturb it, but is jealous of the attention of other birds, and defends its home with admirable vigor and success. The song, which is heard most frequently and pleasingly toward sunset, is excelled by that of none of the more familiar Eastern birds either in musical quality or in sentiment. It is low, sweet, evenly modulated and flute-like, yet has far-carrying power, and when heard at twilight across the fields, or from unseen recesses of the orchard, it brings to the mind a hymn chanted in praise of the serenity of the summer evening. This thrush is bright cinnamon above, brightest on the head; below white, with large rounded black spots forming lines down in front.

**WOOD-WARBLER**, a book-name for the small and beautiful American birds of the family *Mniotiltidæ* (see WARBLER); but the name is without special significance, as these birds are not more characteristic of woodland than of other places; nor than other warblers.

**WOOD-WORKING MACHINERY** embraces the various machines employed to reduce the timber as cut in the forests into lumber, shingles, doors, sashes, moldings, veneers, barrels, buckets and the endless variety of wooden objects and contrivances used for industrial purposes. As the woods upon which they are used vary in many qualities from the docile white pine to the difficult elm and the almost metallic hardness of the ebony and toughness of the lignum vitæ, their variety and adjustments must be almost numberless. They may be conveniently divided into four general classes—saws, which operate by rending or scission; planers, by which the work is accomplished by a paring action; lathes, in which the wood is turned or pared while being revolved; and grinders or abrading machines, which are generally employed as finishers and accomplish the work through the medium of sand or emery. Saws are blades of steel with toothed edges and though also used to divide metal and stone, they are employed principally to divided wood. (See SAWS AND SAWING; SAW-MILL). For saws used in metal-working see METAL WORKING MACHINERY. The use of saws is of very ancient origin, and it is practically impossible to enumerate in detail their adaptations to various mechanical processes. Among uncivilized peoples, saws were made of flakes of flint imbedded in wooden blades and held in place by means of bitumen. Later, among the ancients, bronze saws were used, but all modern saws are made of steel of the finest quality. Band saws were invented about the beginning of the 19th century, and although their particular merits were known long before the circular saws came into general use, they were not adopted until the latter part of the century, owing to the difficulty of making blades capable of withstanding the severe service. But, with the manufacture of the finer grades of steel of greater tensile strength and elasticity, since 1885, they have been adopted in addition to the circular saws in many of the larger mills. They are made in sizes ranging from one-half inch in width, used for ordinary shop-work, to from six to eight inches in width, for the use of the larger lumber mills. In mode of operation, which is as that of a belt over two pulleys, they cut with a continuous downward motion, with the toothed edge always in the kerf. The pulleys or guide-wheels, one of which is the driver, range from 54 to 72 inches in diameter. The saw blades are in a continuous band, from 45 to 60 feet in length, and the saw is run at a speed of 4,000 feet per minute. Being made extremely thin, they are used for continuous and rapid cutting in planing mills and other wood-working plants, where some cuts have to be made in scrolls and curves, and require a very flexible blade. The thinness of the blade insures a much smaller kerf-waste than that resulting from the circular saw, and as installed in their larger forms in the lumber

mills are capable of sawing an average of 40,000 feet of lumber per day. The table of hand saws used in shop-work is often made to tilt, for beveled work; or the saw blade and its pulleys may be tipped backward, for the

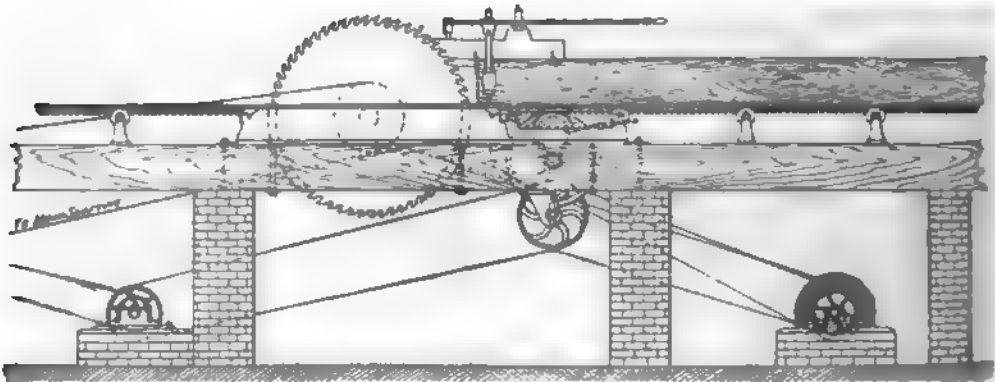

edge of a strong cast-iron centre, which gives the required rigidity. The larger sizes range up to six feet in diameter and possess cutting edges so light that they are capable of cutting veneers almost as thin as a sheet of paper.

Gang Saw.

same purpose. The saws commonly known as scroll saws and jig saws are very narrow straight blades of steel, often as fine as 1/32 of an inch in width, which are operated with a reciprocating movement, and are employed to cut various ornamental designs as for brackets, corner-pieces, clock-cases, etc., and in making furniture.

Another form of veneer-cutting saw is a single-bladed reciprocating saw doing its work in a horizontal position in a carriage which rises and falls in vertical guides. Another form of veneer cutter is a vertical knife against which the log of wood is revolved so as to take off a continuous shaving. Planers are used to smooth lumber and to reduce it to exact dimen-

Circular Saw, with Rack-feed.

Of saws used for special purposes, the segment saw used for cutting veneers should receive mention. The segment saw is circular in shape and is formed by holding the blade segments, which are extremely thin, upon the outer

sions by removing the rough surfaces of the product of the sawmills. In the surface planer this is accomplished by a rank of overlapping revolving cutters which pare off shavings and leave the surface of the timber quite smooth.

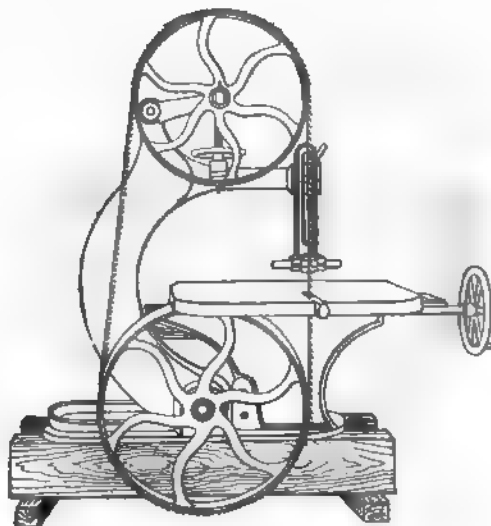

cutters are very ingeniously arranged, and they cases all four sides of the board are down, and the tongue and groove cut in at one operation. The cutters may be arranged as to produce curved surfaces following a pattern or model which controls the depth of the cut, and are extensively used in the manufacture of moldings, panels, etc. These machines also cut rebates and grooves in a limited amount of shaping. They can be run at several different speeds, whichever is best adapted for the kind of wood being worked. Moldings are, however, usually cut on machines with upright spindles, the head only being above the table. Some have two spindles and two cutters, so that both sides of a strip may be modeled at once. They can run at a speed of 5,000 feet per minute.

Shaping machines are of two classes: (1) in which the cutter is chisel-shaped and works in a reciprocating motion; and (2) in which a revolving cutter is used. Large machines of the first kind, as used in shipbuilding, usually carry several cutters on a single frame, so that several mortises may be cutting at the same time. The blocks to be mortised are adjusted on a feed table so that each chisel cuts its own chip, and scores for the next chip; each succeeding chisel cutting deeper into the wood. The ordinary shop, carrying a single chisel, is actuated by a link motion so that each successive blow is deeper than the one before. Or the depth may be arbitrarily regulated by the foot of the operator on a tilting table.

Tilting tables enable the mortise to be cut to the bevel if desired. These machines can run at the speed of about 400 strokes per minute.

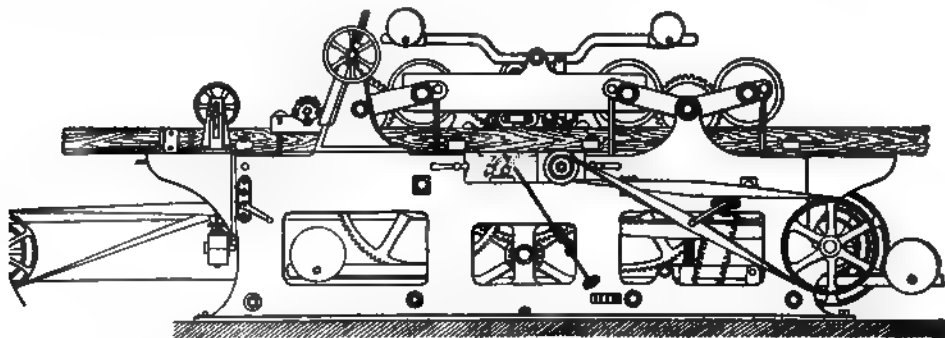

To this class also belong the dovetail machines in which the cutters are arranged in gangs, similar to a gang of chisels, and revolve upon a vertical spindle. They cut the tongues and spaces automatically. Working lathes are similar in principle

handles, gun stocks and shoe lasts are produced. Other machines involving the lathe principle are the various kinds of borers for drilling holes; tenoning machines and mortising machines for making tenon joints and the mortises to receive the tenons; and ganging ma-

Band Saw.

chines for cutting grooves. Abrading machines are of two kinds—those in which an endless belt coated with sand or emery is brought in contact with the work, generally of small dimensions; and those in which a drum similarly coated is employed to work down large surfaces. Or they may take the form of simple disks of sandpaper or emery paper glued to a face plate.

Planer, with Roller-feed.

are employed in metal-working. The piece to be worked is held between the stocks of the lathe and revolved rapidly, while a chisel or tool is pressed against it and removes a chip; by a combined paring and severing motion.

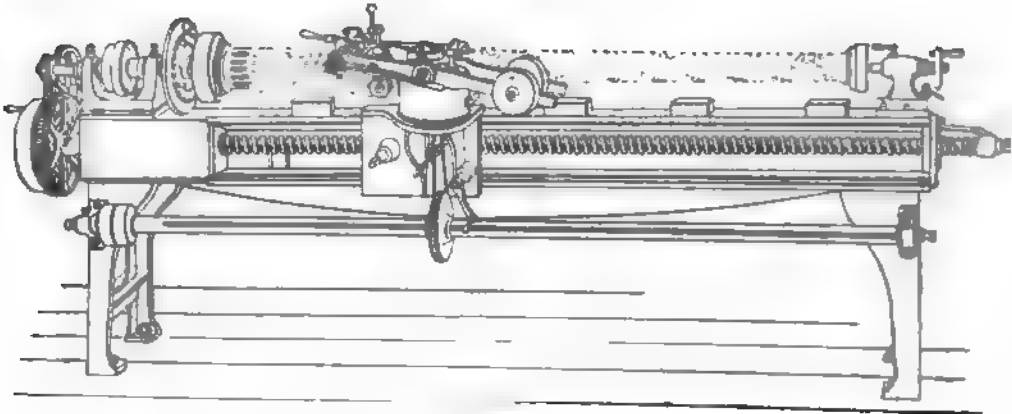

By the use of various automatic dressing attachments in conjunction with patterns in the case of the Blanchard lathe, in the case of the Blanchard lathe, in patterns and blanks are revolved together, and facsimiles are readily obtained, and the accuracy of the machines greatly increased. By machines such irregular shapes as axe

**Practical Suggestions.**—The very important place occupied by the circular and band saws among the various classes of wood-working machines demands a few practical suggestions and rules relative to their use, care and management. The principal points to be observed in this connection are as follows:

**Hanging the Saw.**—Circular saws should always be hung upon the mandrel with the side marked "log side" next to the log on the mill, and should be perfectly plumb when the flanges have been screwed up. Thin saws and saws

driven at high speed should be put up very open in order to allow the centre to pull through. These saws when hung on the mandrel may be concave or convex on the log side when at rest, but when running at the speed for which they are hammered they should straighten up and be flat on the log side. The difficulties resulting from too much crowning or dishing on the log side may be overcome by the use of suitable paper rings placed between the saw and the collars, so that when the saw is clamped between the flanges it will be brought to the proper position.

teeth are in the best of condition; but, when the teeth have lost their sharp edge, the saw will dodge whenever it runs against the slightest obstacle. Speeds too low are also objectionable, but they do not produce such ruinous effects upon the saw. These difficulties may be partially remedied by the hammering of the saw, but it is impossible to overcome them completely by such means. The accompanying table gives the proper speed of circular saws of varying diameter. It is calculated on the basis of a periphery speed of 9,000 feet per minute. As a general rule, however, saws for portable mills

Copying Lathe.

**Lining the Saw with the Track.**—The track should be solid, level and straight, and should be put down by careful measurement so as to be from one-eighth to one-quarter of an inch farther from the saw at its centre than at a distance of 20 feet from it. Some saws require more inclination toward the track than others in order to hold them to their work on the log, and if the track is properly adjusted any small variations from the required inclination may be effected by means of the set screws on the box.

The lead or the holding of the saw to its work may be adjusted by its position to the track as already described, or by beveling on the back of the teeth. Assuming that the teeth are properly filed perfectly square in front, then level filing on the back of the teeth on the board side will lead the saw into the log, and level filing on the log side will lead it out of the log. A "snaky" or in-and-out lead indicates that the rim of the saw is too large for the centre and, therefore, requires to be opened out at the centre. This may be effected by running the saw warm at the centre by creating friction, by reducing the set or spread of the teeth, or by hammering between the centre and the rim.

**Motion.**—The motion of circular saws is one of the conditions which requires the most careful attention. The saw should always be run at a speed approximating as nearly as practicable to a periphery speed of 9,000 feet per minute (in soft woods), and it should be run at a uniform speed both in and out of the cut. Excessively high speeds generate heat in the saw and make it so touchy and limber that it will do good work only on light feed and while the

are usually run at a speed of 450 revolutions per minute, and those for steam feed mills from 600 to 900 revolutions per minute.

TABLE OF SPEED OF CIRCULAR SAWS.

Diameter, inches	Revolutions per minute	Diameter inches	Revolutions per minute
8	4,500	42	97
10	3,600	44	100
12	3,000	46	103
14	2,585	48	106
16	2,222	50	109
18	2,000	52	112
20	1,800	54	115
22	1,636	56	118
24	1,500	58	121
26	1,384	60	124
28	1,285	62	127
30	1,200	64	130
32	1,120	66	133
34	1,050	68	136
36	1,000	70	139
38	950	72	142
40	900		

The three following rules may be readily employed for calculating the speed of saw-pulleys or drums.

1. To find the number of revolutions of the driven when its diameter is known.

Multiply the diameter of the driver by its number of revolutions and divide the product by the diameter of the driven; the quotient will be the number of revolutions of the driven.

2. The diameter and revolution of the driver being given, to find the diameter of the driven that shall make any given number of revolutions in the same time.

Multiply the diameter of the driver by its number of revolutions and divide the product by the number of revolutions of the driven; the quotient will be the diameter of the driven.

to find the size of the driver. Multiply the diameter of the driven by the number of revolutions it is required to make, divide the product by the number of revolutions of the driver; the quotient will be the size of the driver. In the case of band saws the most important thing requiring careful attention is the tensioning of the blade so as to place the strain on the centre of the band. The tensioning of saws is accomplished by the use of rolls, or by the ring, the last-named method being preferred as the saws are liable to hold their shape longer. The accompanying table shows the tension for band saws of different gauges and gauges. These figures give the saw the tension as it will take and lie flat on the working-board, a condition which accords with the best practice.

TABLES OF TENSION FOR BAND SAWS.

Gauge	Circle, feet	Width, inches	Gauge	Circle, feet
16	26	10	15	35
17	26	10	16	40
18	26	11	14	40
19	30	11	15	45
20	30	12	13	40

16	30	16	13	66
17	35	16	14	66
14	30			

It is often desirable that the toothed edge of the saw be strained a little tighter than any other part of the saw. This may be accomplished by rolling or curving the back of the saw to a curve showing one-sixty-fourth of an inch rounding out at the tip, and then tilting the upper wheel so that the saw has a uniform pressure across the blade. The strains usually put upon saws range from 1,000 to 12,000 pounds, and should be only just sufficient to prevent slipping on the wheels. A tire three-fourths of an inch in thickness on the upper pulley adds much to the endurance of the blade. This upper pulley should also be fitted with a tension link. The following tables give the strains for band saws of different gauges and gauges.

TABLE OF STRAINS FOR BAND SAWS.

Gauge	Pounds	Width, inches	Gauge	Pounds
16	4,212	10	15	7,770
17	3,756	11	13	11,286
18	3,174	11	14	9,856
19	2,718	11	15	8,547
20	2,268	12	13	12,312
15	5,439	12	14	10,752

16	6,318	16	13	16,416
13	10,260	16	14	14,336
14	8,960			

**Gauges.**— In selecting a saw, the nature of the work for which it is required, and the power available to drive it, should always be taken into account. In this connection the first important point is the proper gauge. Generally speaking, a thin-gauge saw blade lasts much longer than a thick one. For mills of ordinary capacity and operating on a general line of work the most suitable saws are those measuring seven gauge at the centre and eight on the rim. If the timber is valuable, and the sawyer skillful, saws as light as eight or 10 gauge may be used, but saws lighter than that are impracticable for use in ordinary mills. In large mills where the saving of time is more desirable than the saving of lumber, and consequently greater speed and feed are used, the most suitable saws are those of six and seven gauge, which are sufficiently heavy to stand up to the more severe service. In the case of these heavier saws it is imperative that the pulleys be of large diameter.

The second important point in the selection of a saw is the number of teeth. With high speed and the accompanying high feed, more work is required of a saw in a given time, and, therefore, it should have more teeth with which to do that work and to distribute the strain evenly. The speed, however, should not exceed 3,500 feet per minute with 36-inch pulleys. The number of teeth should depend not only on the thickness of the saw, but also on the character of the timber to be sawed and the speed and feed of the mill. Gullet teeth are preferable for all except very hard woods, and they should not be too close together. Consult Bale, M. P., 'Woodworking Machinery' (London 1914); Hasluck, P. N., 'The Wood-Turner's Handy Book' (London 1910); U. S. Vocational Education Board, 'Factory Woodworking Trades' (Washington 1919).

**WOODBERRY**, wüd'bër-ī, George Edward, American critic and poet: b. Beverly, Mass., 12 May 1855. He was graduated from Harvard in 1877, became professor of English in the University of Nebraska in 1878-79, was on the *Nation* staff in 1879-80, was again at Nebraska, and subsequently, until 1891, was in active literary work, holding the literary editorship of the *Boston Post*, and contributing much to the *Atlantic*. From 1891 until his resignation in 1904 he was successively professor of literature and of comparative literature (from 1899) in Columbia University. He became known as an authoritative critic, and a poet of much distinction, and must be ranked among the most scholarly and important of the more recent American litterateurs. The titles of his works include 'A History of Wood-Engraving' (1883); a very valuable 'Life' of Poe (1885); 'American Men of Letters'; 'The North Shore Watch, and Other Poems' (1890); 'Studies in Letters and Life' (1890); 'The Heart of Man' (1899); 'Makers of Literature' (1900); 'Nathaniel Hawthorne' (1902); 'American Men of Letters'; 'Collected Poems' (1903); 'America in Literature' (1903); 'North Africa and The Desert' (1914); 'The Flight, and Other Poems' (1914). He also edited the poetical works of Shelley (4 vols., 1892); Poe's works (1894; with Stedman); Lamb's 'Essays of Elia' (1892); Aubrey de Vere's 'Select Poems' (1894); 'National

Studies in American Literature' (4 vols., 1899-1900); Columbia University Studies in Comparative Literature' (9 vols., 1899-1903); 'Bacon's Essays' (1900); Sidney's 'Defense of Poesie' (1908); 'European Years; Letters of an Idle Man' (1911); 'New Letters of an Idle Man' (1913).

**WOODBINE, N. J.**, borough in Cape May County, 48 miles southeast of Philadelphia, Pa., on the Pennsylvania and the Atlantic City Railroads. It is the seat of the Baron de Hirsch Agricultural School. There are garment factories and an iron foundry. Pop. about 2,399.

**WOODBIDGE, Frederick James Eugène**, American educator and philosophical scholar: b. Windsor, Ontario, Canada, 26 March 1867. He was graduated at Amherst College in 1889, at the Union Theological Seminary, New York, in 1892, and studied at the University of Berlin in 1892-94. He became a member of the faculty at the University of Minnesota in 1894, and held the chair of philosophy there in 1895-1902. He was appointed professor of philosophy at Columbia University in 1902, became Johnsonian professor of philosophy there in 1904, and since 1912 has also been dean of the faculties of political science, philosophy, pure science and fine arts. He was prominently connected with the neo-realism movement in philosophy. He is editor of the *Journal of Philosophy, Psychology and Scientific Methods*, and of the *Archives of Philosophy*; has contributed to scientific periodicals, and is author of 'The Philosophy of Hobbes' (1903); 'The Purpose of History' (1916).

**WOODBIDGE, William**, American politician: b. Norwich, Conn., 20 Aug. 1780; d. 20 Oct. 1861. He removed with his father to Marietta, Ohio, in 1791, but studied law at Litchfield in his native State, and in 1806 was admitted to the Ohio bar, becoming a member of the Ohio assembly the next year. A State senator 1808-14, as well as county attorney, he was appointed secretary of Michigan Territory in 1814, was territorial delegate to Congress 1819-20, and judge of the Supreme Court of the Territory 1824-32. In 1837 he became a State senator, was governor of Michigan 1839-41, and a United States senator 1841-47. Consult Lanman, Charles, 'Life of William Woodbridge' (Washington 1867).

**WOODBIDGE, N. J.**, township, Middlesex County, on Staten Island Sound, and on the Central New Jersey and the Pennsylvania railroads, about 25 miles southwest of New York. It has regular steamer connection with New York. It has valuable deposits of fire-clay, and the chief industrial establishments are brick, tile and drain pipe works. The township contains several villages. It has a high school, established in 1876, public and parish graded schools and a public library. Pop. about 8,948.

**WOODBURN, James Albert**, American educator and historian: b. Bloomington, Ind., 30 Nov. 1856. He was graduated at the Indiana State University in 1876; taught in the preparatory department of that university from 1878 to 1886; from 1889 to 1890 was Fellow in history at Johns Hopkins University; and since 1890, has been professor of American history in the University of Indiana. He has written 'Higher Education in Indiana' (1890); 'Causes of the

American Revolution' in 'Johns Hopkins University Studies' (1891); 'The Historical Significance of the Missouri Compromise, in 'Reports of the American Historical Association' (1893); 'The American Republic and Its Government' (1903); 'Political Parties and Party Problems in the United States' (1903; rev. ed. 1914); the article 'United States — Political Events of the Civil War,' in the *ENCYCLOPEDIA AMERICANA*, etc. He has also edited (with Prof. C. W. Hodgin) 'Select Orations of Burke and Webster' (1892); Lecky's 'American Revolution' (from Lecky's 'England in the Eighteenth Century'), with bibliography and notes; 'American Political History' from Prof. Alexander Johnston's articles in Lalor's 'Cyclopedia of Political Science and United States History' (4 vols.), etc.

**WOODBURY, Charles Herbert**, American artist: b. Lynn, Mass., 14 July 1864. He was graduated at the Massachusetts Institute of Technology in 1886, and studied art in Paris at the Julien Académie under Boulanger and Lefebvre. He later established himself in Boston, where he became well known as a painter of marines. He was elected to the National Academy of Design in 1907; was awarded medals at the expositions held at Paris, Buffalo, Saint Louis and Buenos Aires; received a gold medal at Atlanta in 1905 and a gold medal and medal of honor at San Francisco in 1915. Among his works are 'The North Atlantic (Worcester Museum); 'The Sea' (Indianapolis Art Association); 'The Cliff' (Carnegie Institute, Pittsburgh); 'The Forest'; 'On a Lee Shore,' etc.

**WOODBURY, wud'būr-ri, Daniel Phin-cas**, American soldier and military engineer: b. New London, N. H., 16 Dec. 1812; d. Key West, Fla., 15 Aug. 1864. He was graduated from West Point in 1836 and was appointed second lieutenant of artillery. He was not long afterward transferred to the engineers and became first lieutenant in July 1838. After service to 1840 in constructing the Cumberland Road in Ohio, he took charge until 1847 of repairing works on the Atlantic Coast. He was in charge of construction at Forts Kearny and Laramie till 1850 and on the North Carolina Coast till 1856. He became captain of engineers 1860, major 6 Aug. 1861, lieutenant-colonel Sept., and brigadier general of volunteers 19 March 1862. At the opening of the Civil War he was assigned for engineer duty in the Army of the Potomac and was active in planning the defenses of Washington. He controlled all the engineering operations in the siege of Yorktown and those before Richmond, and his prompt action at the battle of Fredericksburg in bridging the Rappahannock, won for him the brevet of brigadier-general in the regular army. While in command of the Key West District he died of yellow fever. He published 'Sustaining Walls' (1845); 'Theory of the Arch' (1858).

**WOODBURY, Levi**, American jurist: b. Francestown, N. H., 22 Dec. 1789; d. Portsmouth, N. H., 7 Sept. 1851. He was graduated at Dartmouth in 1809, studied law, was admitted to the bar in 1812, and practised his profession at Francestown till 1816, when he was elected clerk of the State senate. In 1817 he was appointed a judge of the Superior Court, and

he was elected governor of New Hampshire in 1825 represented Portsmouth in the state legislature and became speaker of the same. He sat in the United States Senate 5-31, and on the expiration of his term elected in March 1831 to the State senate, declined the offer in order to accept that of the Navy, to which he had been elected by President Jackson. In July 1834 transferred to the office of Secretary of the Treasury, which he retained during the remainder of President Jackson's second term, and the whole of President Van Buren's administration, retiring on the inauguration of President Harrison 4 March 1841. In this period the post of chief justice of the superior Court of New Hampshire was offered him, but was declined. In 1841 he was returned to the United States Senate, but declined in 1845 on account of his appointment as justice of the United States Supreme Court an office which he held until his death. He was a highly influential member of the Democratic party and at the time of his death was considered its most likely Presidential nominee. Consult Capen, N. (ed.), 'Political, Social and Literary Writings of Levi Woodbury' (Boston 1852).

**WOODBURY**, N. J., city, county-seat of Sussex County, on the Delaware River, and on the West Jersey and Sea Shore (Pennsylvania) Railroad, eight miles south of Philadelphia. The chief industrial establishments are glass factory, chemical works, piano and machine shops. Woodbury ships large quantities of fruit and vegetables. There are churches, a high school, public and private schools, and the Deptford Institute Free School. The local banks have a combined capital of over \$300,000. Pop. about 4,642.

**WOODBURYTYPE PRINTING**, a process of obtaining by means of photography a copy of an illustration for press printing. This was invented by W. B. Woodbury, and is the only photo-mechanical one which, in the operation of the press, realizes the gradations of tone and grain or texture of any kind. The process emanated from the carbon process in which the picture is formed in all its tones by various thicknesses of pigmented paper; the shadows, representing the greatest darkness, being in relatively high relief, and the lights the lowest. Mr. Woodbury conceived the idea of making an electrotype mold from a carbon picture and using the mold so obtained as a printing surface by covering it with warm pigmented gelatine and by flatly attaching a sheet of paper to the pigmented surface that when the gelatine jelly was set and detached it from its mold and thus by the operation obtain unlimited copies. As practically the Woodburytype; but of course there were difficulties and imperfections, the inventor quickly set to work to overcome them. He found that a thick film of gelatine chromate, when exposed under a negative and washed, gave a very high, sharp relief; he also found that when this relief was made dry it possessed the property of being nearly incompressible, in other words, it was as hard as steel and could be used as a die. The relief film of gelatine was placed on a

block of smooth, hardened steel, with raised edges, upon this was laid a sheet of type metal or lead about a quarter of an inch thick and the arrangement was then placed under a hydraulic press capable of exerting a pressure of about 40 hundredweight to the square inch. The pressure forced the lead into the gelatine image with such accuracy that every shade and detail of the relief was impressed. The raised edges round the steel block prevented the metal from squeezing out and on being detached, a mold in lead was obtained which could be used as a printing surface for thousands of copies. The seemingly delicate relief in gelatine was quite uninjured by this treatment, and would serve for any number of further pressed molds.

The printing press for these pictures is special, resembling the copperplate process in principle. It is formed of a cast-iron base, on which is fitted a movable table to hold the mold, which is bedded down with gutta serena; over the table is a hinged lid, faced with plate-glass, with a lever attachment for giving the pressure. The printing ink is a solution of gelatine in a hot state to which a pigment is added to give any desired tint. In printing, the lead mold is first oiled to prevent the gelatine sticking, and a pool of the warm ink is poured on to the middle of the mold; over this pool is laid a sheet of paper waterproofed with shellac, and the lid of the press is brought down over the whole, and pressure applied. The pressure squeezes out over the edges of the mold all superfluous ink, and all that is left is that retained in the graduated hollows and depressions of the lead mold; the warm ink sets in a few minutes, and on opening the press the paper support is removed with its gelatine copy of the molded picture firmly attached to it.

**WOODCHAT**, wūd'chat, a bird which, notwithstanding its name, is not a chat, but a shrike, and belongs to the genus *Lanius rutilus*. Its whole length is about seven and one-half inches. The upper parts are mostly black, under parts white, with some white on head, wings and tail; crown of the head and nape of the neck rich chestnut-red. The woodchat is abundant in southern Europe; and it is an African bird, being found from the Mediterranean to the Cape of Good Hope at all seasons of the year.

**WOODCHUCK**, or **GROUND-HOG**, an American marmot (*Arctomys* or *Marmota monax*), 18 to 24 inches long, grizzled above and chestnut red below, the feet and tail blackish. It is found from Hudson Bay to South Carolina, and west to the neighborhood of the Rocky Mountains, several distinct sub-species and varieties appearing in this wide range. It digs deep holes in the fields, on sides of hills, or under rocks in the woods, in a slanting direction, at first upward to keep out the water, with several compartments, and usually with more than one entrance. It passes the winter in the burrow, in a dormant state. The digging is effected by the powerful fore feet, assisted by the teeth, the dirt being thrown backward under the belly and then kicked out by the widespreading hind feet. The food consists of various plants, fruits and vegetables; they are especially fond of red clover,

often doing great mischief to this crop and to garden; another favorite food is celery.

Woodchucks feed chiefly during the early morning and late afternoon and spend most of the remaining time lying in the sun or sleeping in the nests at the bottom of their burrows. They become extremely fat and retire to hibernate on the first intimation of approaching winter and only appear after the snow is gone in the spring. A large brood of young is born in the spring or early summer and when a few months old they are forced to leave the burrow and to shift for themselves. The woodchuck is generally a bold and unsuspecting creature, but has alert senses and where much persecuted may become vigilant. When driven to bay it may fight with considerable courage and effectiveness. Its chief natural enemies are foxes and skunks, but the animal remains generally abundant in both cultivated regions and woodlands in the New England and Middle States. Consult Ingersoll, Ernest, 'Wild Neighbors' (New York 1898); Seton, E. T., 'Life Histories of Northern Animals' (New York 1909); Stone and Cram, 'American Animals' (new ed., ib. 1914).

**WOODCOCK**, any of several birds, particularly certain snipe-like birds of the family *Scolopacidae*. The American woodcock, duck snipe, hog-sucker, big-headed snipe, mud snipe, etc., as this bird is variously named by gunners, is the *Philohela minor* of ornithologists. The body is full and robust; the wings short and rounded; the head and eyes very large, and the bill straight; tapering from the stout base, grooved for nearly the entire length and exceedingly sensitive at the end; there is practically no gape; the ear is situated beneath the eye; the legs are very short for a snipe and the tibiae are fully feathered. The woodcock is 10 or 12 inches long and weighs from seven to nine ounces, the females being the larger. The colors are a soft harmonious blending of various shades of brown and gray, with black mottling above, nearly uniform pale brown below. Except that it invades Ontario and other southern provinces of Canada the woodcock seldom ventures beyond the limits of the eastern half of the United States at any season. In winter it migrates to the South Atlantic and Gulf States, but most of them breed in the central and northern States. Migration northward begins very early and many of the more hardy individuals reach the Middle and New England States in early March before the frost has left the ground. At such times, and also in the late fall, they secure their food, consisting of insects and their larvae, snails, etc., by turning over fallen leaves, but during the summer and whenever the ground is sufficiently soft they probe it with their long sensitive bills and with great skill extract the earthworms which constitute their chief food, and of which enormous quantities are consumed. They frequent bogs and swampy places along alder-crown streams, hillside springs, etc., during the summer; but in the autumn forsake these coverts for cornfields and the undergrowth of low woods, the surest indication of their presence being their perforations in the soft earth. Few birds are more uncertain in the choice of their feeding grounds, changing

from high to low as the weather varies from wet to dry. Their solitary habits are no doubt the result of the character of their favorite food, to obtain which they not infrequently search city lawns after nightfall. As the large size of the eye suggests, the woodcock is crepuscular and nocturnal, the period of its greatest activity being in the hours immediately succeeding sunset and preceding dawn, though, especially when moonlight, it may be abroad throughout the night. During the day it remains hidden in deep bogs and thickets, rising only when forced and then springing perpendicularly above the bushes it flies in an irregular course for a short distance and drops as suddenly to the ground and its concealment.

Mating takes place as soon as the sexes meet in the spring and is followed in April or even earlier by the building of a simple nest of leaves and grass in a dry and well concealed spot in a bog. Four or sometimes five buff or clay-colored eggs variously spotted with dark brown and lilac are laid, and after three weeks of incubation yield the fluffy, brownish-white young, which at once leave the nest led by the old birds to the feeding grounds. The love antics and nuptial flights of the male are curious and interesting. In the former he is a diminutive of a turkey cock; in the latter he mounts in the darkness of night on swift wing high in the air above a wet meadow, then falls like a shot with a whistling sound as the air rushes through his tail and wing-quiets. He has also a simple whistling vocal note. The female especially is very solicitous in the care of her young and not only feigns injury in order to entice an intruder from their vicinity but frequently has been observed to bear them one by one between her thighs to a place of safety. Later in the summer the members of a family scatter to feed singly in their home-bog and with the advance of fall seek the uplands as above described. With the coming of hard frosts most of the woodcock leave for the South and become concentrated in favorite bottoms along the lower Mississippi and other sections of the Gulf States. There and at this time the outrageous practice of fire-hunting is indulged in, chiefly by negroes and market hunters. One person bears a torch which lights the ground and confuses the birds which are often killed in great numbers by a second person with gun or club as they crouch confused on the earth. It is to this practice, as well as to the equally to be condemned spring and early summer shooting still permitted in some of the northern States, that the almost threatened extinction of this fine bird in many parts of the country is to be largely traced. Among natural enemies of the woodcock are mink, hawks, owls, red squirrels, cats and snakes.

Next to the quail the woodcock is probably the most popular game bird of the eastern United States, and deservedly so, but its numbers have greatly decreased since about 1880. To save it all gunners should unite in abolishing spring and summer shooting and in restricting the great destruction which takes place in the Gulf States during the winter by the absolute prohibition of fire-hunting and similar barbarous methods. In every respect fall hunting is the most delightful sport and the birds are then in the best condition for

2. Most gunners prefer a cocker or snipe for flushing the birds from thick cover and much the same style of gun and ammunition as quail shooting requires. The ideal woodcock shooter must be a quick and accurate shot, for these birds are as changeable as the Wilson's snipe in their moods, and require great difficulties. When in cornfields the gunner sometimes stands on an elevated platform so that he can shoot the stalks among which his dogs are

working. European woodcock, which occasionally occurs in this country, is a much larger species and belongs to the genus *Scolopax*, which has long pointed wings, in which the outer feathers are neither much shortened nor attenuated. Its color is a brown of various shades, the darkest hue on the back, while the underparts are black above, tipped with gray. Their appearance is very similar to those of the American woodcock. Consult Lewis, 'American Sportsman' (Philadelphia 1868); Fisher, 'Year-Book of the United States Department of Agriculture' (1901).

**WOODEN WALL**, the side of a ship; the wall of a city. When Athens was in danger from the Persians 483 B.C., the invasion of Xerxes, the oracle at Delphi was consulted, and, intimating that the Athenian country were doomed to ruin, added that when all was lost, a wooden wall should be built to shelter her citizens. The Athenian young man Themistocles, who had probably influenced the oracle to utter the prediction or had given it, was of the same opinion; as put in the navy and the result was the victory of Salamis. It was from this that the expression, "The wooden walls of Athens," arose.

**WOODFALL, Henry Sampson**, English journalist: b. London, 21 June 1793; d. there, 12 Dec. 1805. From about 1819, when he disposed of his interest in the *Public Advertiser*, he conducted the *Public Advertiser*, among the contributors to which was Sir Francis (q.v.). He printed the 'Letters to Junius' (see JUNIUS), which have been commonly assigned to Francis. Woodfall, however, on record as stating that he definitely printed Francis' "never wrote a line of Junius." In the Junius letter to the king had appeared in the *Advertiser*, Woodfall was prosecuted for libel by the Crown, but the verdict was practically one of acquittal. In Woodfall was master of the Stationers' Company. The *Advertiser* ceased to exist in

**WOODFORD, Steward Lyndon**, American diplomat: b. New York, 3 Sept. 1835; d. there, 18 Dec. 1893. He was graduated at Columbia in 1857 and admitted to the bar three years later, beginning practice in his native city in 1857. He served in the Federal army 1862-65, being period military commandant of Charles Id. Savannah, and becoming brevet major-general of volunteers. He was lieutenant-governor of New York 1866-68, but in 1868 he was the Republican candidate for governor and defeated. A member of Congress 1873-75, representing the southern district of New

York 1877-83, he subsequently engaged in private practice, but was appointed Minister to Spain in 1897, returning to the United States the next year on the opening of the Spanish-American War. He was president of the commission in charge of the Hudson-Fulton Celebration in New York in 1909.

**WOODHULL, Alfred Alexander**, American brigadier-general: b. Princeton, N. J., 13 April 1837. He was graduated at Princeton, from which he received the degree LL.D. also, and from the University of Pennsylvania as M.D. He served through the Civil War in various medical and surgical offices, and in March 1865 he was brevetted captain, major and lieutenant-colonel "for faithful and meritorious services." He has since filled many other offices in the surgical department of the army, and by Act of 23 April 1904 he was advanced to the rank of brigadier-general, retired. He lectured on personal hygiene and general sanitation at Princeton 1902-07, and has been the author of several medical works, especially 'Military Hygiene' (1890, 1898, 1904, 1909), and 'Personal Hygiene' (1906).

**WOODHULL, John Francis**, American university professor: b. Westport, N. Y., 2 July 1857. He was graduated at Yale, studied at Johns Hopkins and received Ph.D. from Columbia. He was teacher and principal in secondary schools 1881-85; professor of natural sciences at the New York State Normal School 1887; professor physical sciences, Teachers' College, Columbia, 1888-; member of the University Council of Columbia 1899-1902. He is a lecturer and author; some of his books being 'Physics' (1900); 'Simple Experiments in Chemistry' (1905); 'Physical Nature Study Library' (1906); 'Electricity and Its Everyday Uses' (1911).

**WOODHULL, Maxwell**, naval officer: b. New York, 2 April 1813; d. 19 Feb. 1863; only son of the founder of Williamsburgh, Long Island, Richard Miller Woodhull. He entered the navy 4 June 1832, and after service in the Mediterranean, on the coast of Africa, at Brazil, and in the Gulf of Mexico, he engaged in the survey of New York Harbor, made plans for removal of obstructions from Hell Gate, and executed surveys on the New England Coast. In the Civil War, with rank of commander, 1 July 1861, he organized the supply service for the blockading fleet, commanded a division of the James River flotilla in the Peninsular campaign, was later attached to Admiral Wilkes' flying squadron in Florida waters, and after being ordered North was accidentally killed.

**WOODLAND, Cal.**, city, county-seat of Yolo County, on the Southern Pacific Railroad, about 85 miles northeast of San Francisco, and 18 miles north of Sacramento. It is in an agricultural region, in which wheat and grapes are among the chief products. Many sheep are raised in Yolo County. The chief industries are connected with raising and shipping grapes, and shipping wheat, fruit, barley, wool and livestock. The educational institutions are Holy Rosary Academy (Roman Catholic), Hesperian College (Disciples of Christ), opened in 1861, a high school established in 1895, graded elementary public and parish schools and a public library. The city has several

banks with deposits amounting to about \$2,000,000. The commission form of government is in operation. Pop. about 3,187.

#### WOODLAND AREA OF THE UNITED STATES. See LUMBER INDUSTRY OF THE UNITED STATES.

**WOODMEN OF AMERICA, Modern,** a fraternal beneficiary society instituted at Lyons, Iowa, 5 Jan. 1883, by Joseph Cullen Root, who served as its president until November 1890. It affords life insurance to its members and pays to the designated beneficiary on the death of a member the amount designated in the certificate or policy held, the maximum being \$3,000. Available statistics indicate a membership of 1,082,255; benefits disbursed since organization, \$210,251,048.53; benefits disbursed in a recent fiscal year, \$14,750,000. The society maintains a sanatorium for the treatment of tuberculosis. The head consul's office is at Lincoln, Neb.; the head clerk's office at Rock Island, Ill. The recognized women's auxiliary of the Modern Woodmen of America is the Royal Neighbors of America, which has a membership of about 375,000.

**WOODMEN OF THE WORLD, Sovereign Camp.** The Sovereign Camp of the Woodmen of the World was organized in Omaha, June 1890, by the founder, Joseph Cullen Root, in conjunction with John T. Yates, B. W. Jewell, F. F. Rouse, F. A. Falkenburg and W. O. Rodgers. The Woodmen of the World, Sovereign Jurisdiction, includes all of the United States except the eight States on the Pacific Coast. It is a beneficiary society affording life insurance to members thereof and has a membership approximating 1,000,000, carrying \$1,263,547,700 insurance and erects a monument at the grave of every member; provides 70-year old benefits and has a juvenile class insurance. The Woodmen Circle is the recognized women's auxiliary of this order and has a membership of 225,649. The headquarters of the society are located at Omaha, Neb., where they have erected an 18-story office building, costing \$1,500,000, the institution occupying the greater part of the building for headquarters.

**WOODPECKER,** a bird of the family *Picidae*, one of the most sharply defined families of birds which, with the related *Picumnidae* and *Tyrannidae* form the natural order *Piciformes*. These birds have a unique type of bony palate (saurognathous) especially characterized by the separation of the vomer into a pair of splint-bones; the fourth toe is reversed permanently so that it forms a pair with the hallux, which, however, is occasionally absent. The *Picidae* are distinguished by the acute, rigid and bristly character of the tips of the five well-developed pairs of tail-quills, the outer or sixth pair being rudimentary. In typical woodpeckers the head is large, the neck slender but very powerful, the bill stout, straight, chisel-pointed, and often strengthened by longitudinal ridges, the nostrils protected by a thick screen of bristly feathers, and the feet very powerful, with short stout tarsi, strongly hooked claws and rough scales. The tongue is slender and flexible, with a barbed, hard tip in most cases, and the posterior hyoid "horns" curving up over the rear of the skull

into sheaths of muscle. This tongue is provided with muscles for projecting it far beyond the tip of the bill. This arrangement enables these birds to explore deep recesses for insects, and even to drag larvae from their burrows by means of the barbed tip and the adhesive secretion which the tongue receives from the greatly developed salivary glands.

The woodpeckers are a large group, 45 genera and 350 species having been enumerated in 1890. Except Australian, Madagascar and certain groups of the Polynesian Islands they inhabit the forest-clad regions of the entire globe. Their food, which consists to a great extent of the long-lived wood-boring larvae, makes them largely independent of seasons, and they are, with some exceptions, little migratory and are equally at home in far northern and tropical forests. A few woodpeckers, like *Colaptes* (see *FLICKER*), robin-like, search for worms and insects on the ground, and these have weaker, slightly curved rounded bills and smaller heads. Some, as the sapsuckers (*Sphyrapicus*), drill the outer bark of rosaceous trees and lap the flowing sap with their bristle-brushed tongues or, like the redhead woodpecker, peck the ripest apples, green corn and other sweet and succulent vegetables. But the great majority are strictly insectivorous and perform an invaluable service to human kind by their enormous destruction of a class of pernicious insects largely beyond artificial attack. In searching for insects woodpeckers usually begin at the very base of a tree trunk, move spirally upward supported by their strong feet and bracket-like tail, peering into every crevice, pausing occasionally to tap the bark, then remain in an attitude of apparent intense listening and move on. From time to time they peck the bark with hammer-like blows delivered with intense energy, which make the chips fly rapidly and soon expose the larva whose presence within had apparently been detected by the bird's keen sense of hearing. As soon as one tree is sufficiently explored they go to another, but often spend a long time searching and drilling a decayed limb or stump much infested with insects. Woodpeckers have a very characteristic undulating or galloping flight which is seldom much arrested. Their nests are in holes drilled themselves first horizontally then vertically downward and chambered in the usually decayed limb or hole of a tree or suitable substitute. The eggs are always with a highly polished porcelain-like surface, are usually numerous, and are deposited in a few wood chips at the bottom of the nest. Woodpeckers are unmusical, their typical song being a loud harsh rattling cry, laugh, combined with a loud drumming on resonant branches. Except during the nesting season they are usually silent and are not migratory birds.

About one-half of the known species are American and eight genera and sub-species enter the United States, a number of racial forms being confined to the extreme Southwest. As their habits are pretty closely to the account just given a few representative forms need be

is the magnificent ivory-billed (*Campycolaptes principalis*), the of all the attributes of wood-and structure. (See IVORY-BILL), duller colored, but generally close of the ivory-bill is the paleated (*Ceophylax pileatus*), of similar only less quickly affected by the agencies of man. Its original ver, was much wider, but it is now very rare and wary inhabitant of oods. It is about 17 inches long, lack and the fourth toe is peculiar ch shorter than the hallux. *Dryoc-*es numerous species of small and ise with the plumage variously spotted with black and white, the a red head-patch which the females familiar nearly resident species of t and orchard are the little downy ger hairy woodpeckers (*D. pubes-*. *villosus*). A more southern and pecies is *D. borealis*, the red-cock- pecker, while the West has *D. nuttallii* and *D. arizonae*. *Xeno-*ns the noteworthy *X. albolarvatus*, a completely white head; while still more noteworthy in the entire the hallux. Two or three species -toed woodpeckers (*P. arcticus*, *P.* etc.), inhabit the northern parts mountains of North America, and r in Eurasia. Besides the much ck and white the plumage shows and brown. The remaining North pecies are less typical in structure First of them is the handsome and red-headed woodpecker (*Melan-*ocephalus), locally a common bird timber everywhere east of the ntains, except in New England. it is resident, northward migratory vegetarian than most woodpeckers, des insects, which it sometimes ng, nuts, berries, green corn and search of which it haunts the The California woodpecker (*M. s*), as its name indicates, finds rite article of diet, but also eats and acorns, and has a remarkable oring vast quantities of the latter id holes, often completely studding f tall trees with acorns wedged in sometimes using the space behind s of houses for storage. Much has been indulged in concerning ut the fact is that these birds are and but few of the acorns or the rubs thus stored are ever utilized The eastern red-head stores up regularly. This genus also in- other western species and the red- pecker (*M. carolinus*) chiefly of stern United States. -sucking habit and the peculiar f the tongue of *Sphyrapicus* have d to above. The eastern species, bellied woodpecker (*S. varius*), is own sap-sucker, whose rows of etely encircling the trunks of es are so familiar. In the West *halis*, *S. ruber* and *S. thyroideus* genus *Colaptes* contains the hand-

some ground-woodpeckers or flickers (q.v.), which, while retaining much that is picine in structure and habit, in other respects depart widely.

The Old World woodpeckers for the most part belong to the typical groups of genera, but three-toed woodpeckers are found in Europe and Asia and in the Malayan Islands, the latter being a peculiar crested genus (*Ganropicoides*). A ground woodpecker (*Geocolaptes olivaceus*) of South Africa is gregarious and remarkable from its habit of nesting, kingfisher-like, in holes in banks. The related wrynecks (*Tyrannidæ*), confined to the Old World, have the general aspects of larks, with soft broadly webbed tail feathers, but their feet and other anatomical parts and their habits, as well, are those of the woodpeckers. However, they nest in natural holes in trees or banks and often seek their food on the ground. The *Picuwidæ* have short tails with feathers of the ordinary structure. They are mostly diminutive insectivorous birds, chiefly confined to tropical America.

Consult Malherbe, 'Monographie des Picidées' (Metz 1862); Evans, 'Birds' (London 1900); Eckstorm, 'The Woodpecker' (Boston 1901); Coues, 'Key to North American Birds' (Boston 1903); Beal, 'Food of Woodpeckers,' Bulletin 37, United States Department of Agriculture (Washington 1911).

**WOODROW**, wud'rô, James, American Presbyterian clergyman and college president; b. Carlisle, England, 30 May 1828; d. Columbia, S. C., 17 Jan. 1907. He was graduated from Jefferson College, Canonsburg, Pa., in 1849, subsequently studied at the Lawrence Scientific School at Harvard, and at the University of Heidelberg. He was professor of natural science in Oglethorpe College, Ga., 1853-61, entered the Presbyterian ministry in 1860 and was Perkins professor in the Presbyterian Theological Seminary, Columbia, S. C., 1861-84. From 1891 to 1897 he was president of South Carolina College.

**WOODRUFF**, Charles Edward, American army surgeon and ethnologist; b. Philadelphia, Pa., 2 Oct. 1860; d. 13 June 1915. He was graduated at the General High School of Philadelphia in 1879, studied at the United States Naval Academy in 1879-83, and was graduate at Jefferson Medical College in 1886. He became an assistant surgeon in the navy in 1886, but in 1887 was transferred to the army. He was on duty in the Philippine Islands in 1890, 1902-04, and in 1909-10, and attained the rank of lieutenant-colonel. In 1913 he was retired. He was subsequently chief health officer at New Rochelle, N. Y. He was author of about 75 monographs and of 'The Effects of Tropical Light on the White Man' (1905); 'Expansion of Races' (1909); 'Medical Ethnology' (1915).

**WOODRUFF**, Clinton Rogers, American municipal reformer; b. Philadelphia, Pa., 17 Dec. 1868. He was graduated at the University of Pennsylvania in 1889 and received the degree of LL.D. there in 1892. He was counsel of the Philadelphia Municipal League in 1891-1903, and in 1903-04 he was special Indian commissioner for the investigation of alleged frauds. He served in the Pennsylvania Legislature

two terms and fathered the "personal registration" amendment to the Pennsylvania Constitution. In 1906 he was appointed president of the board of personal registration commissioners for Philadelphia. He later served as secretary of the National Municipal League, and in 1917 he was appointed to the advisory committee of the National Council of Defense. He edited the *Proceedings of the National Conference for Good City Government* in 1894-1911, and is editor of the *National Municipal Review*. He has published 'City Government by Commission' (1911).

**WOODRUFF, Wilford**, American Mormon leader: b. Northington (now Avon), Conn., 1 March 1807; d. Salt Lake City, Utah, 3 Sept. 1898. He adopted the Mormon faith in 1833 and in subsequent years made missionary tours to England, and in the eastern States. He was one of the Mormon emigrants to Salt Lake City; became one of the 12 apostles in 1839; and in 1887 was elected president of the Mormon Church. For 22 years he held a seat in the Utah legislature.

**WOODRUFF**, wüd'rûf, or **WOODROOF**, plant of the genus *Asperula* and natural order *Rubicaceæ*, with whorled leaves, native of northern parts of the old world, and distinguished by a funnel-shaped or bell-shaped corolla, a bifid style, capitate stigma, and dry didymous fruit. The sweet woodruff (*A. odorata*) is common in shady woods in all parts of Europe. It has a creeping root, a stem five to 10 inches long, weak and sub-erect, four or five whorls of lanceolate leaves, six to eight in the whorl rough at the edge and keel, and small white flowers. The plant when dried has a very agreeable fragrance, similar to that of *Anthoxanthum odoratum* under similar circumstances. It forms an agreeable herb-tea, and enters into the composition of the popular *Maydrink* of the Germans. Dyer's Woodruff (*A. tinctoria*) is a native of the continent of Europe and of Siberia, a perennial, with reclining stems about 12 inches long, whorls of six or four linear leaves, upper leaves opposite, flowers whitish. The root is used in Dalmatia and elsewhere instead of madder; but the crop obtained from a field is inferior in quantity to that of madder. For flavoring, the Germans in this country use the sweet-scented bedstraw (*Galium triflorum*), of the same family, and with odor much like that of woodruff; it is procumbent, the fruit hur-like, with hooked bristles, the flowers in threes, greenish; it is common in woods that have a rich soil.

**WOODS, Charles Robert**, American soldier: b. Newark, Ohio, 19 Feb. 1827; d. there, 26 Feb. 1885. He was graduated at the United States Military Academy in 1852 and was engaged in garrison and frontier service until 1861. He commanded the troops on the steamer *Star of the West*, in the attempt to relieve Fort Sumter in the April 1861, and was appointed colonel of the 76th Ohio volunteers 13 Oct. 1861. He saw service at Fort Donaldson, at Shiloh, the siege of Corinth and in the Vicksburg campaign, and was promoted brigadier-general of volunteers 4 Aug. 1863. He commanded a brigade at Lookout Mountain and Mission Ridge and a division in the Georgia and Carolina campaigns. He was

mustered out of the volunteer service 1 Sept. 1866, with brevet rank of major-general in the regular army and was transferred to the regular army. He was later engaged in the Indian warfare of the western plains. He was appointed colonel of the Second infantry 23 March 1874 and was retired from service in December 1874.

**WOODS, Frederick Adams**, American biologist: b. Boston, Mass., 29 Jan. 1873. He studied at the Massachusetts Institute of Technology in 1890-94 and took the degree of M.D. at Harvard University in 1898. He was connected with the faculty of the Harvard Medical School in 1898-1903, and since 1903 has been lecturer on biology at the Massachusetts Institute of Technology. He has published many papers on heredity and the volumes 'Mental and Moral Heredity of Royalty' (1906); 'The Influence of Monarchs' (1913), and is joint author of 'Is War Diminishing?' (1915).

**WOODS, Katherine Pearson**, American novelist: b. Wheeling, W. Va., 28 Jan. 1853. She was educated in private schools in Baltimore. During 1893-94 she held a fellowship under the College Settlement Association and published the report of investigations during that period in the *American Journal of Statistics* (December 1895.) She engaged in missionary work among the whites of North Carolina from 1903-06. Her published works include 'Metecroft Shoemaker'; 'Mark of the Beast'; 'A Web of Gold'; 'From Dusk to Dawn'; 'A Tale of King Messiah'; 'The Son of Ingar'; 'The True Story of Captain John Smith'; and many magazine articles.

**WOODS, Leonard**, American Congregational clergyman: b. Princeton, Mass., 19 June 1774; d. Andover, Mass., 24 Aug. 1854. Graduated at Harvard in 1796, he studied theology at Somers, Conn., as a pupil of Dr. Charles Backus, in 1798 was ordained pastor of the church at Newbury, Mass., and upon the establishment of the Andover Theological Seminary in 1808 was made professor of Christian theology there. In 1846 he retired from the active duties of the chair. He was a strict Calvinist, well-versed in metaphysical studies, a clear and vigorous writer and a champion of the New England theology against Ware, Bachminster, Channing and other Unitarians. "He is emphatically," says H. P. Smith, "the 'judicious' divine of the later New England theology." He was prominent in the founding of the Temperance Society, the American Tract Society, and the Board of Commissioners of Foreign Missions. Among his works are 'Life of Mrs. Harriet Newell' (1814); 'Letters to Unitarians' (1820); 'Lectures on the Inspiration of the Scriptures' (1829); 'Letters to the Rev. N. W. Taylor' (1830); 'Memoirs of American Missionaries' (1833); 'Examination of the Doctrine of Perfection' (1841) and 'Lectures on Church Government' (1843); 'Theology of the Puritans' (1851). **Consult** Foster, F. H., 'A Genetic History of New England Theology' (Chicago 1907), and Walker, Williston, 'Ten New England Leaders' (New York 1901).

**WOODS, Leonard**, American theologian and college president, son of Leonard Wood

54 (q.v.): b. Newbury, Mass., 24 Nov. 1807; d. Boston, Mass., 24 Dec. 1878. He was educated at Union College in 1827 and at the American Theological Seminary in 1830. He was professor of sacred literature at Bangor Seminary in 1836-39, and in 1839-66 he was professor at Bowdoin College. He edited the *Yankee and Theological Review*, New York, 1837-39; translated G. C. Knapp's 'Christianity' (2 vols., 1831-33), and was author of many valuable papers on the early history of Maine, contributed to the *Proceedings of the Maine Historical Society*.

**WOODS, Robert Archey**, American university-settlement worker: b. Pittsburgh, Pa., 9 Feb. 1865. He was graduated at Amherst University in 1887 and from Andover Theological Seminary in 1891, and made a European tour for the purpose of investigating social problems, spending several months at Toynbee Hall, London, and has been president of the South End House, a university settlement in Boston, since 1891. He lectured on social and industrial economics at Andover Theological Seminary (1890-95), and on social ethics at Episcopal Theological School, Cambridge (1914). In 1911 he became secretary of the National Federation of Settlements, and he was president of the National Conference of Social Work (1917-18). He is the author of 'The Social Movements' (1891); 'The City Wilderness' (1898); 'Americans in the West' (1902); and was joint editor of 'Book of Settlements' (1911); 'Young Men and Girls' (1913).

**WOODS, William Burnham**, American lawyer: b. Newark, Ohio, 3 Aug. 1824; d. Washington, D. C., 14 May 1887. He was graduated from Yale in 1845, was admitted to the Ohio bar in 1846, and was mayor of his native city in 1856-57. In the last-named year he was elected to the Ohio legislature and chosen speaker, at the outbreak of the Civil War entered the Union Army as lieutenant-colonel of the 76th Ohio regiment and was promoted brevet major-general, serving under Grant and Sherman. At the close of the war he took up his residence in Washington, D. C., was chosen chancellor of that State in 1870, appointed circuit judge of the Fifth Circuit in 1870, and in 1880 became an associate justice of the United States Supreme Court.

**WOOD'S HOLL, or WOOD'S HOLE**, a small inlet in the town of Falmouth (q.v.), in Washington County, on Buzzards Bay, and on the coast of New York, New Haven and Hartford Railroad. It has a large, deep harbor, and is known as the location of a station with the name of the United States Fish Commission.

**WOODSFIELD**, Ohio, village and county-seat of Monroe County, 100 miles southeast of Columbus, and on the Ohio River and Western Maryland Railroad. It is situated in an oil region, has many shops and several small manufacturing industries. Pop. about 2,502.

**WOODSTOCK**, Canada, the county-seat of York County, New Brunswick, charmingly situated on the left bank of the Saint John River and on the Canadian Pacific Railway, 15 miles from Fredericton. The industries include sawmills, tanneries, foundries, woodshops, etc. Pop. about 3,856.

**WOODSTOCK**, Conn., town in Windham County, about 40 miles northeast of Hartford and five miles northwest of Putnam. It contains six villages. The town is in an agricultural and stock-raising region. The chief industrial establishments are creameries and cotton twine factories. It has Woodstock Academy, graded schools and a public library. Woodstock belonged to Massachusetts when it was incorporated in 1690. In 1749 it was annexed to Connecticut. Pop. about 1,849.

**WOODSTOCK**, Ill., city and county-seat of McHenry County, on the Chicago and Northwestern Railroad, about 50 miles northwest of Chicago and 30 miles east of Rockford. It is in an agricultural and dairying section. It has flour and lumber mills, a creamery, typewriter works, planing mills, machine shops, pickle and canning works. The principal public buildings are the county courthouse, city hall and business blocks. It has several churches, the Todd Seminary for boys, the Chicago Industrial Home for Children, the Old Folks Rest Home, an armory, a high school, established in 1867, public elementary schools and a public library. Pop. about 4,331.

**WOODSTOCK**, Vt., town and county-seat of Windsor County, on the Ottaguechee River, and on the Woodstock Railroad, 38 miles south of Montpelier and 30 miles east of Rutland. It is in an agricultural and dairying region, and contains four villages. The chief industrial establishments are butter and cheese factories, sash, door and blind factories, flour and lumber mills. Other manufactures are hay-rakes, sleighs, wagons, carriages, butter tubs and cheese boxes. The town has several churches, graded grammar and elementary schools, and the Norman Williams Public Library, founded in 1885. Pop. about 2,545.

**WOODSTOCK**, Va., town and county-seat of Shenandoah County, on the north branch of the Shenandoah River, and on the Baltimore and Ohio Railroad, about 95 miles west of Washington, D. C., and 155 miles northwest of Richmond. It was founded in 1762. It is in an agricultural and stock-raising region, and its industries are connected chiefly with farm and dairy products and the marketing of livestock. It has several churches and graded schools for both races. Pop. about 1,200.

**WOODSTOCK**, a novel by Sir Walter Scott, published in 1826. It is an English tale of the time of Cromwell; the events occurring in the year 1652, immediately after the battle of Worcester. The scene is laid chiefly in the Royal Park and Manor of Woodstock.

**WOODWARD**, Calvin Milton, American educator: b. Fitchburg, Mass., 25 Aug. 1837; d. Saint Louis, Mo., 12 Jan. 1914. He was graduated at Harvard University in 1860 and was principal of Brown High School, Newburyport, Mass. (1860-65). During one year of the Civil War he was captain of Company A, 48th Massachusetts Volunteers, serving in Louisiana. In 1865 he was called to Washington University, Saint Louis; elected professor of mathematics and applied sciences (1870); dean of the school of engineering (1871-96) and was founder and director of the Saint Louis Manual Training School since its organization in 1879. Dr. Woodward's service to the cause

of education was marked by success along practical lines. He served as a member of the Saint Louis School Board (1877-79) and again after 1897; regent of the Missouri State University (1891-97) and in 1906 president of the American Association for the Advancement of Science. In 1909-10 he was also president of the North Central Association of Colleges and Secondary Schools; president of the Society for the Promotion of Engineering Education and was re-elected dean of the School of Engineering and Architecture (1901). In 1905 Washington University conferred upon him the degree of LL.D., and in 1908 he received the same honor from the University of Wisconsin. He contributed many valuable articles to educational and scientific journals and wrote 'History of the St. Louis Bridge' (1881); 'The Manual Training School' (1887); 'Manual Training in Education' (1890), etc. In the summer of 1910 he retired from the deanship and the last four years of his life were devoted to works of philanthropy and to the authorship and publication of his book upon 'Rational and Applied Mechanics.'

**WOODWARD, Robert Simpson**, American astronomer, physicist and mathematician: b. Rochester, Mich., 21 July 1849. He was graduated with the degree of C.E. at the University of Michigan 1872 and was appointed assistant engineer, United States Lake Survey. During 1882-84 he served as assistant astronomer to the United States Transit of Venus Commission; from 1884-90 he was astronomer, geographer and chief geographer to the United States Geological Survey, became assistant in the United States Coast and Geodetic Survey in 1890, and served for three years. From 1893-1905 he was professor of mechanics and mathematical physics at Columbia University, and from 1895 to 1905 was dean of the faculty of pure science. In 1905 he became president of Carnegie Institution, Washington, D. C. Dr. Woodward was president of the American Mathematical Society 1898-1900, American Association for the Advancement of Science 1900-01, New York Academy of Sciences 1900-02. In 1892 he received the degree of doctor of philosophy from the University of Michigan, and in 1904 the degree of doctor of laws from the University of Wisconsin. He has published many papers and addresses on astronomy, geodesy, mathematics and other scientific subjects. (See article EARTH in this Encyclopedia). He has written 'Smithsonian Geographical Tables' (1894); 'Higher Mathematics — a Text Book for Classical and Engineering Colleges' (1896 with Mansfield Merriman), etc.

**WOODWARD, Okla.**, city and county-seat of Woodward County, on the North Canadian River, 130 miles northwest of Oklahoma City, and on the Atchison, Topeka and Santa Fe and the Wichita and Northwestern railroads. A government agricultural experiment station is located here. There are a Carnegie library, Federal building, courthouse and school. The city is a shipping centre for wheat, corn, livestock and poultry. Pop. about 2,096.

**WOODWORTH, Robert Sessions**, American psychologist and physiologist: b. Belchertown, Mass., 17 Oct. 1869. He was graduated

at Amherst College in 1891, received the degree of A.M. at Harvard University in 1897, and that of Ph.D. at Columbia University in 1899, and later studied at the universities of Edinburgh, Liverpool and Bonn. He was demonstrator in physiology at the University of Liverpool in 1902-03, and was subsequently connected with the faculty of Columbia University, where since 1909 he has been professor of psychology. He was president of the American Psychological Association in 1914. He is joint author of 'The Elements of Physiological Psychology' (1911), and author of 'The Accuracy of Voluntary Movement' (1899); 'The Care of the Body' (1912); 'Dynamic Psychology' (1917), etc.

**WOODWORTH, wüd'wérth, Samuel**, American author and editor: b. Scituate, Mass., 13 Jan. 1785; d. New York, 9 Dec. 1842. He received a limited education in his native town and was apprenticed in Boston to Benjamin Russell, editor and publisher of the *Columbian Sentinel*. After the expiration of his indentures he published for a brief period at New Haven, Conn., the *Weekly Belles Lettres Repository*, and engaged in other literary pursuits, in which he continued with more or less success until the close of his life. He was one of the founders in 1823, in conjunction with George P. Morris, of the *New York Mirror*, from which he withdrew within a year. Among his writings were a number of dramatic pieces, and 'Champions of Freedom,' a romance of the War of 1812 (1816), but his reputation rests principally upon his songs and miscellaneous poems, one of which, 'The Old Oaken Bucket,' obtained a wide popularity. His collected poems were published by his son, with a memoir by George P. Morris (2 vols., 1861).

**WOOF.** See WEAVING.

**WOOL, wül, John Ellis**, American general: b. Newburgh, N. Y., 20 Feb. 1789; d. Troy, N. Y., 10 Nov. 1869. He was in early life proprietor of a bookstore in Troy, and his property being consumed by fire, he turned to the law, but his studies were interrupted by the war with Great Britain in 1812, when he became captain in the 13th infantry. He distinguished himself at Queenstown Heights, Plattsburgh and Beekmantown, and in 1816 was appointed inspector-general of the northern division. In 1818 lieutenant-colonel; in 1821 inspector-general of the whole army; and in 1825 brigadier-general for 10 years' faith. In 1832 the government sent him to examine the military systems of some of the principal nations. In 1836 he was charged with removing the Cherokee Indians to the west, and in 1838, during the Canadian rebellion, made a reconnaissance through the northern Maine, with a view to the opening of the frontier. He was appointed brigadier-general, 25 June 1841, and at the outbreak of the Mexican War was ordered to organize the volunteers, 30 May 1846, in less than six weeks dispatched to Mexico of war with 12,000 troops fully equipped. He selected the ground where he was fought the battle of Buena Vista, 23 Feb. 1847, commanded in the early part of the war and for his conduct on 17 Feb. 1847 brevetted a major-general in the regular army, and after return home in July 1848, he

military division, with headquarters at until October 1853, when he was placed in command of the department of the East, with headquarters at Baltimore. From 1854 to 1857 he was in command of the department of the Pacific and of the Eastern department from 1857-60. When civil war was imminent toward the close of 1860, he offered his services to the government, and after the attack on Fort Sumter went to New York to recruit, equip and send to Washington the 1st Regiment of volunteers. In August he went to Fortress Monroe as commander of the 2nd Department of Virginia, and from that time led an expedition which occupied Norfolk, Virginia, in July 1862. He was promoted to be full general in the regular army, 16 May 1862. The next year was placed on the retired list.

**WOOL.** Wool is the soft elastic fiber which grows on the domestic sheep. It so closely resembles the longer hairy fibres growing on the llama, Alpaca, Angora and Cashmere goats that these fibres are imported under the name of wool for commercial reasons.

Wool is shorn from the sheep ordinarily once each year; however, there are some sections in which it is thought desirable on account of continued hot weather to shear twice each year. The shearing season varies with climatic conditions but generally speaking it occurs once in the spring. In those sections where shearing is done twice each year, it is done once in the spring and fall. Most of the sheep in the large wool-producing sections of the world are shorn by machine clippers. The remainder are shorn by hand shears or "blades." Skilful shearers can shear very rapidly, sometimes with machine clippers handling more than 200 sheep in a day of 10 hours.

An average shearer will probably shear 200 sheep each day. With the hand shears or "blades" the number would be somewhat smaller. The amount of wool obtained from each sheep varies with the breed and the section from which it is obtained. Ordinarily from 3 to 12 pounds of wool are obtained from each sheep. A large fleece might be said to weigh from 10 to 18 pounds.

According to the Bradford system of manufacturing, wools are classed as "combing" or "clothing." A wool, to be combing, must be at least two and one-half inches in length, and the fibres shorter than that are used for clothing and are termed "clothing." There is a class called "carpet wools," which includes the coarse wools and inferior wools not adapted to the finer class of goods for which the first two classes are used. Carpet wools are, however, either carded or combed. The introduction of the French comb has made it possible to comb wools of a shorter length than heretofore and many of the wools formerly used for carding or clothing are now combed with the comb and are known as "baby combing." Another possible system of classifying wools divides them into four groups which take into account the breed of sheep and gives better divisions than the system mentioned.

These groups are: (1) Merino wool; (2) British wool; (3) Crossbred wool; (4) Continental wool. The breed of the sheep has a marked influence on the character of the wool and

this fact makes such a system especially desirable for classifying fleece wools.

There are more than 200 different breeds of sheep in the world, representing all grades of wool, from the finest to the coarsest. The entire wool production of the world for the year 1917 was 2,790,472,220 pounds. Of this total the distribution is as follows: Europe, 793,400,043; Australia, 741,802,000; South America, 470,120,707; United States, 285,573,000; Asia, 273,146,000; Africa, 207,680,470, and a remaining 18,750,000, of which 11,400,000 is from British provinces of North America, 6,500,000 from Mexico, 750,000 from Central America and the West Indies, with 100,000 pounds from small oceanic countries not included under any of the above classifications.

Carpet wools as the name implies are generally used in making carpets, Oriental rugs and also more or less in the coarser grades of clothing. For the most part they come from Asia and southeastern Europe. The crossbred wools from South America, South Africa, New Zealand and Australia have a considerable variation in grade and a wide range of uses. The British wools are from sheep of English blood and are divided according to the character of the wool into long and medium wools. The long wools are noted for their lustre and are classified in the trade as lustrous and semi-lustrous, being used for fancy-dress goods, linings and braids where the lustre of the material is an important consideration. The medium wools are much finer than the long wools and were until recently used for woollens. Now with the improved combing machinery and the introduction of the French combs they are used for either woollens or worsteds. They come mostly from Great Britain and British provinces and the United States. Merino wools are our finest wools and are used for materials of very fine texture, either woollens or worsteds. These wools are produced in Continental Europe, Australia, South Africa, South America and the United States.

The wools of the United States are divided into two groups, territory and domestic. The territory wools, sometimes called "range" or "western," are those grown under range conditions as found in Wyoming, Montana, Idaho, Nevada, Utah, Arizona, New Mexico, Colorado and other States where the same conditions prevail. The domestic wools are those grown under farming conditions and are often spoken of as "farm," "eastern" or fleece wools.

Sheep in sections producing territory wools are exposed to all kinds of weather on the range and are seldom protected from storms, for which reason the wool is often harsh and contains more dirt and foreign matter than the domestic wools. Often the fleeces are composed of very weak fibres or fibres that are weak at some one point in their length. The domestic wools on the other hand are usually strong and are more free from dirt and, therefore, have a smaller shrinkage. They are protected from inclement weather and are given more care and attention than the territory wools.

It has been stated above that there is a large variation in the quality of wools from the different countries. There is a difference in the quality of wools from different breeds of

sheep, and indeed there is a variation in the wool on different parts of the same animal. This variation in wools makes it necessary to classify them according to their qualities. Wools are generally separated out according to the grades of the different fleeces, either at the time of shearing or at the wool warehouses. When this work is done at the shearing shed it is sometimes called classing, while at the warehouse it is called grading. The most progressive wool-growing centres of the world class and bale their wool at the time it is shorn,

used for the manufacture of worsteds, while the clothing is used in the manufacture of woollens.

Pulled wool or skin wool is wool that is obtained from the pelts of sheep that have been slaughtered or have died from disease or exposure. It is generally inferior to shorn wool obtained from live sheep. This is due to the methods of obtaining it. The skin is treated chemically or submitted to a special treatment which loosens the roots of the fibres. The wool is then pulled out by hand much as the bristles

FIG. 1.—Shearing wool in Wyoming.

others ship it to the warehouse where it is graded and baled. Though much advancement has been made in the Western States in the past five years in the manner of handling wool, there is still much room for improvement. There is considerable difference in the terms used in classing and grading wool throughout the world. The terms most widely used are those of the topmakers' system. They classify wools according to fineness or coarseness in terms of spinning counts; a spinning count referring to the number of hanks of worsted yarn that a pound of a given grade of wool will spin. For example, a lot of wool classed as 60<sup>s</sup> would spin 60 times 560 yards, or 33,600 yards of worsted yarn. The terms used in the American system, "Boston Terms," were originally based on the proportion of Merino blood a sheep producing the given wool possessed. The pure-blood Merinos, having the finest wool, were used as the standard. These terms are still retained but no longer carry their original significance, as any one of a large number of different breeds might easily produce a half-blood wool.

The terms "staple" or "combing" and "clothing" are often added to the grade names to distinguish them. Both the staple or combing and the clothing of a given grade are the same fineness, but the combing wools are generally

are removed from a hog after scalding. During the year 1917 there were 40,000,000 pounds of pulled wool produced in the United States. In addition to the pulled wools from the United States there are large wool-pulling establishments in practically all the large wool-producing centres. Mazamet in France is the largest wool-pulling centre in the world.

The following table shows the American grades, together with the corresponding topmakers' terms:

American terms	Topmakers' quality term
Fine and fine medium .....	60-70
Half-blood .....	50-60
Three eights-blood .....	30-50
Quarter-blood .....	40-50
Low quarter-blood .....	40-40
Common or broad .....	30-40

**The Wool Fibre.**—The wool fibre as has been stated above is the hair-like covering growing on the skin of the sheep. Each fibre is similar to hair in its method of growth. The appearance presented by a cross-section of a hair follicle under the microscope is shown in Fig. 2.

The skin of the sheep is composed of four layers, an outer or scarf, which is composed mostly of dead cells; the epidermis, or true

a papillary layer filled with minute blood vessels, and finally the dermis or corium. Proceeding through this skin are innumerable so-called hair follicles or sack-like bodies. Each fibre is formed in one of these follicles and grows from it. As the fibre is pushed out through the skin it is rather plastic, but on coming to the surface it soon hardens. The fibre is composed of three parts. In the center is the medulla composed of soft globules. This medulla is well defined in the coarser fibres but in the finer grades of wool it is seldom visible even under the most powerful microscope. Next surrounding the medulla are spindle-shaped cells which make up the largest part of the fibre known as the cortex, while on the outer part are the horny-like cells. These cells surround the central part of the fibre scales, projecting somewhat from the body of the fibre and overlapping like the shingles on a roof. These scales are very important for it is the scales upon the surface of the wool fibre that produce what are known as the crimps and give the wool fibre its property of elasticity, a property possessed by no other fibre to such a marked degree. The serrations are most numerous, acute and pointed, in the finest sheep such as Merinos. In Saxony there are for example as many as 2,800 have been counted in one inch. This surface or scaly layer of scales gives the wool its characteristic quality. The fibre with smooth flat scales is generally very lustrous. This is shown in some of our hairy, long-wooled breeds such as the Leicester and Lincoln. These breeds have fewer serrations, there being about 1,800

per inch. In spinning, the fibres interlock with their serrations and the crimp or curliness helps to keep them from untwisting. They also give to cloth made from them a much better felting property, although this property is due only in part to the curliness of the fibres. The serrations or scales, as stated above, play the most important part. There seems to be a definite relation between the curliness and fineness of the wool fibre. The curliness and waviness are noted points in the judging of wool.

Wool, even the finest, has a high tensile strength and the fibre is strong throughout its length. Sometimes tender wool results from

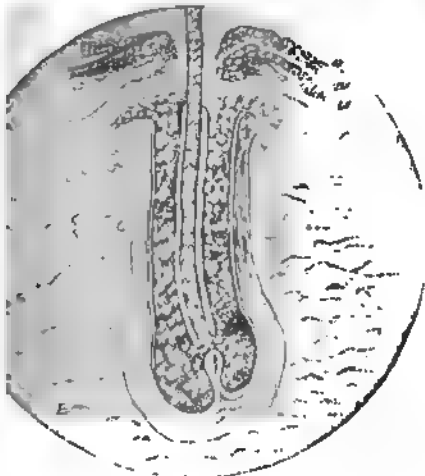

FIG. 3.—A, Merino wool fibres; B, Lincoln wool fibres; C, Leicester wool fibres.

- Drawing showing cross-section of a hair follicle.

Some of the coarse inferior wools exceed 500 serrations per inch. There is much difference in the size of the individual fibre. The finest Merino wools will range from 1/2000 to 1/4000 of an inch, while the maximum diameter of 1/250 of an inch is obtained in the coarsest wools.

The crimp or curliness is an important property of wool fibres, since it plays a large part in the spinning of yarn and the felting of cloth. The curly fibres will spin finer and make a stronger thread than the straighter ones. In

the lack of proper foods, severe climatic conditions or sickness. This is wool having a weak spot at some point in its length. Dead fibres are sometimes found on poorly-bred sheep and are known as "kemps" and referred to as kempy wool. Dead or weak fibres are highly undesirable as they will not stand the strain which fibres must undergo in spinning, but will break instead of stretching.

The elasticity of wool is one of its most important qualities, giving to wool its soft feel and to the finished cloth its characteristic pliability and softness. Many of the finer wools will stretch 35 per cent of their length without breaking. There are many shades of wool found throughout the world, including black, white, brown, fawn, yellow and gray shades. White is by far the prevailing color. The colored wools are made use of in the spinning, knitting and weaving of rough yarns, knitted shawls and tweeds.

From a chemical standpoint wool is a highly complex substance. There are three components which go to make up the raw wool. All wool in its natural state contains a fatty or greasy matter called yolk. This is secreted from the skin and covers the fibres. It serves to lubricate the fibres, prevents their matting together and protects them during growth, and protects the fleece to a great degree against injury by outside agencies. It is a natural

impurity of the wool. There is also the wool fat which permeates both the yolk and the fibre, and the wool fibre, which is really a more complex chemical compound than either the yolk or the wool fat.

According to Hummel, the composition of the average wool is as follows: Moisture, 4-24 per cent; yolk, 12-47 per cent; dirt, 3-24 per cent; wool fibre, 15-72 per cent.

According to Bowman, the composition of the wool fibre is as follows: Carbon, 50.8; hydrogen, 7.2; nitrogen, 18.5; oxygen, 21.2; sulphur, 23.0.

It is said to have a probable empirical formula of  $C_{22}H_{32}N_2SO_{10}$ . However, this conveys but a small idea of its complexity. The wool fibre belongs to a class of chemical compounds known as proteins. The complexity of this group of compounds is clearly seen when we consider the fact that on hydrolysis they are usually broken up into 17 distinct units known chemically as amino acids.

Wool as distinguished from cotton burns slowly with an odor characteristic of burning animal matter such as horns and feathers, leaving at the end of the fibres a small crusty globule. Cotton on the other hand burns without odor to a white ash. Wool is readily dissolved by hot caustic soda solution, while cotton is practically unaffected. This, although a simple test, is an important one for use in determining the presence of cotton, one of the most common adulterants found in woolen goods.

**Manufacture of Wool into Cloth.**—When wool is received at the mill, it is generally in a graded condition, having either been graded at the shed where shorn or at some one of the numerous wool warehouses. The first step in the preparation of the wool at the mill is to remove the string and open up the fleece and tear out all hard part which will not scour out when the fleece is cleaned. The fleece is then spread on a table, the centre of which is covered with a wire netting. This allows the sand and dirt to pass readily to the floor. The sorters tear the fleece apart, separating it into piles according to its different qualities. As a rule the best wool is obtained from the shoulder and sides. That from the forepart is irregular and sometimes filled with burrs, while the loin wool is shorter and coarser. The wool from the britch and hind quarters is the coarsest, while the wool from the under side of the throat is liable to be short, worn and dirty. The wool on the shoulder is finest and superior in soundness of fibre, softness of curl and evenness of length.

After the wool is sorted it is next passed through a machine called a duster, which not only removes much sand, dirt and dust, but opens up the wool and better prepares it for the next operation, the scouring.

After the wool passes from the duster, the first operation is to scour it to remove the dirt and grease, thereby obtaining the pure wool fibre. This operation consists in passing the wool through three or four vats or bowls which contain a cleaning solution of hot soapy water. Each vat has its own set of rollers which squeeze out the washing solution from the wool before it passes on to the next vat. In this way the wool is gradually cleaned and on pass-

ing through the rollers of the last vat is propelled by means of a chain elevator to the dryer. The dryer is a specially constructed chamber kept very hot by means of steam. Most of the moisture is removed from the wool while in the dryer.

When wool contains burrs, chaff and similar vegetable matter it must pass through a special treatment. When the wool is very burry it is passed through what is known as the carbonizing process. This consists of dipping it in a bath of aluminum chloride or sulphuric acid solution, extracting the moisture and heating the wool to 212° F., when the vegetable matter is reduced to a powder and may be readily shaken or blown from the wool. Wools having comparatively few burrs are ordinarily only run through the machine known as the burr-picker, which removes the burrs mechanically by tearing them from the wool. Sometimes when quite burry it is found more satisfactory to run the wool first through the burr-picker to remove larger burrs and then to carbonize it to remove all the fine seeds and such material as is not entirely removed by the burr-picker.

The wool is now ready for the next operation, known as carding. None of the operations up to this point has made an attempt to straighten the fibres, but all have left them in a more or less tangled condition. The purpose of carding is to open the fibres so that they lie loosely separated in a uniform film, and to eliminate remaining impurities and fibres too short to spin. In the manufacture of woollens the rotary cards are used. These cards consist of rollers in the surface of which there is a large number of wires. These rollers revolving in opposite directions cause the wool as it is passed between them to be opened, separated and straightened. The fibres are usually carded three times by being passed successively through three cards known as scribbler, intermediate and finishing card. From the first two the fibres come out in the form of a filmy lap. From the third, this product goes to a condensing machine, where it is divided and comes out in light strands about one-eighth of an inch in diameter. These strands, known as rovings, are wound onto spools and are now ready for the spinning room.

The next operation is the spinning of the yarn. This consists of drawing out the roving and twisting it into yarn. Up to this stage the wool has received no twisting, but has held itself together by the binding action of the scales on the wool, and their natural curlicues or crimp. The spinning is for the most part done on a machine known as a mule and is in four successive steps which are practically automatic. Mule spun yarns are soft and rather loosely spun. Another kind of spinning is known as frame spinning. The frame spinning requires less space and labor for its operation. However, frame-spun yarns are not so soft as those produced on the mule. After the yarn is spun, it is used singly or twisted together into two, three or four strands, depending upon the coarseness or fineness of the fabric into which it is to be made. The yarn is now ready for the weave room, where it will be woven into cloth.

Cloth consists essentially of two sets of interlaced threads. One set runs lengthwise and is known as the warp, while the other runs cross-wise and is known as the weft or filling. In a plainly woven cloth, the weaving consists of running each strand of filling alternately above and below each strand of warp. Mounting the warp beam consists of drawing several thousand threads through wire heddles in a frame called a harness and then through a wire reed. When this is done the warp beam is ready for the loom. These heddles are so arranged that the alternate threads rise and fall in rotation. Through the opening made between these sets of raised and lowered warp threads, a shuttle containing the filling is run and the cloth is woven. This covers in a general way the manufacture of woolen cloth. The manufacture of worsteds is similar in operation to the manufacture of woolens, differing for the most part in preparation of the yarn. The main difference between woolens and worsteds is in the thread. In the preparation of the wool for woolen threads, it is carded. This leaves the fibres of the thread in a mixed and matted condition and results in a rather irregular thread. In the making of worsted thread the wool is not only carded, but is also combed. The combing operation leaves the fibres lying parallel to each other, removes the short ones and, after spinning, the thread is found to be well formed and regular in shape. Upon examining woolen and worsted fabrics, it will be found that a woolen is soft and elastic, with a blended pattern and threads that are not really distinguishable. On the other hand, a worsted has a much brighter and more clearly defined pattern and a close, even and well-defined weave.

**United States Wool Manufacturing Statistics.**—The wool manufacturing industry of the United States as recorded by the last Special Census of Manufactures grouped under this title 501 establishments making woolen goods; 298 establishments making worsted goods; 97 making carpets and rugs; 53 making wool felts; and 30 making wool-felt hats—a total of 979. The entire industry so constituted engaged 203,716 persons, of which number 195,285 were wage earners; 22,160 being spinners, and 46,173 being weavers. Of the whole number, 109,527 were employed in making worsted goods; 49,165 in making woolen goods; 31,309 in making carpets and rugs; 4,035 manufacturing felt; and 1,249 in making wool-felt hats.

The number of establishments engaged in this industry has steadily declined since 1869, when 3,208 were in operation. This reduction in number has been due in part to the abandonment of many rural carding mills operated often in connection with the local grist-mill or saw-mill, and in larger part to the consolidation of the smaller concerns into large units. The industry is at present centralized in Pennsylvania and Massachusetts, 266 of the establishments reported being in the former State and 183 in the latter. Rhode Island appears as a distant third with 80.

Practically all of the wool used in the manufacture of woolen, worsted and felt goods is of the finer grades—that is of clothing and combing wools. The raw wool used by the

carpet mills is nearly all of foreign origin, and of low grade. Less than  $\frac{1}{10}$  of 1 per cent of American grown wool enters into the carpet and rug manufacture.

The capital employed in all branches of wool manufacture in the United States as reported by the last census amounted to \$497,699,293, and the total production was valued at \$464,-249,813, divided thus: worsteds, \$275,688,474; woolens, \$103,815,905; carpets and rugs, \$69,-128,185; felts and felt hats, \$15,637,249.

The specific products of the industry were reported as follows:

All-wool woven goods, a total of 323,067,563 square yards, comprising

Worsteds suitings, overcoatings and dress-goods.	222,420,785
Woolen suitings, overcoatings and dress-goods.	90,980,381
Underwear flannels.	2,176,264
Blankets.	6,489,689
Horse blankets.	102,205
Carriage cloths.	514,226
Carriage robes.	132,399
Shawls.	124,486
Miscellaneous.	127,128

Cotton-warp woven goods, a total of 196,-179,866 square yards, comprising

Worsted-filling suitings, overcoatings, and dress goods.	56,763,091
Wool-filling suitings, overcoatings, and dress goods.	53,509,462
Domest flannels and shirtings.	16,092,266
Linings, Italian cloths, and lastings.	36,196,243
Satinets and linseys.	8,415,079
Blankets.	17,973,821
Horse blankets.	5,831,305
Carriage robes.	1,282,417
Miscellaneous.	116,182

Union or cotton-mixed goods, a total of 46,244,730 square yards, comprising

Suitings, overcoatings and dress-goods.	31,400,082
Underwear flannels.	4,995,575
Blankets.	3,937,463
Horse blankets.	2,231,162
Carriage robes.	354,049
Miscellaneous.	3,326,399

In addition there were manufactured 1,598,-444 square yards of upholstery goods; 132,-559,701 pounds of yarns for sale; 8,985,170 pounds of tops and slubbing; 23,961,100 pounds of noils; and 26,433,970 pounds of wool waste.

In the carpet and rug industry a total of 66,340,314 square yards was produced, divided as follows:

Axminster and moquette.	15,742,835
Wilton.	5,616,263
Brussels.	2,698,840
Tapestry velvets.	13,227,859
Tapestry, Brussels.	13,614,354
Ingrain.	5,795,807
Ingrain art squares.	3,177,563
Smyrna rugs.	822,150
All other carpets and rugs.	5,644,643

In the hosiery industry large quantities of wool were used in making the yarns consumed, and the census reported the finished yarns as follows: merino yarn, 24,180,036 pounds; woolen yarns, 7,714,761 pounds; worsted yarns, 231,752 pounds. These quantities must be accounted a part of the wool consumption of the country, as they were in addition to the 25,000,000 pounds of yarn bought by the hosiery mills from the woolen mills.

The materials used in the wool manufacturing industry embraced 277,588,101 pounds of domestic wool and 225,269,232 pounds of foreign wool—equivalent to about 307,705,932 pounds of scoured wool. In addition there was used 6,928,622 pounds of domestic mohair;

2,446,219 pounds of foreign mohair; 6,619,750 pounds of camel, alpaca and vicuna hair; and 28,136,636 pounds of other animal hair. Hags and clippings yielded 62,083,016 pounds, and wool recovered from other materials, 30,158,915 pounds. Yarns purchased in foreign countries totaled 214,455,204 pounds, divided thus: woolen yarn, 23,802,234 pounds; worsted yarn, 62,895,372 pounds; merino yarn, 706,483 pounds. Silk yarns were used to the extent of 706,483 pounds; cotton yarns, 56,988,329 pounds; linen yarns, 7,611,078 pounds; and yarns of jute, ramie, and other vegetable fibre in the amount of 61,653,015 pounds. The cotton, linen, jute, and other vegetable yarns were used almost exclusively by the carpet and rug industry.

Closely associated with the wool manufacturing industry are the wool shoddy and the wool pulling industries. Shoddy is the trade name given to wool recovered by tearing apart soft woolen rags. It is of the class of short staple, and while it is not as durable as new wool, it provides a very large amount of material suitable for cheap garments, blankets, etc. The wool shoddy industry according to the census was carried on by 64 establishments employing a capital of \$6,420,985, and 2,145 hands, and producing a yearly output valued at \$7,706,843. The wool pulling factories reduce waste yarn to fibre which may be recarded, spun and woven. In 1914 there were 34 such establishments with a combined capital of \$3,534,203. They employed 708 hands, and their annual output was valued at \$8,272,721.

**WOOL-GRASS**, a rush. See SCIRPUS.

**WOOL-SORTERS' DISEASE.** See ANTHRAX.

**WOOLF**, wulf, Albert Edward, American chemist and inventor, son of Edward Woolf (q.v.); b. New York, 26 Sept. 1846. He was educated in the College of the City of New York. Among his discoveries are the antiseptic and medical properties of seawater combined with the electric current, and the use of electrically decomposed seawater for sanitary purposes, used in many large cities in treatment of drinking water, sewage and garbage, and adopted by the United States government to combat the yellow fever epidemic in Cuba; the use of peroxide of hydrogen to bleach black ostrich feathers white, and also its employment

as an antiseptic. He also modeled the bronze medallion of General Grant, now at the former home of the general at Mount McGregor.

**WOOLF**, Benjamin Edward, American dramatist and musician: b. London, 16 Feb. 1836; d. Boston, Mass., 7 Feb. 1901. Coming to New York in childhood with his parents, he early displayed a passion for music and was carefully trained by his father, with such results that in later days he became leader of orchestras in Boston, Philadelphia and New Orleans. He settled in Boston, where he was dramatic critic for the *Saturday Evening Gazette* 1871-93, a post which he quitted for a similar one on the *Boston Herald*. He was an industrious musical composer, writing many overtures, quintets and trios, besides plays and operettas. His most successful comedy was 'The Mighty Dollar,' while his operetta, 'The Doctor of Alcantara,' was a favorite in its time.

**WOOLLETT**, wul'et, William, English engraver: b. Maidstone, Kent, 15 Aug. 1735; d. London, 23 May 1785. His family originally came from Holland, and he was instructed in his art by an engraver named John Tinney. He engraved historical subjects and portraits, but was most successful in landscapes, in which he exhibited such varied excellences, as in the opinion of Longhi, to entitle him to be considered "the marvel and the example for all contemporary engravers and for those of the present time." His foregrounds are vigorous and solid, and his aerial perspective wonderfully clear and true, while he treats water, the crux of the engraver, with supreme success. His masterpieces are his 'Niobe' and other plates after pictures by Richard Wilson, and the 'Death of Wolfe' and the 'Battle of La Hogue' after West. He was the first who conceived and embodied in practice the idea of uniting in one plate the three methods of engraving, by aqua fortis, the burin, and the dry needle. His genuine plates are estimated at 123, but impressions are exceedingly rare and valuable, as he permitted no imperfect prints to be struck off. Consult Fagan, Louis, 'Catalogue Raisonné of the Engraved Works of William Woollett' (1885).

**WOOLLEY**, wul'i, Celia Parker, American Unitarian minister: b. Toledo, Ohio, 14 June 1848. Graduated from Coldwater Female Seminary, in 1868 she was married to J. H. Woolley, and in 1876 removed to Chicago. She was pastor of the Unitarian Church, Geneva, Ill., for three years, and of the Independent Liberal Church, Chicago (1896-98), since when she has been active as a lecturer and in the work of women's clubs. She is the author of the novels 'Love and Theology' (1887), republished as 'Rachel Armstrong, or, Love and Theology'; 'A Girl Graduate' (1889); 'Roger Hunt' (1893); 'The Western Slope' (1903).

**WOOLLEY**, John Granville, American prohibitionist: b. Collinsville, Ohio, 15 Feb. 1850. Graduated from the Ohio Wesleyan University in 1871, he was admitted to the bar of the Illinois Supreme Court in 1873, became city attorney of Paris, Ill., in 1875, prosecuted attorney in Minneapolis in 1881, and practised at New York, 1886. At one period addicted to intemperance, he began lecturing against it in 1888, and has lectured to many and

on this theme at home and abroad. He is editor of *The New Voice*, a prohibitory organ in 1899, and was the Presidential agent of the Prohibition party in 1900, receiving a vote of 208,914. He has published: 'The Sower'; 'Civilization by Faith'; 'Christian Citizen' (1897-98); 'The Lion' (1900); 'Temperance Progress in the Century' (1902); 'South Sea Letters'.

**WOOLLEY, Mary Emma**, American educator. b. South Norwalk, Conn., 13 July 1863. Educated as a teacher and was an instructor at the Western Seminary, Norton, Mass. (1886-1894) she was graduated at Brown University. She was teacher of biblical history at Wesley College, 1895-1900, the last two years being professor and head of the department of biblical history and literature. In 1901 she became president of Mount Holyoke College and the growth and development of the institution have largely been due to her.

She has received honorary degrees from Brown, Amherst, Smith and Yale. Miss Woolley is closely identified with many educational movements, having served as member of the board of electors of the Hall of Fame, on the board of the Y. W. C. A., executive committee of the American School Peace Council, of the National Institute for Instruction, Commission on Peace and Education; senator of United Chapters Phi Kappa; honorary vice-president of the National Consumers' League, etc. She has published: 'Early History of the Colonial Post Office'; 'Development of the Love of Romance Scenery in America'; also many educational articles.

**WOOLMAN, John**, American Quaker abolitionist. b. Northampton, Burlington County, N. J., August 1720, d. York, England, 7 Oct. 1790. In 1741 he became a speaker in the meetings of the Society of Friends. He was at this time bookkeeper in a mercantile house, but eventually learned the tailor's trade. In 1746, in company with Isaac Andrews, he made his first merchant tour in some of the back settlements of Virginia, and from that time continued at intervals to visit the societies of Friends in the different portions of the colony. In 1763 he visited the Indians on the Susquehanna. He both spoke and wrote much against slavery. His best-known work is the 'Journal of John Woolman's Life and Travels in the Service of the Gospel', which Whittier edited, with an introduction in 1871. Woolman's simple and candid style has been highly praised by Charles Lamb, Robinson, and others. Among his other works are 'Some Considerations on the Condition of Negroes' (1753; Part II, 1762); 'Reflections on various topics (1768); 'Serious Considerations' (1773). In 1774 a collective edition of his works appeared. Whittier's sketch in the above-mentioned edition of the 'Journal'; also Shore, 'John Woolman. His Life and Our Times' (New York 1914).

**WOOLNER, Thomas**, English sculptor. b. Hadleigh, Suffolk, 17 Dec. 1825; d. London, 7 Oct. 1892. At 12 he was placed in the studio of William Behnes, in 1842 en-

tered the schools of the Royal Academy, and in the following year his first work, 'Eleanor Sucking the Poison from the Arm of Prince Edward,' was exhibited. His first work to attract attention was 'The Death of Boadicea' (1844), and this success was followed by 'Alastor' (1846); 'Puck' (1847); 'Titania and Her Indian Boy' (1848), and 'Eros and Euphrosyne' (1848). About 1850 he was associated with Rossetti and the other artists who formed the "Pre-Raphaelite Brotherhood," in founding the short-lived but famous periodical called *The Germ*. His contributions, which were in verse, were collected and published, with additions, under the name 'My Beautiful Lady' (1863). Woolner visited Australia in 1852, and one of his first works on his return was a life-size statue of Lord Bacon for the Oxford Museum. Among his more important works are 'Elaine with the Shield of Sir Lancelot'; 'In Memoriam' (1870); 'Guinevere' (1872); 'Lady Godiva' (1876); portrait busts of Carlyle, Tennyson, Darwin, Newman, Gladstone, Kingsley and Dickens, and statues of Lord Macaulay for Trinity College, Cambridge (1866), Sir Bartle Frere for Bombay (1872), Dr. Whewell for Trinity College, Cambridge (1873), Lord Lawrence for Calcutta (1875), J. S. Mill for the Thames Embankment (1878), Captain Cook for Sydney (1879), Sir Stamford Raffles for Singapore (1887) and Lord Palmerston for Palace Yard, Westminster. He became a Royal Academician in 1874, and for a time was professor of sculpture in the Academy. His fame as a sculptor has overshadowed his reputation as a poet, but 'Pygmalion' (1881), 'Silenus' (1884), 'Tiresias' (1886) and 'Poems' (1887) give him honorable rank among the minor poets of his time. Consult Garnett, in 'Dictionary of National Biography.'

**WOOLSACK**, a sack filled with wool; hence, the seat of the lord chancellor in the House of Lords, a square cushion of wool, covered with red cloth. It is said to have been first placed in the House of Lords in the 14th century to symbolize an act prohibiting the exportation of wool from England.

**WOOLSEY, wul'si, Sarah Chauncey** ("Susan Coolidge"), American author, niece of T. D. Woolsey (q.v.): b. Cleveland, Ohio, 1835; d. Newport, R. I., 9 April 1905. As "Susan Coolidge" she was a popular writer for children, but also wrote for their elders 'Verses' (1880); 'A Short History of Philadelphia' (1887). Among her books for young people were 'The New Year's Bargain' (1871); 'What Katy Did' (1872); 'A Guernsey Lily' (1881); 'A Little Country Girl' (1885); 'Clover' (1888); 'Curly Locks' (1899); 'Short History of the City of Philadelphia' (1887). She also edited 'The Diary and Letters of Mrs. Delaney' (1878); 'The Diary and Letters of Frances Burney, Madame D'Arbly' (1880).

**WOOLSEY, Theodore Dwight**, American college president and scholar, nephew of Timothy Dwight (q.v.): b. New York, 31 Oct. 1801; d. New Haven, Conn., 1 July 1889. He was graduated at Yale College in 1820; studied law in Philadelphia, and theology at

Princeton, was tutor at Yale, 1823-25, and was licensed to preach in 1825. After studying abroad (1827-30) he was professor of Greek at Yale 1831-46, and president of the college 1846-71. In 1871-81 he was chairman of the American company of revisers of the New Testament. Besides editions of Greek plays—the 'Alcestis' of Euripides (1833), the 'Antigone' (1835) and 'Electra' (1837) of Sophocles, the 'Prometheus' of Plato (1837), as well as the 'Georgias' of Plato (1842)—his works include an 'Introduction to the Study of International Law' (1860; 5th ed. 1879); 'Essays on Divorce and Divorce Legislation' (1869); 'Political Science; or the State Theoretically and Practically Considered' (1877); 'Religion of the Past and of the Future' (1871); 'Communism and Socialism' (1880); 'Helpful Thoughts for Young Men' (1882). He also edited Lieber's 'Civil Liberty and Self-Government' (1871), and his 'Manual of Political Ethics' (1871). He was one of the founders of the *New Englander*, to which he often contributed, one of the regents of the Smithsonian Institution, and at one period president of the American Oriental Association. Woolsey Hall of Yale University was named in his memory.

**WOOLSEY, Theodore Salisbury**, American professor of international law, son of T. D. Woolsey (q.v.): b. New Haven, Conn., 22 Oct. 1852. He was graduated from Yale in 1872, became instructor in international law at Yale in 1877, and since 1878 has been full professor there. He has published 'America's Foreign Policy,' and edited Pomeroy's 'International Law' (1886); and the 6th edition of Woolsey's 'International Law' (1891). He was also associate editor of Johnson's 'Universal Cyclopaedia' (1892-95); and editor of the *American Journal of International Law*. He received the degree of LL.D. from Brown University in 1903.

**WOOLSON, Constance Fenimore**, American author: b. Claremont, N. H., 5 March 1848; d. Venice, Italy, 24 Jan. 1894. Educated in Cleveland, Ohio, and New York, she resided in Ohio, then in Florida and other Southern States, and finally abroad, chiefly in Italy. Her first story published in a secular magazine—contributions to Episcopalian periodicals had preceded it—was 'The Happy Valley' in *Harper's Monthly* (1870). In this much of her subsequent work appeared. Many poems were printed from time to time, but these were never collected. Her reputation was based on works of fiction, the volumes being 'The Old Stone House' (1873); 'Castle Nowhere: Lake Country Sketches' (1875); 'Rodman the Keeper' (1880); 'Anne' (1882); 'For the Major' (1883); 'East Angels' (1886); 'Jupiter Lights' (1889); 'Horace Chase' (1894), and 'The Front Yard, and Other Italian Stories' (1895). Their background is generally American, preferably the Lake region or the South; and when it shifts to Europe is less skilfully treated. They were highly praised by Stedman and other critics for equal freedom in presenting diverse types and conformity to high literary standards.

**WOOLSTON, wul'ston, Thomas**, English deist: b. Northampton, 1669; d. London,

21 Jan. 1731. He was educated at Sidney Sussex College, Cambridge, became a Fellow, and took orders in the English Church. He made a careful study of Origen, and in 1705 published the 'Old Apology for the Truth of the Christian Religion against the Jews and Gentiles Revived.' He maintained in this work that Moses was an allegorical personage, and his history typical of that of Christ. In 1721 he published 'The Moderator between an Infidel and an Apostate,' dialogues tending to show that the Gospel miracles by themselves could not prove Christ to be the Messiah. This work occasioned great scandal, and it was only through the intervention of Whiston that the author escaped a prosecution. In 1721 his college deprived him of his fellowship. The views set forth in his last work Woolston developed more fully in 'The Moderator between an Infidel and an Apostate' (1725). His famous series of six 'Discourses on the Miracles of Christ' appeared 1727-29, with two 'Defences' in 1729 and 1730. He was indicted for blasphemy in consequence of the publication of this work and was imprisoned 28 Nov. 1729. His collected works with 'Lie' appeared in five volumes (1833). See DEISM, and consult Cairns, J., 'Unheliel in the Eighteenth Century' (1880), and Sayons, 'Les Déistes anglais' (1882).

**WOOLWICH, wul'ich**, England, a municipal and parliamentary borough of London, in Kent, eight miles below London Bridge. Area, 8,277 acres. It has many ancient, together with a number of handsome modern houses, an old church (restored 1894), other places of worship, a town hall and several charitable endowments. It owes its importance to the royal arsenal, which occupies an area of above 350 acres, and is one of the most complete and magnificent establishments of the kind in the world, with extensive forges, foundries and workshops of various kinds in which the newest types of machinery are employed for the manufacture of immense quantities of warlike stores which are kept in suitable magazines and storehouses. Woolwich Dockyard, for centuries the most important in the kingdom, having become unsuitable for modern requirements, was made over to the War Office in 1872. In the Rotunda there is a fine historical collection of arms and other interesting objects. A large garrison is stationed at Woolwich, which is the headquarters of the royal artillery; and there are various barracks, a military and a naval hospital, etc. On the edge of Woolwich Common, a fine large open area, are the handsome buildings of the Royal Military Academy (see MILITARY SCHOOLS); and the Royal Ordnance College is also at Woolwich. At North Woolwich, on the opposite side of the river, to which runs a fine steam ferry, many houses and extensive factories, especially of telegraph cables, have recently sprung up. The borough returns one member to Parliament. Pop. 121,376. Consult Larking, 'The Domesday Book of Kent' (1869); Vincent, 'Records of Woolwich' (1890).

**WOOLWORTH, Frank W.**, American merchant: b. Rodman, N. Y., 13 April 1852; d. Glen Cove, L. I., 9 April 1919. He received

lic and commercial school education, and established a "five cent store" at Utica, removing the business to Lancaster, Pa., in that year. Out of the business grew a chain of about 1,000 "five and ten cent" stores in the United States and Canada, and 75 in England. The business was conducted under the firm name of Frank W. Woolworth and Company, of which Woolworth was president. He amassed a great fortune, and was a director in various banks and trust companies. He also built in New York the first skyscraper known as the Woolworth Building, 57 stories high and of beautiful

**WOONSOCKET**, woon-sōk'ēt, R. I., city in Providence County, on the Blackstone River, between the New York, New Haven and Hartford (two branches) Railroad, about 15 miles west of Providence and 37 miles southwest of Boston. It has electric lines extending to the near-by towns. The river here is crossed by a bridge which cost originally \$1,000,000. It has three parks and the county is divided into several townships. It is a well-known manufacturing center. The chief manufactures are cotton goods, foundry and machine-shop products, leather goods and hosiery and knit goods, rubber boots and shoes and wringing machines. Marble manufactures are carved and turned into wagons, carriages, woolen goods, masonry and furniture. The educational institutions are a high school, established in 1857; Sacred Heart College (Roman Catholic) for young men; Saint Ann's Academy (Roman Catholic) for girls and women, public and parish schools, the State Institute Library containing about 16,000 volumes. There are several banks and trust companies. The city owns and operates the water works. Woonsocket is a consolidation of several factory villages. The first village of Woonsocket is not included in the limits of the present city. The city was set off from the town of Cumberland; in 1871 a part of Smithfield was annexed, and 13 June 1872 the city was incorporated. Pop. 40,075. (See Richardson, 'History of Woonsocket' (Woonsocket 1876).)

**WOORARI**, or **WOORARA**. See **CURARI**.

**WOOSTER**, wūs'tēr, David, American Revolutionary general: b. Stratford, Conn., 2 May 1710; d. Danbury, Conn., 2 May 1777. He graduated at Yale College in 1738, and in 1749, when the war broke out between England and Spain, entered the provincial army as lieutenant, and was subsequently made captain of a vessel built and equipped by the colony for the defense of its coasts. In 1745 he participated in the expedition against Louisburg, and went in command of a cartel ship to England, where he was made a captain in the British service under Sir William Pepperell. He fought in the French War which ended in 1763, he was commissioned by the governor of Connecticut as colonel, and subsequently as brigadier-general, and served during the whole war. In 1775 he was one of the members of the Council of Connecticut who concerted the plan for the seizure of Ticonderoga; and when the Continental army was organized he was appointed one of the eight brigadier-generals.

He was engaged in the expedition into Canada, where after the death of General Montgomery he for a time held the chief command. He resigned and returned to Connecticut, and was major-general of the militia when Tryon invaded that province for the purpose of destroying the military stores at Danbury. He attacked Tryon's rear guard 27 April 1777, and while rallying his men was mortally wounded. On 17 June Congress voted that a monument should be erected to his memory, but no steps were taken to have the resolution carried into effect, and his neglected grave was not identified until 1854, on 27 April of which year the cornerstone of a monument to his memory was laid, by act of the legislature of Connecticut. The town of Wooster, Ohio, was named in his honor.

**WOOSTER**, Ohio, city and county-seat of Wayne County, on the Killbuck Creek, and on the Pennsylvania and the Baltimore and Ohio railroads, about 50 miles southwest of Cleveland. It is in an agricultural and stock-raising region. It has manufactories of flour, furniture, doors, sash and blinds, boilers, engines, aluminum ware, pumps, brushes, farm implements, pianos, glass, mill-gearing, and brick. There are banks having a combined capital of over \$200,000. The educational institutions are Wooster University, the Ohio Agricultural Experiment Station, a high school, public elementary schools, and libraries. Pop. about 6,136.

**WOOSTER**, College of, located at Wooster, Ohio, was founded under the auspices of the Presbyterian Church, chartered in 1866 and first opened in 1870. In 1899 the charter was revised and the power of electing the members of the board of trustees delegated to the Presbyterian Synod of Ohio. Previously the board was self-perpetuating. In 1914 the name of the institution was changed from "The University of Wooster" to "The College of Wooster." It is a coeducational non-sectarian institution.

The organization of the college now consists of the collegiate department, the Bible and missionary training school and the conservatory of music. The college offers two baccalaureate degrees, bachelor of arts and bachelor of science. It has always stood for a high grade of scholarship, being a member of the North Central Association of Colleges. On a beautiful campus of 100 acres on a hilltop overlooking the city of Wooster are the 12 modern and fully equipped college buildings. The prevailing style of architecture is the English Collegiate-Gothic. Splendid athletic facilities are furnished by the large gymnasium and a 14-acre stadium given to the college by the late L. H. Severance of New York. A unit of the Students' Army Training Corps was established in 1918. The faculty consists of 41 members. The college has over 2,000 alumni, and represents an investment in buildings and endowment of over \$2,000,000. Its aim is to provide a liberal and thorough education embracing physical, mental and moral development.

**WORCESTER**, Dean Conant, American educator: b. Thetford, Vt., 1 Oct. 1866. He was graduated at the University of Michigan in 1889, having previously accompanied the

Steere scientific expedition to the Philippine Islands in 1887-89. He was instructor in animal morphology at the University of Michigan 1893-96, becoming assistant professor in the last-named year. In 1890-92 he again traveled in the Philippines, with F. S. Bourns, in a tour known as 'The Menage Scientific Expedition,' and in January 1899 was appointed one of the United States commissioners to the islands to investigate and report on conditions there. He was the only member of this commission to be appointed on the second or Taft commission, which returned to the Philippines in 1900, and established civil government there. He was Secretary of the Interior of the Philippines (1901-13). He has published 'Preliminary Notes on Birds and Mammals collected by the Menage Scientific Expedition to the Philippine Islands' (1894); 'Contributions to Philippine Ornithology' (1898); 'The Philippine Islands and their People' (1898); 'The Philippines, Past and Present' (1914); and numerous articles on the 'Wild Tribes of the Islands,' which were under his executive control for 12 years.

**WORCESTER, Edward Somerset, 2d MARQUIS OF**, English inventor; b. Raglan Castle, Monmouthshire, 1601; d. 3 April 1667. He engaged in the service of Charles I during the Civil War, and was employed by the king to act for him in Ireland; but when his errand was discovered he was treated with duplicity by Charles, and retired to France in 1648. Returning to England in 1652 he was imprisoned in the Tower 1652-54, and his estates were seized, but after the Restoration he recovered most of these. He afterward spent his time in retirement, and in the cultivation of natural philosophy and mechanics. In 1663 he published a book entitled 'Century of the Names and Scantlings of Inventions as I can call to mind to have been Tried and Perfected,' in which he first gave a description of the uses and effects of an engine for "driving up water by fire"; and afterward published a small pamphlet, called 'An Exact and True Definition of the most Stupendous Water-commanding Engine, invented by the Marquess of Worcester.' In neither of these does he give any statement of the mode of constructing his engine; but, from his description and account of its effects, it may be inferred that its action depended on the condensation as well as the elastic force of the steam. (See STEAM-ENGINE). Consult Dircks, Henry, 'Life, Times, and Scientific Labors of the Second Marquis of Worcester,' London (1865); Dircks, 'Worcesteriana' (1865).

**WORCESTER, Edwin Dean**, American railway official; b. Albany, N. Y., 19 Nov. 1828; d. New York, 13 June 1904. He studied law, and followed various pursuits, but entered rail-roading in 1853, when he became a member of the accounting department of the New York Central Railway. He laid out, opened and managed the books of this company when there were no precedents in the United States for the organization of large railways, and the present accounting system of railways in this country is largely the development of his work. Subsequently he became successively treasurer and secretary of the company; in 1873 secretary and treasurer of the Lake Shore and

Michigan Southern; in 1883 its vice-president; and in 1878 secretary of the Michigan Central, in 1883 its vice-president. From 1883 he was also secretary, or treasurer, or both, in 15 other companies.

**WORCESTER, Elwood**, American Protestant Episcopal clergyman and author; b. Massillon, Ohio, 16 May 1863. He was graduated at Columbia University in 1886 and received the degree of Ph.D. at the University of Leipzig in 1889. He was professor of philosophy and psychology at Lehigh University in 1890-96, also serving as chaplain; was acting rector at Saint John's, Dresden, Germany, in 1894-95; rector of Saint Stephen's, Philadelphia, in 1896-1904, and has since had charge of Emmanuel Church, Boston. He originated the Emmanuel Movement, which gives moral treatment for nervous and, rarely, for organic disorders, with the aid of medical practitioners in such cases as require medical assistance. His works include 'Religious Opinions of John Locke' (1889); 'The Book of Genesis in the Light of Modern Knowledge' (1901); 'Religion and Medicine' (1907); 'The Living Word' (1908); 'The Christian Religion as a Healing Power' (1909); 'Religion and Life' (1914); 'The Issues of Life' (1915), etc.

**WORCESTER, Joseph Emerson**, American lexicographer and philologist; b. Bedford, N. H., 24 Aug. 1784; d. Cambridge, Mass., 7 Oct. 1865. He was graduated from Yale in 1811, and from 1819 resided in Cambridge, Mass., busily preparing and publishing books. Among his earlier works, compiled with much accuracy and excellent considerations, were 'A Geographical Dictionary' (1817), of which an enlarged edition appeared in 1823; a 'Gazetteer of the United States' (1818); and 'Outlines of Scripture Geography' (1828). His first effort in English lexicography was an edition of 'Johnson's English Dictionary, as Improved by Todd and Abridged by Chalmers, with Walker's Pronouncing Dictionary Combined' (1828). In 1829 he prepared an abridgment of Webster's 'American Dictionary'; and in 1830 published his 'Comprehensive Pronouncing and Explanatory Dictionary.' After collecting philological works in Europe in 1830-31, he edited the 'American Almanac' in 1831-43, and in 1846 published the 'Universal and Critical Dictionary of the English Language.' His chief work, 'A Dictionary of the English Language,' appeared in 1860, being the first work of the sort to employ illustrations. For this many collaborators were employed, particularly for the definition of technical terms.

**WORCESTER, Noah**, American theologian; b. Hollis, N. H., 25 Nov. 1758; d. Brighton, Mass., 31 Oct. 1837. He was a sifer in the Continental army in 1775, and entered the service again for a short time as sife-major in 1777. In 1786 he was licensed to preach by a Congregational association, and in 1787 ordained pastor of the church in Thornton, N. H., where he had held local offices and been elected representative to the General Court. In 1802 he was employed as the first missionary of the New Hampshire Missionary Society, and in that capacity traveled and preached widely in the northern portion of the State. In 1810 he removed to Salisbury and took charge of the

gation, and in 1813 settled at Brighton.

His work on the doctrine of the Trinity, in 'Bible News of the Father, Son, and Ghost' (1810), soon became the subject of severe criticism, the Hopkinton association, of which he was a member, passing a sentence of condemnation against the

From 1813 to 1818 he edited *The Christian*, a periodical published in Boston. In 1814 published his tract, 'A Solemn Reflection on the Custom of War,' once well known, translated into several languages. Shortly after this the Massachusetts peace society was formed, and in 1819 he began *The Friend*, which continued in quarterly numbers for 10 years, nearly the whole of it being written by himself. In 1829 he published 'The Great Sacrifice, a Display of Love, not of Power'; in 1831, 'The Causes and Evils of Intemperance among Christians'; and in 1833, 'Thoughts on Important Subjects.' Among his other writings is a 'Respectful Address to the Trinitarian Clergy' (1812). Consult Henry, 'Memoirs of Noah Webster,' (Boston 1844).

**WORCESTER, Samuel Austin**, American clergyman and translator: b. Worcester, Mass., 1798; d. Park Hill, Indian Territory, 20 1868. His father was a Congregational minister and also a printer. His parents moved to Vermont during his childhood. He was educated in the University of Vermont (of which his uncle, Rev. Samuel Austin, was president), where he was graduated in 1819. He was educated from Andover Theological Seminary in 1825 and in 1825 was ordained to the ministry and shortly afterward entered the service of the American Board of Commissioners for Foreign Missions, being assigned to duty at the Park Hill Mission in East Tennessee. In 1827 he transferred to New Echota, Ga., which was the Cherokee capital. He aided in the establishment of the *Cherokee Phoenix*, which was the first paper to be printed in the Cherokee language and alphabet. In March 1829 he was arrested by the Georgia authorities because of his refusal to take a special oath of allegiance to that State—an obligation which had been devised and prescribed for the avowed purpose of discouraging missionary work among the Cherokee Indians. He was released but was re-arrested, tried, convicted and sentenced to the penitentiary for the term of four years. In the garb of a felon, he was confined to hard labor until January 1833, though the Supreme Court of the United States had declared nearly a year before that his imprisonment was illegal. He then returned to Brainard, where he was beyond the jurisdiction of Georgia. In 1835 he moved to the Indian Territory, where the Western Cherokees had removed from Arkansas in 1829. After visiting the Park Hill Mission he tarried for a season at the Indian Mission, where he set up the first printing establishment in the Indian Territory. In December 1836 he settled at Park Hill, five miles south of the present town of Tahlequah, where his mission was established and where he labored during the remainder of his life. In addition to his work as a preacher and teacher at Park Hill, Worcester devoted himself to the task of bringing various works into the Cherokee language, to be printed and published at his

Park Hill Mission. The mission press also printed many books and pamphlets for the missionaries laboring among the Creek, Seminole, Choctaw and Chickasaw nations. His own translations included large portions of the Bible, tracts, hymn-books, school books and the Cherokee Almanac, printed in English and Cherokee, with astronomical calculations for the meridian of Fort Gibson. In translating the Bible he rendered the text from the original Hebrew directly into Cherokee without the medium of either the Greek, Latin or English versions. Prior to his removal to the West he had laboriously prepared manuscripts for a grammar and a dictionary of the Cherokee language, both of which were unfortunately lost when the steamboat transporting his personal effects was sunk while ascending the Arkansas River. He was greatly revered among the Cherokees by whom he was known as "The Messenger." Consult Mooney, James, 'Myths of the Cherokee' (in 19th Annual Report of the Bureau of American Ethnology); Lumpkin, Wilson, 'Removal of the Cherokee Indians from Georgia'; Benson, Henry C., 'Life Among the Choctaws'; and Drake, Samuel G., 'The Aboriginal Races of North America.'

**WORCESTER**, England, (1) a city, the capital of Worcestershire, situated in a beautiful vale on the eastern bank of the Severn, 120 miles west-northwest of London. The cathedral is a noble specimen of Gothic simplicity. It was first erected by Ethelred, king of Mercia, in 680, and a later edifice was burned down and rebuilt in the beginning of the 13th century. It was restored in 1857-74. It is 394 feet long, 78 feet wide and 68 feet high, and the tower, which rises from the intersection of the nave and aisles to the altitude of 170 feet, is ornamented at the corners by lofty pinnacles. It contains many handsome monuments and sculptures, including the tombs of King John, of Bishop Gauden and of Arthur, Prince of Wales and son of Henry VII. There are about 20 other handsome places of worship, such as Holy Trinity, Saint Nicholas, Saint Andrew's, Saint Helen's etc. Among other buildings are the shire-hall, guildhall, Victoria Institute (library, museum, etc.), corn-exchange, the hop and fruit market, museum of natural history, two grammar-schools, several charitable institutions, etc. Worcester is the chief seat of the English leather glove trade, has celebrated porcelain-works, "Worcester sauce" works, vinegar-works, chemical and manure works, foundries, railway signal works, locomotive works, horse-hair weaving, agricultural implements, carriage factories and other works. Its trade in hops is extensive. There are municipal electric lighting works and a service of electric trams. The most remarkable event here was the victory of the English army, under Cromwell, over the Scotch in the cause of Charles II, in 1651. There are traces of Roman occupation, but its history dates from the establishment of the Episcopal see in the 7th century. The first charter was obtained from Philip and Mary in 1554; James I granted another in 1622 and its government was again altered by the Municipal Reform Act of 1835. Pop. about 50,000. (2) An inland county bounded on the north by Shrop and Stafford, on the west by Hereford, on the south by Gloucester and on the east by

Warwick; with some separated portions, enclosed by the counties of Gloucester and Warwick. The area is 751 square miles. The surface, generally level or gently undulating, has some extensive and beautiful vales, the principal of which, that of the Severn, is 30 miles long and one quarter to a mile broad. On the southwest are the fine Malvern Hills, the loftiest of which is 1,444 feet above set-level. The soil, composed chiefly of clay and loam, is of great fertility. The principal crops are wheat, barley, oats, beans, peas, turnips and hops. The orchards are celebrated for their apples and cider. The vales consist of meadows and rich pastures. The sheep are of the Leicester breed. Coal is found in the north and northwest; the brine springs at Droitwich and Stoke Prior supply immense quantities of salt; iron is found with the coal, and the manufacture of iron and steel, and of hardware, is extensive; carpets and rugs are made at Kidderminster; and porcelain, gloves and other articles at Worcester. Pop. 427,064. Consult Brassington, 'Historic Worcestershire' (Birmingham 1894-95).

**WORCESTER**, Mass., city and county-seat of Worcester County, on the Blackstone River, and on the New York, New Haven and Hartford, the Boston and Maine and the New York Central railroads, 44 miles west of Boston and 45 miles northwest of Providence. Electric railways extend to all the nearby towns and to Boston. The city was begun in a valley, but it now occupies a number of the surrounding hills; the elevation above sea-level is 481 feet; area, 38.41 square miles.

**Industries.**—Worcester is noted for the number and variety of its manufacturing establishments. According to the State census the city's manufactured products in 1915 were valued at nearly \$100,000,000, while the figure for 1917 reached nearly \$193,000,000. Among the numerous factories are those producing steel, wire, machine-tools, grinding wheels, carpets, leather goods, steam and electric cars, firearms, textile machinery, automobile parts, musical instruments, chains, etc. About 6,500 men are employed in the building trade. There are approximately 3,200 mercantile establishments employing about 25,000 people. The trading population of the suburbs is estimated at about 450,000. Owing to its large, up-to-date machinery equipment, Worcester became one of the most important war material producing cities in the country.

**Buildings and Municipal Improvements.**—The principal public buildings are the Federal building, courthouse, city hall (\$650,000), State armory, Mechanics Hall, the Young Men's Christian Association, the Young Women's Christian Association, buildings of the women's clubs and of several fraternal organizations, the State Mutual Assurance Company, Masonic temple, one of the finest in New England, several charitable institutions, the religious and educational institutions and the union station. There are 17 public parks, having a combined area of 1,071.88 acres; Lake Park has 110 acres and Elm Park 80 acres. Playgrounds occupy 74 acres. The system of waterworks cost \$7,150,000. The sewer system covers about 240 miles and cost \$5,977,499. Together with the sewerage pumping and purification works the

total cost is over \$7,000,000. The city is divided into 10 wards, which diverge from its centre like the spokes of a wheel. The principal business streets run north and south. There are 221 miles of public streets, 12 theatres and 33 hotels.

**Churches, Charitable and Educational Institutions.**—There are over 100 church organizations with property valued at \$3,000,000. The denominations rank, according to the number of their buildings, as follows: Congregationalist, Baptist, Methodist Episcopal, Roman Catholic, Protestant Episcopal, Unitarian and other one or two each. The hospitals are the Washburn Memorial Hospital, for women and children, the City Hospital, Homœopathic Hospital, and Saint Vincent's Hospital. Other institutions are the State Insane Asylum, the State Odd Fellows' Home, Saint Ann's Orphan Asylum, Saint Vincent's Home for the Aged, Saint Francis' Home for the Aged, Our Lady of Mercy Orphanage, a home for the friendless, and a number of private hospitals. The educational institutions are Clark University, a post-graduate school for original research, opened in 1889, Clark College, Worcester Polytechnic Institute, College of the Holy Cross (Roman Catholic), opened in 1843, the Bancroft School, Kimball's School for Girls, Saint John's School (Roman Catholic), Worcester Academy, Assumptionist College, Becker's Business College, Hinman's Business College, State Normal School, Boy's Trade School and Girls' Trade School, the evening high school, 74 public school buildings (four public high schools) and 10 portable schoolhouses, the Free Public Library, two antiquarian societies, historical and literary societies and several school libraries. There are altogether more than 30 libraries with some 600,000 volumes; the Public Library contains 219,000 volumes. There are also 594 newspaper and magazines. Worcester boasts one of the finest art museums in the United States, with an endowment of \$4,000,000.

**Banks and Finances.**—In 1919 Worcester had five savings banks with deposits of \$100,000,000; two national banks; two trust companies and four co-operative banks. At 1 July 1917 the city had a valuation of more than \$187,000,000 with \$7,000,000 exempt. This valuation does not include \$15,000,000 intangible personalty taxed directly by the commonwealth. The four insurance companies (one life and three fire) have total assets over \$56,500,000, with a total surplus of about \$5,000,000. The municipal expenditures for maintenance and operation are about \$6,500,000. The chief items of expense are as follows: schools, \$1,200,000; streets, \$600,000; fire department, \$320,000; police department, \$495,000; charity department, \$350,000; public library, \$82,000.

**Government.**—The government is vested in a mayor, whose term of office is one year. He is the chief executive officer and has extensive power of veto over the acts of the board of aldermen and the common council, the former consisting of 11 members, one from each ward and one at large; and the latter of 30 members three from each ward. The two boards constitute the city council, who have power to accept or reject the mayor's appointments. The council elects the heads of the departments.

**History.**—A settlement was made here in 1673-74, called Quansigamog Plantations. The

were hostile to the settlers from the start at the beginning of King Philip's war; their hostility increased and the whites fled the settlement. Another attempt to settle was made in 1684, but after the Indians forced the whites again to leave the second time the place was named Worcester on account of Worcester in England being the home of some of the settlers. The permanent settlement was made in 1735. Worcester was incorporated; and chartered as a city in 1848. Isaac Thomas, a publisher from Boston to Worcester in 1775, about 1800 the town was among the flourishing places in the country.

Population.—The city ranks second in the population which is made up of 50,000. Since 1850 it has grown rapidly. In 1800 the Federal census returns were as follows: (1800) 2,411; (1820) 17,049; (1870) 41,405; (1880) 84,655; (1900) 118,421; (1910) 162,697; (1915 State census), 200,000.

Publications.—F. E. Blake, 'Incidents of the First Settlements of Worcester' (Worcester); Hurd, D. H., 'History of Worcester' (ib. 1889); Lincoln and Hersey, 'Worcester' (1837-62); Metcalf, 'Illustrated Business Guide to the City of Worcester' (ib. 1880); O'Flynn, 'School History of Worcester' (1910); Nutt, 'History of Worcester and Its People' (1919); Rice, 'Worcester in 1898' (ib. 1898).

JOHN D. HUGHES,  
Director of Mercantile Bureau, Worcester  
Department of Commerce.

**WORCESTER**, South Africa, a town of 6,000, 60 miles northeast of Cape Town, reached by rail through Paarl and Tulbagh. The town is regularly laid out, the streets being lined with trees. It is well supplied with water from the Hex River. The vine is extensively cultivated in the neighborhood and brandy is made in considerable quantity. Population about 6,000.

**WORCESTER COLLEGE**, Oxford, England, originally called Gloucester Hall, was founded in 1714 by Sir Thomas Cookes of Buntingford, Cambridgeshire, for a provost, six fellows and 10 scholars. Under the statutes of 1882 the college consists of a provost, 9 or 10 fellows and 19 scholars. There are a number of residences, two of which are connected with the Terhouse School, and three with the University School. There are 10 livings within the college. See OXFORD UNIVERSITY. See also Daniel and Barker, 'Worcester College' (London 1900).

**WORCESTER MUSICAL FESTIVAL**, an annual musical event held at Worcester, Massachusetts, consisting of four concerts, including more or less large oratorio or choral work, under the auspices of the Worcester Musical Association. The festival is the result of the joint meetings of the Association in the vicinity, and the first festival was held in September 1858. The choirs were first organized at the Worcester County Convention in 1863, and the present constitution was adopted in 1871. The first entire festival was given in 1866, with Karl Zerrahn as conductor. Zerrahn continued as conductor

until 1897; G. W. Chadwick was conductor in 1898-1901, Walter Doodrich occupied the office in 1902-07, and since the 1908 festival Arthur Mees has been conductor. Victor Herbert was associate conductor in 1889-91, and Franz Kneisel in 1892-1908. The musical festival held at Worcester, England, is known as the Three Choirs Festival.

**WORCESTER POLYTECHNIC INSTITUTE**, a professional school of engineering and chemistry located at Worcester, Mass. It was founded by a gift of \$100,000 from John Boynton of Templeton; was chartered in 1865, and opened to students in 1868. Since that time its resources have been largely increased both by private benefactions and State donations. Though one of the earliest schools of the kind in the United States, it has in every way kept pace with the progress in scientific and technical education, and is recognized as one of the leading American technical schools. From the time of its organization, laboratory and shop work have been a distinctive feature of its plan, it was one of the first schools to emphasize the importance of laboratory methods and the first in the United States to establish a workshop as an essential part of the training in mechanical engineering. The institute offers five courses of four years each leading to the degree of B.S.; these are mechanical, civil and electrical engineering, chemistry and general science. English, political science, French or German, and mathematics are included in all courses; the work of the freshman year is practically the same for each course; with the sophomore year the special work of each course begins. The work of the junior and senior years of the general science course is largely elective; otherwise the courses are practically all prescribed. Graduate courses are provided leading to the degrees of M.S., D.S., M.R., C.E., E.E., and Ch.E. The students maintain a Christian association, student branches of the national engineering societies, chapters of several Greek fraternities and an athletic association. The institute publishes a bi-monthly *Journal*, containing original articles on technical and scientific subjects by the alumni and faculty and news of the institute and general scientific progress. The students publish a weekly paper. The institute campus comprises 34 acres on a slight elevation in the northwestern part of the city; it slopes on the north to Institute Park and includes a large athletic field with a quarter mile track, gridiron and baseball diamond. The buildings on this campus are Boynton Hall, the Washburn shops (pattern, machine and forge), the Salisbury laboratories (chemistry, physics), the electrical engineering laboratories, the mechanical laboratories, the power laboratory, the foundry, the magnetic laboratory, and the alumni gymnasium and the Alden hydraulics laboratory at Chaffinsville, five miles distant. The laboratories and shops are all excellently equipped, the library in 1919 contained 17,096 volumes including departmental libraries; the Worcester Free Public Library, with 230,000 volumes in 1919, is also open to students. Free tuition is given to 40 Massachusetts students in consideration of which the institute receives an annual State appropriation. The students in 1919 numbered 474, and have averaged over 500 for the past 10 years; the total number of graduates was 2,075.

**WORCESTER PORCELAIN.** In 1751, Dr. John Wall, physician, and William Davis, apothecary, established the "Worcester Tonquin Manufacture," to imitate Chinese blue-and-white ware. Many connoisseurs declare some of the porcelain pieces were the best ever made in England. Robert Hancock, the clever engraver at the Battersea Enamel Works, helped by introducing transfer-printing; his fine work made the ware famous with such decorative pictures as "Garden Scene," "Milkmaid in a Farmyard," "The Hunt," etc., from noted artists as Gainsborough, Watteau, etc. Hancock left in 1774 and Dr. Wall died in 1776; then Thomas Flight purchased the factory, and, with his sons, John and Thomas, ran the works. Frequent changes of partnership changed the firm name respectively to Flight and Barr; Barr, Flight and Barr; Flight, Barr and Barr, when, in 1840, the competition of Robert Chamberlain forced an amalgamation in the firm name "Chamberlain's." Oriental decoration and English silverware forms characterize the Dr. Wall period (1751-83). The quality of the potting, as well as decoration, was first class from the start, but the "inky" quality of the blue (through impurity) was a defect of early pieces. Worcester soon acquired a deserved reputation for its wonderful gilding. O'Neal and Donaldson painted lovely figure decoration. The "Japan" pattern gained fame. A number of pieces in Worcester paste are facsimiles of Bow and Chelsea ware ("quail" pattern, etc.). Wall period blues (all underglaze) as backgrounds were "scale blue" and "powdered blue," of very variable quality. Other early colors were canary yellow, turquoise, copper green, apple green and purple. In enameling sprays and stripes, a dead-surface opaque *gros bleu* is frequent. Favorite decorative motifs were "exotic birds," flowers, fruit, figures, landscapes, etc., also handpainted camaieu "sprig pattern" in pink or overglaze blue. The early transfer-printing was in dark blue, chocolate brown, red, *puce* or purple, in overglaze. Decoration in the Flight period changed to "armorial" services of a gorgeous character; Grecian fret, anthemion and "Early Empire" conceptions (then in vogue) are favored. The great change in decorative treatment appears to have been without a transition period. The heavy gilding was still of fine execution but excessive and changed too in style. The final period is noted for grand services made for the emperor of Russia, George III, George IV and William IV. Artists were, besides Hancock, such men as Valentine Green, James Ross, Thomas Baxter, engravers; Donaldson, Williamson, Dyer, O'Neal, Fogo, etc., painters. The products were large vases after Sévres and Dresden, table services, jugs, beakers, etc. Documentary evidence adds figures to Worcester ware, but none are known. Early Worcester paste was a glassy, translucent, beautiful frit of greenish tinge when looked through. This gave way to a semi-opaque paste of yellowish tone, of which inferior body some of Worcester's most costly pieces is composed. The Flight period paste was no longer so soft, but hard, opaque, greyish body, often both thick and heavy. From 1783 to 1793 we have a pure, translucent, fine paste of bone-ash, china stone and china clay. *Markes:* First came a crescent or the Chinese square "seal" mark, and the letter W, two on the same

piece sometimes. At times a capital E lies within the horns of the crescent. Then we get "FLIGHTS" or the same in italics, some with a superposed crown. These are followed by the changed firm names. Crossed swords closely resembling the Dresden mark are on some pieces.

**Chamberlain Worcester.**—On the purchase of the Worcester factory by Flight, Robert Chamberlain (about 1783), whose capacity is a mooted point, left the factory and started on his own account at the Diglis works. His brother Humphrey and Richard Nash were partners. H. Chamberlain, Junior, and Robert Chamberlain, Junior, ran the works from 1798 to 1811, and, from 1804 to 1811, G. Boulton was a partner. Competition between the Worcester factories was so keen that Barr, Flight and Barr, after heavy losses, combined with Chamberlain (1840) when the work was continued in the Chamberlain plant only. The art value of the product soon fell off. Under Kerr and Binns the later factory produced, in the 19th century, very fine work. "Chamberlains" started the lovely, translucent "Regent" body in their finest pieces, but it was very costly and unprofitable. Chamberlain ware so closely resembles the Flight and Barr product that they are hard to sometimes differentiate. Both did spiral-fluted table services. "Japan" style was used by Chamberlains for many years. Marks were "Chamberlain's" or "Chamberlain's Worcester," also "Chamberlains Worcester." The crown appears on "Regent Paste" pieces and over some Flight firms' names. The factory is still running as the Royal Worcester Works.

**Grainger Worcester.**—A nephew of Humphrey Chamberlain, a porcelain painter in the Worcester works, named Thomas Grainger, opened (about 1801) an independent factory with a partner in the firm name of Grainger and Wood. In 1812 the firm became Grainger, Lee and Company, then G. Grainger and Company in 1830. Their chief product was services, and excellently painted views in panels with handsome gilding appear on extant pieces. Among other marks are "George Grainger, Royal China Works," "Grainger, Lee and Co.," the last mark being "G. & Co." in a shield with three martlets in a canton.

CLEMENT W. CUMBE.

**WORCESTER VS. GEORGIA.** A statute of Georgia which prohibited residence within the territory of the Cherokee nation without the license of the State governor. Worcester was prosecuted in the criminal courts for having violated this statute. He appealed from his conviction to the Supreme Court of the United States claiming that the decision of the lower

was in derogation of rights and privileges granted by him under treaties existing between the Government of the United States and the Indian nation. The latter was held to be a sovereign nation having the inherent power of making treaties with the United States independent subject only to the protection of the United States against the aggression of foreign nations.

It was held also that the State of Missouri within whose limits lay the territory of the Indians had no power to legislate as to the rights of white persons residing in said territory, and consequently his conviction of a crime against the laws of the State for residing in that territory with the license of the State was without authority and void. Consult *Conanfield, G. P.*, in *American Law Review*, XV (1881); *Thayer, J. B.*, in *Atlantic Monthly* (Vol. LXVIII, 1891); and *Willoughby, W. W.*, 'Constitutional Law' (1910).

**WYRD, wôrd, Wynkyn de**, English printer and stationer: b. Alsace, late 15th century; London, about 1534. His name was given by Jan van Wynkyn, de Worde being a name referring to Worth in Alsace. He first went to England with Caxton from France in 1476, and later was an apprentice in London's printing office, in which he established himself in 1491. He printed between 700 and 800 works, which are known through fragments at least one complete copy. This is thought not more than half his work. Among the works printed by him were Higden's 'Polychronicon' (1495), in which occurs the first use of music type; Wakefield's 'Oratio' in which italic type was first used in England; and Trevius's rendering of Bartholomaeus Anglicus' 'De Proprietatibus Rerum'.

**WYRDEN, wôrd'n, John Lorimer**, American naval officer: b. Ossining, Westchester Co., N. Y., 12 March 1818; d. Washington, 18 Oct. 1897. He was appointed a midshipman in the navy in 1834. At the beginning of the Civil War he was captured by the Confederates, but after seven months was exchanged and was subsequently ordered to the command of the *Monitor*, which left New York City on 23 Feb. 1862. He arrived at Hampton Roads on the evening of the 8th, after the iron-clad *Montgomery* had destroyed the wooden frigates *Virginia* and *Congress*. On the morning of the 9th a memorable battle was fought by the *Monitor* and *Monitor*, the former of which was severely disabled and abandoned the fight, after several violent collisions with the *Monitor*. Warden commanded in 1862 and captain in 1863. He commanded the iron-clad *Monitor* in operations against Fort Sumter in April of 1862. In June 1868 he was promoted commodore, and in 1872 rear admiral. He was superintendent of the Naval Academy at Annapolis in 1870-74; commander-in-chief of the squadron in 1875-77; and was re-elected in 1886.

**WORDSWORTH, wôrd's-wérth, Charles**, English prelate, son of Christopher Wordsworth (1774-1846) (qv). b. Lambeth, 22 Aug. 1817. Educated at Saint Andrews, Scotland, 5 Dec. 1839. He was educated at Harrow and Christ Church, Oxford, and, becoming a private tutor, had John Addington and Manning as pupils. From 1835 he was second master at Winchester

School, and from 1846 to 1854 was the first warden of Trinity College, Glenalmond, Perthshire. He was elected bishop of Saint Andrews, Dunkeld and Dunblane in 1852, and was a prominent figure in the ecclesiastical life of Scotland, being filled with an earnest desire to heal the dissensions between the different churches and pave the way for their reunion. Besides volumes of sermons, discourses, etc., he published a widely-used 'Greek Grammar' (written in Latin) (1839); 'Shakespeare's Knowledge and Use of the Bible' (1864; 4th ed. 1892); 'Annals of My Early Life' (1891). Consult 'Annals of My Life' (1893), edited by Hodgson; and 'The Episcopate of Charles Wordsworth' (1899) by John Wordsworth.

**WORDSWORTH, Christopher**, English Anglican clergyman, youngest brother of William Wordsworth (qv.): b. Cockerpoth, Cumberland, 9 June 1774; d. Buxted, Sussex, 2 Feb. 1846. He was educated at Hawkshead Grammar School and Trinity College, Cambridge, and was elected a Fellow of his college in 1798. He held various livings in the Church and was master of Trinity College 1820-41. He published 'Ecclesiastical Biography' (1810); 'Sermons on Various Subjects' (1814); 'Christian Institutes,' a series of discourses and tracts (1836); 'Who Wrote Elkon Basilina?' (1824-25), etc.

**WORDSWORTH, Christopher**, English Anglican prelate, son of the preceding: b. Lambeth, 30 Oct. 1807; d. Harwood, Yorkshire, 21 March 1885. He was educated at Winchester and at Trinity College, Cambridge, and from 1836 to 1844 was head master of Harrow School. He then became canon of Westminster, and after being made archdeacon of Westminster in 1865 was appointed bishop of Lincoln in 1868. He was the author of writings connected with classical, theological or ecclesiastical subjects, among which are 'Athens and Attica' (1836); 'Greece: Pictorial, Descriptive, and Historical' (1839); an edition of 'Theocritus' (1844; fuller one, 1877); 'Memoirs of William Wordsworth' (1851); 'Saint Hippolytus and the Church of Rome in the 3d Century' (1853); 'The New Testament in the Original Greek' (1856-60); 'The Old Testament in the Authorized Version,' with notes and introduction (1864-71); 'A Church History to the Council of Chalcedon, 451 A. D.' (1881-83). Consult 'Life' by his daughter Elizabeth and J. H. Overton (1888).

**WORDSWORTH, Christopher**, English Anglican clergyman and scholar, second son of Bishop Christopher Wordsworth (qv): b. Westminster, 26 March 1848. He was educated at Trinity College, Cambridge, in 1870-88 as a Fellow and Tutor of Peterhouse College, and in 1877 was appointed rector of Galstou, in Rutland. In 1886 he became a prebendary of Lincoln Cathedral, and in 1889 rector of Tyncham, Dorset. Since 1897 he has been rector of Saint Peter's, Marlborough. His published works comprise University Society in the 18th Century' (1874); 'Scholar Academics' (1877); 'Breviary and Usum Sarum' (1879-86), edited with F. Procter; 'Pontificale Ecclesie S. Andreae' (ed. 1888); 'Linc. in Cathedral Statutes' (1892-97), edited with H. Bradshaw; 'Coronation of King Charles I' (1892-94); 'Medieval Services' (1898), etc.

**WORDSWORTH, Dorothy**, English writer: b. Cockermouth, 25 Dec. 1771; d. Grasmere, 25 Jan. 1855. She was the only sister of the poet and was a woman of remarkable mental powers, who described country life with keen observation and much literary skill. Besides her 'Recollections of a Tour in Scotland' (1874) other journals and letters of hers have been published, the manuscripts having been finally collected by Knight in 1897. Her mind was latterly clouded. Consult Lee, 'Dorothy Wordsworth' (1886; new ed., 1894)

**WORDSWORTH, John**, English Anglican prelate, eldest son of Bishop Christopher Wordsworth (q.v.): b. Harrow, 21 Sept. 1843; d. 16 Aug. 1911. He was educated at New College, Oxford, was ordained deacon in 1867, and in 1868 became an assistant master in Wellington College. In 1870 he was made prebendary of Lincoln, and in 1883-85 was Oriel professor of the interpretation of Holy Scripture, Fellow of Oriel and canon of Rochester. He was Bampton lecturer in 1881 and in 1885 became bishop of Salisbury. His chief publications are 'Fragments and Specimens of Early Latin' (1874); 'University Sermons of Gospel Subjects' (1878); 'The One Religion' (1881, Bampton Lectures); 'Old Latin Biblical Texts' (1883-86), with Sanday and White; 'The Holy Communion' (1891); 'Novum Testamentum Latine, secundum editionem S. Hieronymi' (1898); 'The Episcopate of Charles Wordsworth' (1899); 'Teaching of the Church of England for the Ministry of Eastern Christians' (1900); 'The Ministry of Grace' (1901); 'Unity and Fellowship' (1910), etc. Consult Watson, E. W., 'Life of Bishop John Wordsworth' (London 1916).

**WORDSWORTH, William**, English poet: b. Cockermouth, Cumberland, 7 April 1770; d. Rydal Mount, Westmoreland, 23 April 1850. He was the second son of John Wordsworth, attorney-at-law, who was descended from a York-hire family dating back to the Norman Conquest. His mother, Anne Cookson, belonged to an ancient family of Crackanthorpes, who had lived in Westmoreland from the times of Edward III. He was educated at Hawkshead Grammar School and at Saint John's College, Cambridge, where he entered in 1787, taking his B.A. degree in January 1791. In the summer vacation of 1790 he went to the Continent with Robert Jones, a fellow-collegian, starting, as he says, "staff in hand, without knapsacks, each his needments tied up in a pocket-handkerchief, with about 20 pounds apiece in our pockets." They spent most of the time in walking through Switzerland.

He left Cambridge with no definite plans for the future. He did not feel himself, as he said afterward, "good enough for the church," and had no inclination to the law. He had studied military history with much interest, and at one time thought of going into the army, but on reflection gave up the plan. He finally went to London, where he lived for a time on a small allowance with no special aim or employment. In November 1791, he went to France, with the idea of spending the winter and learning French, but, becoming interested in the revolutionary politics of the period, remained in the country until October 1792, when

his friends, fearing for his safety, stopped his funds, and he reluctantly returned to England.

He soon began to turn his attention to literary work. He had written verse in his school days, at first as a task imposed by his master, the subject assigned being "The Summer Vacation," to which of his own accord he added a poem on "The Return to School." This was before he was 15, for in 1785 he was called upon to write verses in commemoration of the second centennial anniversary of the founding of the school. These, he says, "were much admired—far more than they deserved—for they were but a tame imitation of Pope's versification, and a little in his style." His first publication was in 1792 (not 1793, as generally stated), a thin quarto entitled 'An Evening Walk—an Epistle in Verse addressed to a Young Lady from the Lakes of the North of England. By W. Wordsworth, B.A., of Saint John's College, Cambridge.' This was followed, the same year, by 'Descriptive Sketches in Verse, taken from a Pedestrian Tour in the Italian, Grison, Swiss and Savoyard Alps.' The books attracted little attention, and sold very slowly; but they led to the friendship between Wordsworth and Coleridge, which proved to be a lifelong intimacy. Coleridge says in his 'Biographia Literaria': "During the last year of my residence at Cambridge I became acquainted with Mr. Wordsworth's 'Descriptive Sketches,' and seldom, if ever, was the emergence of an original poetic genius above the literary horizon more evidently announced." Wordsworth himself did not estimate these early poems very highly. In a letter to a friend at the time he says: "It was with great reluctance that I sent those two little works into the world in so imperfect a state. But as I had done nothing by which to distinguish myself at the university, I thought these little things might show that I *could* do something. They have been treated with unmerited contempt by some of the periodicals, and others have spoken of them in higher terms than they deserved."

In the latter part of 1794 Wordsworth received a legacy of £900 from a young friend, Raisley Calvert, son of the steward of the duke of Norfolk, who owned large estates in Cumberland. They had long been very intimate when Calvert was attacked by consumption, and Wordsworth was his devoted companion and nurse until his death. The poet now felt that he could make a home for himself and his only sister, with whom, the next autumn (1795), he settled down in a cottage at Racedown in Dorsetshire. In July 1797, they moved to Alfoxden, in Somersetshire, in order to be near Coleridge at Netherstowey. Here Wordsworth added to his income by taking a young son of Basil Montague as pupil; and here he wrote many of the poems included in the 'Lyrical Ballads,' published in the autumn of 1798 by Mr. Joseph Cottle of Bristol, who had been rash enough to pay 30 guineas (about \$150) for the copyright. The volume contained Coleridge's 'Ancient Mariner,' which he and Wordsworth had planned together, and to which the latter had contributed a few lines: together with Wordsworth's 'Idiot Boy,' 'We are Seven,' and 20 other poems. A were the famous lines on 'Tint

were written just before the book appeared. Five hundred copies were issued, but of them were afterward sold to a London bookseller at a sacrifice. When Cottle set up business soon afterward, his copyrights were transferred to Mr. Longman of London, and in the estimation of their value 'Lyrical Ballads' were put down as "worth nothing." Cottle, therefore, asked that the right might be given back to him, and, when being granted, he made a present of it to the authors, who both lived to see it become one of really valuable literary property. It is easy to imagine a book containing 'The Ringer' and the 'Tintern Abbey' as absolutely worthless, from a commercial view, only about a century ago. Immediately after the publication of the 'Lyrical Ballads,' Wordsworth, his sister and sailed for Hamburg, with a view of their acquaintance with the German poet by a winter at Goslar. During the months spent in that dull and dismal town, particularly cold and disagreeable season, Wordsworth wrote some of his best and most poetic poems, full of the loveliness of natural scenery and life. Coleridge independently of his friends a part of the time they were abroad, but the three made excursions together in the rural districts of Germany and had some unpleasant experiences. Sometimes they found it difficult to obtain food even in the wretched inns of the country. For instance, as Coleridge records, they were driven out of doors and had to spend the night in the fields. But they met with no misadventures than these, and the Wordsworths got safely back to England in the spring of 1800.

The poet was always fond of travel, and in his years frequently indulged in it both in the British Isles and on the Continent. In August 1800 he went to France again, and in 1803 and 1804 visited Scotland. In 1820 he went with his wife and sister through Switzerland and Italy. In 1823 he traveled in Holland, in 1824 in North Germany, in 1828 in Belgium with Coleridge, and in 1829 in Ireland with his friend Marshall. In 1830 he and his daughter visited Scott at Aberdeen. In 1833 he made another tour in France, and in 1837 a long one in Italy with the poet Robinson. In all these journeys he gathered more or less material and inspiration for his poems.

After his return to England in 1799 he and his sister decided to settle down in their ancestral Grasmere, and soon took a small cottage at Grasmere. Here and in the immediate vicinity the remainder of their lives, except for occasional journeys abroad, was passed in quiet and poetic seclusion, with few importunate to disturb the calm current of the years. In 1802 the poet married Mary Schlegel, whom he had known from childhood with whom he had attended the same school at Penrith, where his boyhood was partly spent with his mother's parents. His marriage he and his wife continued to reside with his sister at Grasmere, and there of his children were born. From 1808 to he family lived in the same neighborhood as other houses, and then removed to Rydal Mount, a few miles distant, which was the poet's

home for 37 happy years. There, among his native lakes and hills, he died in his 81st year.

In his early manhood the poet's resources were very slender, but his tastes were simple and he made what he had suffice for his needs. He and his sister managed to live for six or seven years on about \$500 a year. Later he came into possession of a little property, and later still was appointed stamp-distributor for Cumberland and Westmoreland, an office worth £500 a year, the duties of which were mostly discharged by a clerk, leaving the poet leisure for his literary pursuits. In 1803 he became acquainted with Sir George Beaumont, a descendant of the dramatist and a cultivated man, who presented him with a beautiful piece of land at Appletrethwaite, near Skiddaw, hoping that he might be induced to settle there, but he could not make up his mind to leave his chosen home at Grasmere. His friendship with Beaumont remained unbroken until the death of the latter in 1827.

Wordsworth retained the stamp-collectorship until 1842, when it was transferred to his second son. A more lucrative office, the collectorship of Whitehaven, was offered him, but he declined it, being unwilling to exchange his secluded life at Rydal "for riches and a load of care." In 1843, he was made poet-laureate on the death of Southey. He declined the honor at first as imposing duties which at his advanced age he hesitated to undertake; but he finally accepted it, at the personal solicitation of Sir Robert Peel, who assured him that nothing "should be required of him," adding that the appointment was "a tribute of respect justly due to the first of living poets," that "the queen entirely approved of the nomination," and that there was "one unanimous feeling on the part of all who had heard of the proposal that there could not be a question about the selection."

In 1800 a second edition of 'Lyrical Ballads,' with other poems, was published, and others appeared in 1802 and 1805. Meanwhile, the poet had made few friends and many and bitter enemies. The issue of two more volumes of 'Poems' in 1807 led to a fresh onslaught upon the author, who persisted in writing verse after the autocratic *Edinburgh Review* had given judgment against him. Jeffrey, in noticing the new volumes in the *Review*, remarked: "Even in the worst of these productions there are, no doubt, occasional little touches of delicate feeling and original fancy; but these are quite lost and obscured in the mass of childishness and simplicity with which they are incorporated." Such was the high critical verdict upon a collection of poems that included the 'Ode to Duty,' the 'Sonnets dedicated to Liberty,' 'The Happy Warrior,' the exquisite lines, "She was a Phantom of Delight," etc., and the sublime 'Ode on the Intimations of Immortality.' Eight years elapsed before another edition of the poems was printed; and the year previous (1814) Wordsworth had published 'The Excursion.' Five hundred copies of this sufficed to supply the demand for six years. The new poem was savagely treated by Jeffrey, who boasted that he had "crushed 'The Excursion.'" Southey remarked: "He might as well seat himself on Skiddaw, and fancy that he crashed the mountain." Jeffrey

began his crushing criticism with "This will never do," and went on to pronounce the poem "longer, weaker and tamer than any of Mr. Wordsworth's other productions"; but though he and his fellow reviewers prevented the sale of the poem, they could not kill it, in spite of its obvious faults.

Other volumes were brought out by the undismayed poet in 1815 ('The White Doe of Rylstone'), in 1819, 1820 and 1822, and all were condemned by the *Edinburgh Review*, as they appeared; but the reaction had now begun among the critical authorities, and henceforth Wordsworth had powerful defenders in literary circles. "War was no longer waged against his poems, but rather concerning them." It was, however, a long fight yet before their rightful position was accorded them by the general consent of the contending parties. De Quincey has well summed up the matter thus: "From 1800 to 1820 the poetry of Wordsworth was trodden under foot; from 1820 to 1830 it was militant; from 1830 and onward it has been triumphant." And the triumph was complete. There were still those who could see little to admire in the meditative measures of the Cumberland recluse, but the general verdict was in his favor, and his place among the great poets of our literature was secure beyond dispute. Honors, too, were conferred upon him. In 1839 he received the degree of D.C.L. from Oxford University; and the enthusiasm of the audience on the occasion was such as had never been known except upon the visits of the Duke of Wellington. One who was present says: "Scarcely had his name been pronounced than from 3,000 voices at once there broke forth a burst of applause, echoed and taken up again when it seemed about to die away, and that thrice repeated." The poet no doubt went through the ceremony with his wonted calmness and composure; but it was none the less significant as a tribute to the man and a testimonial that he had fairly won the laurel crown. A few years later, as we have seen, he received the further honors of a government pension and the laureateship.

Wordsworth's famous theory of poetic art was first set forth in the preface to the second edition of the 'Lyrical Ballads' (1800), and more at length subsequently in prefaces and appendixes. He took the ground that not only might the poet draw his subjects from common life, but he might treat of them in the language of common life. "I have proposed to myself," he says, "to imitate and, as far as is possible, to adopt the very language of men. . . . I have taken as much pains to avoid what is usually called poetic diction as others ordinarily take to produce it." And again he asserts that "there neither is, nor can be, any essential difference between the language of prose and metrical composition." But his theory was the result of his rebellion against the highly artificial style of Pope and his school, and like many reformers, he was at first inclined to go too far in the opposite direction. He himself admitted this later by giving up the poetic style in which many of his earlier poems were written and adopting a more elevated diction, and also by changing some of the most prominent expressions in those early poems. To take a single first example of these emendations, in "The Thorn," one of the

'Lyrical Ballads,' as printed in 1798 and 1815, we have this arithmetical statement:

And to the left, three yards beyond,  
You see a little muddy pond  
Of water never dry.  
I've measured it from side to side.  
'Tis three feet long and two feet wide.

Crabbe Robinson told Wordsworth that "he dared not read these lines aloud in company." "They ought to be liked," was the poet's reply; but he nevertheless modified the last two lines in 1820, so that now they read:

Though but of compass small and bare  
To thirsty suns and parching air

Wordsworth was much gratified at the comparatively early appreciation of his works in America. The 'Lyrical Ballads' were reprinted at Philadelphia in 1802, and an edition of his poems in four volumes appeared in Boston in 1824. A complete edition was brought out (Philadelphia 1837) by Prof. Henry Reed, with whom the poet interchanged many letters. In one of these he says: "The acknowledgments which I receive from the vast continent of America are among the most grateful that reach me." Reed's edition was revised and enlarged in 1851. In 1854, a Boston edition in seven volumes was published, with a biographical introduction (though without his name) by James Russell Lowell. Thirty years later (1884) when Lowell was Minister to England, he was made president of the Wordsworth Society, and in the closing words of an address on that occasion he thus aptly and admirably expressed what we may call the "true mission" of the poet:

"As in Catholic countries men go for a time into retreat from the importunate dissonances of life to collect their better selves again by communion with things that are heavenly and therefore eternal, so this Chartreuse of Wordsworth, dedicated to the Genius of Solitude, will allure to its imperturbable calm the finer natures and the more highly tempered intellects of every generation, so long as man has any intuition of what is most sacred in his own emotions and sympathies, or of whatever in outward nature is the most capable of awakening them and making them operative, whether to console or strengthen. And over the entrance gate to that purifying seclusion shall be inscribed:

Minds innocent and quiet take  
This for a hermitage

**ORK, Henry Clay**, American song writer entor: b. Middletown, Conn., 1 Oct. 1832; tford, Conn., 8 June 1884. He was a for a time, but studied harmony and widely popular during the Civil War by his songs, such as 'Kingdom Comin'; 'Nicodemus'; 'Babylon is Fallen'; and 'ing Through Georgia.' He wrote also nce songs, which had a wide circulation, them, 'Father, Dear Father, Come Home e Now'; and sentimental melodies like 'randfather's Clock' and 'Lily Dale.' inventions by him were a rotary engine, ng machine and a walking doll.

**ORK**, in mechanics. See **ENERGETICS**; **NICS**.

**ORKHOUSE**, in the United States, a onal prison for petty offenders. In d the poorhouse is called a "workhouse." ouses appear to have been correctional lly in England also and were first erected reign of Charles II in order to compel and vagabonds to work for a living. Act les I, ch. vii, entitled the churchwardens

or overseers of the poor, with consent of the majority of the inhabitants to establish work- houses for lodging and maintaining the poor, and made various arrangements for union of parishes for this purpose. By 34 and 35 Vic- toria, ch. cviii, the guardians of every union are bound to provide casual wards, with such fittings as the poor-law board consider neces- sary, for the accommodation of the casual poor. Every workhouse has to keep a register of re- ligious creeds and also a register of persons under 16, hired out as servants or apprentices, whom the relieving officer must visit to in- quire into their food and treatment. The inmates of workhouses are not allowed to go out and in at pleasure and the able-bodied are compelled to work when required. In suitable situations they are often employed in field labor. Married persons are separated unless both are above 60 years of age. Drunkenness, misconduct or re- fusal to work exposes to the penalty of im- prisonment with hard labor. The workhouses, after being under the control of the poor-law board, were placed under the local government board in 1891.

In Scotland the legal designation of houses provided for the accommodation of the poor is "poorhouses," as in America, the designation "asylum for the poor" being also used in the United States. See **CHARITIES, PUBLIC**; **PEN- SIONS**; **PAUPERISM**; **SOCIOLOGY**.

**WORKINGMEN'S ASSOCIATION, In- ternational**. See **INTERNATIONAL WORKING- MEN'S ASSOCIATION**; **SOCIALISM**.

**WORKINGMEN'S CLUBS**, organizations for educational and social purposes composed of workingmen, but having none of the benefit or industrial features of the trade-union. In the United States they are not numerous, and where they exist are organized by those interested in philanthropic work for the benefit of working- men, and are usually largely educational. In Europe, however, clubs are often formed by the workingmen themselves, and are sometimes political, usually socialistic, and sometimes purely social; there are also numerous philanthropic clubs, especially in England, organized generally under church auspices. These are both social and educational.

**WORKINGTON**, wer'king-ton, England, a seaport and manufacturing town in Cumberland, near the mouth of the Derwent, which enters the Solway Firth 33 miles from Carlisle. It has a good harbor furnished with a breakwater, and is provided with docks. The municipal borough, incorporated 1888, does not include the whole of the previously existing urban district. The town is of importance from its industrial establishments, which comprise large iron- smelting works and works for steel rails, iron plates, etc.; it has a shipbuilding yard and collieries, and carries on a considerable shipping trade. The salmon fishery is increasing in importance and seaborne commerce has made great advances in recent years. Pop. 25,092.

**WORKINGWOMEN'S CLUBS**, organiza- tions for educational and social purposes for workingwomen. The formation of these clubs was begun in Boston in 1890, and they are now numerous throughout the United States; there is a National League of Workingwomen's Clubs; and several State leagues. These clubs have been organized on the initiative of women out-

side the working class, and include in their membership both workingwomen and "women of leisure"; one of their great benefits is the promotion of understanding and sympathy between these two classes. The clubs are entirely self-governing, all members being on an equal footing and having equal share in the management. They are also self-supporting by means of moderate fees and the proceeds of entertainments. The club rooms furnish the workingwomen with a place for recreation with pleasant surroundings and the social feature is emphasized, but the educational side is not neglected; public questions are discussed and instruction in domestic science, stenography, etc., is given. In some cases the clubs have been instrumental in obtaining reforms in industrial conditions for women; the Massachusetts State League, for instance, was largely influential in establishing the eight-hour day in Boston department stores. Some clubs maintain vacation homes.

**WORKMAN, Fanny Bullock**, American traveler and mountain climber, wife of W. H. Workman: b. Worcester, Mass., about 1850. She was a daughter of Gov. A. H. Bullock of Massachusetts, and was educated in New York and in France and Germany. She was married in 1881, afterward traveling with her husband in Northern Africa, Asia Minor and the Far East. In 1889 she made several record first ascents for women in the Himalayas, of which the highest was Mount Koser Gunge, 21,000 feet in altitude. She gained the women's world record for mountaineering in 1906 by her ascent of the Nun Kun Peaks, reaching an altitude of 23,300 feet. In 1912 she surveyed the Rose Glacier, and discovered the watershed between the Indus and the Turkestan regions. She is a Fellow of the Royal Geographical Society, and has collaborated with her husband in writing books of travel.

**WORKMAN, George Coulson**, Canadian educator and theological writer: b. Grafton, Ontario, 28 Sept. 1848. He was graduated at Victoria University in 1875, and received the degree of Ph.D. at the University of Leipzig in 1889. In 1876-78 he was assistant editor of the *Christian Guardian*, and he afterward served several years as a pastor in the Methodist Church. He was professor at Victoria University, Coburg, in 1884-91; and in 1904-08 he was professor of Old Testament exegesis and literature at the Wesleyan Theological Seminary, Montreal. He was later engaged in writing and gained a high reputation as a biblical critic. He has written 'The Text of Jeremiah' (1889); 'The Old Testament Vindicated' (1897); 'How to Study the Bible' (1902); 'The Servant of Jeremiah' (1907); 'At Onement, or Reconciliation with God' (1911), etc.

**WORKMEN'S COMPENSATION**, a system of indemnifying wage-workers and employees generally for economic losses caused by injuries (either through accident or occupational disease) and due to employment. The modern development of industry, especially through application of mechanical energy and complicated machinery and through the growth in the dimensions of industrial operations, has raised industrial accidents and injuries to the dignity of a grave social problem. It is enough to point out that in Germany alone the number

of accidents reported annually exceed 700,000, of which the fatalities approach 10,000; that in the United States the number of industrial accidents is estimated from 2,000,000 to 3,000,000 and the fatalities from 25,000 to 30,000 a year.

The theory of compensation first developed in Europe when the older theory of employers' liability (q.v.) proved inadequate to meet the economic problems created by these fatal or disabling accidents. Employers' liability, or the general legal principle of liability based upon the code civil, gave the injured workman the right to recover damages if he could establish by proper evidence that the accident was due to the negligence of the employer or his agent. In the nature of things this was possible only in a small percentage of cases, perhaps 10 per cent; in a large number of cases the accidents were found to be due to the negligence of the injured employee, or of one of his fellow employees, or the inherent hazards of the industry. The result was a rapid increase in litigation with comparatively little benefit to the injured. This became a serious problem in the more hazardous industries and special legislation developed in the railroad and mining fields. Beginning with the early 70's the problem of industrial accidents began to attract the attention of European legislators. The earlier proposals were directed at a change of the burden of proof, so as to force the employer to show that the accident had occurred without any negligence on his part, rather than to require the injured person to establish negligence. The next step was the announcement of the doctrine of "trade risk" (*risque professionnelle*, in French terminology). This established a right of recovery when an accident was admittedly due to no one's negligence but to the inevitable hazard of the industry. Yet even with these modifications the doctrine of employers' liability failed to give general satisfaction. The final step in the evolution of the compensation method was taken in Germany when the question of negligence was entirely left out. Proposals made in 1879 have materialized in Germany in legislation in 1884. This legislation established on the basis of recovery entirely irrespective of the cause of the injury, but simply on the basis of the fact. On the other hand, it established the principle of a specified (admitted) compensation according to a definite scale which compensation is graded according to the nature of the injury, the degree and extent of disability and generally the earning capacity of the injured person.

The movement for accident compensation began in Germany, spread rapidly out Europe and later throughout the world—as the following list shows, which the acts are listed according to the year in which they have passed). *Europe*: 1848; Austria, 1887; Norway, 1889; Great Britain, 1897; Denmark, 1898; Spain, 1900; Greece, 1901; Sweden, 1901; Luxemburg, 1902; Belgium, 1903; Hungary, 1907; Lichtenstein, Servia, 1910; Switzerland, 1912; Roumania, 1912; Portugal, 1913. *Other Countries*: New Zealand, New South Wales, Australia, 1900; British Columbia, Brunswick, 1903; Cape of Good Hope, 1905; Transvaal, 1907; Alberta, 1908; Quebec, 1909; Manitoba,

1910; Tasmania, Saskatchewan, Labrador; W. Australia, 1912; Victoria, 1914; a. 1916. *Other Foreign Countries.*—(Mexico), Venezuela, 1906; Peru, Japan, Cuba, 1916. *United States.*—Maryland, United States (government employees), itama, 1909; New York, 1910; Kansas, n, New Jersey, California, New e, Wisconsin, Illinois, Ohio, Massa- a, 1911; Michigan, Rhode Island, Ari- anal Zone, 1912; West Virginia, Oregon, Texas, Iowa, Nebraska, Minnesota, cut, New York, 1913; Maryland, Louisi- entucky, 1914; Wyoming, Indiana, Mon- Oklahoma, Maine, Vermont, Colorado, i, Pennsylvania, 1915; Kentucky, Porto 1916; New Mexico, Idaho, 1917; Dela- 1918.

A long list of legislation seems to in- dicate that the basic principle is accepted now- about the civilized world. It represents a of the economic and social considerations d over the purely legal considerations of al fault and responsibility.

ough based upon the same general prin- ple numerous compensation acts present a great variety of provisions. The special s of the American compensation legisla- ill be referred to presently, and in view very large number of compensation acts, e most important European acts need to ed here.

i the elimination of the principle of at the very bottom of all compensation ion, in several acts vestiges of the con- l remain, as for instance in the excep- - accidents due to wilful misconduct (tain) or even gross negligence (Den- sia, Sweden, etc.). In some acts (tain) compensation is limited to ac- e "out of employment," but the pre- y is to cover all accidental in- - d during employment (Germany, Hungary, France, Italy), so as to avoid y enquiry and controversy.

o comparatively few countries have all em- en covered. During the early history, ensation was still considered an ex- . it was limited to specified groups of tes and wageworkers; and while in most s by subsequent amendments the appli- of acts was rapidly extended, Germany reat Britain are perhaps the only ones in the acts are almost universal. Agricul- aborers are still outside of the compen- acts in most countries, and office and l employees and even all commercial es- ents are excluded in most European

thin the recent years, with better study of loal hygiene, the danger of vocational (such as poisons, etc.) has attracted e deal of attention. The British and the acts are, however, the only ones which in- uch occupational diseases under compen-

In the other acts the fact of sudden tance of the injury through an accident e established, and the entire branch of ion is still known as accident compen-

re to the elimination of the question of he specific benefit scale is a fundamental : of the compensation system, a benefit hich admittedly grants a limited and not

full compensation for losses sustained. One method of limitation is the waiting period which leaves minor accidents entirely without money compensation. This waiting period varies between two days (in the Netherlands), or three days (in Austria-Hungary), or none in Italy and Spain, to 13 weeks in Denmark or Germany. In four countries, however, all accidents are treated and compensated out of the compulsory sickness insurance system (13 weeks in Germany and Russia, 10 weeks in Hungary and four weeks in Austria). The general method of compensation is a weekly benefit in proportion to the usual earnings of the injured person, the proportion varying between 50 per cent and 66 $\frac{2}{3}$  per cent, though scales up to 80 per cent are occasionally met. This method of weekly compensation during the time of disability is considered preferable to a lump sum usually payable as a result of litigation under liability laws, because it is better adapted to the normal conditions of a wageworker's existence and prevents the squandering of the indemnity either in unwise living or unwise investment.

The compensation of partial disability, which often is permanent in character, raises many complicated problems. The economic consequences of such injuries are a decrease in earnings rather than total disability. The German method followed by many acts is to grant a permanent pension commensurate with the degree of loss of earning capacity. This is admitted, however, to develop undesirable consequences; a very large number of persons drawing very slight pensions, a desire to retain this small pension by constant exaggeration of insignificant injuries, and a computation of small pensions to lump sums finds many advocates.

Still more complicated is the compensation for fatal accidents. Here many different methods are found, from lump sums to life pensions. The latter method is recognized as preferable, and the pension in proportion to the wages is adjusted to the number of surviving dependents. The latter includes the widow and orphans under a certain specified age (from 14 to 18 in various acts) and sometimes other relatives, parents, brothers, grand-children. The socially adequate way is to compensate the widow till death or remarriage; in the latter case a small lump sum is offered as a dowry so as to counteract the unfavorable influence of discontinuance of pension upon the frequency of remarriage. Some laws, however (and this includes the British Act and acts of most British colonies) place definite money limits on the total amount of compensation for fatal accidents. It is evident, therefore, that the entire subject of compensation for industrial injuries is still in a primitive stage even in Europe. Up to the beginning of the European War there was a constant and growing stream of legislation by means of which compensation systems were being gradually extended and improved.

**Workmen's Compensation in United States.**—The movement for compensation legislation did not reach the United States until some 25 years after it began in Europe. Meanwhile the rapid industrialization of the country made the problem of industrial accidents a very grave one. The condition of Employers'

Liability based upon the Anglo-Saxon common law are very much less favorable to the injured workman than the Code Civil of European countries. The doctrines of "fellow servant," "contributory negligence" and "assumption of risk" substantially affected the proportion of cases in which recovery was possible. For years legislative efforts were made to strengthen the liability of employers by complex legislation and the result was very much increased litigation with greater waste for attorney's fees, occasional heavy verdicts, and on the whole, very limited compensation to the injured.

Agitation for a radical change to a system of compensation appeared sporadically even toward the close of the last century, but gained strength only toward 1910, when a veritable flood of legislation appeared. The earlier acts were declared unconstitutional. In fact, the famous Ives decision by which the New York Compensation Act of 1910 was declared unconstitutional, influenced the subsequent development of legislation very strongly. A very large number of States adopted the so-called New Jersey or elective system. According to this system employers may elect or reject to come under a compensation system. But the penalty for rejection is a strengthening of the liability provisions by the abolition of some or all of the three doctrines above referred to, of "fellow servant, contributory negligence or assumption of cost," while the award for election is freedom from the obligations of employers' liability. In fact, most of the States are still operating their compensation under this elective system except Arizona, California, New York, Ohio, Washington, Wyoming, Maryland, Oklahoma. Of these seven States three (California, New York and Ohio) took the precaution to amend their State constitutions before passing compulsory acts, while in the other States the opinion prevailed that compulsory laws were not contrary to the Constitution of either the State or the Union. Opinions differ among authorities on Constitutional Law as to whether both compulsory or even elective (with their hidden methods of coercion) are in accordance with the Constitution of the United States.

The necessity of making compensation acceptable to employers under an elective system has kept the scale of benefits down so as to make it cheaper. The benefit scale of the numerous acts fluctuates considerably, the New York act of 1913 presenting the highest, and the acts of New Jersey, Colorado, Pennsylvania the lowest levels of compensation, so that on an average the New York acts offers about twice as much to the injured workman as the acts of New Jersey or Pennsylvania. Considerable dissatisfaction with the provisions of compensation acts is, therefore, rapidly accumulating. Most frequent causes mentioned is the length of the waiting period which remains two weeks in most acts, the 50 per cent scale of compensation, which is the rule, only five or six acts having raised it to 60 per cent or 66 2/3 per cent and the strict time limitation for permanent injuries as well as fatal accidents, varying between 300 and 500 weeks. In some acts, however, the necessity for life pen-

sion in total or otherwise serious disabilities has been recognized (notably New York and California) as well as life pensions to widows.

An interesting feature of American Compensation acts is the so called dismemberment schedule, i.e., a schedule of specific benefits expressed in number of weeks of payments for loss of extremities or parts thereof. This was first introduced in New Jersey, being adopted from the usual commercial accident insurance contracts and was accepted by almost all of the other acts, because of its simplicity and ease of adjustment. It is questioned how just such an appraisal of surgical injuries irrespective of occupational difference can be.

The tentative character of these benefit provisions is shown by the very large number of amendatory acts notwithstanding the short history of compensation in this country. In Massachusetts the amendments of 1914 increased the average value of benefits by nearly 50 per cent. In other States elective acts were substituted by compulsory acts (California, Ohio, Maryland), in others the administrative provisions have been thoroughly rewritten. The strongest tendency in administration is the establishment of special commissions or board for adjudication of disputed claims and control of all settlements.

**Compensation Insurance.**—The compensation principle establishes new relations between employers and employees. In a certain sense it makes the employer an insurer of the employee. Unless, however, the principle of insurance would be further developed, compensation might prove a very serious hazard to the employer, especially the smaller employer. Most compensation laws contain, therefore, provision for insurance by means of which a collective responsibility takes the place of the individual responsibility of the employer. In some acts such insurance is compulsory and in the other only permissive. As to the organization of insurance an active struggle may be observed between ordinary commercial (stock) insurance companies, mutual insurance companies on general lines, employers' associations or State funds. The struggle expresses itself either in legislative elimination of some forms and provision for others, or in open competition between co-existing various forms.

A classification of the various compensation acts according to their insurance system may be presented in tabular form as follows: (1) Compulsory insurance in prescribed carriers (a) In a monopolistic State insurance fund (Norway, Switzerland, Ohio, Washington, Wyoming, Nevada, Oregon, West Virginia) (b) In employers' mutual association controlled by the State (Luxemburg, Roumania, Servia, Hungary, Austria, Russia, Germany Greece). (2) Compulsory insurance with choice of insurance form. (a) State fund competing with private or mutual insurance companies (Italy, Netherlands, Maryland, New York, Oklahoma, Michigan, Colorado, Pennsylvania, Montana); (b) Private or mutual insurance companies (Massachusetts, Texas, Connecticut, Illinois, Iowa, Wisconsin, Indiana, Maine). (3) Voluntary insurance. (a) State fund competing with private or mutual insurance carriers (Sweden, France, Portugal,

nia); (b) Private or mutual insurance is only (Belgium, Great Britain, Spain, Prussia, British Colonies, Japan, Nuevo Peru, Venezuela, Cuba, Alaska, Arizona, Louisiana, Minnesota, Nebraska, New Jersey, New Jersey, Rhode Island). In the United States the principle of compulsory insurance has evidently made substantial progress. In some form this principle is in 22 States, though in 15 of these, the principle itself is, in form at least, elective. Another significant feature brought out in the table is the development of State insurance, not only in Europe but in the United

States. In the non-political State Compensation Insurance in Europe in Norway, Switzerland; in the United States in Nevada, Ohio, Oregon, West Virginia, Wyoming.

In the competitive State Compensation Insurance in Europe in Italy, Netherlands, Sweden, Portugal; in the United States in Maryland, New York, California, Colorado, Pennsylvania, Montana. The development of state compensation insurance is in seven European countries and 13 of the American Union.

The development indicates a growing tendency to eliminate both private profits and the expenses of private competitive business in this field, so that insurance can be afforded to employers at cost and the burden of the industry made as light as possible. See INSURANCE and the authorities there.

ISAAC M. RUBINOW.

**WORKS, John Downey,** American jurist and author. b. Ohio County, Ind., 29 March 1857. He served 18 months in the United States in the Civil War, later studied law, and was admitted to the bar. He practised law in Weymouth, Ind., in 1868-83, and served in the legislature in 1879. After 1883 he was in practice at Los Angeles, Cal., was of the Superior Court of San Diego, 1886-87, and justice of the Supreme Court of California in 1888-91. He afterward returned to law practice and was active in connection with anti-race track legislation and other reforms. He served in the United States Senate as a Republican in 1911-12. He published 'Courts and Their Jurisdiction' (1894); 'Practice, Pleading and Forms' (1882-86; 4th ed., 1906); 'Irrigation' etc.

**WORKSHOP COMMITTEES,** or the "WHITLEY'S INDUSTRIAL" COUNCILS, joint committees of employers and employed in each British factory, workshop or coal pit, the formation of which was advocated in 1918 in the first report of the Committee on Relations between Employers and Employed of the Ministry of Reconstruction, by the Rt. Hon. John Henry Whitley, chairman of Ways and Means and deputy speaker of the House of Commons. The purpose of work committees is to establish and maintain a system of friendly co-operation and discussion between employers and employed, by regular meetings at fixed times, keeping in the forefront the idea of constructive co-operation in the improvement of the industry to which they belong. Reports of the operations of these works committees are issued by the Ministry of Labor.

**WORKSHOP TERMS.** The following list of mechanical terms includes a selected number of the most significant terms and phrases commonly used in workshops by mechanics, machinists and metal-workers, describing briefly the various methods, processes, and special operations usually required in the execution of a general line of shopwork, either in wood or metal.

For information relative to similar terms specifically applied to the making and handling of hand and machine tools; to the construction of engines and machines, etc., consult articles under the titles BOILER SHOP TERMS; ELECTRICAL TERMS; ENGINE; ENGINEERING TERMS; FOUNDRY AND FORGE SHOP TERMS; LOCOMOTIVE, PRINCIPAL PARTS OF; MECHANICAL TERMS; TOOLS; and VALVE AND VALVE TERMS; in this Encyclopedia.

**ABOUT SLEDGE.**—To deliver heavy blows with a sledge hammer by swinging it through large arcs, as distinguished from "Up Hand" meaning the delivering of light blows by swinging the hammer through small arcs, or by the use of a lighter hammer.

**ABRASION.**—The wearing away by grinding instead of cutting. It is effected by the use of emery wheels and other forms of grindstones, when cutting tools cannot be used on account of the hardness of the material worked upon, or where the action of such tools would be too slow, or tend to produce inaccurate results.

**ARBORING.**—The shouldering back of a flat bearing face to receive the washers and nuts of attachment bolts.

**ASSEMBLING.**—The putting together of the parts of a machine preparatory to the final work of fitting and adjusting. It is especially applicable in cases where such parts are made in great numbers by machinery, and are designed to be interchangeable.

**AUTOGENOUS SOLDERING.**—The joining of pieces of metal by fusing their contact surfaces, and without the use of solder.

**BABBITTING.**—The process of lining bearings with Babbitt metal or with white metal.

**BACKING-OFF.**—The cutting away of the "leaving" portion of a screw tap so as to allow the "entering" portion to work more freely. It effects a reduction in the friction between the sides of the tapped hole and the portions of the tap which do not cut.

**BACKING-OUT.**—The withdrawing of a tap or die after the thread has been cut.

**BARE.**—Slightly less than; scant; applied to a dimension slightly below a definite size. So slightly, that the difference cannot be detected by rule measurement, and may be determined only by calipers, that is, a difference less than 1-64 of an inch.

**BARFFED.**—Iron work which has been coated with a film of magnetic oxide by the "Barff" process, to prevent it from rusting.

**BEADING.**—The edge of a sheet of metal thickened or turned over to stiffen and strengthen it. A fillet or strip curved around the edge of a casting to strengthen it, or for ornamental purposes. The semi-circular termination of the spigot end of a pipe.

**BEAUMONTAGUE.**—Any compound used for filling up holes for purposes of concealment. As prepared for filling up blow-holes in castings, it consists of beeswax, resin, lamp-black and iron borings.

- BENCH WORK.**—Work executed at the bench or vise as distinguished from lathe work, the work of the fitter, or that of the erector.
- BEND.**—The curved part of a pipe by which its axial direction is changed. A bend ought to be of as large a radius as possible in order to reduce the friction of the liquids conveyed by them. They are known as quarter-bends, eighth-bends and sixteenth-bends, having angles of 90°, 45° and 22½°, respectively.
- BLACK PIPE.**—Iron pipe that is not galvanized or polished.
- BLACK WORK.**—Machine work which has not been machined or polished.
- BLANK.**—A piece of metal cast, stamped or forged to a rough shape, designed to be later machined to some particular form. Blank bolts are the rough forgings of the bolts before the screw threads have been cut.
- BORING.**—The making or finishing of circular holes of comparatively large diameter, in metal or wood, by the use of tools having one cutting edge only, as distinguished from drilling, which signifies the making of small holes with tools having two cutting edges.
- BRASS BORINGS.**—The borings and turnings of brass castings which are collected in shops. They are separated from the iron borings by the use of magnets and are then melted.
- BRASS FINISHING.**—A special branch of work involving the later stages of the manufacture of brass cocks, lubricators, valves and other similar engine and pump fittings. It combines the operations of turning, milling, grinding and burnishing.
- BRAZING.**—The joining of metallic surfaces by the use of an interposed film of brazing metal, an alloy of about 98 parts of copper to two parts of tin. The joints to be brazed are first cleaned and bound with wire. Then they are subjected to the action of a clear fire, sprinkled with brine and heated until the alloy is melted. This process is also known as hard soldering. The proportion of copper in the alloy should be as high as possible, so as to prevent the use of a brazing temperature that would melt the surfaces being brazed.
- BRIGHT WORK.**—Those parts of a machine which are polished, either to reduce the friction of the bearing parts, or for the purpose of ornamentation.
- BROACHING.**—The enlarging, smoothing and turning out of drilled holes by the use of a broach or reamer. Broaches are sometimes called rose reamers. They are made of various sectional forms, their cutting angles ranging from 90° to 130°.
- BUCKLE.**—A localized inequality in plates of wood or metal caused by unequal strains and stresses. Buckling is produced in timber by the presence of moisture, by dryness, or by unevenness of grain. In metals, it is caused by unequal stresses set up by variations in density, temperature, or in the rate of cooling.
- BUFFING.**—Polishing by means of leather and emery, or other abrasive powder, on a buffing wheel.
- BURNISHING.**—The polishing of one metallic surface by rubbing with another. It is sometimes erroneously applied to the process of buffing.
- BURR.**—The ragged and undetached edge of metal turned over when a metal plate is subjected to abrasion, or when it is subjected to punching, drilling, or cutting operations in general.
- BUSH or BUSHING.**—The internal cylindrical lining of a bearing. Bushes are made of gun metal, or of some kind of anti-friction metal, and are used, either for purposes of economy or for convenience. In the former case, an inferior metal is lined with one more expensive, thus reducing the total cost, and in the latter case in order to permit of their being replaced when worn out, without replacing the main casting. A bush is unfluted, thus being distinguished from a brass, which is divided.
- BUSHING.**—The fitting or driving in of bushes into their seatings.
- BUTT MEASUREMENT.**—The taking of measurements by means of a rule placed against the part measured, as distinguished from measurements taken by the use of triangles, calipers, compasses or dividers.
- CAMBER.**—The amount of curvature given to an arched bar or structure.
- CHAMFER.**—A bevel imparted to edges otherwise rectangular, such as the bevels of nuts, and the rounding ends of bolts.
- CHATTER.**—The noise caused in machine work by a lack of rigidity in the cutting tools.
- CHIPPING.**—The removal of minute particles of metal from the faces or from the edges of metal work with a chisel and hammer when the amount of metal required to be removed is too large to be accomplished by the use of the file alone.
- CHUCKING.**—The method of attaching lathe work to the various blocks of a lathe.
- CLEARANCE.**—The amount of space, open or free, between the contacting part of a machine or the like. Wheel clearance is the space between contiguous teeth. In the case of brass castings it is the space between their flanges and the collars from their bolts.
- CLEARANCE ANGLE.**—The angle formed between the face of a cutting tool and the face of the material operated upon. The maintenance of the proper angle is very necessary to prevent the setting-up of undue friction or grinding action between the tool and the work. The angle varies from about 3° in some metal working tools, to about 25° in wood-working planes. Also called the angle of relief.
- CLEARING HOLE.**—A hole full to the specified size, so that a turned stud or bolt of the same nominal diameter will pass freely yet closely through it. It is used in opposition to the term tapping hole.
- CONING.**—The tapering of the running edges of the wheel of railway cars, cranes and turntable rollers. When a train runs around a curve, the wheels are thrown outward by centrifugal force, and the inner and outer wheels describe arcs of unequal length. By coning, the outer wheels are enabled to run on their greater, and the inner wheels on their lesser diameters, thus compensating for the difference in the arcs described by the wheels, by the difference in the diameters of the wheels.
- COUNTERSINKING.**—The process of recessing a hole conically with a countersink, or with a rose bit, or with drill, so that the head of a screw or a rivet will lie level with the surface of the material into which it is fitted.
- CROW'S FEET.**—The marks made thus < > on drawings to indicate the points between which a dimension or measurement is given.
- CUT.**—The removal of a shaving from a piece of work in a lathe, or in a planing, boring or other similar machine.
- DEAD SIZE.**—The exact size or length without any allowances whatever for contingencies or for machining.
- DRAW FILING.**—The polishing of a metallic surface with a file moved transversely in the direction of its own longitudinal axis so that the cutting action of the teeth is very slight. Sometimes called "poker filing."
- DRAWING-DOWN.**—The thinning down of forged work by the use of hammers, fullers and flatters, or drawing dies. The dimensions may be reduced all around equally or reduced in one direction and increased in the other.
- DRAWING-IN or FITTING.**—The condition when a cutting tool cuts to a greater depth than that intended for it to cut. Usually due to the improper form of the tool; to an unsuitable cutting angle; or to the improper position of the cutting point relatively to the shank.
- DRAWING-ON.**—A method by which wheels, pulleys, etc., are attached to their axles or shafts when they are too large to be driven on by a hammer. As commonly applied, long bolts, the heads of which are held in a massive cross attached to one end of the axle, pass on the outside of the wheel, or through it between the arms, and the tightening of their nuts against a washer plate placed across the face of the wheel, pulls the wheel into the proper position on the shaft. Hydraulic presses are also used for this purpose.
- DRIFTING.**—The shaping and enlarging of holes by the use of a drift. Also applied to the adjusting of overlapping rivet holes into alignment with each other.
- DRIVING FIT.**—The fit of a bush, a spindle, or of a shaft when it is driven by the blows of a hammer into the hole bored for its reception.
- DRIVING-HOME.**—The driving of a wheel, shaft, or any other part of a machine to its final and permanent position.
- EAR.**—A lug or projection upon a casting designed for the reception of a bolt or other attachment.
- ERECTING.**—The final building-up of machines in readiness for working. The work is accomplished by the "erector," to whom all the work of the turners, planers, slotter, drillers and fitters is brought, ready to be put together with little adjustment being required of them.
- FEMALE.**—The recessed part of any piece of work designed for the reception of a male piece or stud.
- FIN.**—Any thin wafer-like expansion of metal that occurs on the side or edge of a larger portion, such as those on the joints of castings, and on the edges of forgings pressed or dies.
- FINGER.**—A narrow projection of metal used as a guide in various kinds of metal work.
- FITTER.**—A working mechanic whose duty consists of the work of putting together machine or engine parts after they have passed through the hands of the turners, planers, drillers, etc.
- FIXED CENTRE.**—A centre, the position of which is localized in space, as distinguished from a movable centre.
- FLUSH.**—The parts of a machine are said to be flush when their surfaces are on the same level.
- FORMING.**—The shaping of work on special lathes by means of broad cutting tools, the faces of which correspond exactly to the sections of the pieces to be cut. The value of the method lies in its capacity to produce irregular contours, curved and otherwise, by the use of single tools which ordinarily would require the use of several tools thereby rendering the attainment of uniformity in many kinds of work practically impossible, or economically difficult. The method is extensively applied to the work of brass finishers and automobile manufacturers.
- FRETTING.**—The abrasions of a cutting tool when it is sharpened on an oil-stone.
- FROSTING.**—A finish put upon the exposed surfaces of machine parts for ornamental purposes only. It is

- effected by scraping at different crossing angles from which the light is reflected irregularly, producing a beautiful effect.
- PULL.**—Slightly larger than it ought to be, but so slightly that the excess may be measured only by calipers rather than by rule measurement.
- GEAR.**—A term widely applied to a great variety of arrangements of toothed wheels, valve motions, pump work, hoisting tackle, ropes, etc. Gearing is a synonymous term, but it is specifically applicable to gear wheels, and also to the driving in and the working of the wooden cogs of mortise wheels.
- GLAZING.**—As used in the workshop, the filling up of the interstices of the surface of a grindstone, or of an emery wheel, with the minute particles of metal detached by the process of grinding, giving the surface a smooth and polished appearance, and reducing its cutting quality. It is primarily caused either by an insufficient supply of water; by the grinding of material unsuitable to the nature of the stone or wheel; or by the grinding of so broad a surface that the abraded particles of metal are imprisoned by it and are squeezed between the rigid particles composing the grinder.
- GRINDING-IN.**—The process of bringing the bearing surfaces of cylindrical cocks and plugs to an exact fit by the use of emery powder.
- GUMMING.**—The tendency of lubricating oils to become thick and sticky.
- HACKING.**—The dressing-off of the projections on the face of a grindstone which has become so uneven that the effective use of the ordinary pointed grinding tool is rendered very difficult. It is accomplished by means of a chisel-shaped, cross-paned hammer called a hack-hammer, the chief projections being reduced by a series of cross hatchings, or chequered cuts.
- HANDING.**—Making symmetrical work right and left hand respectively, and the changing of patterns from right to left hand, and from left to right hand.
- JACKING-UP.**—The elevating of machinery or heavy structures by means of jacks. Also the planing of the rough outsides of boards with a jack plane.
- JAG.**—A roughed-up or barbed projection of metal produced by nicking underneath, or in front of it, with a cold chisel, or by castings.
- JOINTING.**—The joining together of iron pipes, sockets, etc. The jointing of iron pipes is effected with red lead and boiled oil when the flanges are brought together, while that of sockets is effected with melted lead, with a gasket, or with rubber rings. Hydraulic jointing is accomplished with sal-ammoniac and iron borings.
- JUMPING-UP.**—The knocking down of the end of a bar of iron upon the anvil so as to thicken the heated portion.
- KEEF.**—The width of the cut produced by the teeth of a saw. It depends upon the amount of set given to the teeth.
- KINK.**—The sharp bend or angle given to a piece of metal by a blow or a strain. It is also applied to the knotting of the links of a chain.
- KNOCKING.**—The noise caused in a machine, pump, etc., when some part is loose and makes a regular rapping.
- KNOTTING.**—A compound, either of shellac and methylated spirit, or of red lead and glue, used for filling-in or covering knots to prevent the absorption of oil paint.
- LAP.**—A body of lead, tin, brass, or other soft metal employed to hold or support the emery or pumice stone used in the grinding of surfaces of hardened steel, chilled iron and other substances too hard to be attacked with ordinary tools. The character and shape of the lap depends upon the nature of the work performed. Usually the outline of the lap is made similar to that of the work. Lead is used for the commonest grades of work, tin for better grades, and brass for the finest grades. The term is also applied to the extent to which the plates pass over each other in the making of rivet joints, and to a single turn of a rope or chain around the barrel or drum of a hoisting machine.
- LAPPING.**—The polishing and truing up of spindles and circular bearing parts in general, by the use of laps of lead or other material.
- LATHE WORK.**—Work commonly accomplished in the lathe. It embraces nearly all kinds of mechanical work accomplished by turning operations.
- MACHINING.**—A general term applied to the operations of turning, planing, shaping, boring, etc., performed on metal work by machines.
- MAGNETING.**—The process of separating particles of iron from those of brass and copper turnings by the use of a magnet, prior to remelting.
- MALE.**—A stud, screw or dowel that fits into a recess formed for its reception, in a particular piece of work.
- MANDREL or MANDRIL.**—In a general sense, any cylindrical rod of metal. Specifically, the revolving spindle used for chucking lathe work; the spindle of a circular saw; the round rod upon which the nuts made by a smith are finished to shape.
- MARKER OUT.**—The workman who marks out the centres and the working lines of metal work preparatory to the operations of the machinists and the fitters.
- METAL-SPINNING.**—The process by which light articles of malleable metal are formed into circular and other shapes by means of pressure applied to them while they are rapidly rotated in a lathe.
- MILLING.**—The method of forming metal into various shapes by means of tools or cutters rotated in milling machines. A greater variety of surface contours can be produced more rapidly and accurately by milling than by the ordinary planing and shaping operations in which single cutting tools are employed. The great value of the method is its capability to produce an indefinite number of articles or machine parts exactly similar in outline, and of uniform size.
- MITRE.**—Lines or edges which meet at an angle of 45° with each other, as in the case of any two adjoining corners of a picture frame.
- MORTISE.**—A joint in timber work formed by a recess cut in one piece, and a corresponding tenon in the other.
- NICKING.**—The cutting of a shallow V-shaped groove around a pipe, or across a bar of metal so that it may be broken by a blow at that particular point.
- OPENING-OUT.**—The enlarging of the diameter of a hole by means of a broach or reamer.
- OUT AND OUT, or OVERALL.**—An outside dimension taken to its utmost extent.
- OVERHAULING.**—The examination of machines and machine parts, preparatory to the making of repairs.
- PATTERN WORK.**—The making of patterns for purposes of casting, turning, milling, etc.
- PENING.**—The beating over or the smoothing over of a metallic surface with the pene or smaller end of a hammer-head.
- PIPE CONNECTIONS.**—The various parts used in making the joints of pipes, such as bends, tees, unions, elbows, nipples, thimbles, etc.
- PLANING.**—The removal of material from plane or flat surfaces by the use of cutting tools. In the case of small wood work, hand planes are employed; but, in the case of wood work in large quantities or sizes, and in metal work, the operations are performed by the use of planing machines.
- PLANISHING.**—The smoothing and polishing of metallic surfaces by hammering, or by rolling, instead of by cutting or by abrasion. Shafting is very often planished instead of turned. Planishing hammers used on sheet metal are capable of delivering blows at the rate of 300 per minute.
- PLAY.**—The freedom of movement, within definite limits, allowed in bearing or working parts, to prevent their jamming by heating, or by oscillation.
- PLUMB.**—In a vertical position, as indicated by the position of a weighted cord hanging at rest.
- PLY.**—Signifies a fold, a twist, or a single thickness of a material such as wire gauze or cotton belting. In the latter case, the terms two-ply, three-ply and four-ply indicate that the belting is made up of two, three or four single thicknesses of the material.
- PRESS FIT.**—The fit of adjoining parts which is a little tighter than a sliding fit. It is provided for the purpose of allowing such parts to be jammed together by hydraulic pressure.
- PRISING.**—The turning of a wheel around its axle with a crowbar; sometimes called "barring."
- PUNCHING.**—The making of holes through metal plates by a punching machine, as distinguished from the making of holes by drilling.
- RAISED WORK.**—Metal work whose surface is raised in part by being hammered into the required outline.
- RAISING.**—The production of raised work in curved outlines in sheet metal by hammering.
- REAMING.**—The enlarging of holes, already punched or drilled, by the use of a reamer. By this method, holes which have been roughly drilled, or those in which ridges have been left by the drill, are smoothed down and made truer; holes which have been punched or drilled in plates, and which do not correspond exactly, are corrected by clamping the plates together and passing the reamer through both of them at once; and punched holes in the immediate vicinity of which local tension has been set up by the punching operations, are relieved of that strain by reaming them slightly larger in diameter.
- RED LEAD.**—The red oxide of lead. Mixed with boiled oil, or with boiled oil and white lead, it is used in making steam joints; mixed to the consistency of a thin semi-fluid paste, it is used for checking the accuracy of contact surfaces during the operations of fitting, the color being transferred from the surface that has been finished to the highest portions of the surface to which the finished surface is being fitted.
- REDDLE.**—Red lead mixed with oil, used in the fitting of metal surfaces by the processes of scraping and filing.
- RIVET.**—A double-headed, solid, bolt-like fastening, used for securing metal plates together, when they are subjected to shearing and not to tensile strains. They are made of soft iron, superior in quality to that of the plates, and are pressed into form in dies while red hot. They hold partly by the grip due to contraction on cooling, and partly by the frictional resistance of the plates to slipping.
- RIVETING.**—The forming of the rivet heads in place. The rivets are first heated to a red heat, then they are placed in the rivet holes in the plates, and the tail turned over or

clenched by the blows of a hammer. This operation is commonly called closing-up. Large rivets are usually closed-up when red-hot, and small rivets when cold; but, if the length between the heads is more than four inches the heads formed on hot rivets are liable to be broken off by the contraction of the metal when it cools. Rivets of that length and over ought to be closed-up cold. Riveting is accomplished either by the use of hand hammers and hand riveting-sets, which close up and form the tails of the rivets, or by hydraulic pressure. In machine riveting, the closing-up and the forming of the tail are performed in one operation.

**ROUGHING-DOWN OR ROUGHING.**—The removal of the outer skin or scale, and the larger bulk of the material from a piece of work preparatory to the more accurate shaping with finishing cuts.

**RULE MEASUREMENTS.**—The taking of all ordinary dimensions with a rule where the character of the work does not require the exactness which can be attained only by the use of calipers, trammels, gauges and micrometer gauges.

**RUNNING-OUT.**—In boring operations, slipping away of the drill from the centre in which it was started. It is caused in various ways, such as the carelessness in the initial centring; the improper setting of the work; the influence of inequalities on the surface of the work; or the bad form of the drill itself.

**RUSTING.**—The coating of bright iron or steel surfaces, such as those of iron patterns, with rust so that they will take shellac varnish without the risk of peeling off. Rusting is accomplished very quickly by coating the iron with a solution of sal-ammoniac, or with a weak solution of hydrochloric acid, and allowing it to dry.

**SCALING.**—The taking of measurements or dimensions by means of a scale from drawings made full or actual size, or from those upon which the dimensions are not given in figures.

**SCRIBING.**—Marking out with a scribe on rough pieces of wood or metal, the outline of the shape or pattern to which such pieces are to be worked by the subsequent operations. A timber scribe is a steel tool pointed at one end for scratching, and knife-shaped at the other end for cutting. A metal fitter's scribe is pointed at both ends, one being straight for top scribing, and the other curved for marking underneath work.

**SET WORK.**—Regular work or that which is repeated many times or perpetually in a workshop. It is also applied to any class of work which is made a specialty by a manufacturing concern.

**SHRINKING-ON.**—The fixing or clamping of wheel tires, the securing of the jackets of built-up guns over the central tube, etc., by expanding the wheel or jacket, as the case may be, by means of heat, then placing it in the desired position, and allowing it to grip or tighten on the receiving part by the shrinkage caused by cooling.

**SHUTTING.**—The welding together of joints in wrought iron or steel.

**SLACK FIT.**—A bad fit, or the fit of machine parts in contact, which have more play than is sufficient or desirable for their easy movement.

**SLIDE PRINCIPLE.**—A principle of construction upon which the adjacent moving parts of a machine are so fitted to one another with guides or guiding strips, that they can slide or move over each other in one direction only. It is a principle which is applied in one way or another in the construction of many kinds of modern machine tools.

**SLIDING FIT.**—The fit obtained when cylindrical or plane surfaces move over each other freely, but without any perceptible slackness. The difference of 1-10,000th of an inch is equivalent to the difference between a sliding and a slack fit.

**SOLDERING.**—The joining of two pieces of metal by means of another metal or an alloy. Soft soldering is accomplished by means of the various alloys of lead and tin; while hard soldering or brazing is effected by the use of the alloys of copper and tin. Clean surfaces are essential to effective soldering. In soft soldering a copper bit is used to fuse the alloy; in hard soldering the metal parts are held together by means of binding wire, and the melted alloy allowed to run in between them.

**SPINNING.**—See METAL SPINNING in this article.

**SWAGING.**—The drawing down of wrought metal to a definite form with or without the use of swage tools. It is the reverse of upsetting.

**SWAGING OR SWAGING-ON.**—The soldering of metallic surfaces without the aid of a copper bit. After being thoroughly cleaned the surfaces are heated and covered with a thin film of oil. Then they are brought together and heated until the oil has driven off and unite them. The method is often employed to hold together temporarily various kinds of work which have to be turned or shaped, and which could not be accurately held in any other manner. The subsequent separation of the parts is easily accomplished by the aid of a file.

**TAKING-UP.** A general term, which signifies the making of adjustments of a work. Specifically, it denotes the closing up of straightened or bent shafts, the cone bearings of lathes, conical articles, etc., and the smooth working

of bearing and moving parts, rather than the tightening of parts which are either bolted or welded together.

**TOOLING.**—The working or cutting of metals with ordinary cutting tools as distinguished from the shaping of surfaces by grinding.

**TRIAL AND ERROR.**—A method commonly employed in the workshop to obtain correct work in the construction of mechanisms, or in the making of tools. The most accurate results are obtained as follows: When a piece of work has been produced as accurately as possible by the use of a particular set of tools, or by a particular method of construction, some other set of tools, or some other method of construction is resorted to for the detection of the error left uncorrected by the tools or method previously employed. The production of surface plates and straight edges, and the centring of work in a lathe with chalk, are cases in point.

**TRYING-UP.**—The straight and accurate planing of wooden surfaces, out of warping and at right angles with each other.

**TURNING.**—The fashioning of wood and metal work to regular forms in a lathe. It is accomplished either by hand tools, or by power-driven machine tools.

**UP-HAND OR UP-HAND SLEDGE.**—The delivering of light blows with a smith's sledge-hammer in light work, or the use of a light hammer for that purpose.

**WORKSHOP REGULATIONS.** See FACTORIES AND FACTORY INSPECTION; CHILD-LABOR; LABOR LEGISLATION IN THE UNITED STATES; LABOR LEGISLATION, FOREIGN, etc.

**WORKSOP,** England, a town of Nottinghamshire, on the Ryton and the Chesterfield Canal, 16 miles east-southeast of Sheffield. It lies near the northern extremity of Sherwood Forest, in a district known as the "Dukery" from the number of ducal seats. Its parish church, dating from 1103, was an ancient Norman abbey church. There are manufactures of agricultural implements, mill machinery, Windsor chairs, chemicals, etc., and there are iron and brass foundries. Pop. 20,387.

**WORLD** (old English, weoruld, composed of *wer*, man, and *cald*, *eld*, age, the age of man), the globe or planet on which we live. The word is also used to designate any celestial orb considered as the scene of interests analogous to those of mankind; the present state of existence; the enjoyments and cares of the present life; the customs and practices of men; people in general; mankind, or some particular section of mankind; a large and more or less definite division of the globe, as the New World, the whole human race; the ungodly as contrasted with the self-styled "children of light"; a great number or quantity, very much or a great deal, as a "world of good." See EARTH.

**WORLD-ENGLISH,** the name given by Prof. A. Melville Bell to a proposed new phonetic system of spelling the English language, so as to render its acquirement by foreigners more easy and to make it available for international use.

**WORLD AND HIS WIFE,** The. See EL GRAN GAIEDO.

**WORLD POLITICS AND THE EXPANSION OF EUROPEAN CIVILIZATION. I. Introductory.**—The modern man who is able, through the aid of the recently provided mechanism for the communication

**EDITORIAL NOTE.**—As the article on "World Politics" was prepared after the greater part of the *Encyclopedia* had appeared in print, it has been possible to introduce with considerable exactness a number of important cross-references containing material bearing directly upon the various subjects and areas discussed in the article. The article forms a coherent introduction to the subject and the cross-references put at the disposal of the reader the resources of the entire *Encyclopedia* and make available a more detailed treatment of this important subject than has been previously attempted in any similar work in the English language.

dissemination of information, to familiar-  
 itself with the more important events  
 have taken place throughout the world  
 previous 24 hours, finds it very difficult  
 apprehend that during the greater part of  
 led history the chief successive centres of  
 ation have occupied an extremely limited  
 of activity and have had only the most im-  
 t and tardy knowledge of what was con-  
 raneously taking place within even this  
 area. Oriental history developed and  
 l chiefly within the confines of what Pro-

Breasted has called the "fertile cres-  
 of the valleys of the Nile and the Tigris  
 uphrates. Classical history added to this  
 of historic activity the coast of the Medi-  
 can Sea, with a varying depth of hinter-

Mediæval civilization, driven on primar-  
 the expansive power of Christianity work-  
 a the basis of the ruins of the Roman im-  
 system, brought within the realm of  
 iced human endeavor northern and west-  
 urope. While one should not forget the  
 ing north European civilization of pre-  
 ic or proto-historic times, which has been  
 ed by Déchelette, Montelius, Peet, Munro  
 thers, or the advanced and extremely old  
 ations of India and China, it is fairly ac-  
 : to maintain that up to the opening of  
 th century the great historic civilizations  
 risen and had declined, all of them within  
 ea not greater than that of the present  
 d States of America. The subsequent his-  
 of the world in its larger aspects has been  
 cess, based upon exploration, colonization  
 mechanical invention, of extending the area  
 storical interaction between peoples, of  
 ing down the earlier localism, isolation,  
 icialism and stability, and of utilizing the  
 ons of these changes upon the original  
 ean centres of world-wide expansion.  
 HISTORY, ITS RISE AND DEVELOPMENT (Vol.  
 pp. 226-232, 253); HISTORY, ANCIENT.

**The Dynamic Forces Behind the Ex-  
 on of European Civilization.**—Of all the  
 : producing the general process of Euro-  
 expansion in modern times, the oldest and  
 permanent, if not the most important, has  
 the missionary impulse of Christianity,  
 has not only been widening the field of  
 ean civilization during the period from  
 ill of the Roman empire to the height of  
 iddle Ages, but ever since that time it has  
 ained its energy and activity. As Pro-  
 s Robinson and Beard have well expressed  
 latter: "The way for imperialism has  
 smoothed by the missionaries. There have  
 s been ardent Christians ready to obey the  
 and, 'Go ye into all the world and preach  
 ospel to every creature.' No sooner was  
 country brought to the attention of Eu-  
 rians than missionaries flocked thither with  
 s and soldiers." The Crusades (1095-  
 constitute the first notable religious move-  
 which possesses great significance for the  
 uent expansion of Europe. While the in-  
 ual and economic results of the Crusades,  
 ng in the appropriation of Arabian culture  
 he development of trading relations be-  
 East and West by the Italian city-states,  
 much more significant for posterity than  
 mporary triumph of the Cross over the

Crescent, it is certain that without the initial  
 religious impulse there would have been no possi-  
 bility for the development of the subsequent  
 significant intellectual and economic interaction  
 between Europe and the East which followed the  
 Crusades. In the period of European explora-  
 tion which ushered in the Commercial Revolu-  
 tion the Catholic missionaries, Franciscans, Do-  
 minicans and Jesuits, were in the vanguard of  
 expansion. About the beginning of the 19th  
 century the Protestant missions entered into the  
 campaign of conversion, which has since been  
 in a process of ever greater expansion and more  
 perfect organization. Profoundly impressed  
 with the semi-fanatical conviction as to the  
 uniqueness and the superiority of Christianity  
 over all other forms of world religions, these  
 missionaries have often cut sharply across the  
 theology and the "mores" of the native or Ori-  
 ental peoples. This has frequently been fol-  
 lowed by the persecution or the extermination  
 of the missionaries, which has in turn opened  
 the way for the military intervention of mod-  
 ern governments, driven on by eager capitalists  
 anxiously awaiting the opportunity for invest-  
 ment in these undeveloped areas. As Dr. Dennis,  
 Mr. Macdonald and Prof. E. C. Moore have  
 shown, the missionary movement has ever been  
 closely linked up with the expansion of Euro-  
 pean civilization and the growth of modern im-  
 perialism. See MISSIONS, PROTESTANT FOREIGN;  
 MISSIONS, ROMAN CATHOLIC.

One of the most persistent and effective of  
 all influences stimulating the process of expan-  
 sion has been the desire to develop more ex-  
 tensive and profitable trading relations. It was  
 the trade which the Italian merchants carrying  
 the Crusaders to the East built up with the  
 Levant that produced the flourishing Mediter-  
 ranean commercial activity that was both a  
 harbinger and a cause of the later overseas ex-  
 ploration. The jealousy on the part of the  
 western and northern European powers of the  
 Italian monopoly of the trade with the East  
 led to attempts, first made by the Portuguese,  
 to discover another route to the Indies. This  
 resulted in that great era of exploration which  
 brought about the Commercial Revolution and  
 the beginnings of modern world trade. From  
 1550 to the present day the development of world  
 trade has been one of the most notable dynamic  
 agencies promoting the movement of expansion,  
 particularly since it has been reinforced by the  
 Industrial Revolution, and at the present time  
 it quite overshadows all other stimuli in this  
 field. See COMMERCE, HISTORY OF; COMMERCE  
 OF THE WORLD.

A powerful psychological and political mo-  
 tive for expansion is to be seen in modern na-  
 tionalism, a force which has been developing  
 with ever greater intensity since the first ap-  
 pearance of the dynastic national states during  
 the 16th and 17th centuries. It was nationalism  
 which promoted the narrow and exclusive eco-  
 nomic and political policy, known as "Mercan-  
 tilism," which dominated European commer-  
 cial and colonial methods from the close of the  
 16th century until its overthrow by the eco-  
 nomic liberals following the middle of the 18th  
 century. It was nationalism which combined  
 with trade rivalry to produce the series of Eu-  
 ropean wars over colonial interests in the late

17th and 18th centuries. In the period of recent national imperialism since 1870 the nationalistic or patriotic impulse has played a most important part. Territory overseas has been sought as compensation for European losses, as in the case of France; for the purpose of stimulating national pride, as was most evident in the case of Germany; or as a means of providing investment opportunities for national capital, which has been the case with all modern nations, but was most particularly true of Great Britain, the United States and Germany. In the last half century, the period in which the capitalistic party gradually displaced the landlords and became the dominant group in the control of modern governments, patriotic pride in national expansion overseas has been assiduously fostered by the governing classes in order to gain a psychological support for their imperialistic policies. See NATIONAL IDEALS AND THE WAR; NATIONALISM.

All of the motives leading to overseas expansion have been powerfully advanced and given new energy by the Industrial Revolution of the 18th and 19th centuries, which has furnished the perfected mechanism of modern expansion and has greatly augmented the economic motives for imperialistic activity. The vast increase in the productivity of marketable commodities through the application of the machine processes and the factory system has led to the search for more markets. The improved methods of oceanic transportation and of the communication of intelligence have made the search for world markets more feasible and successful. Exploration in the undeveloped regions has revealed the wealth of raw materials to be obtained from these districts, and the increase of available capital has led to a desire to develop the economic potentialities of these backward regions. This has been made easy through the fact that the industrial and scientific revolutions affected the military, as well as the economic field, and provided the modern machines of war which put the natives completely at the mercy of the European invaders. Modern world politics, then, is a great historic complex of ever greater significance, which draws its motive power from the realms of religious fanaticism, commercial ambitions, national pride and the multifarious impulses from modern capitalism. See INDUSTRIAL REVOLUTION, THE.

**III. The Commercial Revolution and the First Period of European Expansion.** 1. *The Background of the Commercial Revolution.*—While the volume of European trade during the so-called "Dark Ages" was greater than was once supposed, it is true that the earliest notable development of mediæval trade followed the Crusades. The peoples of western Europe desired the edible spices from the Malay Archipelago and the East Indies to make their coarse and ill-preserved food palatable. They further wished to secure the precious stones from Persia and India; the drugs, perfumes, gums, dyes and woods from the Indies, China and Japan; and the draperies, cloth, rugs and fine steel work from Persia and Asia Minor. The desire for these commodities was awakened by the contact with the East during the Crusades and was exploited by the Italian city-states. Their merchants purchased these products which had

been brought from the East through the R Sea, Asia Minor or Turkestan, took them to Europe and sold them to distributing merchants. It was long a venerable tradition in European history that the occupation of above-mentioned eastern trade-routes by the Turks following 1453 constituted the chief cause of the downfall of the Italian city-states and of the subsequent development of attempts to discover new routes to the East. Prof. A. Lybyer has shown, however, that Thor Rogers' and M. D'Avènel's statistics of prices following 1453 indicate no appreciable effect of Turkish occupation on the volume or prices of commodities coming from the East to Europe and further calls attention to the fact that the Turks did not occupy the southern routes until nearly a generation after overseas communication had been established with the Indies. Rather, it seems that the chief cause of overseas exploration was the jealousy of the western and northern European powers and merchants toward the Italian monopoly of Eastern trade. The Portuguese under Henry the Navigator and Diaz began, in the middle of the 15th century, the explorations which ended in the successful voyage of Vasco da Gama to India in 1498. Under Spanish auspices Columbus discovered America in 1492 and Magellan's fleet circumnavigated the globe in 1519-22. These and contemporary and subsequent explorations opened the way for further expansion and constituted the geographical foundations of the Commercial Revolution of the dawn of modern history. Along with this major economic impulse to exploration, colonization should be mentioned, the religious ambition to convert the heathen, the political desire to increase the territorial possessions, the national prestige of the states of western Europe, and the hope of satisfying that intellectual curiosity which had been developed since the cultural revival of the 12th and 13th centuries. See AMERICA, DISCOVERY AND COLONIZATION OF; COLONIES AND COLONIZATION.

2. *The Rival Commercial Empires.*—The period from 1500 to 1763 in world politics can be most intelligently viewed as the era of rise and struggles of what has been called "rival commercial empires." This period starts with the rise of the Portuguese to commercial supremacy following the return of Vasco da Gama from India in 1499, and ended with the conquest of the French in North America and Great Britain in 1763. Taking advantage of her priority in explorations in this region Portugal occupied the Spice Islands and several parts of the East Indies and established a partial monopoly over this valuable trade, but her international strength was not equal to the strain imposed by this over extensive and rapid external expansion. She lacked the naval power to defend her trading monopoly; she was unable to organize a systematic and competent distribution service for the Eastern commodities; she was unable to take a few commodities to be taken East in exchange for materials purchased; and a corrupt and dissipated government made it impossible for her to continue her expansion. Her decline invited a series of foreign aggressions, and in 1580 Portugal was annexed to Spain and held in subjection for 60 years. Spain vied with Portugal as an e

der for colonial and commercial su-  
 cy, occupying the greater part of the New  
 l, especially South and Central America,  
 veral groups of Pacific islands. The  
 wealth thereby controlled by Spain might  
 nade that country the greatest of modern  
 s, had it been guided by a wise adminis-  
 : and fiscal policy, but such wisdom was  
 g and the Spanish decline was only slightly  
 ipid and complete than that of Portugal.  
 xcessively strict regulation of the colonial  
 crippled commerce with the mother coun-  
 d invited smuggling; a cruel and wasteful  
 of native labor lessened productivity in  
 lonies; the expulsion of Jews and Moors  
 Spain lost her the possession of her  
 d classes, while repudiation of debts  
 the withdrawal of German credit; re-  
 bigotry and fiscal exaction lost the rich-  
 ce of the Netherlands; the Inquisition  
 d out all individual originality and initi-  
 and the loss of the Armada in 1588  
 the end of Spanish naval supremacy.  
 e beginning of the 17th century Spain  
 coming that second-rate power which she  
 ince remained. Stirred to action by  
 h oppression, the Netherlands enjoyed  
 mmercial supremacy of Europe for more  
 half century following 1590, occupying  
 of the old Portuguese possessions in the  
 as well as valuable areas in North and  
 America. But the Dutch were not equal  
 task of building up a permanent com-  
 l empire of great extent. Like ancient  
 s, the Netherlands were a loosely united  
 of jealous city-states rather than a com-  
 ational unit; the "Spanish Fury" helped  
 Antwerp and the closing of the Scheldt  
 its prosperity; the Dutch devoted their  
 chiefly to commercial activity with little  
 on to permanent colonial policy; and in  
 trest with England under Cromwell and  
 the early years of the Restoration the  
 were thoroughly worsted. France was  
 ted from making an early entry into the  
 rcial and colonial scramble through the  
 is divisions that led to the civil wars of  
 ter part of the 16th century. Even when  
 d make some systematic attempt to con-  
 s a first-class commercial and colonizing  
 her strength was sapped by the suicidal  
 of Louis XIV, who at the critical mo-  
 vated the national energy of France in  
 e attempt to extend the eastern bound-  
 hat country. France was immensely more  
 rd powerful than England in the 17th  
 th centuries, but lost out in the final con-  
 cause of a corrupt administration, the  
 to devote her resources to the strength-  
 of her colonies, and the adoption of a  
 weak colonial policy—that of scattered  
 y occupation. England, which emerged  
 his first period of European expansion  
 leading colonial and commercial state of  
 dern world, was but a small and weak  
 after its loss of the Continental territi-  
 til the time of Elizabeth. Her rising  
 ver was based upon the naval training  
 d her sailors by buccaneering expeditions  
 the Spaniards and was proved by the  
 tion of the Spanish Armada in 1588.  
 utch were vanquished in the middle of  
 h century and the duel of a hundred

years with France for colonial supremacy  
 began. Aside from the fact that England took  
 her colonial enterprise seriously and France  
 looked upon it as a "side issue" as compared  
 with the dynastic struggle on the continent of  
 Europe, the chief significance of this century-  
 long contest was that it represented a struggle  
 between two different colonial systems—the in-  
 tensive occupation and exploitation of a limited  
 area versus the extremely meagre occupation of  
 a vast territory by a few soldiers and traders.  
 In 1688 there were about 300,000 English col-  
 onists in the narrow Piedmont region of the  
 Atlantic Coast, while there were scarcely  
 20,000 Frenchmen in the vast regions of Canada  
 and the Mississippi Valley. With the French  
 handicapped by futile dissipation of energy  
 elsewhere and infinitely weaker in colonial  
 policy, there could be only one issue to the  
 conflict, and by the Treaty of Paris of 1763  
 Great Britain took over the possession of the  
 great majority of the French colonies in Amer-  
 ica. See COLONIAL WARS IN AMERICA; COL-  
 ONY; EXPLORATION IN AMERICA.

But this very triumph of Great Britain over  
 her traditional European enemy only involved  
 her in a more serious struggle with her most  
 important colonial domains, the English col-  
 onies of the Atlantic Coast. The occupation  
 of the vast territory conquered from France  
 west of the Alleghenies forced upon England  
 a reconstruction of her hitherto loosely orga-  
 nized and indifferently enforced colonial policy.  
 This imperial organization necessitated addi-  
 tional expenditures, which Great Britain pro-  
 posed to raise through direct taxation and  
 through an enforcement of the long-dor-  
 mant navigation laws. But this fiscal policy  
 aroused the opposition of the colonial merchants,  
 long accustomed to unhampered smuggling, and  
 they united with the debtor landlords of the  
 southern colonies to give vitality to that as-  
 piration for independence which Mr. Sydney  
 George Fisher has analyzed with such acumen.  
 The revolution which ensued was in its essence  
 a civil war within the British empire, in which  
 British and American liberals made common  
 cause against conservatives and imperialists in  
 both countries, and the colonial cause prevailed  
 chiefly on account of that defection of the  
 British Whigs which Trevelyan, Fiske and  
 Lecky have clearly recognized and described.  
 The loss of the more important British col-  
 onies in America produced a marked tendency  
 toward the granting of greater autonomy in the  
 British colonies that remained. This changing  
 attitude was reflected in the Quebec Acts of  
 1774 and 1791, the Irish Parliament Act of  
 1782, and the India Act of 1784, but the thor-  
 oughgoing revision of British imperial policy  
 in a liberal direction did not take place until  
 a half century later, following Lord Durham's  
 famous Canada report of 1839. In this first  
 phase of European expansion Germany, Aus-  
 tria and Russia failed to participate, Germany  
 because of the distracting religious wars and  
 Austria and Russia on account of isolation,  
 inertia or propinquity to a vast amount of  
 unoccupied districts in Asia. Their remaining  
 without the circle of the new commercial and  
 colonial powers was most influential in de-  
 termining the lines of their later political and  
 economic evolution and possessed the greatest

significance for their subsequent history and for that of the rest of the world. It should not be forgotten, however, that Russia was beginning that expansion eastward through Siberia which was to make her an important participant in the second great period of colonial expansion after 1870.

3. *The Larger Aspects and Results of the Commercial Revolution.*—The outstanding effect of the Commercial Revolution and the era of colonization in this first phase was the rude shock which it gave to the mediæval order. It broke down the previous isolation, stability and repetition and gave Europeans a new and ever-varying and extending outlook; in other words, it first introduced the dynamic element and the world-wide viewpoint into western European civilization. It further brought a shifting of the centre of progressive civilization from the Mediterranean Basin to northern and western Europe. The economic effects of the period were varied and profound. Commerce was greatly expanded through its becoming oceanic rather than thalassic and through the entry of many new commodities which had been discovered in the process of exploration. The centres of commerce shifted from Italy to western Europe. With the resulting "intervention of capital" there developed the whole mechanism of capitalistic institutions, a greater supply of money, banking practices, credit instruments and insurance. New types of commercial organization sprang up, such as chartered companies, joint-stock companies and commercial corporations. A definite type of economic theory emerged in what was variously known as Mercantilism, Cameralism and Colbertism, but which in all cases consisted in a strict state regulation of national industrial and commercial activities. Again, there emerged a new class of ever greater proportions, the new merchant group or *bourgeoisie*, who were to play so important a part in the commerce and politics of the age. Finally, probably the most significant economic result of the Commercial Revolution was its preparation of Europe for the most far-reaching transformation in human history, the Industrial Revolution of the 18th and 19th centuries. Through producing a greater supply of capital, introducing and improving the mechanism of credit and banking, developing more scientific and efficient methods of industrial and commercial organization, extending commercial relations and expanding the volume of commerce, opening up new markets, and increasing the power of the business classes in the law-making bodies, with the resulting protection of business interests, the Commercial Revolution alone made possible the coming of the great industrial and social revolution associated with the growth of mechanical industry, the development of the factory system and the rise of the urban age. England led in this new industrial era solely because of her more extensive and successful participation in the previous colonial and commercial activity. In the field of social results there were introduced new standards of comfort; new food products; novel beverages with important social consequences, such as the rise of the coffee-houses and the use of narcotics, especially tobacco. The stimulation of travel and emigra-

tion, and a general increase in the mobility of mankind ensued. In the political realm the Commercial Revolution produced the national dynastic states, which were built on the ruins of feudalism by the monarchs through the increase in the royal income and by the aid of the new merchant classes. The new middle class at first supported the monarchs, but later rose against the old order, terminated despotism and established the beginnings of representative government. The rise of the national states and the usages and necessities of commerce led to the development of international law, which was first systematized in the 'De jure belli et pacis' of Hugo Grotius (1625). In the realm of intellectual and cultural influences the effects of the Commercial Revolution were most significant. It gave an irreparable shock to the Patristic and Scholastic outlook and view of man and the world. The discoveries brought to Europe the most prolific and varied types of scientific data, stimulating general scientific curiosity and giving a great specific impulse to the natural sciences, such as astronomy, geography, cartography and biology. The social and moral sciences were also deeply affected, in turn. The discovery of the new types of man produced the origins of anthropology, while the observation of diverse customs and institutions gave rise to the study of comparative jurisprudence, philology, religion and ethics and to the growth of descriptive world history. These combined to develop a philosophy of science, which appeared in the writings of Bacon and Descartes; a secular and human outlook, exemplified in the writings of Montaigne; a eulogy of the state of nature in the early works of Rousseau; and an application of the new concepts to the problems of intellectual and social progress by the English Deists and the French Philosophes. Further, artistic and decorative standards were profoundly modified by the introduction of new designs from the Orient. In short, there were few of the novel trends in thought and culture in the late 17th and 18th centuries which were not in one way or another intimately related to the reaction of the European expansion upon Europe itself. See BANKS AND BANKING—ORIGIN AND DEVELOPMENT; COMMERCE, HISTORY OF; DEMOCRACY, HISTORY OF; HISTORY, ITS RISE AND DEVELOPMENT; NATIONALISM.

IV. *The Revolt Against Mercantilism and the Old Colonial Order.* 1. *The Background of the Reaction.*—The old colonial system was built up chiefly by the dynastic national states at a time when they were dominated by royal absolutism, narrow chauvinism, and an extremely archaic and fallacious view of economic and commercial theory. It was constructed as much on the basis of a desire to promote an increase of wealth in royal hands as to make possible the maximum expansion of national trade. It was a narrow political and class policy rather than a broad democratic or socialized procedure. Therefore, it naturally aroused the animosity of the merchant classes at home and in the colonies who desired a maximum degree of activity and business. Further, the attempt to enforce this unpopular policy proved expensive, especially in the face of ever-increasing colonial resistance. Finally, the intellectual currents promoted by the Commercial Revolu-

ned toward an opposition to mercantilism. The eulogy of the "natural" and the belief that social and economic production functioned most perfectly when in conformity with those natural laws which men and others had shown to govern the natural universe, combined to discredit so artificial a system as the extensive legislative restraints on free competition which were emblematic in the mercantilistic order. In this way economic and political theory were being used so as to reinforce the practical commercial and administrative objections to the colonial régime. See **ECONOMICS**.

**Economic Liberalism and the Assault on Mercantilism.**—At the same time when the colonialists were offering a successful challenge to British mercantilism in practice, economic theorists were submitting a doctrinal assault upon the foundations of this system. Leaders of the movement were the French economists and their defender, Turgot; and the English classical economists, with their followers on the continent. This group of so-called economic liberals assumed that economic progress and social welfare could best be promoted by securing as far as possible the conditions of economic processes and institutions that supposedly benefited "natural order" and was believed to pervade and govern the world. This conformity would be realized through the greatest assurance through ushering in an era of free competition in the economic realm.

It was thus necessary to repeal the restrictive legislation which had grown up as a by-product and essence of mercantilism. There was a practical program of the economic liberals called for a thorough-going abolition of restrictions on the perfect freedom of the movement of industry and trade. Indeed, the economists held that the chief function of the state, at least temporarily, was the passing of laws repealing the restrictive legislation formerly enacted. While there were important differences of difference in the details of the program of this group of writers, varying all the way from the physiocratic eulogy of agriculture to the excessive praise of mechanical manufacturing by J. B. Say, all united in opposing the acquisition of colonial territory and in advocating near or complete freedom of trade.

The doctrines of the theorists were widely espoused by the new capitalistic class that was produced by the Industrial Revolution as well as by all others likely to benefit from a greater degree of industrial and commercial freedom. In England, Huskisson, and later Cobden and Bright led in the attack upon the protective and corn laws, and by 1860 this had succeeded in bringing free trade to England and in discrediting to a very considerable degree the idea of the advantages of an exclusive imperial policy. The "cosmopolitan" program of Cobden embodied the acceptance of the freedom of trade, anti-imperialism, international arbitration. In France the program of Cobden in applying these new theories to the realm of statesmanship was carried on by Thiers, who opposed French intervention in Mexico, and by Bastiat and Saint-Beuve, who strove with some success to secure the repeal of the downward revision of the French tariff of 1860 and similar subsequent agree-

ments with other states. In Prussia, Maassen, Bülow, Eichhorn and von Motz carried through the liberal trade policy embodied in the Zollverein of 1818-67. Every important European state was affected to some extent by this reaction against trade restrictions and colonial expansion. But at the very time when free trade and anti-imperialism were receiving the largest degree of practical application great historic changes were beginning to work out their effects in a manner designed to wreck the program of the economic liberals. Nationalism, intensified by the French Revolution and subsequent political events, made for the defeat of cosmopolitanism, while the increased productivity made possible by the Industrial Revolution stimulated that search for additional markets in backward districts which doomed the impulses supporting anti-imperialism. With the French intervention in Tunis and other north African territory and the English purchase of the Suez Canal stock, and with the reaction toward higher tariff schedules which was initiated by the German act of 1879 the day of economic liberalism was over and there began that commercial warfare and that struggle for colonial dominion which, with other co-operative forces, led straight to the European War of 1914. See **FREE TRADE; GREAT BRITAIN—THE FREE TRADE MOVEMENT; IMPERIALISM**.

**V. The Rise and Development of the New National Imperialism since 1870.** 1. *The Historical Background.*—One of the most striking phases of the modern dynamic age has been the rise of the new national imperialism since 1870. By this is meant the development of European or American control over the territory or the resources of the less highly developed or the less powerful peoples outside of Europe and the United States, accomplished usually with the sanction or the armed intervention of the states of which the traders were citizens. As a movement this has varied greatly, extending all the way from simply a dominating control over the commerce of a given area to complete political absorption. Perhaps the most conspicuous phase of modern imperialism has been the great swiftness of this European expansion and occupation. More territory has been actually procured for European occupation of one sort or another within 40 years than was occupied in the three centuries of the old colonial movement. In 1800 about four-fifths of the land area of the world had not been opened to civilized man through exploration, and as late as 1870 more than half of the habitable surface of the earth had not been touched by Europeans. By the beginning of the 20th century the whole planet outside of the extreme polar regions had been traversed by the white man and its resources and potentialities for exploitation had been catalogued. Africa had been explored and partitioned. Oceania and Australasia had been occupied, and a commercial hegemony of Europe and America had been established in Asia and Latin America. See **GEOGRAPHICAL CONQUESTS**.

The forces or causes lying back of this expansive movement are conventionally classified as economic, political, social, religious and psychological. The economic causes of expansion grew directly out of the Industrial Revolution. While this movement had affected England and France at a somewhat earlier period,

the great era of industrial development in Germany and the United States was in the years following 1860. This new industry, carried on by mechanical processes under the factory system, gave rise to an unprecedented increase in productivity and to an enormous expansion of capital available for investment. At the same time, the vast improvement in the means of land and water transportation made possible the growth of world trade on a scale which exceeded anything before known, because of cheap transportation, the rapidity with which shipments could be made and the decreased proportion of losses in ocean shipments. All of these developments inevitably led to a scramble for foreign markets and to large scale investment of capital in overseas areas. These markets and areas for investment were sought, when possible, in colonies carved out of backward and unoccupied tracts, and, when these were not available, in seats of older civilizations which had not yet passed into the modern industrial age. Political causes co-operated with the economic in producing the new movement of expansion. The growth of modern nationalism stimulated and intensified the desire to secure and control colonial areas. Italy and Germany had just achieved national unification in 1870 and had developed an intense patriotic fervor which required an outlet in foreign expansion. France turned to foreign areas to secure compensation for the loss of Alsace-Lorraine. Russia, not satisfied with a vast area still awaiting exploitation and development, turned southward to seize more territory in Asia. England had long staked her future on supremacy as a commercial and colonizing nation. Even the United States, before the close of the 19th century, had occupied all the available free land within its boundaries and turned to the Spanish-American area for a new region of investment and exploitation. This process naturally produced as a sort of psychic compensation the notion of the "civilizing mission" or the "white man's burden," and gave rise to sharp national jealousies over the relative extent of external possessions. Then, there was a strong sociological motive which combined with the political impulses to favor expansion. For some set of causes not yet well understood, but which centre about modern industrialism and the growth of medical science, the population of Europe increased from about 175,000,000 to over 450,000,000 from 1800 to 1915. This led in many countries to a real pressure of the population on the means of subsistence and emigration was stimulated, if not necessitated. It was natural that the mother country should desire to retain a political control over its emigrants and this could be achieved only when they migrated to colonies. Again, the religious motives for developing oversea areas had not declined, but had increased instead. To the Catholic missionaries, who had never ceased activity since the beginning of expansion, were added an ever-increasing number of Protestants. The appeal of the missionaries was further strengthened when it became possible for them to carry with them not only "the word which maketh wise unto salvation," but also modern industrial arts and the blessings of sanitary and medical science. Finally, psychological impulses have served to extend the interests of Europe oversea. The love of adventure has

operated as ever, and the compelling power of scientific curiosity has not abated. Again, the social prestige usually attached to colonial service has acted as an incentive to the movement. Further, the various psychological aspects of modern aggressive nationalism have been utilized in the propaganda of skilful and unscrupulous imperialists to effect a popular espousal of their program.

The newer movement of expansion has been national rather than one of persons or privileged companies, and its chief field of operation has been the eastern hemisphere, rather than the western, as was the case with the earlier period of exploration and colonization. Africa, Oceania and Australasia have been forcibly colonized, while economic exploitation has been vigorously cultivated in Asia. This statement does not, however, ignore the extensive commercial exploitation of Latin America by European nations and the United States. The significance of this more recent period of expansion has been vividly described by Professor Shotwell: "Conquistadors, clad in khaki or glittering in helmeted display, have proclaimed to most of the savages of the globe that they belong henceforth to European nations. On the wharves of London there are goods from German workshops for the merchant adventurers of today to carry off to Bantus or Negroes. Piles of coal from Cardiff lie inside the coral reefs of Australasian islands, for the ships which come to break the silence of farther Hebrides than Wordsworth dreamed of. But for the historian there is more significance than romance in such events. The men whom Joseph Conrad and Kipling describe are responsible for the transformation of Africa and Asia. And that transformation in its turn is mainly responsible for those policies of imperial expansion, of commercial and colonial rivalries which underlie the causes of the present war." The effects of the new imperialism upon the political and diplomatic events and tendencies of the last half century in Europe have been most profound. Scarcely a dominating alliance or an armed conflict has existed which has not been more or less directly a result of overseas policies and ambitions, while these policies have very frequently even determined the characteristics and trends of domestic politics, as well as the destinies and careers of statesmen.

While it cannot be doubted that much of the older policy of thorough-going exploitation has been carried over into the new imperialistic movement since 1870, it is certain that a somewhat higher moral level has prevailed in the activities of the colonizers. There has been at least some rhetorical, though often hypocritical, recognition of a moral obligation in the "white man's burden" and of the duty of elevating the cultural standards of the natives. There can be no question that even Karl Peters and the agents of Leopold of Belgium treated the natives of Africa with a greater degree of fairness and honesty than can be discerned in the relations of the Puritans of New England with the Indians of the district. See HISTORY, MODERN; INDUSTRIAL REVOLUTION; NATIONALISM; POPULATION, GROWTH OF; MISSIONS.

2 *The Rediscovery and Partition of Africa The Explorations.*—Africa has during historic times presented great ethnographic contrasts, her inhabitants varying all the way from whi-

ogists now believe to have been the original African ancestors of the white race to whom Negroes of the equatorial forests and cultural contrasts have not been less different. At least three times in historic eras, ancient Egypt, in the Alexandrian Age, and during the Saracen hegemony in the Middle Ages, northern Africa was the seat of the most advanced type of human culture, while the south was at all times inhabited by some of the most backward of savages. Down to the 15th century Europeans had made little progress in the way of opening up the African continent. Arabs had pushed southward along the coast, carrying with them the propaganda of Islam and developing the deplorable slave trade. In the middle of the 15th century the Portuguese began their explorations which were to carry them around the Cape of Good Hope to India. In the 17th century the Dutch tended to displace the Portuguese, and after 1795 the English began to make inroads upon the Dutch settlements.

Despite some scattered trading posts the French made no permanent conquests of Africa until the acquisition of Algeria followed in 1830. Spain possessed a few trading posts of little consequence, and Prussia in 1720 opened the settlement made on the coast of Senegal by the Great Elector in 1681. Yet all these advances, significant as they were, had not been able to penetrate more than a narrow and incomplete fringe around the western and southern portions of the continent. But on the eve of the new imperialistic developments following the 19th century's scientific curiosity, religious propaganda, and journalistic enterprise were leading to carry on those epoch-making explorations which revealed to enthusiastic European and American capitalists the economic and commercial potentialities of the "Dark Continent." The process of exploration has been clearly summarized by Professor Harris: "Fortunately, at a time when the European states began to seriously consider colonial expansion, the interest in Europe in the Dark Continent, as a field of commercial and economic activity, was not to a degree never before known. Considerable information existed concerning certain parts of Africa and its general contour, for, 40 years prior to 1870, a large part of the continent had been explored; but few persons, geographers and scholars, had taken particular notice of it. Before 1880, indeed, Dr. Park, Major Laing and M. Caillé had traveled from the west coast up the Gambia and Senegal rivers, found the upper waters of the Niger and Timbuctu and crossed the Sahara to Tripoli, while Clapperton and Denham were exploring the Central Sudan from Chad to the Niger River, and the brothers Borchgrevink down that stream to its mouth. Dr. Barth spent the years 1850 to 1855 in a scientific study of the language, peoples and geography of the region just mentioned (west of Lake Chad) including the kingdom of Bornu. Farther south, on the east coast, Paul Caillié traveled over the Gaboon River between 1856 and 1868; and, in the year 1871, David Livingstone explored the Zambezi, the region about Lakes Nyasa and Nyika, and crossed the continent to Benue during the 18 years following 1851. Meanwhile, Burton, Speke and Grant, coming from the east coast, had discovered Lake

Victoria Nyanza and the headwaters of the Nile; and Sir Samuel Baker, traversing the whole of that river from the north to the south, found its other source in Albert Nyanza. But it was the work of Dr. Nachtigal, who in 1869 to 1871 studied carefully the eastern Sahara and Sudan; of Cameron, who crossed the whole continent from the Zanzibar Coast to Benguela between 1873 and 1875; of Savorgnan de Brazza, who explored scientifically the whole region between Libreville on the Gaboon and the north banks of the Kongo and Ubangi rivers from 1874 to 1884; and of Henry M. Stanley, who found Livingstone in 1873, that drew the attention of the general public to Africa. Books were written, money raised, and colonial societies formed with the purpose of inducing people to study African conditions and to start colonies. By the time Stanley returned from his second journey in 1877, with the news of the discovery of the great Kongo River and its tributaries, the statesmen and the intelligent public of Europe were taking a very considerable interest in African affairs. The general topography of the continent had been mapped,—in outline, at least,—the location of all the important lakes and waterways pointed out, and the possibilities of the different sections as sources of wealth and trade for Europe ascertained with a fair degree of accuracy." See AFRICA.

About a decade after most of the great African discoveries had been concluded the diplomatic and legal basis for the partition was arranged by the Berlin Conference of December 1884 to February 1885. The slave trade was branded as illegal; formal notice was ordered given of all protectorates assumed; it was declared that no territory should be annexed which was not "effectively occupied"; freedom was prescribed for all nations in the navigation of the Kongo and Niger rivers; and provision was made for general freedom of trade in the Kongo Basin. No systematic provision, however, was made for carrying out the "white man's burden" of advancing the cultural and moral status of the natives.

*Leopold of Belgium and the Episode of the Kongo Free State.*—The first notable apostle of modern capitalistic imperialism to Africa was none other than King Leopold II of Belgium. His interest was aroused by Stanley's first report of his African explorations in 1876. Under Leopold's leadership an "International Association for the Exploration and Colonization of Africa" was formed in the autumn of 1876. Two years later Stanley returned from a second exploring tour and conveyed to Leopold's agents an account of the natural resources of the Kongo district in rubber, palm products, ivory and various tropical woods, gums and fibres. Stimulated by this information Leopold developed through the Belgian branch of the International Association the "Committee for the Study and Investigation of the Upper Kongo" (1878), which employed Stanley for the next few years in making a detailed geographic and economic survey of the Kongo district. In the meantime, Leopold carried along his plans to obtain full political and economic control of this region. In 1882 he organized the "International Association of the Kongo," with himself as president. Between April 1884 and February 1885, in part by

intrigue at the Berlin Conference of 1884-85, he secured from the great powers the recognition of the International Association of the Kongo as an independent sovereign state, and in April 1885 he realized his full ambition by transforming it into the "Kongo Free State" with himself as its king. It should be kept in mind that Leopold was not the sovereign of the Kongo Free State in virtue of his position as king of Belgium, but that the African district was his own private possession. While Leopold persistently maintained that his enterprise was founded primarily upon the desire to bring to the natives of the Kongo district the blessings of Christian civilization, his actual administration, especially in its economic phase of forced labor, was one of the most notorious examples of cruel and extortionate exploitation of a backward people of which modern history bears any record. Protests, begun by missionaries who were greatly handicapped by the difficulty of spreading the gospel in the face of the concrete demonstration of the methods of the "most Christian King," were taken up by leading nations who were motivated in part by humanitarian considerations and in part by commercial jealousy of Leopold's financial profits from his African patrimony. Revelations of extreme cruelty, made by English investigators in 1902 and 1904, were confirmed by an international commission in 1905, and the strength of indignant public opinion in Europe and America, including liberal Belgian opinion, forced Leopold to surrender the Kongo Free State to the Belgian government in 1908, in return for an ample indemnity. Since the establishment of Belgian control, not only has the political administration been greatly improved and liberalized, but also the commercial importance of the district has been greatly increased under more generous concessions to merchants and capitalists from Belgium and other states. See AFRICAN INTERNATIONAL ASSOCIATION; KONGO.

*German Colonial Enterprise in Africa.*—For a number of historical reasons Germany was extremely tardy in her entry into the colonial movement. Though the Great Elector had begun a policy of colonial expansion and naval development in the latter half of the 17th century, the agrarian fixation of the Prussian Junkerdom had led his successors to abandon these beginnings. The persistence of the mediæval empire, the lack of national unification until 1870, and the absence of significant industrial and commercial expansion down to the '70's had served to prevent Germany from being a contender in the old colonial movement. Even as late as 1870 Bismarck had opposed overseas expansion and had declared that he would not accept the entire French colonial empire as a gift. But forces were at work in Germany which made Bismarck's opposition ineffective and which produced one of the most enthusiastic and aggressive policies of colonial expansion witnessed in modern times. The unprecedented industrial development during the decade following 1870 and the exuberant patriotism produced by the process of unification created an overwhelming desire for world markets and a prominent colonial dominion. This movement was initiated by private merchants and capitalists, but at a slightly later period they won over the government to that co-opera-

tion in building up German commercial expansion which resulted in the phenomenal success of German officials and merchants in securing a great proportion of the trade of the world and in erecting a very respectable colonial empire. While German missionaries had explored the southwestern coast of Africa in the middle of the 19th century and German steamship companies had begun a desultory trade along the coast shortly afterward, the real awakening of German interest in imperialism came about in 1878, when the German branch of the International African Association was established. In 1882 a society for the development of *Mittelpolitik* was founded as the German Colonial Union, and two years later several mercantile marine companies and colonial societies openly sponsored a program of commercial and colonial expansion. Within two years after 1884 Germany had acquired what was substantially the basis of her African domains. In each case the territory was acquired by government exploration or by representatives of private commercial or colonial societies, and then Bismarck was won over to annexation through the pressure of national pride or foreign opposition. Dr. Gustav Nachtigal, the noted explorer, negotiated for the possession of Kamerun and Togoland in 1884 and both were taken over as a German protectorate in 1884. F. A. E. von Luderitz, a Bremen merchant, in the summer of 1883 purchased what became German Southwest Africa when it was taken over by the German government in the next year. Karl Peters, one of the most blatant of Pan-Germans and a representative of the German Colonial Society, acquired German East Africa in 1884, and his activity was approved and confirmed by the government in 1885. This German territory in Africa, totaling slightly over 1,000,000 square miles, was later defined in its boundaries and somewhat extended in the Anglo-German agreement of July 1890 and the Franco-German arrangement of November 1911 respectively. In a financial sense the German colonies have not been a profitable investment, though Kamerun and East Africa gave promise of developing into fruitful areas for economic exploitation. The general nature of the German colonial administration in Africa may best be described by dividing it into two periods, that before and that after the reconstruction of the administrative system in 1906-07. In the earlier period the administration was under the control of chartered companies, not unlike the famous British East India Company. A policy of ruthless exploitation, more perfect in its refinement of cruelty than that of Leopold in the Kongo district, was followed during this period, but in the same way that the Sepoy mutiny of 1857 led Great Britain to transfer India to the Crown, so the frightful Herero wars of 1903-06 and the massacre of the natives in East Africa in 1905 forced the German government to undertake a sweeping reorganization of their colonial policy and administration. A colonial office was established in 1906 and Dr. Bernhard Dernberg took charge as colonial secretary in the following year. After 1907 the oppressive methods were abandoned and a systematic attempt made to introduce the essentials of Western civilization into these colonies, including transportation systems, scientific forestry work, sanitary science and some degree of elementary

on. It must frankly be admitted that no country has governed its African colonies in the same level of culture in a more efficient and lightened manner than Germany since the deprivation of Germany of her African possessions by the Peace Conference. It is one of the least justifiable acts of that body to have placed the best proof that colonial booty, as the safety of the democratic principle in the world, weighed heavily upon the attention of the Allied powers. See GERMANY—GERMAN POLICY IN THE WAR.

#### *Great Britain and the Boers in South Africa.*

The original white population of South Africa was a colony of Dutch farmers, called from the Dutch term for peasant, who at Cape Colony in the latter part of the 17th century. The region was permanently ceded to the British in 1806. On account of racial and linguistic differences, the extension of political equality to the native blacks, and, finally, the arming of the natives, the Boers' existence under British domination increased, and in 1836 under the leadership of Piet Retief they began their "Great Trek" toward the Orange and Vaal rivers toward Natal, where they established a Boer republic in 1838. Some vicissitudes respecting political independence of two Boer republics, the Transvaal Orange Free State, had emerged by 1854. As a consequence happened in South African politics from 1854 to 1877, when Disraeli met the first enthusiasm of the new British imperialism, annexed the Transvaal. This led to the first Boer War of 1881 which ended in a complete defeat of an insignificant British force at Majuba Hill in 1881. This victory, coupled with Gladstone's grant of independence to the Orange Free State, produced a great inflation of Boer nationalism and did much to create that inflexible stubbornness which furnished the pretext for British intervention in 1899. The significant background of the Boer War was provided through the great influx of following the discovery of the rich gold and diamond mines in the Boer republics in the 1870's.

By 1896 these foreigners or "Uitlanders" came to own two-thirds of the land and about 90 per cent of the personal property in the Orange Free State, and paid about 95 per cent of the taxes. In spite of this they were excluded from political rights and subjected to extortionate and irritating economic restrictions. Despite their efforts to secure enfranchisement, legal means some of the more daring Boers, encouraged by Cecil Rhodes and led by Leander S. Jameson, attempted in an ill-considered raid to overthrow the Boer government and to plant it by Uitlander control. While this escapade failed miserably, it had consequences of the utmost importance for South African history. The Boers grew more suspicious and intolerant, and the Uitlanders came to trust more and more in the hope of British intervention in their behalf. Matters were still further complicated by the German ill-considered congratulatory telegram to President Kruger following the capture of Pretoria, which did much to create greater tension between Germany and England. In March 1900 the Uitlanders appealed to Great Britain for relief, and the British commissioner, Lord Milner, advised intervention. When it was too late Kruger agreed to the long-

sought reforms, but Great Britain had then resolved upon war. To crush the Boers Great Britain was compelled to put more soldiers in the field than ever before in her history and the war was the most expensive she had ever undertaken, with the sole exception of the series of conflicts in the Napoleonic period. Her action was bitterly opposed at home by liberal statesmen like Lloyd George and by progressive publicists like J. A. Hobson. The triumph of the British Liberal party in 1905, however, brought into power the group that had opposed the war, and a liberal policy of conciliation was immediately adopted. A constitutional convention for South Africa was held from October 1908 to June 1909. It drew up a constitution for the Union of South Africa, which was approved by Great Britain on 20 Sept. 1909, and the Union—a new self-governing colony—was thereby created out of Cape Colony, Natal, Orange Free State and the Transvaal. While the Boers have dominated the government, their interests have been in the hands of moderate and statesmanlike leaders, most notably Gens. Louis Botha and Johannes Smuts, who have recognized that the future prosperity and peace of the Boer people depend upon an avoidance of the narrow intolerance of the Kruger régime. Their loyalty was vindicated when in the autumn of 1914 they speedily repressed a nationalist revolt, encouraged by the German emperor and led by Hertzog, Beyers, De Wet, Maritz and other irreconcilables. Botha and Smuts participated with credit in the conquest of the German colonies in Africa and General Smuts was generally recognized as easily the ablest and most far-sighted representative of the Allied powers at the Peace Conference. The economic prosperity of South Africa still rests chiefly upon the gold and diamond products, though livestock and wool have become prominent products in recent years and some considerable development of manufacturing industry has taken place. Immense coal reserves exist, but iron ore is lacking. The economic expansion of the colony has been handicapped by the lack of an adequate and competent labor supply. Native labor has been inefficient; the introduction of Chinese labor proved an unsuccessful experiment in 1904-05; and the importation of labor from India which followed was abandoned in 1911. See BOERS; GREAT BRITAIN—FOREIGN POLICY IN AFRICA AND AMERICA.

*Great Britain in Egypt and the Sudan.*—The interest of modern Europe in Egypt was first stirred by Napoleon's romantic campaign there in 1798. French interest survived during the first half of the 19th century, and in 1869 a French engineer, Ferdinand de Lesseps, completed the Suez Canal. Great Britain turned her attention to Egypt following the explorations of Baker and others in the '60's. She had particular reasons for desiring a dominating control over the Suez Canal. In addition to the general commercial advantages to be derived from its control, it provided the shortest water-route to India and Australasia, and Great Britain could scarcely regard with complacency the spectacle of a rival in possession of so vital a point for British imperial communication. A fortunate combination of circumstances—the French defeat and indemnity of 1870 and the contemporaneous bankruptcy of the khedive

-- made it possible in 1875 for Disraeli to purchase some 177,000 shares of canal stock from the khedive for £4,000,000 (\$20,000,000) after France had refused the offer. The reckless financial operations of the khedive led to the establishment of a dual control over Egyptian finances by Great Britain and France in 1877. Some five years later an Egyptian nationalist revolt broke out, led by native officers who were restive under the domination of foreigners. France was prevented from intervening to suppress the revolt by the opposition of Clemenceau and other radical anti-imperialists, and Great Britain had to crush the revolt unaided in the summer of 1882. The result was to exclude France from a parity in the control of Egypt and to make Egypt practically an English protectorate, although this relationship was not formally proclaimed until 18 Dec. 1914, and Egypt was controlled during this period by a British "financial adviser" (Lord Cromer, 1883-1907; Eldon Gorst, 1907-11; Lord Kitchener, 1911-14). The British occupation has brought great material advantages to both Egypt and Great Britain. Archaic and oppressive native customs and institutions have been uprooted; new industrial methods have been introduced; great public works, especially irrigation projects, have been completed; and the finances have been put on a stable and scientific basis. Great Britain has been rewarded by the possession of not only the key to the British empire, but also the basis for the development of her interests in the "Cape-to-Cairo" project and for the extension of her dominion in western Asia and Arabia, and by the control of the foreign trade and the valuable cotton crop of Egypt. See EGYPT.

South of Egypt is the great district of the Sudan. Nominally under Egyptian control, the inefficiency of that administration enabled a group of Mohammedan fanatics under El Mahdi to secure control of that region and to massacre the distinguished English soldier, Gen. Charles George Gordon, and his forces at Khartum in January 1885. Gladstone took no active steps to avenge the murder, but by 1896 some action was rendered necessary to protect Egypt from invasion and to safeguard the Egyptian water-supply. This task of conquering the Sudan was entrusted to Gen. Horatio Herbert Kitchener, who completed the conquest on 2 Sept. 1898 and received as his reward elevation to the peerage. The British conquest of the Sudan was followed by a diplomatic crisis of the first importance for subsequent history. At the same time that Kitchener was subduing the Sudanese a French force under Marchand was moving eastward across Africa to the sources of the Nile, and it arrived at Fashoda in the lower Sudan on 12 July 1898. Pushing southward after his victories Kitchener reached the same spot about two months later. War was imminent, but the skilful handling of the situation by the French foreign minister, Delcassé, not only averted hostilities, but also secured a potential Arab-French alliance which was still further strengthened in 1903-04, confirmed in 1911 and given practical demonstration in 1914. The World War completed the occupation of the Egyptian area by the British. Turkey's action in joining the Central Powers in November 1914 furnished the pretext for the British declaration of the Egyptian protectorate on 18

Dec. 1914. The seizure of German East Africa by Great Britain and the approval of this action by the Peace Conference gives Great Britain unobstructed control of a broad strip of territory from Cairo to Cape Town and assures the future hegemony of Britain in African imperialism. At the same time, her domination of this district probably will not remain unchallenged on account of the persistence of a strong Egyptian nationalist movement which is not likely to subside. See KITCHENER, HORATIO HERBERT; SUDAN.

*French Imperialism in Africa*—The earliest centre of French interests in Africa was Egypt, but, as has been pointed out above, France was excluded from Egypt by British action in 1882. In the meantime, however, France had been laying elsewhere the basis for the great French colonial dominions in Africa. Algeria was conquered in the Orleanist period (1830-48). Settlements were made at Gabon following 1840 which opened the way for the colonization of French Equatorial Africa. At the same time posts were located on the Ivory and Guinea coasts which prepared the way for the French expansion in the Senegal and Niger regions. Entry into Somaliland after 1864 put in French hands the key to the lower end of the Red Sea and to the Gulf of Aden. Tunis was made a protectorate in 1881, and Italy was thereby estranged from France and impelled to enter the Triple Alliance with Germany and Austria. By the Anglo-French agreement of 1890 French possession of the Sahara district was confirmed and a protectorate allowed over Madagascar, which was transformed into a French colony in 1896. In the early '90's the French extended their possessions in the Senegal, Niger and Kongo districts, and by the Anglo-French agreement of 1899 France acquired the central Sudan and was enabled thereby to connect Algeria and the Sahara with the French Congo. In 1900 and 1902 Italy agreed to a French protectorate over Morocco in lieu of French consent to Italian occupation of Tripoli, and in 1904 Great Britain gave her assent to the Moroccan protectorate in return for a French willingness to see a British protectorate proclaimed in Egypt, but at this juncture Germany took a hand and the dispute over Morocco threatened the peace of Europe for some seven years. Early in 1905 the German emperor landed at Tangier and hailed the sultan of Morocco as an independent prince, thereby ignoring or defying French interests in that country. France was not able to accept the challenge on account of Russian weakness at the time and the dispute was temporarily settled by the Algeiras Conference of 1906. But the French were unwilling to cease their political penetration and the German economic interests pressed their government for more vigorous action. A second serious crisis arising over the action of the French and German authorities at Casablanca was settled without hostilities through referring the dispute to The Hague. A more serious crisis arose three years later when, as a counterpoise to the French occupation of Fez, a German naval force seized the port of Agadir. War was only averted by a definite statement from the British foreign office that Great Britain would stand with France in the controversy. Germany backed down and agreed to the convention of November 1911, whereby she gave France a

and in Morocco in return for a cession of the French Kongo. Accordingly, transformed Morocco into a French province between 30 March and 28 Sept. 1912, thereby rounded out her possession of the African continent of northwestern Africa. See FRANCE—FRANCIS COLONIES, MOROCCO.

*Italian Imperialism in Africa.*—The Italian people, ever mindful of the classical glories of Rome, were unable to forget that northern Africa once belonged to the Roman empire. In every year of the occupation of Rome by

Emmanuel's army Italy acquired the empire of the Red Sea which soon developed into the colony of Eritrea. In 1889 the Italian-occupied Italian Somaliland and attempted to take the neighboring region of Abyssinia as a protectorate. In this they were unsuccessful, suffering a stinging defeat at the hands of Menelik II.

In 1896 caused the resignation of Crispien, the leader of Italian imperialism, and forced Italy to desist from further attempts to control northern Africa, the independence of which was guaranteed by international agreement 10 years later.

Italian attention was next centred upon Libya, the choicest bit of north African territory which remained after Tunis had been annexed to France. Agreements of December 1900 and November 1902 secured French consent to give action in this area. An ultimatum issued on 28 Sept. 1911 to the sultan of Turkey demanding reforms in Tripolitania brought on the superior Italian forces, together with the embarrassment in the Balkan War, led to the treaty of 18 Oct. 1912, by which Italy obtained formal control of Tripolitania, or Tripoli and Cyrenaica—the "gateway to the East." There is, however, some doubt as to whether the territory was worth the price paid by Italy in the expensive war of 1911–12, and Italy has not yet succeeded in reducing the territory to complete subjection.

*Other African Territory.*—The African territory which has been described above is all that is borne any great significance for world politics. A mere summary enumeration will not account for the remaining districts. In addition to that already enumerated Great Britain possesses Gambia, Sierra Leone, the Gold Coast, Nigeria and Walfisch Bay in western Africa; Bechuanaland and Rhodesia in southern Africa; and British East Africa, Uganda and British Somaliland in eastern Africa. To these should now be added the most of the African possessions of Germany before the war. Italy retains out of her former African possessions, Guinea, Angola and Portuguese Guinea in Africa. Spain has on the western coast small areas of domination, northern Morocco de Oro and Rio Muni. Finally, there are the independent states of Liberia, founded in 1820 under American auspices as a colony for emancipated slaves, and Abyssinia, a native African kingdom with its independence guaranteed by an international agreement of 1906. Africa from an almost untouched continent in the past has passed into a well advanced and largely partitioned area for imperialistic exploitation. Its great natural resources will inevitably result in its ultimate development as an important economic factor in modern civilization. These resources are utilized by the methods of Occidental material culture. See

### 3. *Modern Imperialism in Western Asia.—The Berlin-Bagdad Railroad and the "Drang nach Osten."*

—Among the various plans for imperialistic expansion since 1870, none has been more interesting or significant than the attempt of the German empire to gain control of the resources and means of communication in Asia Minor and Mesopotamia, generally known as the Berlin-Bagdad Railroad or the "Drang nach Osten" plan. There were numerous considerations which impelled Germany to undertake this program of expansion. It meant that Germany would possess the central and most direct commercial route to the Orient and India and that she would also be enabled to develop the rich natural resources of this region. It would be, further, of great strategic value, as it would give Germany a naval base on the Persian Gulf, would put her in a position to strike quickly at either India or Egypt, and would make her the natural heir of British dominions in this area. The first necessary move in carrying through this project was to displace England as the traditional protector of the sultan and the Turkish domains. In 1878 Bismarck took a prominent part in the Congress of Berlin which set back the Eastern Question for 40 years and saved the Turkish empire from partial dismemberment. In 1883 General von der Goltz went to Constantinople and led in the reorganization of the Turkish army according to the German model. In 1897 the emperor took Von Bieberstein out of the German administrative system and sent him as ambassador to Turkey, where, in the ensuing 15 years, he proved himself the most astute German diplomat since Bismarck. A year later the emperor himself made an ostentatious visit to Turkey, honoring the sultan and proclaiming himself upon the grave of Saladin at Damascus the "eternal friend of the 300,000,000 Mohammedans in the world." The friendship of the kaiser, together with the subtle diplomacy of Bieberstein, won for Germany the Turkish consent to the building of a railroad from Konia in western Asia Minor to Basra on the entry to the Persian Gulf. A very considerable volume of international opposition to the project developed. Russia feared German activity in the Balkans and in the Caspian and northern Persian region; France was fearful lest this might threaten her financial and railroad interests in Syria; England was suspicious lest the scheme would cause the bankruptcy of Turkey and a subsequent German protectorate and would threaten both India and Egypt, not only through a possible direct German attack, but also through German encouragement of the dangerous nationalistic sentiment in both of these regions. Only a few Englishmen like Sir Harry H. Johnston favored the project as the least dangerous outlet for German energy. These objections were, however, in the main removed by diplomatic activity. Russia was placated after a meeting of the tsar and the kaiser in November 1910, which arranged an agreement made public on 19 Aug. 1911. French objections did not prove serious, and a satisfactory adjustment was made with Great Britain on 29 June 1914, which safeguarded British interests in the East and gave Germany the desired transit rights. The actual building of the railroad proceeded slowly and was often interrupted by financial and diplomatic obstacles. A

German engineering company had constructed for Turkish interests a railroad from Ismidt to Angora following 1888. In 1896 a southern branch was built from Eskishehr to Konia and either a southern or a northern route was thereby made possible from Konia or Angora. Russian opposition to the northern route led to a favoring of the southern line. In 1899 the Turkish government gave Germany the desired railroad concession, which was confirmed by the sultan's *Firman* of 1903, establishing the Bagdad Railway Company as a Turkish corporation with a majority of German directors, and extending permission to build the railway to the Persian Gulf. The company had hoped to sell the Turkish government bonds, issued to build the railroad, to French and English, as well as German, investors, but the methods of financing the project and the German domination of the enterprise discouraged French and British investment and the project had to be halted until a sufficient sale could be effected elsewhere. This was accomplished by 1908, but the "Young Turk Revolution" broke out in that year and caused a cessation of the work. Arrangements for resuming the construction were made with the Turkish government in March 1911, and work was begun soon afterward. In the months just previous to the outbreak of the World War construction was greatly hastened and since 1914 the work has progressed very rapidly. Several great engineering feats have been accomplished, especially tunnels under the Taurus Mountains and a great bridge over the Euphrates. Over 1,100 out of 1,500 miles to Bagdad have been constructed and about 165 of the remainder can be covered by water on the Tigris. The hastening of construction at and before the outbreak of the war proved of great strategic value to the Central Powers. It enabled rapid Turkish mobilization to protect Constantinople and the Caucasus district and to attack Egypt. Danger to India and Egypt compelled the undertaking of the British Mesopotamian and Western Asian expeditions that early met with disaster, but which later gained a sweeping victory under General Allenby in the autumn of 1918 and put Turkey out of the war. Whatever the specific arrangements as to mandates over this area, it seems perfectly evident from the Anglo-French agreement over Syria, announced 16 Sept. 1919, as well as from the Anglo-Persian agreement of 9 Aug. 1919, that France and Great Britain will take over the former German interests in this region. See BAGDAD RAILWAY; MESOPOTAMIA.

*Great Britain and Russia in Western Asia.*—The history of Persia in modern times has been one of the most revolting on record, the government not being one in which tyranny was tempered by assassination, but one in which tyranny reveled in assassination and massacre. It was inevitable that in such an environment industry and commerce could scarcely thrive under the control of domestic authorities and that such an internal situation would invite foreign aggression. The natural contenders for this district were Russia, working southward from European Russia and Siberia, and England slowly converging from India and Egypt. Russian occupation of Persian territory developed after 1722, when the northern provinces were seized, and by the close of the third quarter of

the 19th century Russia had occupied all Persian territory as far south as the southern end of the Caspian Sea. British invasion began in 1856, and, while no territory was permanently occupied, Great Britain developed a firm hold upon Persian finances and commerce after her entry into these fields in 1873, 1887 and 1897. From the close of the Napoleonic wars both England and Russia were jealous contenders for the control of Persia. This colored the allied activity in the Greek War of Independence (1827); brought on a general European conflict in the Crimean War of 1854-56; produced Disraeli's sinister interference with the treaty of San Stefano in the short-sighted readjustment at the Congress of Berlin (1878); and constituted the cause for Great Britain's unsavory protection of the "intolerable Turk." After considerable friction, as well as the development of alliances between France and England, and France and Russia, the rivals finally decided to terminate their disputes by a partition of the coveted territory. This was achieved by the Anglo-Russian agreement of 31 Aug. 1907, dividing Persia into two spheres of "influence." Northern Persia was put under Russian domination and the southern portion in control of Great Britain. An intermediate or neutral zone was created in which both powers might operate. Germany was placated in part by securing the withdrawal of Russian opposition to the Berlin-Bagdad project, while France was sufficiently consoled by the compromise and unity thus effected between her two powerful allies. It fell upon Persia to pay the price of the realization of the "Drang-nach-Osten" plan and the consummation of the Triple Entente. While a nationalist revolution of 1908-09 endeavored to free Persia of foreign aggression and intrigue, and an American financier, Morgan Schuster, attempted to put the Persian finances on a sound footing in 1911-12, neither was able to shake off the Anglo-Russian incubus and Persia was successfully "strangled" down to the outbreak of the World War. The only apparent result of the war upon the fate of Persia is that Great Britain has taken advantage of Russian weakness and Russian repudiation of her part in the agreement of 1907 to extend British influence over that part of Persia formerly dominated by Russia. The agreement of 9 Aug. 1919, between England and Persia practically established a military and financial protectorate over Persia. See PERSIA; RUSSIA; RUSSO-TURKISH WARS; SIBERIA.

Russia and Great Britain came into conflict not only in Persia but in Afghanistan, immediately to the east. Russia had pushed southward and occupied western Turkestan by 1895. Nothing stood between Russia and India except the relatively small state of Afghanistan, and Great Britain, failing to capture it for herself, bent all her energies to maintaining its independence as a buffer state between India and Russian Turkestan. An agreement of 1880 gave Great Britain control over the foreign affairs of Afghanistan, and the boundary of this state on the north was adjusted with Russia in 1885. In 1907 a further agreement was made between Great Britain and Russia whereby the commercial equality of both states in Afghanistan was guaranteed, Great Britain was left in full control of the foreign affairs of the district, and

munity of Afghanistan from annexation was safeguarded. Russian power in the region has waned since the Revolution of 1917, but the Amir has made little progress toward winning freedom from British domination.

#### AFGHANISTAN.

*Britain in India.*—The place of India in the history of imperialism is particularly interesting because of the complicated situation which has resulted from the fact that within this vast and densely populated area, imperfectly described as the Indian subcontinent, there are included not only some of the most primitive peoples now in existence, but also some of the oldest and richest of historic nations. In the earlier part of the old colonial era, the rivalry for European control lay between Great Britain and France. This was decided in favor of the British by the decisive British victory at Plassey in 1757, Clive's capture of Wandewash in 1760, and the subsequent capture of Pondicherry. By the treaty of 1763 France lost her Indian possessions, along with most of those in America. During the 19th century the British occupation of India proceeded. The Mahratta confederacy was overthrown in 1816-18; Nepal was overcome in 1816-18; Burma was conquered in successive campaigns in 1826, 1852 and 1885; the Sind and Baluchistan areas were taken over in 1843-49; Sattar, Nagpur and Oudh were annexed in 1818; Baluchistan was added in 1887; while the Punjab was successfully "penetrated" in 1904-14. The development of the administrative machinery proceeded parallel with territorial acquisition. The corruption that had crept into the management of Indian affairs by the East India Company (founded 1600) was curtailed by the Regulating Act of 1773, which provided for parliamentary supervision through a super-council. Eleven years later, by the India Act of 1784, this governmental supervision was ended through the nomination of officials to Indian service by the ministry and the establishment of a board of control in London. In accordance with minor amendments, governed Indian relations until the Sepoy Mutiny of 1857. In this year the native troops, alarmed by continued British aggression in India, irritable at British interference with native customs and enraged by the introduction of new religions which offended their religious prejudices, arose in a rebellion which was put down with the greatest difficulty. The mutiny furnished a sufficient lesson to British statesmen. They re-termined the control of the East India Company in 1858 and transferred the administration to the Crown. A secretary of state for India was created and the local administrative machinery was given to a viceroy appointed by the government. There is, of course, no uniformity in the government of India, some provinces being under the direct control of British administrators, while others are ruled by native princes under only the most nominal British oversight, which is concerned with the prevention of rebellion. In 1876 Queen Victoria formally declared herself the empress of India. The growth of nationalism in the late 19th century led to the Indian Councils Acts of 1892 and 1909, which allowed a greater degree of native participation in both central and local governments. In spite of these concessions, how-

ever, the nationalist movement has continued to thrive, though it had not developed sufficiently to secure Indian independence during Britain's hour of weakness in the World War. The chief obstacle to the nationalist cause is the great diversity in the population of India in race, religion and degree of civilization, which makes unified native action well-nigh impossible. While Great Britain was extremely remiss in granting promotion to brave Indian soldiers in the late war, she did indicate some gratitude for Indian loyalty by allowing Indian representation in imperial conferences on something approaching a parity with the self-governing colonies, and by promising, and to some extent executing, administrative reforms in India. The Amritsar massacre in the Punjab region in April 1919, where about 500 natives were killed and a much larger number injured by British troops, not only indicates the persistence of a strong nationalist feeling, but also the willingness of the British government to turn the methods of 1857 against the natives themselves in order to hold them in line with imperial policy. The chief reason for the British tenacity in maintaining control of India is the great economic advantages from this possession. Great Britain has a nearly complete monopoly of the vast Indian trade. Fine cloth, metal and ivory work, rice, wheat, cotton and some valuable minerals are exported from India; while Great Britain sells to India annually about \$400,000,000 worth of commodities, chiefly cotton goods and iron and steel products. The British administration has brought to India the same material advantages that have accrued to Egypt under British domination in the way of irrigation and other engineering feats and the introduction of modern agricultural and industrial methods and sanitary science. See GREAT BRITAIN—FOREIGN POLICY IN INDIA; INDIA.

4. *Modern Imperialism in the Far East—The Western Intrusion in China.*—Of all the developments in modern imperialism that which will probably possess the greatest significance for the future of world history is the establishment of contact between western civilization and the Chinese Empire. The authentic history of China goes back to some 2,500 years B.C., but the dynasty which alone has any significance for the modern history of China dates from 1644, when, after a war of some 27 years, the Tatar Manchus from the north overthrew the native Ming dynasty and established the foreign domination which lasted until the resignation of the youthful emperor, Pu-yi, in 1912. In a geographic and administrative sense China is divided into southeastern China or China proper, and a number of outlying dependencies of great extent and widely varied degree of population. China proper is the only part of China that has any great historic significance and is the centre of the Chinese population and historic culture. It is about 1,500,000 square miles in area, possesses a population of something over 300,000,000, and is divided into 18 provinces or administrative districts. Surrounding China proper at the opening of the 19th century were the following more or less loosely attached dependencies, Korea, Manchuria, Mongolia, Sungaria, Turkestan, Tibet, Burma and Indo-China. Though Marco Polo had visited China in the 13th century and had been followed

in the succeeding centuries by Catholic missionaries and by Portuguese, Dutch and British traders, China remained practically sealed against European contact, except for some strictly limited commercial relations with a few ports, especially Canton. The first notable incursion of Europeans followed the deplorable Opium War of 1840-42, through which Great Britain, in the Treaty of Nanking, forced China to open four additional important Chinese ports to European trade. The foreign ingress was continued by the War of 1856-60, waged by the English and French against the Chinese and which terminated in the Treaty of Tientsin of 1860, opening six more Chinese ports to foreign trade and guaranteeing the position and safety of foreign traders and missionaries in China. Between 1853 and 1864 Great Britain aided the Manchus in putting down a native patriotic insurrection — the Tai-Ping Rebellion — because she believed the dynastic party likely to be most favorable to the foreign incursion. Further progress was made following the Sino-Japanese War of 1894-95, when the European powers abstracted from Japan most of her territorial gains. Germany followed the lead of Great Britain and France by seizing the port of Kiaochow in the province of Shantung in 1898 as revenge for the murder of two German Catholic missionaries, whom the kaiser suddenly beheld as his "dear brothers in Christ," in spite of his well-known anti-Catholic prejudices at home. Finally, by the joint European and American armed intervention of 1900 to suppress the Boxer revolt all barriers to western commerce and economic penetration were removed and China was put under the commercial, and to a considerable extent the fiscal, tutelage of the western powers, being unable even to determine her own tariff schedules. At the same time that the western powers were forcing a commercial and financial entry into China they were also proceeding to encroach upon the Chinese dependencies and to wrest many of these from the empire. Japan took over the Liukiu Islands in 1874, Formosa in 1895, the Liaotung Peninsula and Port Arthur in 1905, Korea in 1910, and made considerable progress soon afterward in the penetration of Manchuria. Russia, taking a portion of Chinese Turkestan in 1881, pushed southward from Siberia, taking over Amur in 1860, and outer Mongolia in 1913 after having lost her control of Manchuria and the Liaotung Peninsula through the Russo-Japanese War of 1904-05. The British assumed control of Tibet between 1904 and 1914, after having conquered Burma in 1885. France occupied eastern Indo-China between 1862 and 1885. Finally, some of the most valuable Chinese ports, such as Hongkong, Port Arthur, Kiaochow, Weihaiwei and Kwangchow Wan were handed over to foreign powers under military pressure.

The combination of foreign commercial penetration and exploitation and the accompanying territorial aggression with the humiliating defeat of China by Europeanized Japan in the war of 1894-95 led the more thoughtful and progressive Chinese leaders to feel that the old order in China must be altered to allow the entry of the more advanced military and technological methods of western civilization if China was to be saved from ultimate partition. In 1898, accordingly, the reform party, led by

the young emperor, Kwang Hsu, introduced a sweeping set of political, economic and educational reforms, but their beneficent program was halted for the time being, after only about 100 days of the new régime, through a reactionary *coup d'état* led by the dowager empress, Tzu Hsi. The success of the reactionaries in 1898 led them to undertake a more ambitious program, namely, the ousting of all foreigners from China. This movement was led by the Boxers, or the "Society of the Fists of Righteous Harmony." It was stimulated by the foreign aggression; the commercial and financial exploitation; the territorial seizures; the burden of unjust indemnities; the indiscretion of the missionaries in seeking high Chinese rank, in protecting the lawless elements under the cover of a "rice conversion," and in a bigoted interference with Chinese customs; and the loose talk of foreigners about the ultimate partition of China. This anti-foreign movement broke out in 1900, but was speedily put down by Allied military intervention. On the whole, however, it would seem that the Boxer revolt probably helped along the reform tendency by proving once more the utter helplessness of China with her antiquated technique when she was confronted with the material culture of the West. In 1905 the old competitive state examinations were abolished and the basis laid for a new compulsory public school system. In 1906 legislation was enacted looking forward to the extinction of the opium trade. In 1911 occurred the great Chinese Revolution. It broke out on 12 October, and received special support from the southern provinces. In about three months the revolution had accomplished its aims, and in February 1912 the Manchu dynasty was ended and a republic proclaimed. To give greater unity and strength to the new republic the revolutionary president, Dr. Sun Yat Sen, with a high degree of patriotic self-restraint, retired from power and surrendered the presidency to the northern and more conservative statesman, Yuan Shih Kai, a disciple of Li Hung Chang and next to his master the most astute of modern Chinese statesmen. The subsequent history of reform in China has centered around the struggle between the north and south of China. The northerners, led by Yuan Shih Kai, have desired to set up a constitutional monarchy, while the more radical southern party, led by Dr. Sun Yat Sen, have preferred a progressive republic. The southern party organized a revolt in 1913 against the conservative policies and the provisional constitution of 1913, but this was speedily suppressed and conservatism was only strengthened. Encouraged by his successes, Yuan Shih Kai plotted a restoration of the empire in 1915. By carefully manipulating the press and telegraph lines Yuan made it appear that there was an overwhelming desire in China for him to restore the empire and assume the imperial title. He announced his intention "to bow before the mandate of the people" on 11 Dec. 1915, but 12 days later the radical counter-revolution broke out which soon defeated Yuan and supplanted him, after his death in June 1916, by the vice-president, Li Yuan Hung. A final effort to restore the empire came in July 1917 when Gen. Chang Hsun attempted to put the baby emperor, Hsuan Tung, on the throne, but this

ary coup was crushed in seven days. In Hung, refusing to resume office as ant, was succeeded by Feng Kwo in July 1917, and in October 1918, Hih Chang, a northern military leader, elected president. A civil war between n and southern China, alleged to have omented in part by Japanese intrigue, n in progress since 1917 with varied in- and unsuccessful attempts at final ad- it, but it seems likely that the common tion of the Chinese at the treatment of by the Peace Conference will go a long ward healing the breach between the stricts. It appears absolutely certain that will be successful in establishing a lib- rism of government and will go through a onomic transformation within the next ury. The great natural resources of warrant the prediction that she is to become one of the first industrial of the world as soon as she is en- o exploit these resources by more ad- methods. What she needs above all hings is ample public revenue to finance orm program. The World War was a blow to China in this respect, as it pre- the final arrangement of a large inter- loan to her which was contemplated eve of the war. Steps are already being however, by the Western powers to ar- for a great post-war loan to China. See — HISTORY.

*Awakening of Japan.*—European con- ith Japan was first established in the of the 16th century and at first the Jap- welcomed the foreign incursion, but fear- european domination they ousted the for- ment in the decade following 1587, and red many of the Christianized natives. 1600 to 1853 European relations with ere limited to a very severely restricted arrangement with the Dutch. In 1853— amodore Perry, an American naval of- btained certain commercial concessions erican ships, and his success prompted nations to attempt to secure similar es. Native opposition soon developed. aimios or feudal princes opposed the of the *Shogun* in opening Japan to for- terests and began an active anti-foreign gn. As a mode of retaliation for this : the American and European fleets ed the Japanese ports of Kagoshima imonoseki in 1863 and 1864. This ac- oved, a very successful and rapid dem- ion of the superiority of Occidental ma- ulture, and the daimios, like the Chinese eadily perceived the necessity of adopt- e Western technology as a protective e if they desired to preserve the inde- existence of Japan. From 1867 to 1871 a l revolution occurred which ended the ate, revived the imperial power, abolished , carried through sweeping legal and ative reforms, and established a new army drilled and equipped according to a standards. These reforms were syste- l in a new constitution drawn up and ac- in 1889. A patriotic national religion was through the revival and strengthening of sm, and a deliberate and systematic intro- of the European and American indus-

trial technology was provided. As a result Japan has advanced in less than a half-entury from a feudal régime with an archaic industrial and military technique to a modern industrial nation and a first-class military state. But, as in the case of modern Germany, the rapid technological evolution of Japan has not allowed the operation of the broader cultural forces which should accompany and moderate so sweeping a technological change, and the Japanese cultural complex has retained a large number of anachronisms which help to make Japan under the present dominating classes a dangerous and aggressive state. The growth of capitalism, as elsewhere, has produced a tendency toward imperialism and territorial expansion, which in the case of Japan has been greatly hastened and intensified by the dynamic power of a fanatically patriotic religion. In this process of imperialistic expansion it was natural that Japan should turn to the adjoining islands and to the neighboring coast of eastern Asia. The Liulciu Islands were secured from China in 1874; Formosa was retained from the spoil of the Chino-Japanese War of 1894-95; as a result of the Russo-Japanese War of 1904-05 the Liaotung Peninsula and Port Arthur, as well as southern Sakhalin, were obtained, and Korea and Manchuria were freed from Russian domination; in 1910 Korea was annexed and a political and economic penetra- tion of Manchuria begun; as a result of minor and ineffective participation in the World War, Japan was awarded the German possessions in the Shantung Peninsula, with some political reservations, and the German island possessions in the Pacific north of the equator, including the Caroline, Pelew, Marianne and Marshall islands. During the war period the notorious "21 (later 24) demands" of Japan upon China were successfully negotiated and forced by Japan from 18 Jan. to 9 May 1915, and also the deplorable Lansing-Ishii Agreement of 2 Nov. 1917, by which the United States, while formally proclaiming that it recognized and continued the policy of an "Open Door" for China, actually gave up that position and conceded to Japan special interests in China and contiguous Asiatic territory, thereby confirming in practice Japan's claim to a Japanese Monroe Doctrine for China if not for the entire Far East. The "21 demands" are worthy of at least a brief summary and classification. They were divided into some five general groups. Group one required the cession to Japan of the former German interests in the Shantung Peninsula, with some significant extensions of the German concessions. Group two called for a recognition of the special position of Japan in southern Manchuria and Inner Mongolia, with respect to economic and political influence and activity. Group three aimed to give Japan control over the Chinese Hanyehping Company, in other words, over the key to the iron and steel industry and the coal mines of China, with power also to exclude other nations from threatening Japanese domination. Group four was designed to give Japan power to dominate future concessions of Chinese territory by requiring China "not to cede or lease to any third power any harbor or bay or island along the Chinese coast." Most significant of all was the fifth group, according to which "China was to employ Japanese

advisers in political, financial and military affairs; to admit Japanese to joint participation in the policing of 'important places'; to purchase from Japan 'say fifty per cent. or more' of her munitions of war, or allow the establishing of an arsenal in China under Japanese supervision; to grant Japan the right to construct important designated railway lines in the Yangtse Valley; to specify that Japanese might carry on missionary propaganda and own lands for hospitals, churches and schools in the interior; and to give Japan first option for the furnishing of capital for developments, 'including dock yards,' in the Fukien Province." It will readily be seen that these practically abrogated the sovereignty of China in both foreign relations and domestic affairs, and that as long as they are recognized they must inevitably prove a stumbling block to all liberal foreign relations in the Far East. As a result of the war Japan has also advanced to a position of first-rate importance in the world's shipping. While there is little doubt that Japan is likely to prove the most aggressive and intractable modern state in imperialistic expansion, there can be no question that the western nations must refrain from a "holier than thou" attitude in the premises, for Japan received her first lessons in *Weltpolitik* and *Machtpolitik* from the nations of Europe, from the time of the bombardments of 1863-64 to the despoiling of Japan by the European powers after the Chino-Japanese War of 1894-95. Nor has the conduct of the European powers in world politics generally been of the sort to convince Japan that they were all inspired by the golden rule, any more than their redistribution of German colonial possessions, and commercial interests in Africa and western Asia would be likely to make Japan hesitant in demanding the German possessions in the Far East. Probably the most promising aspect of the Japanese question in *Weltpolitik* is the existence of a growing liberal party in Japan which is likely to come into power and to repudiate the aggressive policy now being pursued. See JAPAN—HISTORY, 1889-1919; JAPAN—RUSSO-JAPANESE WAR.

*The Philippine Islands and American Interests in the Far East.*—The occupation of the Philippine Islands by the United States was but an incident in the beginnings of the overseas expansion of this most powerful of American republics. Mr. Bryan and others were greatly stirred in 1898 by what they regarded as a new and doubtful venture in American policy, but in reality the conquest of the Philippines was a new policy only in the matter of geographic location and not from the standpoint of a social or political process. If by imperialism is meant the occupation and exploitation of virgin soil previously possessed by a more primitive people, no nation has been more persistently imperialistic than the United States. Like Russia, the United States was long able to expand through the seizure of contiguous territory, and the history of the United States since 1789 can only be properly comprehended when interpreted as a process of continuous westward expansion. The 19th century witnessed the occupation of the central portion of the American continent from ocean to ocean, but the passing of the frontier in 1890 produced the necessity of dis-

covering a field for expansion and investment elsewhere than within the boundaries of the United States. The dispute with Spain over Cuba proved but a welcome pretext and a moral issue which allowed the formal and systematic initiation of a process which had been long in preparation. While the West Indies and the region of Central America and Mexico have been far more important in the commercial phases of the imperialism of the United States than the Philippine Islands, the latter constitute the best example of a systematic attempt at colonial administration by the United States.

The original population of the Philippines was probably a primitive pygmy negro stock, to which were added by migration Malaysians, Chinese and Arabs. The Philippines were first discovered by Europeans in 1521 when Magellan's fleet reached this region. The actual conquest by the Spanish was carried on from 1565 to 1571 under the leadership of Miguel Lopez de Legazpi. The conquest was most superficial, Luzon being the only island which was subjected to any considerable degree. From this time until 1898 the Philippines were controlled by Spain, save only for the period of 1762-63, when Manila was occupied by the British. They were governed as a subdivision of the larger administrative unit of Mexico. The condition of the Philippines under Spanish rule was one of almost unrelieved stagnation and corruption. The political administration was generally corrupt and extravagant and the occasional honest and competent administrator met a fatal opposition from the "vested interests." The economic and commercial life of the islands was paralyzed under the restrictions imposed by the severe mercantilistic policy of the mother country. Finally, the Catholic friars secured control of much of the best land, especially in Luzon, intimidated the civil government, and secured much immunity from the civil law. So onerous did the clerical domination become that several reform movements developed, the last of which had proved successful on the eve of the American occupation. The military events connected with the American conquest of the Philippines are well known. Dewey crushed the Spanish opposition on the sea by his brilliant victory of 1 May 1898, and the land forces of the Spanish were soon overpowered by General Merritt. By the treaty of 10 Dec. 1898, Spain agreed to cede the Philippine Islands to the United States in lieu of a payment of \$20,000,000 and the guaranty of free entry of Spanish ships into Philippine ports for a period of 10 years. In spite of violent opposition from the "anti-imperialists," the United States government decided to accept the responsibility for "civilizing" the inhabitants of the new island possessions. A preliminary Philippine Commission, headed by President Schurman of Cornell University, went to the Philippines in 1899 and gathered information essential to the establishment of a civil government. A more permanent administrative commission with Judge W. H. Taft at its head was sent to the Philippines in 1900. Before his retirement three years later Mr. Taft had by his constructive administrative ability won that admiration by President Roosevelt which later secured for him the presidency of the United States. A civil government was

ed in July 1901, with the commissioners ad. Native Filipino members were later o the commission. The notable Philip- t of 1 July 1902, made the civil govern- rmanent and provided the governmental ment which, with some modifications, d down to the Jones Act of 1916. Pur- ) the policy of the act of 1902 a census pleted in 1905, and an election held for : assembly in 1907. From 1907 to 1916 mission acted as the upper house of the re, though after 1913 more Filipinos dded to the commission. In August e Jones Act which provides the present tional basis of the Philippine govern- rdered the establishment of a native is well as a native house of representa- The chief executive remains the govern- eral appointed by the President of ited States. The judiciary was estab- 1901, and has from the beginning been ip of a majority of Filipinos. The atic administration has been especia- orable to an early acquiescence in grant- : Filipino request for complete inde- e, but even a Democratic Congress ot be induced in 1916 to commit itself to inite date at which independence might cted. It is extremely doubtful if com- utonomy will be granted as long as rgent need for checkmating Japanese ion in the Orient, for the United States ot afford to retire from so advan- a position or risk the possibility of rersed by Japan as the possessor of ppines. While there is a warm senti- or independence in the native popula- ere can be no doubt that the American tration has in 20 years accomplished sults in the way of improving the ma- ture of the Filipinos, in fact here ; the achievements of the British in The oppression and corruption were iped out; sanitary conditions have eatly improved; the currency has been fized; great public works have been ed; means of communication and trans- n have been improved and widely ex- railroads having been introduced; the mal work with the natives has been one most creditable of the administrative nents, school facilities having been ex- to over half of the population; industry mmerce have been fostered and greatly d; and, finally, the juridical and penal ons have been revolutionized, the Bili- son at Manila and the Iwahig penal on the island of Palawan constituting y the most advanced and successful stem now in existence anywhere. The s of the Philippines are principally ural, being in order of importance, corn, anila hemp, cocoanuts, sugar and to- The rice and corn are, however, raised ntirely for home consumption. Little cturing industry exists, though there n a considerable development of saw- id cocoanut-oil factories. At the pres- e the commerce of the islands is con- by the United States which ships to pippines more goods than all other coun- bined and buys from the Philippines twice as much as all other coun-

tries. While this domination has been ab- normally increased by war conditions, it seems that the United States has arrived at a state of effective preponderance in Philippine commercial relations and that in this case, at least, "trade has followed the flag." It is further probable that there is nothing subtle in the assertion that this state of affairs is not at all conducive to the hastening of the relaxation of the political grip of the United States on the Philippines. See PHILIPPINE ISLANDS.

*Oceania and Australasia.*—One of the areas of so-called backward races which has been most thoroughly appropriated by western imperialistic nations is that which includes the islands, greatly varying in size and importance, which are situated south and east of Asia. These are usually divided into two major divisions, Oceania and Australasia. The former is further subdivided into Malaysia, Polynesia, Micronesia and Melanesia, while the latter is composed of Australia, Tasmania, New Zealand and the lesser adjacent islands. Malaysia, sometimes known as the East Indies or the Malay Archipelago, is made up of the islands lying immediately to the southeast of Asia, the most important of which are Sumatra, Java, Borneo, Celebes, New Guinea, and Luzon and Mindanao of the Philippine group. The great majority of these belong to the Dutch, the only exceptions being the Philippines; eastern Timor, belonging to Portugal; the British possessions of Singapore and parts of Borneo and New Guinea; and the former German colony in northeastern New Guinea, known as Kaiser Wilhelmsland. Polynesia comprises the great majority of the islands of the western and mid-Pacific area, including the Fanning, Ellice, Tokelau, Tonga, Kermadec and Cook islands, belonging to Great Britain; the Samoan Islands formerly belonging, with the exception of an American naval base, to Germany; the Austral Society, Tuamotu and Marquesas islands possessed by France; and the Hawaiian Islands, a territory of the United States. Micronesia consists of the Marianne, Pelew, Caroline and Marshall islands, formerly owned by Germany; and the Gilbert Islands possessed by Great Britain. Melanesia comprises the Santa Cruz, Banks, Fiji, D'Entrecasteaux and Louisiade islands, belonging to Great Britain; the former German colonies of the Admiralty, Bougainville and Bismarck islands of the Bismarck Archipelago; the Solomon Islands, owned formerly by Great Britain and Germany; the French possessions of New Caledonia and the Loyalty Islands; and the New Hebrides owned jointly by France and Great Britain. The economic resources of the region known as Oceania vary greatly. The Dutch possessions in Malaysia have throughout modern times been the chief source of the world's supply of spices, and are also important for production of tea, coffee and tropical fruits and woods. The products of the Philippines have already been mentioned. The lesser islands in some cases possess valuable mineral deposits and most of them produce the cocoanut and tropical fruits in a varying degree of profusion, but, with few exceptions, the western powers have sought dominion in these oceanic regions on account of the supposed strategic value of harbors,

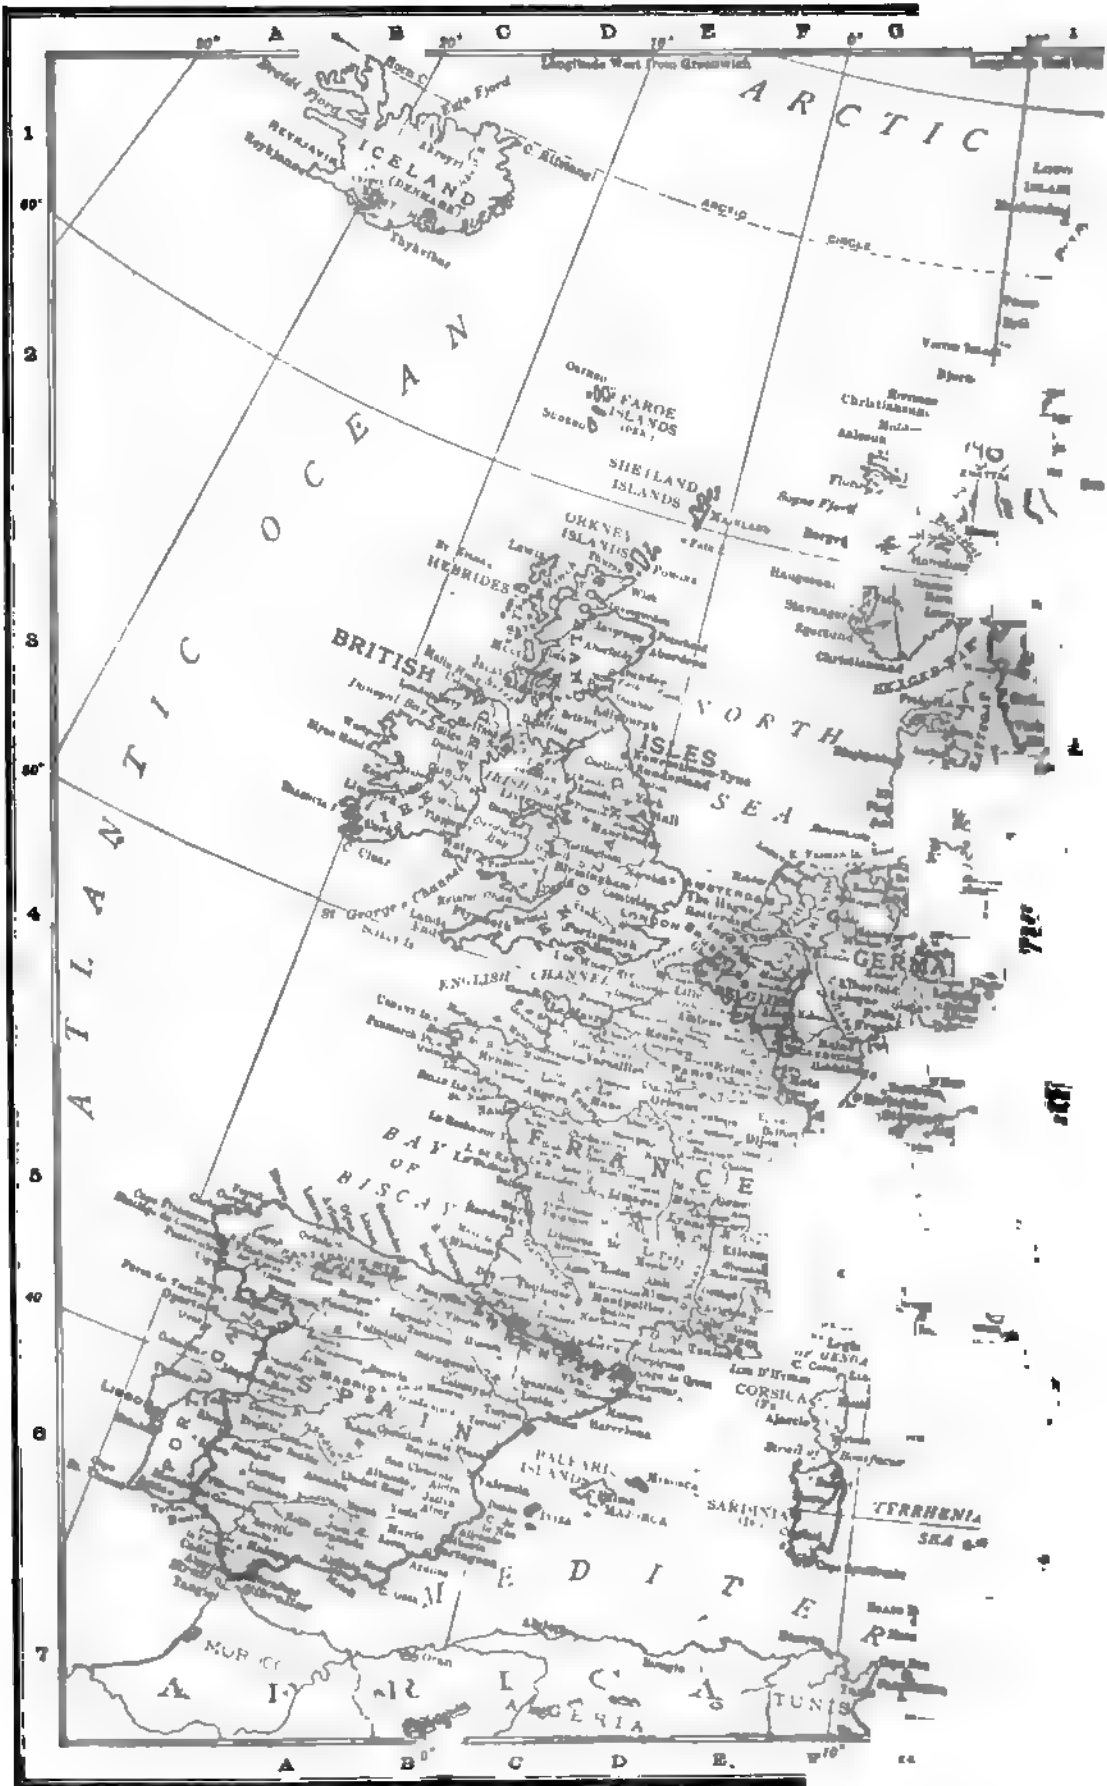

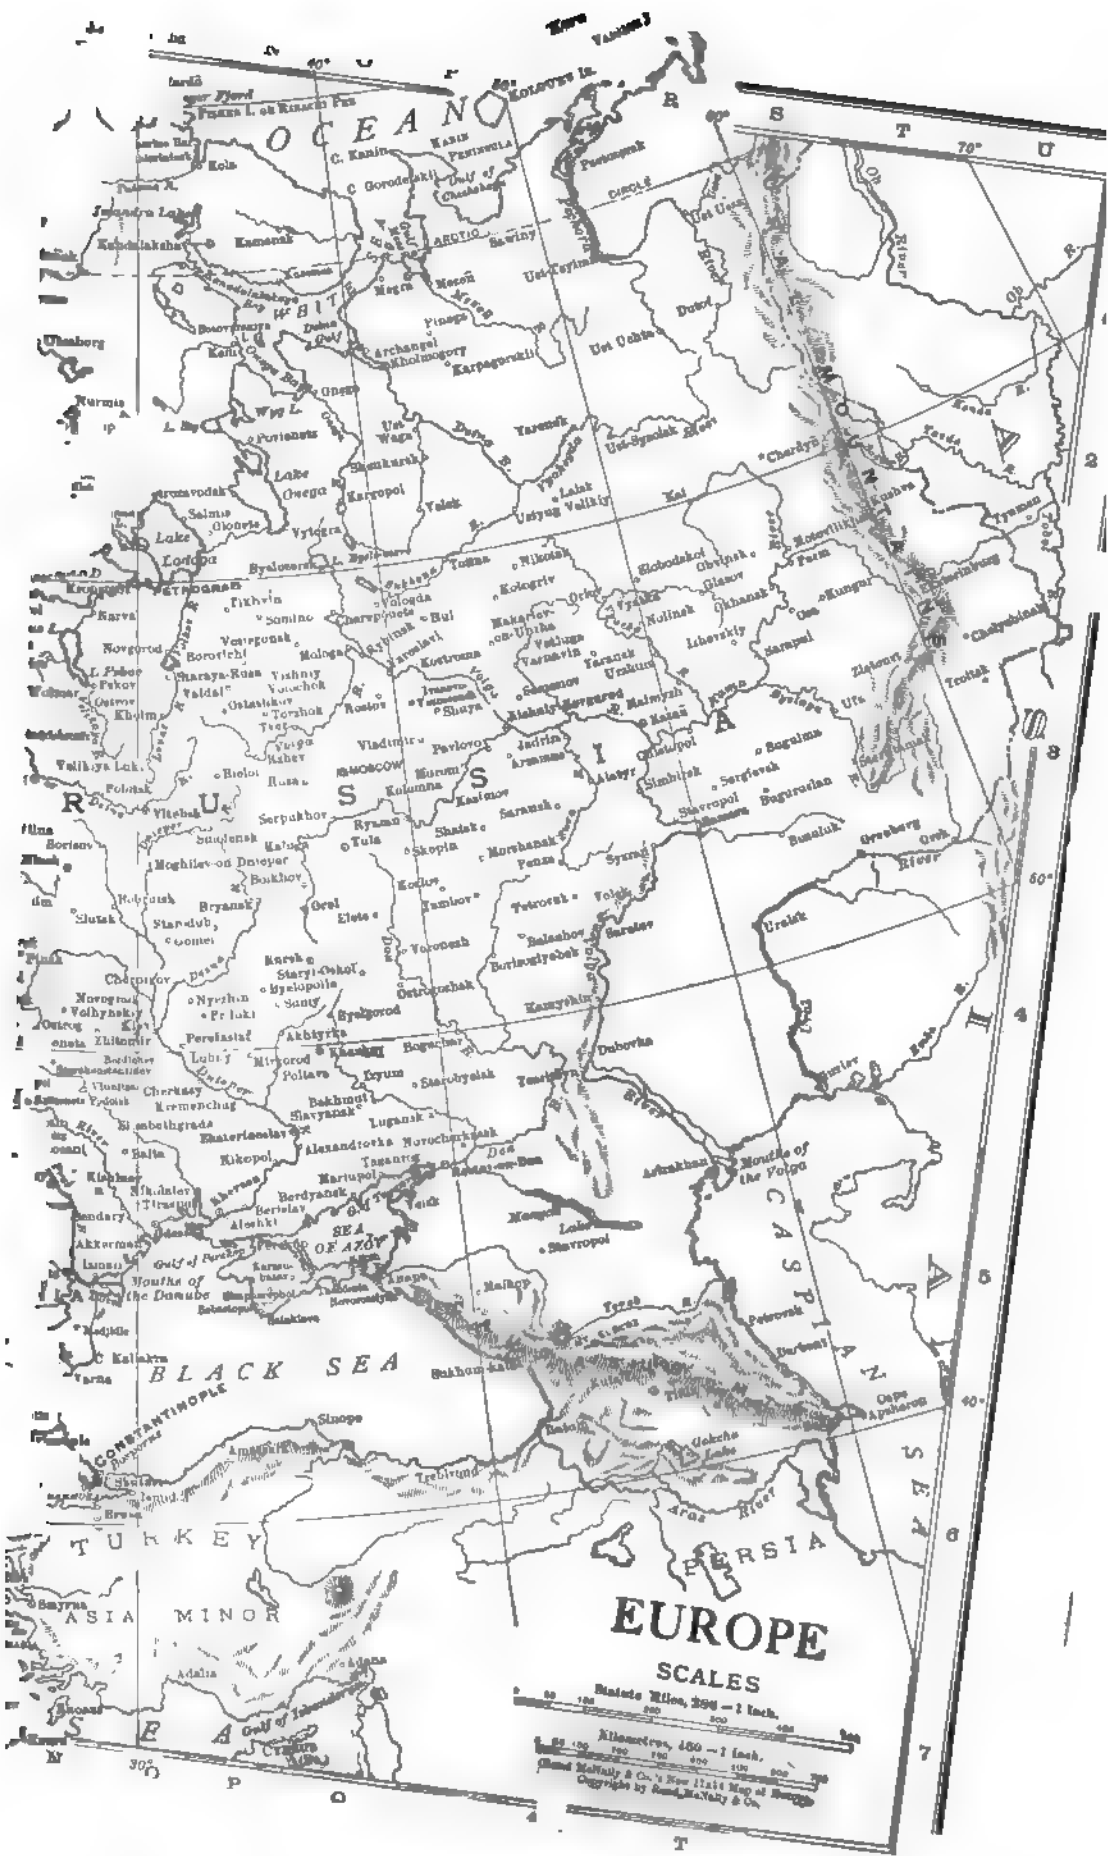

naval bases and coaling stations in the Pacific area. As yet the economic exploitation of much of the district has not been systematically prosecuted. While the international relations in this area have been rich in producing significant developments in diplomatic negotiations, there have been only a few incidents worthy of specific mention. The Philippine situation has already been treated. Next to these islands the most important international controversy in Oceania arose over the Samoan Islands. From 1877 to 1889 Great Britain, Germany and the United States contested in diplomacy for these islands and an international war would probably have been precipitated over them had it not been for the hurricane of 16 March 1889, which destroyed the fleets of the rivals in these waters. Matters were smoothed over, and by the agreement of 2 Dec. 1899, most of the Samoan Islands were handed over to Germany, with the exception of Tutuila and some lesser islands taken by the United States. In the World War the German Samoan possessions were captured by New Zealand and given to this state by the Peace Treaty of 1919. The Hawaiian Islands, annexed by the United States in 1898, after a considerable debate, constituted the first important Pacific extension of American imperialism. The chief significance of the World War in this area was its relation to the disposition of the German possessions in Oceania. In general, the German islands north of the equator were handed over as mandatories of Japan, while those south of the equator, with the exception of Samoa, were given to Australia. This region can never possess any great importance for the future commerce of the world, except in the case of scattered deposits of rare minerals and through providing coaling stations and dry-docks, but, as the Samoan incident proved, trilling disputes over such insignificant islands may jeopardize the peace of the world. The chief cause for apprehension at present is the possibility of an attempt of Japan to assert her right to a hegemony of Oceania, especially if her progress in China and Siberia should be blocked. See MELANESIA; OCEANIA.

Australia, while discovered by Portuguese and Dutch navigators early in the 17th century, was not extensively explored or claimed as a European possession until 1770, when Capt. James Cook sailed along a considerable portion of the coast and established the claim of Great Britain to this great continent. A use for the region was found after the American Revolution had prevented Great Britain from making the American colonies a dumping-ground for the great number of criminals produced by her barbarously severe criminal laws. In January of 1788 the settlement of Australia was begun by the landing of nearly 1,000 criminals at Botany Bay. The Australian penal colony was of great importance in the history of penology, as it was here in 1840 that Alexander Maconochie began his reforms which developed into the Irish system of penal administration under Walter Crofton and the Elmira Reformatory principle under Z. R. Brockway and others. In 1803 the settlement of Tasmania began and the resources of Australia were discovered by such explorers as Sturt, Hume, Stuart and others. The explora-

tions revealed the possibility of an economic exploitation of Australia. Sheep were introduced in the first quarter of the 19th century from South Africa and Spain, and today Australia is much the most important area for the production of export wool in the world. Gold was discovered in 1823 and 1851, and a large immigration of gold-seekers followed. Finally, the adaptability of Australia to wheat raising attracted a large number of farmers. Those who came to Australia for economic reasons naturally opposed the further population of the region by convicts, and their protests, together with the reform of the English criminal jurisprudence, led to the discouragement of criminal transportation after 1840 and to the complete termination of the practice after 1857. By 1859 some six colonies had developed in Australia and Tasmania, New South Wales, Victoria, Queensland, South Australia, North Australia and Tasmania. In 1852 Great Britain permitted the Australian states to hold constitutional conventions and determine their own form of government, but the problem of the method of federal and imperial union was not settled until a half-century later. As early as 1847 it had been proposed by British statesmen that Australia have a general legislative body, but particularism, especially in regard to the tariff, prevented such a project from being immediately executed. From this time onward there were sporadic attempts to secure unity. Intercolonial conferences and conventions, at which the importance of unity was stressed, were held in 1867 at Melbourne, in 1880 at Melbourne, in 1883 at Sydney, in 1890 at Melbourne, in 1891 at Sydney, and in 1897-99 at Adelaide, Sydney and Melbourne. The conventions of 1897-99 drafted a constitution for Australia and Tasmania which was embodied in the Australian Commonwealth Act of 1900, uniting the six colonies into a self-governing unit within the British Empire to be administered under a form of government supposed to combine the best aspects of the governments of England and the United States. New Zealand, though included in Australasia, is situated no less than 1,200 miles from eastern Australia. It was discovered by the Dutch in 1642, and the coast was explored by Captain Cook in 1769. From this time until 1839 it was nominally claimed by Great Britain, but was not settled. In 1840 Great Britain formally assumed possession of the region. In 1853 New Zealand was given self-government, and in 1865 it was separated in an administrative sense from Australia. In 1876 the evils of particularism were remedied by an abolition of the local provincial councils and the establishment of a more unified system. In September 1907, it was proclaimed the "Dominion of New Zealand" and transformed into another self-governing colony of the British Empire. In both divisions of Australasia advanced programs of radical democracy and social legislation have been successfully adopted, and these self-governing units of the British Empire are entitled to rank as the most progressive of the world's democracies. New Zealand has been most conspicuous in this progressive movement. A defeat of the labor unions in a great strike in 1890 led to vigorous political activity on the part of labor, and the radical party controlled New Zealand for

quarter of a century. It proceeded to providing for woman suffrage, representation and the referendum, arbitration of labor disputes, government ownership of railroads and other public utilities, progressive land tax, age pensions, workmen's compensation and other types of modern advanced legislation. While Australia has not gone as far in this direction as New Zealand has adopted most of these advances of a progressive democracy, since the growth of the strength of the Labor Party in the 20th century. The chief industries of Australasia are the raising of sheep and cattle, hardwood timber, wheat cultivation, and gold mining. The wool and mining industry is now developing and the supply of raw wool and the existing rich coal and iron deposits make it at in the future Australia will assume a leading position among the manufacturing nations of the world. The commerce of Australia in 1916 amounted to over a billion dollars, is still over 60 per cent with Great Britain and parts of the British Empire. In recent years there has developed an increasing tendency to trade more and more with other countries. Following the lead of Australia and New Zealand have been the principle of imperial preference and freed their duties on British products imported into Australasia. Provisions for home defense have been made, Australia adopted compulsory military service in 1911, New Zealand in 1910, while in 1909 New Zealand began the construction of her very own navy which played an important part in World War by clearing the Pacific of German raiders. The soldiers of Australia and New Zealand participated with distinction in the war, both in the disastrous Gallipoli expedition and on the Western Front. Australia conquered the German colonies in the Western Pacific. At the Peace Conference Australasian delegates took an aggressive stand demanding the conquered German colonies south of the equator, opposing Japanese occupation of those north, constituting an effective obstacle to Japan's attempt to secure the recognition of racial equality in international laws, and indicating a determination to establish an Australasian "Monroe Doctrine" for the southern Pacific. The vast and rich natural resources of Australasia justify the opinion that it is likely to become the seat of one of the most important advanced civilizations and one of the political organizations of the future.

**AUSTRALIA—DISCOVERY AND EARLY HISTORY.**  
**Generalizations Concerning International Relations in the Far East.**—It may be at this point to summarize the present international relations in the Far East. Great Britain can be relied upon to maintain control over Tibet in order to protect India, and to stand back of Japan in most policies designed to maintain the British Empire in the Pacific. It is likely to evince a lively interest in international relations affecting southern China, but will have a free hand in Syria her imperial efforts are likely to be centred in the

main on Africa and western Asia. The fate of western Siberia apparently hangs on the future of the Russian Empire. If the latter disintegrates into chaos, Japan is likely to dominate the greater part of eastern Siberia, but if a strong Russia emerges it is probable that she will retain her grip on Siberia. The future disposition of Manchuria and Mongolia is also most uncertain. At present Japan dominates Manchuria and inner Mongolia, while Russia still formally preserves her loose control over outer Mongolia. A strong and unified China may oust both Russia and Japan, but it seems more probable that a weak Russia and China will for a time be dominated by an aggressive Japan in this region. Korea is completely controlled by Japan, but the significant development of the patriotic nationalist movement in Korea within the last year makes it certain that Japan will have difficulty in maintaining an iron grip on Korea. How far the "Open Door," or international commercial equality policy, established in March 1900 by John Hay, still prevails in China it is difficult to say. The notorious "21 demands" made upon China by Japan in 1915 certainly compelled special concessions to Japan of a very concrete and considerable nature and they were not vigorously protested by the United States. Indeed, the United States practically acquiesced in this shameful extortion by the Lansing-Ishii Agreement of November 1917, which recognized the "special interests" of Japan in China. It has become evident that only a strong and unified China will suffice to enforce international equality in the Chinese Republic. What China most needs to secure her future development is adequate funds. These were about to be provided in 1912, though not without embarrassing concessions, through an international consortium of the so-called "Six Power Loan Group"—England, France, Germany, Belgium, Japan and the United States. President Wilson's opposition caused the United States to withdraw, and the European War broke up the whole plan. A new loan consortium is now being arranged. Japan, enriched by the spoil of the German colonies in the Far East and by recent extortion in China, is now at the height of her aggressive imperialism, but is likely to meet strong opposition. China is nearly a unit against her since the Peace Conference. The interests of the United States in the Philippines and Hawaii will keep the latter country alert against Japanese domination. Great Britain, no longer fearful of Germany or Russia, is likely to desire to break away from the Anglo-Japanese agreement of 1902. A China militarized and dominated by Japan would be a serious menace to India. Great Britain will probably be strengthened in this attitude by the unmistakable anti-Japanese sentiment in Australasia. With the growth of population and wealth in the last named region a new element is entering the politics of the Far East, and the European and American expansionists seem likely to have to deal with a contender of the same race in the eastern hemisphere. In the main, however, it seems highly probable that the core of the international relations of the Far East during the next half century will be the developments within China. See CHINA—DIPLOMACY

RELATIONS WITH; JAPAN — DIPLOMATIC RELATIONS WITH; RUSSIA AND THE WAR.

5. *Latin America in Modern Imperialism.*— On account of its original settlement by Spanish, Portuguese and French, the American continent and adjacent islands from the southern boundary of the United States to Cape Horn are conventionally known as "Latin America." The matter of the original settlement has been briefly alluded to in an earlier section of this article. It will be sufficient at this place to recall that this region was explored and settled mainly by the Spanish, with the exception of Portuguese Brazil and a few French settlements in the West Indies. Politically Spanish America was controlled through a highly centralized administrative system culminating in the Royal and Supreme Council of the Indies, established in 1542. In an economic sense the trade of the Spanish colonies was regulated under the provisions of the extremely rigid Spanish mercantilism administered through the so-called "House of Trade," which was created in 1503 and extended and systematized during the next half century. Dwelling under a corrupt and inefficient officialdom and a stifled commercial activity the inhabitants of Latin America made little general social and political progress until the era of the revolutions following 1810. The series of revolutions in the Latin-American states were closely related in their origin to contemporary events in European history. In 1808 Napoleon had invaded Spain and aroused the patriots and liberals to resistance. In 1812 they drew up a liberal constitution, modeled after the French constitution of 1791, and the wave of liberalism extended to the Spanish-American colonies in the western hemisphere. After the overthrow of Napoleon in 1814 the reactionary régime under the unspeakable Ferdinand VII was restored in Spain and an attempt was made to revive it in the colonies, but the latter resisted. Spain, unaided, proved unequal to the task, but in the year 1823 the reactionary powers, joined together by the Quadruple Alliance of 20 Nov. 1815 and dominated by the sinister spirit of Metternich, determined to aid Spain in American intervention against revolution. At this juncture Great Britain took a vigorous stand in opposition. She had welcomed the overthrow of the old Spanish trading restrictions after 1812 and had built up a lucrative and flourishing trade with the Spanish colonies. This trade she feared she would lose in the event of the restoration of the Spanish domination. Therefore, on 23 Aug. 1823, George Canning, the English foreign secretary, suggested to Richard Rush, the American ambassador in London, that the United States join with Great Britain in a note to the group of reactionary powers warning them against intervention in Latin America. While Rush was communicating with Washington Canning informed Polignac, the French ambassador at London, that Great Britain would oppose intervention by any country save Spain alone. Alarmed by the European situation and by Russian aggression along the Pacific Coast of North America, President Monroe and his advisers finally accepted the suggestion of Canning in protesting against intervention. The Secretary of State, John Quincy Adams, however, convinced Monroe that the declaration should

be made independent of Great Britain and he formulated what became the famous "Monroe Doctrine," when embodied in the Presidential message of 2 Dec. 1823. The chief pronouncements were the declaration of the separation and distinctness of the two hemispheres; the doctrine of non-intervention of European powers in American domestic politics; the proclamation, set forth especially for the attention of Russia, that the American continent was closed to further European colonization; and that the extension of absolutism to America would be unwelcome to the United States. Canning was pleased with the American attitude and gave notice that the British fleet would back up the policy enunciated by the United States. In this way the independence of the Latin-American states was assured and the first systematic formulation of American foreign policy definitely expressed to the world. The Anglo-American opposition to Metternichian intervention clinched the movement toward independence and Latin America soon became a group of independent American states. Haiti declared its independence in 1804, San Domingo in 1821 (1844), Cuba in 1902, Mexico in 1821, Guatemala in 1821 (1847), Salvador in 1821 (1838), Honduras in 1821 (1839), Nicaragua in 1821 (1839), Costa Rica in 1821 (1838), Panama in 1903, Colombia in 1811, Venezuela in 1811 (1829), Ecuador in 1811 (1830), Peru in 1821, Brazil in 1822, Bolivia in 1825, Paraguay in 1811, Uruguay in 1828, Argentine Republic in 1816 and Chile in 1818 (dates in parentheses refer to establishment of present independent states). As these dates will indicate, the two chief periods of national differentiation were from 1810 to 1830 and from 1838 to 1850, with two late additions at the very opening of the 20th century. Although with these independent states in Latin America there are the following foreign possessions: British Guiana, British Honduras, Jamaica, the Bahamas, the Barbados, the Leeward and Windward Islands, Trinidad and Tobago controlled by Great Britain; French Guiana, Martinique and Guadeloupe owned by France; Dutch Guiana, Curaçao and some lesser islands belonging to Holland; and Porto Rico and the Virgin Islands possessed by the United States. The development of the Latin-American nation since the establishment of their independence may be divided into three broad periods characterized by certain definite advances. That from independence to about 1852 "the age of dictators"; that from 1852 to 1876 as the era of the struggle for stability and organization; while that from 1876 to the present was one notable for general social progress and the emergence of certain leading Latin-American states. It might also be added that the period from 1898 to the present has been conspicuous for the development of international relations in this district, namely, the rise of a distinct Latin-American foreign policy under the direction of the so-called "A B C Powers" (Argentine, Brazil and Chile) which has challenged the Monroe Doctrine over Latin America generally and south of the equator in particular; the development of an opposing tendency in the aggressive imperialism of the United States in this region with a bold extension of the implications of the Monroe Doctrine for Latin America; and the attempt to

compromise these two conflicting tendencies through the development of the Pan-American movement, which has been in progress since 1889.

The expansion of the Monroe Doctrine has kept pace with Latin-American progress and the development of the foreign relations of the United States. Under Jackson the doctrine was not developed because it was associated in its origins with John Quincy Adams, all of whose works were anathema with Jackson. Polk introduced a novel and aggressive interpretation—a sort of precautionary or preventive policy—to the effect that the United States should annex all American territory which might eventually fall into European hands. This view was strengthened by Seward's warning to Napoleon III to leave Mexico in 1865 and by President Grant and Secretary Fish, who announced that no European power might annex any American territory, irrespective of whether the annexation was voluntary or forced, and proclaimed the United States the leader in American policy. In 1889 Blaine further contended that the United States would not sanction the conquest of American territory either by Latin-American states or by foreign powers. The Clayton-Bulwer Treaty of 1850 originated the half-century discussion as to the bearing of the Monroe Doctrine on the isthmian canal project. When the French company was formed in 1878-79 to build the Panama Canal Secretary Fvarts and President Hayes declared that any isthmian canal must inevitably become a coast line of the United States. In 1881 Blaine warned that a European canal would be equivalent to the extension of the European political system to the American continent. Finally, in 1903 President Roosevelt allowed the United States to sanction violent changes in Latin-American governments in order to secure our dominance in the canal scheme, and the completion of the Panama Canal by the United States and our option on the Nicaragua route has settled that problem. In 1895, as a phase of the Anglo-American dispute over Venezuela, President Cleveland and Secretary Olney made a startling extension of the Monroe Doctrine when they declared it to be an accepted and integral part of American public law and that the law of the United States was sovereign on the western hemisphere in such matters as this country saw fit to act upon. President Roosevelt's administration witnessed two notable developments of the doctrine. By allowing the German fleet to bombard ports of Venezuela he refused to accept the "Drago Doctrine" and gave warning that perversely delinquent Latin-American states could not skulk behind the Monroe Doctrine, while at the same time he stood firmly against territorial aggression by Europeans. His second contribution, probably the most important positive moral and political extension of the policy, as well as the most dangerous when dishonestly or unscrupulously applied, amounted to a declaration that when any American state was unable to discharge the duties normally devolving on a civilized state or when it used force on representatives of foreign countries it was the duty of the United States to intervene to maintain order and keep the peace. Following

out this policy President Roosevelt took over the financial administration of San Domingo in 1905, President Taft took similar action with regard to Nicaragua in 1912 and President Wilson did the same with Haiti in 1915. Had a Republican administration been continued after 1912 it is probable that intervention in Mexico would have come ere this. In his famous Mobile speech of 1913 President Wilson declared that the United States would never intervene in any country on this continent for territorial aggrandizement, but only to restore order and promote progress, but this cannot be taken as any guaranty of the future. The question of territorial aggrandizement will be decided by the nature of a future President's advisers and class affiliations. (See MONROE DOCTRINE, THE). The World War has produced a fundamental revolution in the Monroe Doctrine. The participation of the United States in the Algeciras Congress of 1906 proved that the initial doctrine of the isolation and distinct separation of the two hemispheres was fast giving way before the growth of world commerce and international relations. What remained of this conception after 1906 was completely destroyed by the entry of the United States into the World War. Far more significant than the military intervention in Europe were the repeated public declarations of President Wilson that the chief aim of the United States in entering the war was to transform and improve the internal political organization of the German Empire, a complete reversal of President Monroe's statement that the United States would never concern itself with or intervene in the domestic politics of Europe. The United States having destroyed the isolation policy of the western hemisphere and intervened in European politics, the vigorous reassertion of the sanctity of the Monroe Doctrine by the jingoistic senators in the United States can rest only upon two foundations, the fact that we are strong enough to maintain it and the oft-asserted contention that our leadership ensures a higher type of international morality on this continent. Of the former there is no doubt; the latter must await the test of future events.

The most important and interesting phases of international relations in Latin America are the problem of the relations of the United States to Mexico and the distinct difference between the position of the United States north of the equator and south of that line. From 1884 to 1911 Mexico was under the dictatorship of Porfirio Diaz, who has been called "one of the most able and talented administrators of modern times." His rule brought to Mexico peace and prosperity but little progress toward democracy, and when he was forced to resign in 1911 there was a natural relapse into civil war. After a season of murder and treachery Victoriano Huerta, a military leader of Indian blood, emerged as provisional President in February 1913. On account of the violence attending his rise to power President Wilson refused to recognize Huerta, but also refused to intervene, and pursued his famous policy of "watchful waiting" until the local factions would be united and organized by constitutional methods under a Mexican leader. This proved a tedious process. Huerta was

forced to resign in August 1914 and was succeeded by Venustiano Carranza, but a number of the military leaders dominated by Francisco Villa, a half-breed bandit, declared their opposition to Carranza and the civil war continued, though he succeeded in getting the upper hand in the greater part of his country. The forces of Villa conducted border raids and a considerable number of American citizens on the Texan border were killed or wounded. Early in 1916 a detachment of the regular army was sent into Mexico under General Pershing to capture Villa, but the force dispatched was inadequate and not effectively supported by Washington diplomacy, and intervention ended ingloriously. In the middle of the summer the national guard was called out to police the Mexican border, the only result being a demonstration of the ineffectiveness of the militia organization, whatever the bravery of individual guardsmen. In January 1917 the Carranza government revised the constitution and put in force the amended document in May of that year. It was a notably liberal and progressive constitution, providing, among other things, for advanced social legislation, anti-trust legislation and the confiscation of churches, schools and hospitals belonging to religious associations. A new tax schedule was created for foreign oil and mining interests and Article 27 of the new constitution looked forward to the nationalizing of the natural resources of Mexico. These liberal measures aroused against Carranza all the vested interests at home and abroad. Capitalists at home were alarmed at the industrial legislation. The reactionary religious bodies opposed the liberal religious policy of the government. Above all, the foreign mining and oil interests, especially in the United States, were rendered hysterical by the new restrictions placed upon them and the plans for a future confiscation of their holdings. As soon as it began to appear that the Carranza government would remain in command of the Mexican situation and put its program into effect the foreign investors began a systematic propaganda urging every conceivable cause for the intervention of the United States in Mexico. At the close of the year 1919 the situation seemed to justify the belief that they were likely to be successful in bringing intervention to pass. Whatever the advantages of such action might be to investors in Mexico it could not but be disastrous for the country which is to-day nearer to some prospect of developing a stable democracy than ever before in its history. See MEXICO (Vol. XVIII, pp. 757-758; 793-800).

The commercial, and for practical purposes, the political domination of the United States over the Caribbean region and Central America appears to be assured. This proceeds from the lack of internal stability in this region, requiring, according to the Roosevelt interpretation of the Monroe Doctrine, the intervention of the United States to preserve order; the great increase of the trade of the United States with this area, now exceeding that of the rest of the world combined; and the necessity of naval domination to afford proper protection for the Panama Canal. In line with the establishment of this dominating position the United States has retained control of Porto

Rico, exercises a general supervision Cuba, administers the finances of Haiti, Domingo and Nicaragua, has purchased Virgin Islands from Denmark, has intervened in several Central American states and Venezuela in the interest of promoting political stability and peace, and connived at the partition of Colombia in order to secure the Isthmian route for the isthmian canal. While the Monroe Doctrine is formally held to apply to Latin America it ends in practice well north of the equator. There are two chief reasons for this. The first is that in this region European commercial and financial interests dominate completely as do those of the United States north of this line; therefore, the United States has less practical reason for desiring to control the foreign policy of this region. In the second place, the A B C powers have not claimed the authority for determining the general policies of the area south of the equator and resent the intrusion of the United States. In this attitude they have not been without European support and encouragement. The great powers south of the equator, supported by the more liberal element in the United States, have favored the supplanting of the Monroe Doctrine by a broader policy of Pan-Americanism. General Pan-American conferences have met in 1889, 1901, 1906 and 1916, and special scientific and commercial congresses have assembled from time to time. There is no official organization of the 21 American states in the Pan-American Union, established in 1910 and maintained at Washington by an endowment from Andrew Carnegie. The chief obstacles to the development of Pan-Americanism are the commercial value of the Monroe Doctrine to American capital, the disproportionate strength of the United States as compared to the most powerful Latin American states. To these might be added differences in culture, the peculiar Latin-American psychology, the domineering attitude of the United States and the inflated pride of the lesser Latin-American states that leads to demand political equality with Argentina and the United States in any binding organization of American states. The cause of the conflict between Pan-Americanism and the Monroe Doctrine cannot be fixed, but it is safe to predict that the A B C powers will check the Monroe Doctrine at the expense of the American problem will probably be aggravated by the present introduction of modern industrial technology into South America which will tend to make this region a very important centre of the world's politics and culture. While the United States dominates Latin America north of the equator in all matters pertaining to capital, industry and commerce, a similar control is exercised south of the equator by Great Britain, France and Germany. World War was a hard blow to Germany in South America, but they will revive and those of Great Britain seem likely to expand. See LATIN AMERICAN UNION; CARIBBEAN; PANAMA.

6. *The British Empire in Recent World History.* The more significant aspects of

y in the era of the old colonial luding the origins of British e struggle with the French for l commercial hegemony of North idia, the transformation of Britilicity in 1763 and its subsequent ter the revolt of the American ie theoretical attack upon Merce Physiocrats, Adam Smith and en briefly sketched in an earlier article. Between these two probably more powerful than effect upon British foreign pol- als led by Lord John Durham, and Edward Gibbon Wakefield. socio-political theory which has arized by Ramsay Muir: "The

main object of colonization was the systematic draining-off of the surplus population of the older lands. This, it was felt, could not safely be left to the operation of mere chance; and one of the great advantages of colonial possessions was that they enabled the country which controlled them to deal in a scientific way with its surplus population, and to prevent the reproduction of unhealthy conditions in the new communities, which was apt to result if emigrants were allowed to drift aimlessly where-soever chance took them, and received no guidance as to the proper modes of establishing themselves in their new homes." These men were also effective in modifying the Cobdenite view of the inevitability of the independence of the colonies by holding that self-government would give the colonists all the advantages of independence without separating them from the mother-country and destroying all unity of imperial policy. It was their influence which brought practical self-government to Canada in 1847 and formal self-government to Australia in 1852, and to New Zealand in 1853. Finally, there operated the influence of the missionary spirit, which was the logical heir of the anti-slavery crusade in the empire led by Bishop Wilberforce and which met with final success in 1833. The missionaries emphasized the moral obligation of protecting and civilizing the backward peoples and kept alive the impulse to expansion, not only in the growing English-speaking colonies, but also in the regions inhabited wholly by blacks. These forces and theories served to carry the British Empire over intact until Disraeli, who had in his early days declared the empire a mill-stone around England's neck, could purchase the Suez Canal stock in 1875 and initiate the new period of British imperialism. By the '80's" the new scramble for the remaining un-appropriated parts of the earth was in full swing with Britain managing to get the "Lion's share" of the spoil, as she had in the old colonial movement. The influences which stimulated the neo-expansionist movement in Great Britain after 1870 were a continuation and intensification of those forces which checked Cobdenism and the "Little England" tendency in the middle of the century, the contagion of the general wave of colonial expansion which swept over Europe from 1870 to 1895 with the defensive measures which this forced upon England, and, finally, the renaissance of the expansionist group in British politics with the long ascendancy of the Conservative and Unionist parties after 1875. The specific results of British imperialistic activity in this period have been summarized in the description of the progress of imperialism in the various areas which have been brought under review.

The British Empire, as now constituted, embraces something over 13,000,000 square miles, about one-fourth of the land surface of the earth, with a population of about 450,000,000. Of this population, those of European descent number only about 60,000,000, of which number 45,000,000 dwell in the United Kingdom of Great Britain and Ireland. Of the remaining 15,000,000 Europeans in the overseas possessions of the empire not to exceed 13,000,000 are of English descent. The British Empire, then,

is probably the most stupendous example in history of a vast territory and a great population held together and dominated by a small number of persons drawn from a politically and economically more advanced and highly organized civilization. From an administrative standpoint the British Empire as now organized falls into some six different classes of possessions, the self-governing colonies, the crown colonies, the chartered companies, the protectorates, a few residual possessions, of which India is the most important, which are hard to place within any of the preceding categories, and the new mandatories handed over to Great Britain by the Peace Conference. The self-governing colonies are constituted by the Dominion of Canada, Newfoundland, the Australian Commonwealth, the Dominion of New Zealand and the Union of South Africa, the colonies, in other words, which are chiefly inhabited by British emigrants. The administrative and constitutional history of the self-governing colonies, considered in their relation to the British Empire, centres about three progressive processes, the granting of self-government, the progress of local colonial federation and the trend toward imperial federation and tariff preference. The grants of self-government came in most cases in the middle of the 19th century, as a result of the agitation of Wakefield and his adherents. Canada received self-government in 1847, Newfoundland in 1855, Australia in 1852 and New Zealand in 1853. The principle was delayed in the Union of South Africa until 1909, for the obvious reason that the constituent parts of that colony, on account of historical and other causes, were not adapted for self-government before this date. The federation of the various units in each self-governing colony soon followed. Canada was united by the British North American Act of 1867, Australia by the Commonwealth Act of 1900, New Zealand by the Act of 1907 and South Africa by the imperial legislation of 1909. Parallel with this process has come the effort to bring a closer union between the mother-country and the self-governing colonies, led in most cases by the most ardent imperialists in the colonies and at home. The earliest move in this direction was the series of imperial conferences which began in 1887 and have met periodically for a discussion of problems and policies which were a matter of common concern to the empire and its organization and administration. The first conference was held in London in 1887, the second in Ottawa in 1894, and subsequent ones in London in 1897, 1902, 1907 and 1911, culminating in the imperial war conference of March 1917. The conference of 1907 provided for subsequent quadrennial conferences and for the representation of the United Kingdom and the colonies through their respective premiers. The war conference of 1917 resolved upon the institution of an imperial council to meet annually or more frequently if necessary; the calling of a special conference for a readjustment of the constitutional relations of the various parts of the empire; the representation of India at all future conferences; more systematic and scientifically distributed provisions for imperial defence; and such encouragement of imperial preference as would tend to stimulate imperial

production and make the empire independent and self-sufficient in an economic and commercial sense. A war cabinet of imperial dimensions was, accordingly, created and the other provisions are being worked out. Paralleling the movement for imperial federation was the accompanying economic movement toward greater imperial cohesion, namely, imperial tariff preference. The leader in this movement was the colonial secretary, Joseph Chamberlain, who was also an ardent federationist. He proposed that Great Britain return to a protective basis by establishing a small protective tariff on imports brought from other districts than the British colonies, with the understanding that the colonies would reciprocate by reducing their customs rates on British products. This project was put forward in a systematic way in 1903 and was an important plank in the platform of the Conservative-Unionist party in the Parliamentary elections of 1905. The free-trade tradition in Britain, together with the tendency of British labor to favor the Liberals, proved, however, too strong for Mr. Chamberlain, and his party and program went down to defeat in 1905. The colonies, however, had already begun to extend preferential duties to British products since Canada initiated the practice in 1897. The World War finally produced the realization of Mr. Chamberlain's dreams after his death. Great Britain adopted a protective tariff during the war and the imperial war conference of 1917 declared strongly for imperial preference. In the third place, imperial defense has occupied the attention of the statesmen of modern British imperialism, especially since the beginning of the 20th century. With respect to naval defense, some of the colonies, such as Canada, South Africa and New Zealand, have contributed to the strengthening of the British imperial fleet, while Australia has chosen to build and maintain its own navy. All of the self-governing colonies have made provision for military service and have provided efficient local armies. The Australian fleet and the soldiers of all the self-governing colonies participated in force and with great distinction in the late World War, and the war conference of 1917 came out for the necessity of a more scientific determination and provision of imperial defense. The World War has had most significant but what are as yet incalculable effects upon the United Kingdom and its relations with the self-governing colonies. The immediate and extensive rallying of the colonies to the support of the mother-country indicated the strength of the bond of sentiment uniting the mother-country and the self-governing colonies. At the same time, during the war the exploits of soldiers from the various colonies tended to inflate the pride of the colony from which they came and to react even more in the direction of nationalism than in that of imperial solidarity. In the Peace Conference, also, it was apparent that the representatives of the colonies would not sanction any diplomatic action by the United Kingdom which impaired or threatened any of their vital local or national interests. Especially was this true of Australia. While it is difficult to forecast just what the outcome will be in the final adjustment between colonial nationalism and imperial sentiment, it would appear safe to pre-

dict that the self-governing colonies will never again be subordinated to any important control through Downing Street. At present, while Great Britain has a formal control over those colonies through the royal governor, the veto over colonial legislation, the control of colonial foreign relations and the right of appeal over colonial courts to the Privy Council of the United Kingdom, it is safe to hold that, except in the case of a lesser colony like Newfoundland, Great Britain will never attempt to dominate colonial policy or coerce a colony, except in those matters of foreign relations which might, through colonial pugnacity, involve the whole empire in a costly war.

(SEE EXTENSIVE ARTICLES ON EACH OF THE SELF-GOVERNING COLONIES).

Next in order of importance are the crown colonies. These represent the holdover into the present era of what was a typical colonial policy in the original period of colonial administration. One important difference, however, exists, namely, that the modern crown colonies have tended to lose their elective legislatures. Of the older variety possessing an elective legislative body only the Bermudas, Bahamas and Barbados remain. Next come the Leeward Islands, British Guiana, Malta, Mauritius and the Fiji Islands, where the elective members of the colonial legislature are less in number than those appointed by the mother-country. The most numerous of all the grades of crown colonies is the third, in which all the members of the legislative body are appointed by the mother-country. Such are most of the British West Indies, Ceylon, the colonies in tropical Africa and the majority of those in Oceania. Finally, there are small and lightly populated military posts and naval bases, such as Gibraltar and Saint Helena, which possess no legislature at all. Like the crown colonies, colonial government through chartered companies is a heritage of the old colonial movement. In the present empire, however, there are only two such colonies, Rhodesia in southern Africa and northern Borneo. The protectorates in the British Empire exist primarily where a penetration of new territory is in process and is preparatory to a more firm foothold, where the native customs and political organization are of a sort that is best left without interference, or where among a more highly developed people there exists a strong nationalistic sentiment which will not permit a thorough-going form of administrative union with the mother-country. Examples are the Malay Peninsula, Zanzibar, Bechuanaland and Egypt. Persia seems in process of development into a protectorate. The "Empire of India" is difficult to classify from an administrative standpoint. It began as a government by a chartered company, was transformed into a crown colony following 1857 and now seems well on the road toward a self-governing colony. Again, not only historical, but also ethnographic and cultural factors complicate the situation in India, for certain highly civilized parts are administered practically as a self-governing colony and more backward portions as differing types of crown colonies. Finally, there are the few mandatories which have been given to Great Britain as a result of the conquest of the German colonial possessions during the World War. They are akin to a protecto-

rate administered under an alleged international supervision. Some are controlled directly by Great Britain, as in the case of German East Africa, while others, such as German Southwest Africa or the German islands in the Pacific south of the equator, are directly supervised by a self-governing colony. Perhaps the most novel and interesting thing about this new type of administration is that the Union of South Africa, Australia and New Zealand have themselves begun to enter upon an imperialistic expansion of their own.

Of the future of the British Empire it is difficult to speak with certainty. There is no doubt that Great Britain has reached a more complete relative supremacy as a power in imperial and colonial politics than has been the case since the collapse of France in 1763. Both of her most dangerous rivals, Germany and Russia, are now helpless, one conquered and the other in a state of disintegration. Her naval domination is complete and her merchant marine is still far in the lead among all powers, in spite of losses during the war. All of these circumstances would seem to make it apparent that Great Britain might not need to retain any dominating political grip upon her imperial possessions in order to enjoy all the commercial benefits which have come to her as a great colonial power. On the other hand, such policies as imperial preference and imperial defense are likely to lead to a greater degree of imperial cohesion. Then there is the opposition to any thought of imperial dissolution which would arise from the vast body of civil servants who are engaged in colonial service at home and abroad and derive their income from this activity, and from the still more powerful group of large investors in colonial securities and resources who would regard their investments as likely to be jeopardized by a loss of imperial control of the territory. Nor are there lacking political reasons why the empire should persist. Japan seems destined to rival Great Britain as a colonial power of the future and this will create the necessity of a strong British policy in the Pacific area and the Far East generally. A still more ambitious plan than a retention and strengthening of the British Empire is the program of a considerable group of Americans and Englishmen, namely, the union or firm political alliance of the "English-speaking peoples." This project was foreshadowed as early as the middle of the 18th century by Thomas Pownall, governor first of Massachusetts and then of South Carolina, was advocated by Joseph Chamberlain, and its historical background and practical advantages have been made the subject of recent scholarly treatises by such American writers as George Louis Beer and Sinclair Kennedy. The co-operation of the two countries in the World War has brought a closer feeling of unity, and the promise of a more sympathetic study of the history and institutions of each state by the other. See BRITISH EMPIRE; GREAT BRITAIN; FOREIGN POLICIES; BRITISH COMMERCE; BRITISH SHIPPING; BRITISH NAVY.

#### 7. *Modern Imperialism and the World War*

It is difficult at present to analyze satisfactorily the causes of the late World War. It would seem, however, that the causes may be divided into two main classes, those which

is probably the most stupendous example in history of a vast territory and a great population held together and dominated by a small number of persons drawn from a politically and economically more advanced and highly organized civilization. From an administrative standpoint the British Empire as now organized falls into some six different classes of possessions, the self-governing colonies, the crown colonies, the chartered companies, the protectorates, a few residual possessions, of which India is the most important, which are hard to place within any of the preceding categories, and the new mandatories handed over to Great Britain by the Peace Conference. The self-governing colonies are constituted by the Dominion of Canada, Newfoundland, the Australian Commonwealth, the Dominion of New Zealand and the Union of South Africa, the colonies, in other words, which are chiefly inhabited by British emigrants. The administrative and constitutional history of the self-governing colonies, considered in their relation to the British Empire, centres about three progressive processes, the granting of self-government, the progress of local colonial federation and the trend toward imperial federation and tariff preference. The grants of self-government came in most cases in the middle of the 19th century, as a result of the agitation of Wakefield and his adherents. Canada received self-government in 1847, Newfoundland in 1855, Australia in 1852 and New Zealand in 1853. The principle was delayed in the Union of South Africa until 1909, for the obvious reason that the constituent parts of that colony, on account of historical and other causes, were not adapted for self-government before this date. The federation of the various units in each self-governing colony soon followed. Canada was united by the British North American Act of 1867, Australia by the Commonwealth Act of 1900, New Zealand by the Act of 1907 and South Africa by the imperial legislation of 1909. Parallel with this process has gone the effort to bring a closer union between the mother-country and the self-governing colonies, led in most cases by the most ardent imperialists in the colonies and at home. The earliest move in this direction was the series of imperial conferences which began in 1887 and have met periodically for a discussion of problems and policies which were a matter of common concern to the empire and its organization and administration. The first conference was held in London in 1887, the second in Ottawa in 1894, and subsequent ones in London in 1897, 1902, 1907 and 1911, culminating in the imperial war conference of March 1917. The conference of 1907 provided for subsequent quadrennial conferences and for the representation of the United Kingdom and the colonies through their respective premiers. The war conference of 1917 resolved upon the institution of an imperial cabinet to meet annually or more frequently if necessary; the calling of a special conference for a readjustment of the constitutional relations of the various parts of the empire; the representation of India at all future conferences; more systematic and scientifically distributed provisions for imperial defence; and such encouragement of imperial preference as would tend to stimulate imperial

production and make the empire independent and self-sufficient in an economic and commercial sense. A war cabinet of imperial dimensions was, accordingly, created and the other provisions are being worked out. Paralleling the movement for imperial federation was the accompanying economic movement toward greater imperial cohesion, namely, imperial tariff preference. The leader in this movement was the colonial secretary, Joseph Chamberlain, who was also an ardent federationist. He proposed that Great Britain return to a protective basis by establishing a small protective tariff on imports brought from other districts than the British colonies, with the understanding that the colonies would reciprocate by reducing their customs rates on British products. This project was put forward in a systematic way in 1903 and was an important plank in the platform of the Conservative-Unionist party in the Parliamentary elections of 1905. The free-trade tradition in Britain, together with the tendency of British labor to favor the Liberals, proved, however, too strong for Mr. Chamberlain, and his party and program went down to defeat in 1905. The colonies, however, had already begun to extend preferential duties to British products since Canada initiated the practice in 1897. The World War finally produced the realization of Mr. Chamberlain's dreams after his death. Great Britain adopted a protective tariff during the war and the imperial war conference of 1917 declared strongly for imperial preference. In the third place, imperial defense has occupied the attention of the statesmen of modern British imperialism, especially since the beginning of the 20th century. With respect to naval defense, some of the colonies, such as Canada, South Africa and New Zealand, have contributed to the strengthening of the British imperial fleet, while Australia has chosen to build and maintain its own navy. All of the self-governing colonies have made provision for military service and have provided efficient local armies. The Australian fleet and the soldiers of all the self-governing colonies participated in force and with great distinction in the late World War, and the war conference of 1917 came out for the necessity of a more scientific determination and provision of imperial defense. The World War has had most significant but what are as yet incalculable effects upon the United Kingdom's relations with the self-governing colonies. The immediate and extensive rallying of colonies to the support of the mother-country indicated the strength of the bond of sentiment uniting the mother-country and the governing colonies. At the same time, during the war the exploits of soldiers from the various colonies tended to inflate the pride of the colony from which they came and to react even more in the direction of nationalism than in that of imperial solidarity. In the Peace Conference, also, it was apparent that representatives of the colonies would not support any diplomatic action by the United Kingdom which impaired or threatened any of their local or national interests. Especially true of Australia. While it is difficult to forecast just what the outcome will be in the final adjustment between colonial nationalism and imperial sentiment, it would appear safe to pre-

dict that the self-governing colonies will never again be subordinated to any important control through Downing Street. At present, while Great Britain has a formal control over those colonies through the royal governor, the veto over colonial legislation, the control of colonial foreign relations and the right of appeal over colonial courts to the Privy Council of the United Kingdom, it is safe to hold that, except in the case of a lesser colony like Newfoundland, Great Britain will never attempt to dominate colonial policy or coerce a colony, except in those matters of foreign relations which might, through colonial pugnacity, involve the whole empire in a costly war.

(SEE EXTENSIVE ARTICLES ON EACH OF THE SELF-GOVERNING COLONIES).

Next in order of importance are the crown colonies. These represent the holdover into the present era of what was a typical colonial policy in the original period of colonial administration. One important difference, however, exists, namely, that the modern crown colonies have tended to lose their elective legislatures. Of the older variety possessing an elective legislative body only the Bermudas, Bahamas and Barbados remain. Next come the Leeward Islands, British Guiana, Malta, Mauritius and the Fiji Islands, where the elective members of the colonial legislature are less in number than those appointed by the mother-country. The most numerous of all the grades of crown colonies is the third, in which all the members of the legislative body are appointed by the mother-country. Such are most of the British West Indies, Ceylon, the colonies in tropical Africa and the majority of those in Oceania. Finally, there are small and lightly populated military posts and naval bases, such as Gibraltar and Saint Helena, which possess no legislature at all. Like the crown colonies, colonial government through chartered companies is a heritage of the old colonial movement. In the present empire, however, there are only two such colonies, Rhodesia in southern Africa and northern Borneo. The protectorates in the British Empire exist primarily where a penetration of new territory is in process and is preparatory to a more firm foothold, where the native customs and political organization are of a sort that is best left without interference, or where among a more highly developed people there exists a strong nationalistic sentiment which will not permit a thorough-going form of administrative union with the mother-country. Examples are the Malay Peninsula, Zanzibar, Bechuanaland and Egypt. Persia seems in process of development into a protectorate. The "Empire of India" is difficult to classify from an administrative standpoint. It began as a government by a chartered company, was transformed into a crown colony following 1857 and now seems well on the road toward a self-governing colony. Again, not only historical, but also ethnographic and cultural factors complicate the situation in India, for certain highly civilized parts are administered practically as a self-governing colony and more backward portions as differing types of crown colonies. Finally, there are the few mandatories which have been given to Great Britain as a result of the conquest of the German colonial possessions during the World War. They are akin to a protecto-

rate administered under an alleged international supervision. Some are controlled directly by Great Britain, as in the case of German East Africa, while others, such as German Southwest Africa or the German islands in the Pacific south of the equator, are directly supervised by a self-governing colony. Perhaps the most novel and interesting thing about this new type of administration is that the Union of South Africa, Australia and New Zealand have themselves begun to enter upon an imperialistic expansion of their own.

Of the future of the British Empire it is difficult to speak with certainty. There is no doubt that Great Britain has reached a more complete relative supremacy as a power in imperial and colonial politics than has been the case since the collapse of France in 1763. Both of her most dangerous rivals, Germany and Russia, are now helpless, one conquered and the other in a state of disintegration. Her naval domination is complete and her merchant marine is still far in the lead among all powers, in spite of losses during the war. All of these circumstances would seem to make it apparent that Great Britain might not need to retain any dominating political grip upon her imperial possessions in order to enjoy all the commercial benefits which have come to her as a great colonial power. On the other hand, such policies as imperial preference and imperial defense are likely to lead to a greater degree of imperial cohesion. Then there is the opposition to any thought of imperial dissolution which would arise from the vast body of civil servants who are engaged in colonial service at home and abroad and derive their income from this activity, and from the still more powerful group of large investors in colonial securities and resources who would regard their investments as likely to be jeopardized by a loss of imperial control of the territory. Nor are there lacking political reasons why the empire should persist. Japan seems destined to rival Great Britain as a colonial power of the future and this will create the necessity of a strong British policy in the Pacific area and the Far East generally. A still more ambitious plan than a retention and strengthening of the British Empire is the program of a considerable group of Americans and Englishmen, namely, the union or firm political alliance of the "English-speaking peoples." This project was foreshadowed as early as the middle of the 18th century by Thomas Pownall, governor first of Massachusetts and then of South Carolina, was advocated by Joseph Chamberlain, and its historical background and practical advantages have been made the subject of recent scholarly treatises by such American writers as George Louis Beer and Sinclair Kennedy. The co-operation of the two countries in the World War has brought a closer feeling of unity, and the promise of a more sympathetic study of the history and institutions of each state by the other. See BRITISH EMPIRE; GREAT BRITAIN—FOREIGN POLICIES, BRITISH COMMERCE, BRITISH SHIPPING, BRITISH NAVY.

7. *Modern Imperialism and the World War.*—It is difficult at present to analyze satisfactorily the causes of the late World War. It would seem, however, that the causes may be divided into two main classes, those which

arose out of European conditions and those which developed primarily as a result of expansion overseas, however much the latter may in their inception have been produced by European forces. The former may again be classified as social and economic, and political and diplomatic. Among the European economic and social causes might be listed trade rivalry, and, in the case of Germany in particular, the "dangerous" development of the Social Democratic party, the progress of which it was hoped the war would check. The most important of the political and diplomatic causes in European conditions was the hatred between France and Germany which was created in the Napoleonic period, intensified by the Franco-Prussian War of 1870 and kept alive as the dominating thread in European diplomacy by the wiles of Bismarck and Delcassé. All combined to create the war psychological state which was the dominating factor among the immediate causes of the conflict. It has been shown above that the forces leading to expansion overseas were of the most diverse sort, political, social, economic, religious and psychological, and it will not be necessary to analyze them again at this point. The relation of the expansionist movement to the state of mind which brought on the war will be apparent from a bare summary of the international friction which it created. England and Germany clashed in Africa over Walfisch Bay and over the German attitude toward the British policy in dealing with the Boers; in Oceania concerning the Samoan and other islands; and in Asia Minor over the attempt of Germany to secure a port and naval base on the Persian Gulf. England and Russia were led by jealousy over territory in the Near East into a bloody war in the middle of the century and nearly to another in 1878; and mutual aggression in Afghanistan and Persia ended without war only through a parceling out of the territory between them. England and France, after earlier friction over Northern Egypt, came near to war over the Fashoda incident in 1898, and hostility was here averted solely by a redistribution of colonial possessions and ambitions. Germany and France threatened the peace of Europe three times over Morocco before the matter was even temporarily adjusted. The rivalry of Germany and Russia in Asia Minor was not wholly settled by the "Willy-Nicky" correspondence or the convention of 1911, and the conflict between the Mittel-Europa and Pan-Slavic plans, and the mutual rivalry over Turkey created the diplomatic crisis which precipitated the war. Germany and the United States clashed over the Samoan Islands and in regard to the American conquest of the Philippines. Italy broke her long friendship with France over the latter's annexation of Tunis and made war on Turkey to secure Tripolitania after being sharply held up in Abyssinia. Russia and Japan fought over eastern Siberia and Manchuria. Finally, the "glory" of the war with Spain served the better to prepare the United States to enter upon the World War.

It might have been supposed that the states of the world would have profited to some degree by the lessons of the past 40 years as to the dangers of aggressive *Weltpolitik*, and while in the midst of the great conflict would have hesitated to lay plans for a continuance of

the same policies that had done so much to bring on the tragedy, but there are no indications that they had learned anything from the history of the world since 1870. Germany planned, if victorious, to seize most of Africa and western Asia and to extend her possessions in Oceania and the Far East, as well as to expand her spheres of interest in South America. If the Allied plans for annexation were somewhat less extensive it was only because there was less German than Allied territory overseas to be occupied. The Allied powers early entered into secret and nefarious agreements as to the seizure of the German colonies, the conquest of western Asia, the Japanese occupation of Shantung and the partition of Turkey. The United States made no claim for territorial annexation, but proceeded to appropriate nearly a billion dollars' worth of German property in this country, an accession of much greater immediate value than the whole German colonial empire. The extra-European phases of the war were colored and determined wholly by attempts to execute these plans for annexation. Germany tried to stir up rebellion in the British colonies and ordered the Turks to invade Egypt. The Western powers invaded Turkey and sent an expedition into Mesopotamia. Japan seized the German possessions north of the equator in the Far East, while Australia and New Zealand took those below the line. In no case did the Peace Conference seriously interfere with the execution of the secret agreements made by the Allied powers as to the disposition of the spoil. The one progressive policy which has emerged from the war in regard to imperialism is the so-called *mandatory* principle for an international control of the colonial possessions taken from Germany. This is embodied in Article XXII of the Covenant of the League of Nations and provides for the administration of the former German colonies by the various Allied powers subject to the supervision of the council of the league and a special commission created to examine the annual reports upon administration which are to be submitted by the states possessing the mandatory power. Theoretically this marks a very important advance in the way of international supervision of overseas administration, but it would be easy to be over sanguine as to the probable beneficial results of this departure. The mandates will all be in the hands of the Allied states, and it is not probable that there will be any alertness and enthusiasm in mutual criticism of the administration. States that could acquiesce in the annexation of the German colonies and the despoiling of China cannot be relied upon to have extremely tender consciences in the international relations of the future. Finally, the success of the whole scheme rests upon the adoption and successful working of the League of Nations, something which at present is far from assured. See NATIONAL IDEALS AND THE WAR; and WAR, EUROPEAN articles: DIPLOMATIC NEGOTIATIONS DURING THE WAR, THE PEACE CONFERENCE, THE PEACE TREATIES, NEUTRALS AND THE WAR, THE WAR AND THE SMALL NATIONS.

8. *The General Significance of Modern Imperialism*. The broader significance of modern imperialism, as Professor Shepherd has suggested, may best be comprehended by viewing

two different aspects, namely the process of extending European civilization to lands and the reaction of this expansion to European culture itself. There can be no doubt that much of the most important phase of the extension of European culture since 1870 has been in the carrying of the material culture, especially the machine technology of Europe, to the rest of the world. In some cases it has not only been adopted by the native populations, but in the case of primitive tribes, but in such areas it has been transplanted by the white settlers and has been the means of bringing that supremacy of the white over the black which has everywhere accompanied the coming of modern imperialism. The conspicuous effects of the extension of machine technology have been evident in the case of such older civilizations as those of China and India, where even a partial extension of the more advanced industrial technology has wrought a complete transformation of the external aspects of their civilization. If it be true that economic processes tend to shape the other phases of civilization, then this economic transformation is bringing about a general cultural revolution. The material changes in Asia which are now taking place will afford the most extensive social laboratory which could be imagined in which to test the validity of the Marxian theory of cultural development. Certainly the political and social changes which have already been observed in Japan and China would indicate the need of a general cultural readjustment, with the machine technology which has gone through various phases of modern applied science, and that which is directly related to industry, also the sanitary and medical sciences have done so much to save lives and suffering. One of the earliest and always the most energetic and all-pervading channels of transmission of certain phases of European civilization has been the activity of the missionaries. The importance of their work is differently estimated according to the general outlook of the historian. If he believes in orthodoxy he must regard the conversion of millions of Africans and Orientals to the salvation of their souls from eternal damnation as far and away the outstanding achievement of overseas expansion. If, on the other hand, he rejects the Christian dogmas he will view the missionary enterprise as an audacious and arrogant meddling with the local customs and institutions of other peoples. But the orthodox and the sceptic alike must pay tribute to the non-religious phases of missionary activity, such as the introduction of better sanitary and industrial practices, and the bringing of the elementary facts of Western knowledge. In the political realm the extension of European institutions has been of a different character. In the government of backward peoples there has been little real political liberalism or liberalism, except perhaps in such cases as the government of the Philippines.

In most instances it has meant a substitution of an autocratic white bureaucracy which has been quite as oppressive, even more efficient than the native governments. On the other hand, there can be no doubt that the introduction of Western political theories and institutions by such states as China and Japan

will be conducive to a greater degree of liberty and political efficiency than would ever have been possible under the old régime. In the matter of the extension of social customs so little has been accomplished that it would be difficult to generalize. In most cases the European governments have found it best to interfere as little as possible with native social customs, except in the case of what is obviously both cruel and useless. The abolition of infanticide, the suttee and some of the more painful and repulsive religious rites of the natives are definite examples of progress due to the contact with European customs. Much has been done by missionaries in the attempt to improve the sex mores of the natives and the Orientals, but as to how much positive progress is involved in the introduction of the Patristic "impurity complex" among overseas populations is a question upon which students of comparative ethics and modern medical psychology have differed with the missionaries. Lest one might be inclined to regard the European expansion as a wholly beneficent process it is necessary to call attention to certain detrimental effects of the contact of European peoples with those overseas. In economic matters Western industry and commerce, when introduced, mean the development of modern capitalism with all the misery which it has entailed in Western states. Further, there has been a general tendency to exploit native labor, not only in factories and mines, but also on rubber plantations and in agricultural activity, and to oust the natives from their lands when these possess valuable mineral deposits or other important products of commercial significance. Then, over against the saving of native lives by the introduction of modern medical and sanitary science, must be set the introduction or development of the use of alcoholic liquors and opium products which has brought about not only a great loss of life among natives, but also unspeakable misery and serious physical deterioration. In the field of religious endeavor one should not forget the frequent persecution of those natives who persevere in their older beliefs, the protection by missionaries of criminals guilty of atrocious crimes, as was the case in China previous to the Boxer rebellion, and the frequent oppressive economic exploitation of natives, as was well exemplified in the conduct of agrarian operations by the Spanish friars of the Philippines. The undoubtedly superior efficiency of European political control over colonies and the greater liberalism brought in through the Oriental limitation of Western constitutions have been paralleled by extreme autocracy and cruelty in colonial administration, especially in dealing with native revolts or crimes. Cases in point are the administration of Leopold in Belgian Congo, the German suppression of the Herero revolt in southwest Africa and the general administration of Karl Peters in German East Africa, the attempted extermination of the natives by the English settlers in Australia and New Zealand and the conduct of the American military forces in coercing some of the more warlike tribes in the Philippines. Nor has the social side of the contact between Europeans and natives been without unfortunate results. European vices have been introduced for native imitation, especially the use of alcoholics, and, at the same time that missionaries were

trying to inculcate the sexual *mores* of Western monogamy, the white traders and others were systematically debauching the morals of the native women. While one cannot question the fact that the expansion of European civilization has brought a vast amount of material progress to the world at large, it seems equally true that the natives have lost more than they have gained by the process. If this be true, then the progress of modern imperialism can only be justified as Mr. Roosevelt upheld the conquest and expropriation of the American Indian, namely, on the ground that the lower civilization must give way before the advance of the higher.

It has generally been held that all the outstanding results of overseas expansion have been limited to the extension of Western culture to the peoples overseas, but there have been equally notable reactions produced upon European culture and institutions by this process of expansion. In the matter of the economic reaction of expansion upon Europe one of the most significant results has been the introduction of new commodities, extremely important articles of industry like rubber, petroleum and nitrate of soda; food products and beverages, such as tropical fruits, rice, cocoa and tea; and articles of ornament, as in the case of Chinese and Japanese ware and Indian ornamentation. The discovery of these new commodities and the stimulation of diversified industry overseas has promoted the development of a greatly extended international division of labor. Commercial mechanisms and financial institutions have been greatly altered as a result of the discoveries and the increased trade which accompanied the more recent phases of imperialism. While one should not neglect the significant beginnings of credit institutions and other devices to aid commerce in the old colonial movement, the mechanism of commerce in 1800 was extremely crude as compared with that which has developed in the last 50 years to expedite world trade. Again, the volume of money in circulation has been greatly increased, not only by the growth of business, but also by the discoveries of the precious metals in Australia, South Africa and other overseas territories. Finally, the growth of the world trade has stimulated the increase of capitalism quite as much as this has been promoted by it. The political reaction of imperialism upon Western society has been almost wholly unfortunate. The autocratic government of natives has tended to react to the weakening of democratic institutions at home. Then, the burden of imperial administration has proved to be a severe drain upon national resources and has lessened the funds available for advanced social legislation. To this must be added the important part which modern imperialism has played in the recent development of armaments on both sea and land and in producing the most expensive and deadly tragedy of history in the late World War. The only valuable contribution of imperialism in its political reaction upon Europe has been the training it has afforded in colonial administration. In addition to the earlier policies of subjection and partial autonomy, which were typical of the colonial administration in the old colonial movement, there have been three other policies contributed in the more recent era, complete autonomy, as in

the case of the British self-governing colonies; assimilation, or adaptation to Western culture, practised, for example, by France in northern Africa; and association, in which native customs are respected and the native culture allowed to develop along natural lines, though affected by the introduction of new industrial methods and subject to a general oversight of Europeans, cases in point being India, Egypt and Zanzibar. In the field of natural science overseas expansion has been most potent: leading to revolutionary progress. It is conventionally supposed that scientific advances have come almost entirely from isolated work in European and American laboratories, but it would be easy to demonstrate that much of modern scientific progress has come from research in the realm of the greater laboratory: the scientific data of nature which has been opened to many by explorations overseas. In the field of geography there have been contributed, not only the great mass of new data and the perfection of cartography, but also the development of physical geography in all its phases since Alexander von Humboldt, and the analysis of the influence of the various physical environments of the earth upon man and social institutions in the writings of Ritter, Peschel, Ratzel and Reclus. Astronomy has been perfected through the possibility of a wider and more accurate observation of the heavens after modern explorations had begun. In biology and zoology, not only has a vast amount of new data been brought together which has overthrown much of the systems of classification of Linnaeus, Buffon and Cuvier, but also the observation of the diverse species of plants and animals throughout different parts of the world enabled Darwin, Huxley and Wallace to formulate the greatest discovery of the 19th century in biological science, namely, the law of evolution. Both chemistry and the "materia medica" have been infinitely enriched by discoveries made during overseas expansion. Not less significant has been the reaction of overseas discoveries on social science. Without the data supplied by the observation of a great number of different cultures and peoples there could have been no such sciences as anthropology, ethnology, comparative philology, comparative religion, comparative jurisprudence, descriptive sociology, evolutionary politics and historical economics. Nor has the overseas expansion been without its significance in providing the knowledge and *motif* for important contributions to philosophy, literature, the drama and music, as will be evident from noting the influence of the 'Shakuntala' of Kalidas upon Herder, Goethe and the Romantic movement in European literature, of the 'Geeta' upon modern European philosophy, and of the teachings of Manu upon the doctrines of Nietzsche. It is these little-recognized but all important cultural contributions which have accompanied recent overseas expansion that must be set off against its detrimental effects when one attempts to assess the total significance of modern imperialism for European civilization. While there have been certain sporadic attempts to imitate Oriental social customs, it must be admitted that the social reaction of expansion on Western civilization has been effective chiefly in an indirect manner due to the effects upon social customs of the broader cultural changes which

een briefly summarized. If, in conclusion, ere to raise the question of the probable of imperialism little can be said further at it seems to be a function of capitalism *achtropolitik* and is not likely to decline as as these forces and principles remain ive, and their abatement does not appear ent. It would seem, however, that, ex- the event of another world war, the im- sm of the future will have to be carried rarily by economic rather than political , as most of the formerly unoccupied of the earth have now been appropriated : stronger powers.

**liography.**—While there are many vo- us special bibliographies dealing with im- sm and colonization in specific areas, such : great bibliography of the Philippine s prepared by Blair and Robertson, there ip-to-date and comprehensive bibliography : expansion of Europe. The best elery guide is the 'Syllabus of Imperialism World Politics' by Dr. Parker T. Moon , the general order of which has been t roughly followed in this article. It also is a brief, but well-chosen and classified ictory bibliography. Probably the most ctory bibliography of an introductory that which follows chapters ii, ix and x lume I and Part V of Volume II of , C. J. H., 'Political and Social History dern Europe.' A more exhaustive bibli- y may be obtained by consulting the bibli- ies following the special articles on is relating to world politics in this opedia.

ere are a number of fairly complete gen- imaries of the whole movement of col- on and imperialism. While Prof. W. R. erd's comprehensive survey of the expan- f Europe has been limited thus far to lished lectures, he has summarized the ance of this process for world history in es of articles on 'The Expansion of e' in the *Political Science Quarterly* . The best introductory survey of the ion of Europe in English is to be found : above-mentioned work of Professor , Volume I, chaps. ii, ix and x and Vol- l, chaps. xxvii-xxx. Another good intron is to be found in Robinson and Beard's lopment of Modern Europe' (Vol. I, vi, vii and Vol. II, chaps. xxvii, xxx). y Muir's 'Expansion of Europe,' while ing in title, is so preoccupied with British ation as to be scarcely more than a good ction to the growth of the British Em- The standard manuals on the subject are s, H. C., 'History of Colonization'; , A. G., 'Colonization'; Leroy-Beaulieu, a colonisation chez les peuples modernes' Zimmermann, A., 'Die europaischen ien.'

e background of the old colonial move- s best described in Cheyney, E. P., 'The ean Background of American History.'

A. H. Lybyer's important investiga- nodifying the older notions of the relation coming of the Turks to exploration and ation are summarized in the 'Report of merican Historical Association' (Vol. I, 7-133, 1914). The nature of the ex- ions is described in Jacobs, J., 'Story

of Geographical Discovery' and Beazley, C. R., 'The Dawn of Modern Geography.' The most convenient elementary presentations of the old colonial movement are to be found in Hayes, Volume I, chaps. ii, ix and x; and Muir, chaps. i-iv. More thorough treatments are to be found in Cunningham, W., 'Western Civilization in Its Economic Aspects,' (Book V, chaps. ii, iii); Day, Clive, 'History of Commerce,' Part III; Abbott, W. C., 'Expansion of Europe' (Vol. I, chaps. ii, iii, ix, x, xvi, and Vol. II, chap. xxiv); Lannoy and Linden's 'Histoire de l'expansion coloniale des peuples europeens' (Vols. I and II); and in the detailed manuals mentioned above. The standard treat- ment of mercantilism is to be found in Schmoller, G., 'The Mercantile System.' Its relation to the American colonies is summarized by Beer, G. L., in 'The Commercial Policy of England toward the American Colonies.' The background of the American Revolution is admirably set forth in Schlesinger, A. M., 'The Colonial Merchants and the American Revolution'; and Alvord, C. W., 'The Mississippi Valley in British Politics.' The American Revolution is best described in Van Tyne, C. H., 'The American Revolution'; Fisher, S. G., 'Struggle for American Independence'; and Channing, E., 'History of the United States' (Vol. III).

The reaction against the movement of col- onial expansion and the mercantilist system, which followed the American Revolution and the work of the classical economists, is well analyzed in Ogg, F. A., 'Economic Develop- ment of Modern Europe' (chaps. xii-xiv); Muir, chaps. v-vi; Egerton, H. E., 'Short History of British Colonial Policy,' Book IV; and Hobson, J. A., 'Richard Cobden, the Inter- national Man.' The European and American background of the new national imperialism is discussed in Ogg, chaps. vii, x, xi and xvi; Hayes, Volume II, chaps. xviii and xxvii; Bogart, E. L., 'Economic History of the United States' (chaps. xi, xiii, xxviii and xxxii); Farrand, Max, 'The Development of the United States' (chaps. xii, xiii and xvi); and Harris, N. D., 'Intervention and Colonization in Africa' (chap. i).

For modern colonization in Africa the best introduction is Johnston, H. H., 'The Opening Up of Africa.' The most authoritative survey is his 'History of the Colonization of Africa by Alien Races.' Other standard treatments of this area are Keltie, J. S., 'The Parti- tion of Africa'; Harris, N. D., 'Intervention and Colonization in Africa'; and Gibbons, H. A., 'The New Map of Africa.' Harris and Gibbons are particularly valuable for developments since 1870. In addition to these and the general manuals on imperi- alism, there might be mentioned Rose, J. H., 'Development of the Modern European Na- tions' (Vol. II), for the Kongo Free State and Egypt; Morel, E. D., 'Morocco in Diplo- macy'; Lewin, P. E., 'The Germans in Africa'; Piquet, V., 'La colonisation française dans l'Afrique du nord'; Hobson, J. A., 'The War in South Africa'; and Macdonald, A., 'Trade, Politics and Christianity.'

On modern imperialism in the whole con- tinent of Asia there is a very recent breezy survey from the libera point of view in

Gibbons, H. A., 'New Map of Asia.' The Berlin-Bagdad Railway scheme is analyzed in Schmitt, B., 'England and Germany since 1740' (chap. x); Jastrow, M., 'The War and the Bagdad Railroad'; and Rohrbach, P., 'Die Bagdadbahn.' Anglo-Russian imperialism in western Asia is dealt with in Skrine, F. H., 'Expansion of Russia'; Sykes, P. M., 'A History of Persia'; Browne, E. G., 'The Persian Revolution of 1905-1909'; and Schuster, W. M., 'The Strangling of Persia.' British imperialism in India is well discussed in Holderness, T. W., 'The Peoples and Problems of India'; Fuller, J. B., 'The Empire of India'; Ilbert, C., 'The Government of India'; Smith, V. A., 'The Oxford History of India'; and Rai, Lajpat, 'Young India.' The historical background of recent world politics in the Far East is most effectively set forth in Douglas, R. K., 'Europe and the Far East, 1506-1912'; and Reinsch, P. S., 'World Politics at the End of the Nineteenth Century.' The best general treatments in English of this area in modern imperialism are Latourette, K. S., 'The Development of China' and 'The Development of Japan'; Clements, P. H., 'The Boxer Rebellion'; Hornbeck, S. K., 'Contemporary Politics in the Far East'; and Wheeler, W. R., 'China and the World War.' Special works of importance are Tyau, M. T. Z., 'Treaty Obligations between China and other States'; Overlach, F. W., 'Foreign Financial Control in China'; and Blakeslee, G. H., 'Japan and Japanese-American Relations' and 'Recent Developments in China.' On the Philippine Islands there is the remarkably authoritative and comprehensive work of Worcester, D. C., 'The Philippines, Past and Present'; Miller and Storms, 'Economic Conditions in the Philippine Islands'; and Kalaw, M., 'The Case for the Filipinos.' On Oceania the three most useful books are Colquhoun, A. R., 'The Mastery of the Pacific'; Callahan, J. M., 'American Relations in the Pacific and the Far East'; and Fletcher, C. B., 'The Problem of the Pacific.' Other important works are Codrington, R. H., 'The Melanesians'; Alexander, J. M., 'The Islands of the Pacific'; and Bancroft, H. H., 'The New Pacific.' For Australasia the most serviceable books are Jenks, E., 'Short History of the Australasian Colonies'; Scott, E., 'Short History of Australia'; Rusden, G. W., 'History of New Zealand' and 'History of Australia'; Wise, B. R., 'Making of the Australian Commonwealth'; Clark, V. S., 'Labor Movement in Australasia'; and Reeves, W. P., 'State Experiments in Australia and New Zealand.' A very valuable sociological study has just appeared by Northcott, C. H., 'Australian Social Development.' There is an important descriptive article on Australia by Gregory, H. F., in the *National Geographic Magazine* (December 1916).

The historical background of Latin America in modern imperialism is best presented in Shepherd, W. R., 'Latin America,' and 'The Hispanic Nations of the New World'; Bourne, E. G., 'Spain in America'; Paxson, F. L., 'The Independence of the Latin American Republics'; Robertson, W. S., 'The Rise of the Spanish American Republics'; and Hart, A. B., 'The Monroe Doctrine.' The diplomatic and

economic factors relating to Latin America are well summarized in Moore, J. B., 'Principles of American Diplomacy'; Fish, C. R., 'American Diplomacy'; Latané, J. H., 'America as a World Power'; Jones, C. L., 'The Caribbean Interests of the United States'; and Weyl, W., 'American World Policies.' The subject is surveyed from the Latin-American point of view in Calderón, F. G., 'Latin America'; and is presented from both that of Latin America and the United States in Blakeslee, G. H., 'Latin America.' There is an important article on "The Psychology of the Latin American" in the *Journal of Race Development* (January 1919), by W. R. Shepherd. An indispensable compendium of facts is provided in the 'Encyclopedia of Latin America,' edited by G. E. Rines et al.

A concise introduction to the relation of the British Empire to the overseas movement is Muir, Ramsay, 'Expansion of Europe'; a more critical introductory treatment is to be found in chaps. ix, x, xxviii and xxix of Hayes. The standard treatments are Woodward, W. H., 'Short History of the Expansion of the British Empire'; and Egerton, H. E., 'A Short History of British Colonial Policy.' The most satisfactory analysis of the government of the empire is to be found in Lowell, A. L., 'The Government of England' (Vol. II, chaps. liv-lviii). Jebb, R., 'The Imperial Conference' is an important special study. The most detailed description of the British Empire is Herberston and Howarth, 'The Oxford Survey of the British Empire.' A closer union of the British Empire and the United States is proposed in Kennedy, Sinclair, 'The Pan-Angles'; and Beer, George Louis, 'The English Speaking Peoples.' *The Round Table* is a scholarly periodical dealing with British imperial relations. It has published some "Studies," of which Volume I (1912) is a very important analysis of the empire.

The time has not yet come for the appearance of complete and authoritative histories of the World War. A clear introduction to the conflict and its progress is provided in Hayes, C. J. H., 'A Brief History of the Great War'; and Usher, R. G., 'The Story of the Great War.' A large amount of useful information concerning the part of the United States in the World War is to be found in McMaster, J. B., 'The United States in the World War.' The narrative is much clearer in Bassett, J. S., 'Our War with Germany.' An elaborate economic and social history of the war is being prepared by the Carnegie Endowment under the editorship of James T. Shotwell.

The authoritative discussion of the relation of the Peace Conference to imperialistic problems has not yet been produced, though there are pertinent observations in Gibbons' 'New Map of Asia,' and many of the facts as to its work in redistributing territory can be found in the *New York Times Current History Magazine*. The remarkable book by Keynes, J. M., 'The Economic Consequences of the Peace' scarcely touches the problem of imperialism. The League of Nations and imperialism is best analyzed in Duggan, S. P., 'The League of Nations, the Principle and the Practice' (especially chaps. iii, viii, xi, xii, xiv and xvi).

Works calculated to provoke serious re-

flection on the relation of overseas expansion to modern civilization are Hobson, J. A., 'Imperialism'; Angell, Norman, 'The Great Illusion'; Reinsch, P. S., 'Colonial Government,' and 'Colonial Administration'; Macdonald, A., 'Trade, Politics and Christianity'; Johnston, H. H., 'Common Sense in Foreign Policy'; Sumner, W. G., 'Earth Hunger and Other Essays,' and 'War and Other Essays'; Giddings, F. H., 'Democracy and Empire' (particularly chap. xvii); Hobbouse, L. T., 'Democracy and Reaction'; Dennis, J. S., 'Christian Missions and Social Progress'; and Carpenter, J. E., 'Comparative Religion.'

There are periodicals dealing especially with imperialistic problems, such as *Asia; The Asiatic Review; the Far Eastern Political Science Review; The Near East; The International Review; Eastern Europe; Millard's Review of the Far East*; and, most useful of all, the *Journal of International Relations* (formerly the *Journal of Race Development*). Information of great interest and value is often presented in the *National Geographic Magazine*.

#### WORLD'S COLUMBIAN EXPOSITION

an international exposition held in Chicago, Ill., in 1893, to celebrate the 400th anniversary of the discovery of America by Columbus.

**History.**—The fitness of some special celebration of the discovery of America had been recognized and the question agitated several years before the bill providing for a Columbian Exposition was introduced in Congress in 1889. Several cities urged their claims for the site of the exposition; chief among them were New York, Chicago, Washington and Saint Louis; Chicago was finally chosen as the site and the bill passed and approved 25 April 1890. The organization of the fair was placed under the charge of an Illinois corporation previously organized, and the World's Columbian Commission, a national commission consisting of delegates appointed two from each State and Territory, two from the District of Columbia and eight at large. The work of construction was placed under the charge of a Bureau of Construction, of which Daniel H. Burnham was chief; work was begun on the first building in July 1891. On 23 Oct. 1892 the buildings were formally dedicated by the Vice-President of the United States; the dedication ceremony, which was attended by 130,000 people, was held in the Manufactures and Liberal Arts Building. The exposition was formally opened 1 May 1893 by President Cleveland; at the moment when he declared the fair open the flags of the various nations were unfurled, the electric fountains turned on, and the statue of "The Republic" unveiled. The attendance at the fair was 27,539,041, of which 21,479,661 were paid admissions; the days showing the largest attendance were 9 October, Chicago Day, and 4 July, American Independence Day; the average daily attendance was 172,712. The exposition was formally closed 30 October.

**Financial.**—The bill providing for the exposition required the city of Chicago to raise \$10,000,000 toward the expenses; later Congress provided for the gift of a special mintage of \$2,500,000 in souvenir half-dollars, the exposition authorities also issued \$5,000,000 worth of debenture bonds; about \$3,000,000 additional were received from other miscellaneous sources, so that about \$20,000,000 was available before the opening; the total expenditures for the fair were over \$31,000,000, and the profits about \$1,850,000. The United States government appropriated \$2,250,000 to its exhibits, the States \$6,060,350, the foreign governments \$5,830,000, and over \$350,000 was invested in the Midway Plaisance.

**Buildings and Principal Exhibits.**—The site chosen for the exposition was Jackson Park, a portion of the South Park system of Chicago; it covered 666 acres and extended about two miles along the shore of Lake Michigan. There were about 150 buildings erected; the more important were built of the material called "staff," a composition of plaster of Paris and jute fibre, which produced the general effect of white marble, hence the exposition grounds became generally known as the White City. The Manufactures and Liberal Arts Building faced the lake near the eastern end of the basin; this was the largest building ever constructed for an exposition; it covered nearly 31 acres; the main roof was of iron and glass. At the head of the basin was the Administration Building, with its gilded dome; near this were the Agricultural Building, Machinery Hall, and the Electrical and Mining Building. On the west of the lagoon were the Transportation Building and Horticultural Hall, and on the east the Government Building, with a large dome 150 feet high; at the northwestern end of the lagoon was the Woman's Building, and at the northeastern end the Fisheries Building. Still further to the north were the State buildings, many of the foreign nations' exhibits, and the Fine Arts Building. The Fine Arts Building was an example of purely classical architecture; it was entered by four richly ornamented portals. The State and foreign nations buildings were in many cases copies of some characteristic historic building or type; as, for example, Virginia's building was modeled on Washington's Mount Vernon home, Massachusetts' was a copy of John Hancock's house; England's represented a manor house of the time of Henry VIII, and Spain's the Convent of La Rabida. In the southern part of the grounds was the Forestry Building, built in the rustic style; the columns supporting the roof being made of tree trunks furnished by the different nations and the States and Territories of the United States. Near the Forestry Building were a number of the small exhibits, the Krupp exhibit, dairy, etc. The Manufactures and Liberal Arts Building included in its exhibits everything related to engineering, architecture, publishing, technical and domestic arts, together with education, the professions, music and the drama. The Fine Arts exhibit included many masterpieces of painting and sculpture, the Woman's Building containing a collection representing woman's work in all lines of activity; the Transportation Building's collection represented all modes of transportation from the most primitive to the most complete modern

inventions of ocean steamers and locomotives; and the exhibits of the other special departments of human industry showed most excellently the progress of the race in each special industry.

**Special Features.**—Among the special features of the exposition the Midway Plaisance was perhaps most interesting; on this were represented the villages of different nations and peoples, including the Irish village, the Javanese village, the Japanese bazaar, the Samoan and Dahomey villages, etc.; here also were the "Street of Cairo," and the various amusement features; and the Ferris wheel, 250 feet in diameter, carrying 36 coaches. Other special exhibitions of interest outside the main buildings were the reproduction of the cliff dwellers' buildings at Battle Rock Mountain, Colo.; the models of Columbus' three caravels, of the Viking ship, and of a modern United States battleship. Another interesting feature of the exposition was the numerous world's congresses held on the grounds under the auspices of the World's Congress Auxiliary. These congresses discussed the leading phases of professional, scientific, economic, educational and religious thought; the World's Parliament of Religions probably attracted the most general attention. Consult Johnson, Rossiter (ed.), 'History of the World's Columbian Exposition Held in Chicago in 1893' (4 vols., New York 1897-98).

**WORLD'S PARLIAMENT OF RELIGIONS.** See CONGRESS OF RELIGIONS.

**WORM, or SCREW GEARING** are gears connecting shafts that are not parallel and do not meet, and the elements of whose teeth are helical or screw-like. The worm is a screw, sometimes termed an endless screw, made to mesh with the teeth of a wheel called the worm-wheel. The axis of the worm is usually at right angles to the axis of the worm-wheel. Worms are usually made for single curve gear-teeth, because the sides of involute rack teeth being straight, the tool for cutting worm-teeth is easily made. Special gear-cutting machines are used to cut worm-gears. See GEARS.

**WORM-EATING WARBLER**, a small, ground-keeping warbler (q.v.) of the United States (*Helminthos vermivorus*), breeding commonly in the woods of the eastern part, and migrating in winter to Central America. It is five and one-half inches long, olive-green above, yellowish-white below, the distinguishing specific mark being three black stripes on the buffy crown. Its song is a faint trill, heard most often in hilly woodlands, where the bird hunts for caterpillars and similar food among the lower branches of the bushes or upon the ground. Its nest is constructed with great skill in some little natural cavity of a hillside, and is cleverly hidden under an arch of twigs and old leaves, so disposed as to well conceal the white, red-speckled eggs. The mother uses the trick common to so many ground-building birds, of feigning lameness, fluttering ahead of the intruder in a frantic attempt to draw him away from the nesting-place in vain pursuit of herself.

**WORM FEVER**, popular name for the disease formerly described as *infantile remittent fever* but now known to be typhoid fever in young children.

**WORM-SEED**, the flower-heads of certain species of *Artemisia* (q.v.) used as a vermifuge. See also *FRYSIMUM*; *GOOSEFOOT*.

**WORM-SHELL**, one of the curiously uncoiled and distorted gastropod mollusks of the marine family *Vermetida*, whose shells might easily be mistaken for the tubes of annelids, such as *Serpula*. They are free and spiral in early life, and crawl about like ordinary gastropods, but they afterward settle down and become attached to stones, etc., for the remainder of their lives. The animals are worm-like, with a short proboscis, horny jaws and radula and two short tentacles. When they become stationary the foot, being of no further use as a locomotive organ, becomes modified into an organ of attachment, and the shell stretches out irregularly. The species are not numerous and occur mainly within the tropics of Eastern seas.

**WORMELEY**, werm'li, Katharine Prescott, American author and translator: b. Ipswich, England, 14 Jan. 1830; d. 4 Aug. 1908. She was the daughter of an English rear-admiral and a niece of Com. Edward Preble of the American navy, and came to the United States in girlhood. She was engaged in the relief of Union soldiers during the Civil War and was connected with the United States Sanitary Commission. She was widely known as a translator of Honoré de Balzac's novels in 40 volumes (1883-97); of Molière in 6 vols. (1892); and of the Duc de Saint-Simon's 'Memoirs' (20 vols., 1898-1901); and wrote 'Letters from Headquarters during the Peninsular Campaign' (1862); 'The Other Side of War' (1888); 'Life of Balzac' (1892); 'The United States Sanitary Commission' (1863).

**WORMS**, wörms, Hesse-Darmstadt, town on the Rhine, nine miles northwest of Mannheim. The town is irregularly built and has remains of its mediæval walls and ramparts. Its principal building is the cathedral, completed and consecrated in 1101, a noble Romanesque structure with four elegant towers, two domes, a double choir and a flamboyant 15th century Gothic portal. The interior is 357 feet long, 87 feet wide, across the transepts 117 feet and is very imposing from its grand simplicity. On the north side of the cathedral is the site of the Bischofshof or episcopal palace, the seat of the celebrated Diet of Worms in April 1521. It was destroyed by the French in 1689, and again in 1794. On its massive red sandstone substructure the Heil'sche Haus has been erected in the rich Renaissance style. The restored church of Saint Martin, and the church of Saint Paul secularized as a museum, are also of notable ecclesiastical architecture. Outside the town stands the Liebfrauenkirche (dating from the 15th century), which gives its name to the Liebfrauenmilch, a much-esteemed wine grown in the vicinity. The finest monument in Worms is that to Luther, erected from Rietschel's designs in 1868 at a cost of \$85,000. Worms is a considerable river port with a good harbor and an active shipping trade. The principal industries of Worms are the manufacture of patent leather, machinery, worsteds, chicory, slate, tobacco, beer, soap and amber wares. Worms is one of the most historical towns of Germany. It was known to the Romans as *Borbetomagus*, and later as *Augusta Vangionum*,

the capital of the Vangiones. It was destroyed by Attila and rebuilt by Chlodwig in 486. After the partition of the empire among the sons of Ludwig the Pious, Worms became a German free town under the protection of the Elector of the Palatinate. Already in 1255 it belonged to the Confederation of Rhenish towns, and it contained in the time of Frederick Barbarossa 70,000 inhabitants. It was the seat of many Imperial Diets, most famous that under Karl V, at which Luther made his defense. In 1632 the suburbs of the town were leveled by the Swedish Colonel Haubold, and in 1689 the town itself was ruthlessly destroyed by Melac and the young Duc de Créqui under the orders of Louis XIV. In September 1792 part of it was leveled by the French under Custine; at the peace of Lunéville in 1801 it was given to France. The peace of Paris in 1814 gave it back to Germany, and the Vienna Congress in 1815 to Hesse-Darmstadt. Pop. 46,891. Consult Fuchs, 'Geschichte der Stadt Worms' (Worms 1868); 'Beiträge zur Geschichte der Stadt Worms' (Worms 1896); Nover, 'Das alte und neue Worms' (Worms 1895).

**WORMS**, worms, island in the Baltic, east of Dagö, belonging to Esthonia, about 36 square miles in area. It is flat and generally well wooded in the interior and throws out numerous steep promontories, round which strong currents run, so that, often for months together, it is cut off from all intercourse with the neighboring islands of Oesel, Dagö, Runö, etc., as well as with the mainland, and thus the inhabitants who are of Swedish origin have remained unmixed with foreign elements. A stranger is a surprising rarity on this island, and he, in turn, is not less surprised at the peculiar old Swedish dialect, the architecture and the manners and customs of this small, poor, but happy insular people.

**WORMS**, any of many elongated jointed animals; the term has no more definite signification or limits than has Vermes (q.v.). Examples of what may most properly be called worms are earthworms, leeches, marine annelids and the parasitic flatworms, roundworms, etc., especially such as infest the intestinal tract. These are described elsewhere, under their names. See also PARASITES.

**WORMWOOD**, a perennial herb (*Artemisia absinthium*) of the composite family. It is a native of Europe and northern Asia, whence it has been introduced into other countries by way of gardens in which it was formerly cultivated for domestic medicine. The plant grows about three feet tall, is spreading, bears silky, pinnatifid leaves and yellow flowers in heads arranged in racemes. All parts of the plant are intensely bitter on which account they, the leaves especially, have been used for flavoring drinks. Wormwood is cultivated to some extent for the manufacture of absinthe (q.v.), of which it forms one of the most important ingredients and which is named from it. See ARTEMISIA.

**WORSHIP**, the act of paying divine honors to the Supreme Being; or the reverence or homage paid to Him in religious exercises, consisting in adoration, confession, prayer, thanksgiving and the like. The Christian Church distinguishes between the worship due to God

alone (*datria*), the respect paid to the saints (*dulia*) and the worship due to the Virgin Mother of Christ (*Hyperdulia*). The homage paid to idols or false gods by pagans is idolatry. "Worship" is also a title used in Great Britain and some British colonies in addressing certain magistrates. See LITURGY; PRAYERS; RELIGION; RITUAL.

**WORSHIP**, Freedom of. (The word *worship* is derived from A. S. *weorthscipe* = *weorth*, worthy, + *scipe*, ship; it meant *worthiness* in O. E., and is now used to designate *reverence* for a person or a thing). Reverence is the honor due to another because of some excellence which he has and we have not. That excellence is either natural or supernatural. If we reverence another because of some natural excellence, which we have not, our worship is natural. By such natural reverence we honor our parents, because of a superior excellence in them. They gave us life itself. For that gift we can never sufficiently pay them back. By the excellence of parenthood they will ever be superior to us, and an object of natural reverence. Of natural worship and reverence this article does not treat.

**1. Supernatural and External Worship.**— If we reverence another because of some supernatural excellence, which we have not, our worship is supernatural. Now this supernatural excellence may be finite or infinite, created or uncreated. Supernatural reverence of another, because of infinite and uncreated excellence, is called *adoration*. Supernatural reverence of another, because of finite and created excellence, has among Catholics the technical, figurative name of *dulia*—from *douletia*, "slavery." Just as the subscription "Your obedient servant" means servitude only in a figurative sense, so the supernatural reverence of the saints is slavery only by a figure of speech. Moreover, among Catholics the reverence for the Blessed Virgin Mary is called *hyperdulia*, "more than *dulia*," to indicate that the homage paid to her is in a class by itself. It is not adoration, because the motive, objectively considered, is not infinite and uncreated. It is *dulia*; because the motive is finite and created. It is "more than *dulia*"; because divine motherhood, the motive of our reverence for Mary, though a finite and created excellence, is unique and in a class by itself. There is only one mother of the divine Person, Jesus Christ. Supernatural reverence—be it *adoration*, *hyperdulia*, or *dulia*—is either internal or external worship. Quite naturally one is free from State interference with one's internal worship; the State is not concerned with the acts of reverence, which one in no wise expresses by outward signs. The subject of this article is freedom, not of internal, but of external, supernatural worship.

**2. Obligatory Worship.**— This freedom of worship does not preclude man's obligation to religion, which flows from natural law. External, supernatural worship is not a matter of choice to man. Apart from the duty of religion, consequent upon his knowledge of God's supernatural revelation of Himself to the human race, man is by the very law of nature obliged to both internal and external supernatural worship. For man was created to praise, reverence and serve God. But man is

made up of both body and soul. Hence the faculties of his animated body, as well as the powers of his spiritual soul, should join in this praise, reverence and service of the Creator. That is to say, there should be an external manifestation of the reverence, which the mind conceives and the will elicits. "Ever since the creation of the world, the unseen truths about God,—that is, His everlasting power and divinity,—are to be seen by being reasoned out by means of His works. So that men have no excuse." (Romans i, 20). The religious freedom, whereof our article treats, is man's right to follow the dictate of his reason and the mandate of his will as to the manner of external worship. This right should be respected and protected by the State as it now is constituted. It is fundamental to our government. For the First Amendment to the Constitution ordains that "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof."

Freedom of external worship, guaranteed to the individual by the Constitution of the United States, does not preclude the duty of civil society as such to give reverence to God. For God is the author and stay of civil society. Without Him and His gifts there would be no social organism. Hence is society bound to acknowledge His dominion and beneficence. The State recognizes its indebtedness to particular persons and to other States. America is not unmindful of the services of Lafayette and Rochambeau, nor of France that sent them to our aid. Much less should our State be oblivious of the infinite Being, on whom we depend for our existence and well-being. Nor are the United States forgetful of God. Witness the appeal of the signers of the Declaration of Independence to "the laws of nature and of nature's God," to the rights wherewith men "are endowed by their Creator," and "to the Supreme Judge of the world, for the rectitude of their intentions," when they pledged themselves to the support of the independence of the United States "with a firm reliance on the protection of divine Providence." Witness likewise the annual proclamation of Thanksgiving Day by the President of the United States.

The Church, as established by Christ, is a true and perfect society; it has its own inalienable rights, which the State should protect. Such protection is quite feasible, when society is entirely Catholic; but in a State such as ours, would be fraught with many and varied difficulties. Hence Catholics of the United States have always stood for justice to the consciences of each and all. Their principle of action in matters religious has been: Live and let live. Whereas at times Protestants seem to have called upon civil authority to impose on others their own religious tenets. In colonial days, the only real freedom of worship to be found was that of Maryland during the brief control of the colony by Catholics, 1634-89. As Bancroft says, in his 'History of the United States,' the Maryland Act of Toleration, 1649, was "the first in the annals of mankind to make religious freedom the basis of the State."

**3. Free Worship.**—In civil society constituted as is ours, the only feasible attitude of

the State toward external worship is that of the First Amendment to the Constitution. Thereby is safeguarded by the United States the inalienable right, which her every citizen has to liberty of conscience. That right should be respected by civil authority. For authority, the unitive principle of the State, is from God. Therefore it may not validly impose an obligation to violate God's law. But to go against one's conscience is to violate God's law. For it is the function of conscience to dictate to us what is God's law in each particular case. Were the State so to legislate as to atrophy this function of conscience, it would seriously interfere with the observance of God's law. For it is the certain dictate of conscience that testifies just what particular form of worship is willed by God.

From this inalienable right, which each one has to worship God according to the certain dictate of conscience, we may conclude that, in a State such as ours, it would be ethically wrong to force one to practice even the true revealed religion. And this conclusion we draw, despite the fact that Christianity was established as a world-religion, which Jesus wished all to embrace. Just before the Ascension, He appeared to the eleven apostles in Galilee and said to them: "All power hath been given me in heaven and upon earth. Therefore go ye; make disciples of all nations; baptize them in the name of the Father and of the Son and of the Holy Ghost; teach them to observe all things whatsoever I have commanded you. And, lo, I am with you all days, even to the end of the world." (Matthew xxviii, 18-20). And on the very point of ascending into heaven from Mount Olivet, Jesus once again gave this solemn message to the same body of teachers: "Go ye to all the world; preach the Gospel to all creation. He that believeth and is baptized, shall be saved. He that believeth not, shall be damned." (Mark xvi, 15-16). The will of Jesus Christ, the divine Ambassador, is clear. He wishes all to belong to His Church. And yet no one is subject to the authority of the Church, unless he has entered it. And he enters the Church by faith; since faith is the root and foundation of justification. But true faith may not be forced. It must flow from the reason at the mandate of the unhampered, unshackled, free will.

Likewise, as our Constitution decrees, the State may not "prohibit the free exercise" of religion according to one's conscience; nor impose any obligation which runs counter to one's religious duty. It goes without saying that the rights of others must be protected. And the State may prevent such religious practices as interfere with these rights, and hinder the well-being of the community. This juridical status of the modern, constitutional State, as the protector of the religious rights of all, is the logical consequence of two fundamental facts in the science of sociology.

First, the State is not a divinely constituted depository of God's revelation to man. Hence it has neither the duty nor the right to dictate what its members shall believe, nor how they shall externally manifest their belief. Christ established a spiritual, and not a material society. He gave His doctrines to the Church and not to the State, to hand down to men.

asked Him, "Art thou a king?" Jesus reply: "My kingdom is not of this world" (John xviii, 33-36).

Not only, the social organism or State is from God. Because man is by nature a social being.

It is by the law of nature that men themselves into an organic social unit. Whatever is by the law of nature, is from the Author of nature. Therefore the social organism is from God. Therefore the organizing and vitalizing principle of that social organism is from God. But authority is the law which unifies and vitalizes society. Therefore the authority of the State is from God. Therefore civil authority is bound to protect the rights in society. And one of those rights is to the reasonable manifestation, the members of society, of their relations to the Supreme Author of the social organism. Therefore the State has the right to be so godless and so utterly to rule God out. To rule out of society were to do away with the authority of society; to substitute the authority of might for the might of authority; to destroy the vitalizing principle of the State, to devitalize, disintegrate and destroy the social organism.

**Freedom of Worship, Guaranteed by the State.**—Since the State, as to-day constitutes the right and the duty to guarantee subjects that freedom of worship which is guaranteed by the certain conscience of each individual and does not clash with the rights of others, this same freedom may be the legitimate content of international treaties. The provisions of diplomatic, business or other treaties may render it necessary that the subjects of one State reside in another. They have the natural right to worship God in accordance with the dictate of a certain conscience. Their own State may protect that right by treaty, whereby a State protects the religious freedom of its subjects abroad, is an agreement between two sovereign States; and this treaty differs from a concordat. A concordat is a treaty between the Apostolic See and a State in diplomatic relations; it has to do with the relations of the Catholic Church to the State. Before the present reformation there was only one ecclesiastical authority in Christendom; and the religious rights of subjects were amply protected by the canonical relations between the supreme papal power and Christian states. Such protection can no longer be guaranteed. Hence the necessity of treaties between independent states, which have as their object the securing of a freedom of divine worship.

Instances of some such treaties between the United States and other countries, which were originally made for the protection of Protestant missionaries. By a treaty of 1805, with the Bey of Tripoli, the American consul, his family and household, were guaranteed freedom of worship in the consulate. By the Treaty of Guadalupe, 1848, Mexico permitted Americans to practise and spread their religion within that republic. In 1856, Siam signed a treaty with the United States, whereby Americans were allowed to build churches and practise their faith in that kingdom. China, by the treaties of 1858 and 1868, yielded to Americans the right to build churches, maintain cemeteries

and practise their religion in those parts where foreigners were permitted to reside. In 1858, Japan ceded to Americans freedom of worship and the right to build churches; and the United States in turn assured Japan against molestation of her subjects in their worship. The year following, 1859, our government secured by treaty the religious freedom of Americans, residing in Paraguay. In Turkey, American missionaries have been active since 1818. At first they shared in the religious freedom, which the Edict of Toleration has allowed to all Christians in the Ottoman empire since the 15th century. The treaties of 1830 and 1874 guaranteed to Americans the right to build churches, conduct mission schools and spread their religion throughout the Turkish empire.

WALTER DRUM, S.J.,

Professor of Scripture, Woodstock College, Maryland.

**WORSTEDS**, wüst'əd or wūr'stəd, are varieties of woolen yarn or thread, spun from long staple wool which has been combed, and which in the spinning is twisted harder than ordinary. It is knit or woven into stockings, carpets, etc. The name is derived from Worsted, a village in Norfolk, where it is supposed to have been first manufactured.

**WORT**, the saccharine liquid obtained by the action of malt on a mixture of water and crushed barley, corn or other grain, the whole being known as "mash." The water extracts

the maltose and dextrine from the malt and allows the diastase to act on the starch of the grain, changing it also to maltose and dextrine. The pectase of the malt at the same time changes the grain proteids to soluble peptones. Care must be taken of the temperature and the dilution of the mash in order to obtain the best results. Worts are of various kinds, depending on the grain used and the temperature given it. Some are fermented to beer, ale, porter and like beverages, while other forms are fermented to a mash that is distilled for alcohol or whisky.

**WORTH, William Jenkins**, American general: b. Hudson, Columbia County, N. Y., 1 March 1794; d. San Antonio, Tex., 7 May 1849. He received an ordinary education, and when the War of 1812 broke out enlisted as a private soldier, rising to the rank of captain in 1815. He was instructor of infantry tactics and commander of cadets at West Point 1820-28 and in 1838 became colonel of the 8th infantry. In 1840 he was sent to serve in the war against the Florida Indians, and in 1841 took the chief command. He was successful in repeated and severe conflicts with the aborigines, whereby the war was brought to a close, and in August 1842 was brevetted a brigadier-general for gallantry and distinguished services. In the war with Mexico, at the battle of Monterey, 23 Sept. 1846, he bore a very important part. As it was impossible to communicate with the commander-in-chief, Worth was obliged to act independently throughout the battle. He carried the forts commanding his line of approach, stormed the bishop's palace, and had fought his way through the streets nearly to the great plaza, when the town capitulated to Taylor, approaching from the other side. For these achievements Worth was brevetted a major-general, and received a sword from Congress. He was also distinguished at Cerro Gordo, Puebla, Cherubusco, Molino del Rey, and at the storming of the City of Mexico. A monument was erected to his memory by the city of New York, at Broadway and 25th street in 1858.

**WORTH, William Scott**, American general: b. Albany, N. Y., 6 Jan. 1840; d. Clifton, S. I., 16 Oct. 1904. Entering the Union army as 2d lieutenant in 1861, he became captain in 1866; lieutenant-colonel of the 13th infantry in 1894, and colonel in September 1898. He accompanied the army to Cuba, and during the assault on San Juan Hill, 1 July 1898, was severely wounded. He was promoted brigadier-general, United States army, in the following November, and was retired a week later.

**WÖRTH**, wër'th, Alsace, village at the confluence of the Sauerbach and Sulzbach rivers, 10 miles southwest of Weissenburg. It is celebrated as the place where the French under Marshal MacMahon on 6 Aug. 1870 met their first great defeat in the Franco-German War (q.v.).

**WORTHEN**, wër'then, **William Ezra**, American civil engineer: b. Amesbury, Mass., 14 March 1819; d. New York, 2 April 1897. After graduation from Harvard in 1838, he began the practice of civil engineering, and until 1848 was employed chiefly with surveys connected with the Boston water supply, and in

other hydraulic works. He designed and constructed several mills in Lowell, in 1849 began architectural work in New York, was made engineer of the New York and New Haven Railway, and in 1854 its vice-president. After 1854 he was busily employed as a practising and consulting engineer, being frequently retained as an expert in matters relating to the planning, construction or improvement of sewage and water systems. He was chief engineer of the first rapid transit commission of New York, and in 1890-91 chief engineer of the Chicago main drainage canal. In 1887 he was president of the American Society of Civil Engineers. Besides official reports, he published 'Cyclopædia of Drawing' (1857); 'First Lessons in Mechanics' (1862); and 'Rudimentary Drawing for Schools' (1863).

**WORTHING**, wër'thing, England, a watering place in Sussex, wër'thing, England, a watering place in Sussex, 17 miles west of Brighton, with good streets, handsome terraces, crescents, and villas, splendid hotels, baths, smooth sands, a beautiful esplanade, libraries, a literary institution, reading-rooms and assembly-rooms. Fruit-growing under glass is an important industry of the town. Pop. 30,305.

**WORTHINGTON, Henry Rosnier**, American inventor: b. New York, 17 Dec. 1817; d. Tarrytown, N. Y., 17 Dec. 1890. In 1840 he began a series of experiments with steam for the propulsion of canal boats, soon afterward devised a small steam pump to be used in the maintenance of the water supply in the engine boiler, and in 1841 patented an independent feed pump which developed into the direct-acting steam pump which he patented in 1849. Subsequently he built in Savannah, Ga., the first direct-acting compound-engine ever used in waterworks; invented the duplex pump, and devised various improvements in steam and hydraulic machinery.

**WORTHINGTON, Minn.**, village, county-seat of Nobles County, on the Chicago, Rock Island and Pacific, and the Chicago, Milwaukee and Saint Paul railroads nearly 100 miles northwest of Sioux City, Ia. It is in an agricultural section and has flour mills, a grain elevator, stockyards and machine shops. The three banks have a combined capital of over \$125,000. The village has a high school established in 1883, and a public library. Pop. about 2,385.

**WOTHERSPOON, William Wallace**, American military officer: b. Washington, 16 Nov. 1850. He entered upon a military career and was appointed an officer in the army in 1873. He first saw service in the Indian wars of that period, and later took an active part in both Mexican and Philippine wars, and during the latter campaign was collector of customs at the port of Iloilo in the Philippines. On his return to the United States in 1903, Wotherspoon was appointed assistant commandant of the army service schools at Fort Leavenworth, Kansas. Promoted to the general staff of the army (1909-10) he soon rose to the presidency of the Army War College (1910-12); and from April to November 1914 was chief of staff of the United States army. He retired with the rank of major-general, 16 Nov. 1914. In the following year he was appointed superintendent of public works of the State of New York.

**WOTTON**, wōt'ōn, **SIR Henry**, English wit and poet: b. Boughton Malherbe, Kent, 1568; d. Eton, December 1639. He was educated at Oxford, and having studied law under an eminent Italian professor, was proficient in the Italian language. He visited all the principal countries of the Continent, 1599-97, and on his return was secretary to the Earl of Essex. On the fall of that earl he went to Florence, where he composed a treatise, printed after his death, entitled 'The State of Christendom.' The Grand Duke of Tuscany having intercepted some letters disclosing a plot to take away the life of James, king of Scotland, engaged Wotton to discover the secret intelligence of it to that prince. In this service he ably performed in the character of an Italian, and when James came to the crown he sent for Wotton, knighted him, and in 1604 employed him as an Ambassador to the Republic of Venice. As Wotton passed through Augsburg, being desired to write an album, he wrote in Latin that "an ambassador is a good man, sent to lie abroad for the good of his country." This innocent sally was presented as a state maxim sanctioned by the opinion of the king of England. James sought nothing relative either to kingship or state-craft a subject for wit, was highly pleased; and on his return Wotton had to make a humble apology. At length he recovered royal favor, and was restored to his former office in Venice (1616-19). Other missions followed, and in 1624 he was made provost of Trinity College. The first-fruits of his leisure are his 'Elements of Architecture.' A collection of miscellanies was published after his death, entitled 'Reliquiæ Wottonianæ.' This collection includes several poems by Wotton, of which two, 'The Character of a Happy Life' and 'His Mistress, the Queen of Bohemia,' among the finest lyrics in the English language. Consult 'Lives' by Izaak Walton and A. W. Ward (1899) and More, 'Shelburne Essays' (Fifth Series, New York, 1908).

**WOTTON**, **William**, English scholar: b. Wymondham, Suffolk, 13 Aug. 1666; d. Buxted, 13 Feb. 1726. He had acquired a remarkable knowledge of Latin, Greek and Hebrew at the age of 10, was graduated at Saint John's College, Cambridge, in 1679, and was elected a Fellow there. He was later ordained, and held various curacies, and was a prebendary of Ely Cathedral from 1705 until his death. He was prominent in the controversy concerning the respective merits of ancient and modern languages, taking the side of the moderns. He defended his views in 'Reflections Upon the Ancient and Modern Learning' (1694, 1697), which was subjected to an attack by Swift in the 'Battle of the Books.' He was also author of 'History of Rome' (1701); 'Traditions of the Sages and the Scribes and Pharisees' (1702), and he left an unpublished translation of the Celtic laws of Hywel Dda.

**WOUND**, in surgery, a solution of continuity in any tissue or soft part of the body. Wounds are divided by writers on surgery into various kinds, the distinctions being founded upon the sort of weapon with which the

injury has been inflicted; upon the circumstance of a venomous matter having been introduced into the part; or upon the nature of the wounded parts themselves, and the particular situation of the wound. Hence we have cuts, incisions, or incised wounds, which are produced by sharp-edged instruments, and are generally free from all contusion and laceration. The fibres and texture of the wounded part have suffered no other injury but their mere division; and there is, consequently, less tendency to inflammation, suppuration, gangrene and other bad consequences than in the general case of other species of wounds. Another class of wounds are stabs or punctured wounds, made by the thrusts of pointed weapons, as bayonets, lances, swords, daggers, etc., and also by the accidental and forcible introduction of considerable thorns, nails, etc., into the flesh. These wounds frequently penetrate to a great depth so as to injure large blood-vessels, viscera and other organs of importance; and as they are generally inflicted with much violence the parts suffer more injury than would result from their simple division. Many instruments by which punctured wounds are made increase in diameter from the point, and when they penetrate far they force the fibres asunder like a wedge, and cause serious stretching and contusion. Bayonet wounds of the very soft parts are ordinarily followed by violent inflammation, tumefaction, large abscesses, fever, delirium, etc. A third description of wounds are the contused and lacerated, which strictly comprehend, together with a variety of cases produced by the violent application of hard, blunt, obtuse bodies to the soft parts, all those common injuries called gunshot wounds (q.v.). Many bites rank also as contused and lacerated wounds. In short, every solution of continuity which is suddenly produced in the soft parts by a blunt instrument or weapon which had neither a sharp point nor edge must be a contused, lacerated wound.

Poison wounds are those which are complicated with the introduction of a venomous matter or fluid into the part. Such are the stings and bites of a variety of insects, and the surgeon, in the dissection of putrid bodies, or in handling instruments infected with any venomous matter, is exposed to the danger of poisoned wounds from cuts. The most dangerous, however, of this class of wounds occur from the bites of the viper, the rattlesnake, etc., or from those of rabid animals. (See HYDROPHOBIA). Wounds may likewise be universally referred to two other general classes, the simple and complicated. A wound is called simple when it occurs in a healthy subject, has been produced by a clean, sharp-edged instrument, and is unattended with any serious symptoms. A wound, on the contrary, is said to be complicated when the state of the system, of the wounded part, or the wound itself, indicates the necessity for more complex treatment than the simple reunion of the cut surfaces. The differences of complicated wounds must, therefore, be very numerous, as they depend upon many incidental circumstances, the principal of which, however, are hemorrhage, nervous symptoms, contusion, the unfavorable shape of the injury, the discharge or extravasation of certain fluids, indicating the injury of particular bowels or vessels,

etc. All large or deep wounds are attended with more or less symptomatic fever, which usually comes on at a period varying from 16 to 36 hours after the infliction of the injury, and is generally of the inflammatory, but sometimes of an asthenic character. The liability to gangrene is also a formidable danger to be guarded against in the treatment of complex wounds.

In incised wounds the first thing to be attended to is to stop the hemorrhage. This is usually accomplished by simply bringing the edges of the wound together; but if any of the larger blood-vessels have been injured, pressing the trunk by means of a bandage or tourniquet will be necessary; and should this not succeed, the vessels must be secured with ligatures. Next, care should be taken that all extraneous substances are removed from the wound. Then the edges of the wound are to be brought together, and retained either by straps of adhesive plaster, or in some situations by one or two stitches. Generally such wounds heal very quickly, without any suppuration, "by first intention." When, however, this is not the case, and suppuration comes on, all attempts to procure union by first intention should be abandoned, the plasters and bandages removed, poultices and warm dressings used to remove inflammation, and afterward healing ointment applied. Lacerated and contused wounds require to be similarly treated; but they heal less kindly, and suppuration almost always takes place. The swelling and inflammatory symptoms which commonly attend contused wounds are to be diminished by cooling lotions or emollient poultices. Punctured wounds are dangerous from their depth; and the internal effusion of serum and blood which usually attends them. They are frequently also followed by severe inflammation and suppuration. The same general principles apply in this case, too. Sometimes it may be necessary to enlarge the wound a little, so as to remove the stretching of the parts, and to lessen the inflammation; leeches and fomentations are often required. In poisoned wounds free incisions, and even amputation may often be necessary. See GUNSHOT WOUNDS and consult Brewer, G. E., 'A Text-book of Surgery' (New York 1915); Groves, E. W. H., 'Gunshot Injuries of Bones' (London 1915); Penhollow, D. P., 'Military Surgery' (ib. 1916); Stevenson, W. F., 'Wounds in War' (New York 1898).

**WOUNDS, War.** See WAR WOUNDS.

**WOUWERMAN**, wow'ver-män, Philips, a Dutch painter: b. Haarlem, May 1620; d. there, 19 May 1668. He was instructed by his father, an indifferent artist and by Wynants of Haarlem, in which city his life was passed. According to the commonly received account, his reputation as a painter during his life was small. After his death his pictures rose immensely in value, and he is now one of the most esteemed painters of the Dutch school. In consequence, it is said, of the disgust with which this neglect inspired him, he destroyed before his death all the studies he had made during his life, from fear that his son might be induced by the possession of them to become a painter. His subjects consist for the most part of roadside scenes and hunting or battle pieces, and it is commonly believed that he never painted a

picture without a white or gray horse as a conspicuous object. His technical qualities are of a high order and his skies, foregrounds and foliage are executed in the best style of his school. He left upward of 800 carefully finished pictures. Those offered for sale always bring high prices, and in 1892 his 'Halt of a Sporting Party' was sold for \$18,375. The best collection of his works is in the Royal Gallery of Dresden. There are also fine examples in the Louvre, and in Munich, Vienna, Petrograd, Amsterdam, The Hague, Rotterdam, etc. Consult De Groot, C. Hofstede. 'Catalogue Raisonné of the Works of the Most Eminent Dutch and Flemish Painters of the 17th Century' (new ed., 1909).

**WOVEN FURNITURE.** See WICKEN WEAVING AND PRODUCTS.

**WOVOKA** (English name, JACK WILSON), Piute Indian prophet: b. Mason Valley, Nev., about 1856. He was left an orphan at the age of 14, and became a member of the family of David Wilson, a white man, from whom he received his English name. In 1888 or 1889, while in delirium from an illness he had what he described as a revelation to the Indians from the Great Spirit. He established himself as a prophet, foretelling the time when the old Indian life would be restored as it had been before the coming of the whites. Among the principles he put forth in his preaching were the equality of women in ceremonial affairs, the abolition of tribal warfare and the war dance, property distribution, and undue grief at funerals. He became most widely known among the various tribes by the institution of the Ghost Dance (qv) which the Indians generally adopted. The dance reached its greatest popularity in about a year's time after which, largely because of the Sioux outbreak (1890-91) and the action of the United States government, the excitement quickly subsided. Wovoka's influence waned to negligibility upon the failure of his prophecies. Consult Mooney, J., 'The Ghost Dance Religion' (1900).

**WRANGEL**, vräng'el, or **WRANGELL**, Ferdinand Petrovitch, BARON, Russian naval officer and explorer: b. Livonia, 9 Jan. 1795; d. Dorpat, 6 June 1870. He studied at the Naval Academy, Saint Petersburg and in 1820-24 directed a Polar expedition to explore the coast of eastern Siberia and the region north of Asiatic Russia. By sledge-journeys undertaken in 1822 and 1823 he reached lat. 77° 2' N., but he found no trace of the reported land for which he was searching. This was discovered by G. W. De Long in 1867, and is now known as Wrangel Land, though taken possession for the United States as "New Columbia" by Hooper in 1881. In 1829-34 Wrangel was governor-general of Russian America, and in 1840-49 director of the Russian-American Company. He attained vice-admiral's rank in the navy. In 1855-58 he was acting Minister of Marine, and subsequently Councillor of State. He opposed the sale of Russian America to the United States. His account of his Polar expedition appeared in Russian in 1844. An account in German was prepared from Wrangel's journals (1839), and of this an English translation was made by Selim

all's Expedition to the Polar Sea' Consult Von Engelhardt, 'Ferdinand angel und seine Reise' (1885) and Sallé 'Narrative of an Expedition to the sea in 1820-23' (London 1840).

**NGEL, Karl Gustaf von, COUNT, Swed-**ral: b. Skokloster, on Lake Maelar, 13 3; d. Isle of Rugen, 24 June 1676. He nied Gustavus Adolphus in his expedition to Germany, and at the battle of Lützen, rendered great services after the fall of the city. In 1641 he was one of the major-who commanded the Swedish forces at the arrival of Torstenson, and under his leadership in the campaign in Germany, and the successful march of Holstein. After the death of Torstenson in 1644 he received the supreme command of the Swedish fleet, and obtained a great naval victory over the Danish fleet between the islands of Femern and Bornholm.

In 1646 he succeeded Torstenson as commander-in-chief of the Swedish army, effecting a junction at Geissen with the French under Turenne, with whom he crossed the Rhine and besieged Augsburg, which, however, was relieved by the Austrian army. In 1648 he defeated the Swedish and Bavarians near Zusmarshausen, but before the army of Piccolomini. Wrangel died under Charles X in the campaigns against Sweden (1655) and Denmark (1657-59), and led an army of 16,000 men into the election of Brandenburg. His health obliged him to resign this command before the conclusion of the campaign.

**WRANGEL (räng'gël) LAND, or NEW ALASKA,** an island in lat. 71° 32' N., and 3° W.; in the Arctic Ocean, about 100 miles from the coast of Siberia and 300 miles from the coast of Alaska. It is about 75 miles long and 20 miles wide. It consists chiefly of mountains which rise to a height of 2,000 feet. The base and in places near the shore line some vegetation. The first mention of the island in this locality was made about 1810, by the Russian explorer, the Russian explorer, commanded an expedition in 1811 of this land. Long, the American explorer, discovered the island in 1867, and Hooper, an American, visited it in 1881, and took possession of it for the United States. He named the island New Columbia. Consult Rosse, Muir and Nelson, 'Cruise of the Albatross' (Washington 1893).

**WRANGELL,** Alaska, village, on Wrangell near the mouth of the Stikine River, 70 miles southeast of Juneau, and 120 miles from Sitka. A settlement was made here in 1833. It is a trading post for furs. It has a hatchery, salmon canneries and storehouses. It was long an important trading centre for mining camps and trading posts. There is steamship communication with Seattle and the town has a central school for natives. It contains a wireless station. Pop. about 800.

**WRANGLER, Senior,** a term applied to 1909 in the University of Cambridge, to the undergraduate who has the best public mathematical examination—the bachelor's degree. The candidates

for honors were arranged in order of merit in three lists or classes, of which the highest was called that of wranglers, the next that of senior optimises, and the lowest that of junior optimises—the whole constituting what was known as the mathematical tripos. Hence the senior wrangler or the highest in the list of wranglers was the most distinguished mathematician of the year. Since 1909 the results of the examination have been published with the names in alphabetical order.

**WRASSE,** a fish of the family *Labridæ* (q.v.), of which the best known representatives in America are cunners, doncellas, ladyfishes, tautogs, etc.

**WRATTISLAW, rät's-lä, Arthur Henry,** English scholar: b. England, of Bohemian parentage, about 1822; d. 1892. He was graduated from Cambridge in 1844, was headmaster of Felstead Grammar School 1849-57, and of that at Bury Saint Edmonds 1857-79, and was vicar of Manorbier, Pembrokeshire, Wales, 1879-87. He was the leading Slavonic scholar of his day in England, and among his important publications are 'Lyro Czecho-Slavon-ska' (1849); 'The Queen's Court MSS. with Other Ancient Bohemian Poems' (1852); 'Life, Legend and Canonization of Saint John Nepomuk' (1873); 'Native Literature of Bohemia in the 14th Century' (1878); 'Sixty Folk Tales from Exclusively Slavonic Sources' (1889).

**WRAXALL, räk'sal, Sir Nathaniel Wil-**liam, English historian: b. Bristol, 8 April 1751; d. Dover, Kent, 7 Nov. 1831. He was in the East Indian Civil Service, 1769-72, and during the course of some seven years of foreign travel was a confidential agent of Queen Caroline Matilda of Denmark to her brother, George III (1774-75). He published 'Cursory Remarks Made in a Tour' (1775); 'Memoirs of the Valois Kings' (1777); 'History of France from Henry III to Louis XIV' (1795); 'Memoirs of the Courts of Berlin, Dresden, Warsaw, and Vienna' (1799), and the famous 'Historical Memoirs of My Own Time, from 1772 to 1784' (1815). For a libel in the last on Count Woronzov, Russian envoy to England, Wraxall was fined \$2,500 and sentenced to six months' imprisonment. He is an amusing writer, but his veracity has been many times questioned. He sat in Parliament for 14 years from 1780 and was knighted in 1813. Consult his 'Posthumous Memoirs,' continued from 1784 to 1790 (1836).

**WRAY, John.** See RAY, JOHN.

**WRECK,** that which is cast or driven ashore by the waves, the goods, broken timbers, plates, etc., cast ashore from a ship that has been broken up, destroyed or rendered helpless at sea, as by collision, tempest, etc. In maritime law the term means the goods cast ashore by the waves after shipwreck, and left there within the jurisdiction of some country, and subject to common law. A ship also is a wreck when she is rendered unable to pursue her voyages without repairs exceeding half her value. A sunken vessel is not a wreck, but a derelict. In the United States laws have been enacted by the several States bordering on the sea and on the Great Lakes for the safe-keep-

ing and proper disposition of wreck. Goods found at low-water mark, or between high- and low-water mark, whether resting or partly resting on the ground, are wrecks, and, if not reclaimed, belong to the owner of the shore. See SALVAGE; MARINE INSURANCE.

**WRECKAGE**, in navigation, is usually understood to mean any ship or goods driven ashore or found floating at sea in a deserted or unmanageable condition. In law, wreckage is defined as such articles of value as are cast upon land by the sea, and includes jetsam, flotsam, ligan and derelict. In most countries any person found stealing or destroying any wreck is chargeable with felony; and a person proved to be in possession of shipwrecked goods, or who offers such goods for sale, may be fined or imprisoned. See WRECK.

**WREN**, *rĕn*, SIR Christopher, English architect: b. East Knoyle, Wiltshire, 20 Oct. 1632; d. Hampton Court, Berkshire, 25 Feb. 1723. He entered as a student at Wadham College, Oxford, in 1646, having previously given proofs of genius by the invention of astronomical and pneumatic instruments. In 1647 he wrote a treatise on spherical trigonometry upon a new plan, and the following year composed an algebraical tract on the Julian period. He was one of the earliest members of the Philosophical Society at Oxford, which was the origin of the Royal Society, after the institution of which, in 1663, he was elected a Fellow and distinguished himself by his activity in promoting the objects of that institution. In 1657 he was appointed professor of astronomy at Gresham College, but, being nominated to the Savilian professorship of astronomy at Oxford, resigned the former office, and in 1661 returned to the university. He received a commission in 1663 to prepare designs for the restoration of Saint Paul's Cathedral, then the largest Gothic edifice in the kingdom. While his designs were under consideration the cathedral was destroyed by the fire of 1666, and Wren had now an opportunity for signaling his talents by the erection of an entirely new structure. In 1668 he succeeded to the office of surveyor of works, resigned his Savilian professorship in 1673, in 1674 received the honor of knighthood; and in the following year the foundation of the new cathedral was laid. In 1680 he was chosen president of the Royal Society. In 1683 he was appointed architect and one of the commissioners of Chelsea College; and the following year controller of the works at Windsor Castle. He was elected member of Parliament for Plympton in 1685, and to his public trusts were added in 1698 that of commissioner for the repair of Westminster Abbey, and in 1699 that of architect of Greenwich Hospital. In 1700 he represented in Parliament the boroughs of Weymouth and Melcombe Regis. In 1708 he was made one of the commissioners for the erection of 50 new churches in and near the city of London. After having long been the highest ornament of his profession he was, in 1714, deprived of the surveyorship of the royal works from political motives. He was then in the 85th year of his life, the remainder of which was devoted to scientific pursuits and the study of the Scriptures. His remains were interred under the choir of Saint Paul's Cathedral, and over the choir en-

trance was placed the following inscription (since removed to another part of the church):

Subtus conditur  
Hujus Ecclesie et Urbis Conditor,  
Christ. Wren;  
Qui vixit Annos ultra nonaginta.  
Non sibi sed Bono publico.  
Lector, si Monumentum queris,  
Circumspice.

(Beneath is laid the builder of the church and city, who lived above ninety years, not for himself but for the public good. Reader, if thou seekest his monument, look around).

The edifices constructed by Wren were principally public, including a royal hunting seat at Winchester and the modern part of the palace at Hampton Court. Some of the most remarkable of his buildings, besides Saint Paul's, are the monument on Fish Street Hill, the theatre at Oxford, the library at Trinity College, Cambridge; the hospitals of Chelsea and Greenwich; the church of Saint Stephen's, Walbrook; those of Saint Mary-le-Bow, Saint Michael, Cornhill and Saint Bridge, Fleet street; and the great campanile of Christ Church, Oxford. The Royal Exchange and Custom-house, since destroyed by fire and re-erected, were among his works. As an architect he possessed an inexhaustible fertility of invention combined with good natural taste and profound knowledge of the principles of his art. His talents were particularly adapted to ecclesiastical architecture, but in his palaces and private houses he sometimes achieved monotonous results, as at Hampton Court. The interior of the church of Saint Stephen's, Walbrook, which has been considered as his *chef-d'œuvre*, exhibits a deviation from common forms equally ingenious and beautiful, and Saint Paul's Cathedral may be fairly reckoned among the most magnificent productions of architectural genius. Yet the works of Wren have not passed without censure. Even in Saint Paul's, while the grandeur of the whole work is admitted, many faults, and especially waste of interior space, are charged against him. Consult 'Parentalia, or Memoirs of the Family of the Wrens' (1750); Elmes, 'Sir Christopher Wren and His Times' (London 1823); Clayton, 'Churches of Sir Christopher Wren' (London 1848); Milman, 'Annals of Saint Paul's Cathedral' (1868); 'Life,' by Phillimore (1883); Loftie, 'Inigo Jones and Wren' (New York 1893); Marshall, 'Under the Dome of Saint Paul's' (1899); Dimock, 'Handbook of Saint Paul's Cathedral' (1900).

**WREN**, a family (*Troglodytidae*) of passerine birds, having a slender, slightly curved and pointed bill, with the exposed nostrils partly concealed by a scale, the wings very short and rounded, with nine well developed and the first short primaries, the tail short and often carried erect; the legs are robust and rather long. They are abundant in the neotropical region, less common in the nearctic, and only a few occur in the Old World in Europe, Asia and Sumatra, those of the latter region being more or less aberrant. The known species exceed 100 and are arranged in about 15 genera, several of which are confined to tropical America. North America has six genera and 14 species. Closely related to the wrens are the mocking thrushes, which some ornithologists place in the same family, and the creepers (*Certhiidae*). The wrens are plain little birds

ly clothed in modest browns and seldom  
iting bright colors of very conspicuous  
ngs. They are insectivorous and mostly  
tory, though particular species may in-  
either warm or cold regions. Their  
s are mostly brush piles, tangled roots,  
walls and similar places, where they pry  
very nook and cranny; they enter holes  
reappear in another place in very mouse-  
ashion; and are altogether very sprightly  
creatures. Their songs are wonderfully  
and vehement for such small birds, but  
characteristically for each species. Al-  
h the nests vary greatly in their location,  
is most often a hole of some sort, they  
ways more or less spherical in construc-

Few passerine birds are more prolific,  
eggs numbering from five to 10, and many  
species producing several broods.

w birds are more familiar in the United  
; than the house-wren (*Troglodytes aëdon*).  
about five inches long. The color is very  
rm, reddish brown above, barred with  
, and pale fulvous white below. It often  
its nest near houses and in boxes pre-  
for it or in any convenient hole. The  
are made to fill the boxes; and to effect  
large mass of heterogeneous materials is  
imes collected. From six to eight eggs  
tute a brood and two or three broods are  
ced in a summer. The eggs are so thickly  
d with brown that they appear to be al-  
uniformly colored. The song is extremely  
and vivacious as though the performer  
overflowing with good spirits. The male  
ery bold, pugnacious bird, readily attack-  
rds far larger than itself, as the bluebird  
wallows, and taking possession of the  
which they have appropriated for their

It even attacks cats when they approach  
sts and vigorously scolds all intruders.  
e winter wren (*T. hiemalis*) is our small-  
pecies of wren, only about four inches long,  
he ridiculous little tail is usually cocked  
ht up into the air. Above, the color is a  
ark brown; below it is much lighter, both  
is prettily barred. The typical form in-  
most of eastern North America, the  
las, and northernmost United States dur-  
e summer and the rest during the winter.  
t in the higher mountains, it is known

New England and Middle States only in  
tter season. It is a silent, secretive bird  
e winter brush-heap and roadside, but  
bold and saucy and prone to state its  
n of intruders. The summer song is said  
powerful and musical, and the nest to be  
in a hole in a log or root near the  
d. The eggs are white, spotted with red-  
rown.

the genus *Cistothorus*, or marsh-wrens,  
ve three species, of which one (*C. mari-*  
is a Florida form. See MARSH-WREN.  
*ryothorus* comprises the mocking wrens,  
ich *T. ludovicianus*, the great Carolina  
is the best known Eastern species and the  
t of the wrens of this region. It is six  
long, of which the tail is two and one-  
inches, about equaling the wings. It is  
uniform bright reddish brown above with  
ish white under parts, a conspicuous  
superciliary streak and the wings and tail  
barred with black. It lives east of the

plains, but is more abundant South and  
scarcely gets northward beyond Pennsylvania,  
in which region, however, it is becoming more  
plentiful of late years. It inhabits deserted  
buildings, old mills and shrubbery in secluded  
spots, and builds its nest in crannies in such  
places, laying six or more white eggs speckled  
with various shades of brown. The loud clear  
whistled song is very characteristic, and as this  
bird is scarcely migratory is heard in winter  
as well as summer in the neighborhood of  
Philadelphia. This bird also mimics the notes  
of others. Bewick's wren (*T. bewickii*) is a  
related species very abundant in the interior  
southward, while a number of other species and  
subspecies of the same genus are found in the  
West and Southwest. In the latter region also,  
as well as in Mexico and southward, occur  
several large wrens which have broad spread-  
ing tails composed of somewhat cuneate feath-  
ers. Among these are the cactus wrens (q.v.),  
which build purse-shaped nests in bushes in the  
desert regions of Texas, California, etc., and  
the rock-wrens and cañon-wrens (qq.v.), which  
live and nest in rocky places. They have loud  
ringing songs. In Europe are several species  
of *Troglodytes*, of which the beloved common  
or jenny wren (*T. parvulus*) is found in all  
parts of Europe, and in Morocco and Algeria,  
and in Asia Minor and northern Persia. In  
central Asia it is represented by *T. pallidus*,  
in Iceland and the Faroes by *T. borealis* and  
in Norway by *T. bergensis*. In England the  
vernacular name "wren" is also applied to  
various species of warblers and elsewhere to  
other small birds.

Birds of North America' (Boston 1874);  
Sharpe, 'Catalogue Birds of the British Mu-  
seum' (Vol. VI, London 1881); Coues, Elliott,  
'Birds of the Colorado Valley' (Washington  
1878); Forbush, E. H., 'Useful Birds and their  
Protection' (Boston 1913); and 'Bulletin 30,  
United States Biological Survey.'

**WRESTLING**, the most ancient form of  
athletic exercise, and at one time the favorite  
pastime of the Greeks. The Olympic Games  
(q.v.), the great festival of the Greeks, which  
were instituted for the exhibition of various  
trials of strength and skill, included races on  
foot and with horses and chariots, contests in  
leaping, throwing, boxing and wrestling. One  
of the great objects of the old classical wrest-  
lers was to make every attack with elegance  
and grace under certain laws of a most intricate  
nature, and the game is described by Plutarch  
as the hardest working form of athletics. In  
Devon and Cornwall, England, wrestling on the  
catch-hold principle still finds favor. In Lan-  
cashire they adopt a catch-as-catch-can style;  
while in Cumberland and Westmoreland the an-  
cient back-hold system continues to hold its  
own. In the United States and Australia, in  
Germany, France and Japan, ground wrestling,  
which is the most objectionable of all known  
methods, is the most popular. This system has  
been dignified by the title of Græco-Roman  
wrestling. The Græco-Roman style is practi-  
cally the same as the French method, and con-  
sists of a struggle on the ground till one or the  
other of the competitors is compelled through  
sheer exhaustion to give in; indeed, such a con-  
test is simply an exhibition of brute strength.

On beginning, the wrestlers take hold from the head and not lower than the waist, when both roll on the ground, and then the actual struggle begins. Tripping, which is the very essence of the game, is not allowed; therefore weight and strength are the only factors in the contest, which terminates when one of the combatants has been placed on both shoulders. Wrestling has recently become popular in Japan and India. The Japanese have adopted the Græco-Roman style and receive handsome rewards at the conclusion of their contests. The Jap wrestlers, who are a most formidable class of men, before entering the arena adorn themselves with a certain kind of paint, with a huge belt round the waist and their enormous calves encased in stout leggings. The Indians, on the other hand, wrestle in bathing costume, and in a match only contest one bout, and one shoulder on the ground is deemed a fall. Consult Cann, W. E., 'Manual of Wrestling' (Battle Creek, Mich., 1912).

**WREXHAM**, rēks'am, North Wales, a market-town in the county of Denbigh, 12 miles south of Chester, in a district containing coal, lead and iron. It is a station on the Great Western and Great Central railways, 201 miles from London, and has several churches and other places of worship, schools, a guildhall, infirmary, barracks, market-halls, public baths, electrical works, a free library, etc. The restored parish church, dedicated to Saint Giles, was erected in the reign of Henry VIII. There are in the town large breweries, tanneries, paper mills, etc. It is the seat of a Roman Catholic bishopric. In Saint Giles' churchyard is the tomb of Elihu Yale, founder of Yale College, New Haven, Conn., U. S. A. Pop. 18,377.

**WRIGHT, Adam Henry**, Canadian physician: b. Brampton, Ontario, 1846. He was graduated at Toronto University in 1866, took the degree of M.D. there in 1873, and later studied in Europe. He taught in the Toronto School of Medicine in 1879-87; was associated with the staffs of the Toronto General Hospital and the Women's Medical College; was professor of obstetrics at Toronto University in 1887-1912, and has since been professor emeritus. Since 1911 he has been chairman of the provincial board of health of Ontario. He wrote 'A Text Book of Obstetrics' (1905).

**WRIGHT, Arthur Williams**, American physicist: b. Lebanon, Conn., 8 Sept. 1836; d. 19 Dec. 1915. He was graduated from Yale in 1859, studied law and was admitted to the bar, but did not practise, and was a tutor in Latin at Yale 1863-66, and in physics 1866-68. He afterward studied at Heidelberg and Berlin, was professor of physics and chemistry at Williams College 1869-72; of molecular physics and chemistry at Yale 1875-87, and of experimental physics there from 1887-1906. From 1885 he has been in charge of the Sloane physical laboratory at Yale. He has published numerous professional papers, is a Fellow of the Royal Astronomical Society of Great Britain, and a member of various other learned societies. He has also published a 'History of the Class of 1859 of Yale College' (1914).

**WRIGHT, Carroll Davidson**, American statistician and sociologist: b. Dunbarton, N. H., 28 July 1840; d. Worcester, Mass., 20 Feb. 1909.

After studying law, he enlisted in the 14th New Hampshire volunteers at the outbreak of the Civil War, and in 1864 became its colonel. In 1865 he was admitted to the bar at Keene, N. H., in 1867 began practice at Boston, in 1872-73 was a member of the Massachusetts senate, and in 1873-88 chief of the Massachusetts Bureau of Labor Statistics. He was appointed national commissioner of labor in 1885, and he continued in this office for some time after his election as president of the collegiate department of Clark University (Worcester, Mass.) in 1902. In 1895 he became honorary professor of social economics in the Columbian University (now George Washington), and delivered lectures in numerous institutions. He was chosen president of the American Statistical Association, in 1902 chairman of the section on social and economic science in the American Association for the Advancement of Science and vice-president of the association, and in 1903 president. He was recorder of the commission appointed by the President to arbitrate in connection with the anthracite coal strike in the fall of 1902. In 1906 the order of Saints Maurizio e Lazzaro was conferred upon him by the king of Italy in recognition of his services as political economist. Besides numerous contributions to periodicals, he has published 'The Industrial Evolution of the United States' (1895); 'Outlines of Practical Sociology' (1899); 'Some Ethical Phases of the Labor Question' (1902); 'Battles of Labor' (1906); 'The Apprenticeship System in its Relation to Industrial Education' (1908). Consult Wadlin, H. G., 'Carroll Davidson Wright: a Memorial' (Boston 1911).

**WRIGHT, Charles Henry Hamilton**, Irish Anglican clergyman: b. Dublin, 9 March 1836; d. 1909. He was graduated from Trinity College, Dublin, in 1857, was Bampton lecturer at Oxford in 1878, Donnellan lecturer at Duldin 1880, Grinfield lecturer on the Septuagint at Oxford 1893-97, and vicar of Saint John's, Liverpool, 1891-98, examiner in Hebrew at the University of London 1897-99, at the University of Wales 1897-1901, and clerical superintendent of the Protestant Reform Society in 1898-1907. Among his numerous publications are 'Grammar of Modern Irish' (1855; ed. 1860); 'Book of Genesis in Hebrew' (1859); 'Bunyan's Works with Notes' (1866); 'Fragments and Specimens of Early Latin' (1874); 'The One Religion' (1881); 'Biblical Essays' (1885); 'Roman Catholicism in the Light of Scripture' (2d ed., 1897); 'The Intermediate State and Prayers for the Dead' (1900); 'Genuine Writings of Saint Patrick with Life' (1902); 'Daniel and his Prophecies' (1906).

**WRIGHT, Elizur**, American abolitionist: b. South Canaan, Conn., 12 Feb. 1804; d. Medford, Mass., 21 Nov. 1885. He was graduated at Yale in 1826, was professor of mathematics in Western Reserve College in 1829-33, and became identified with the anti-slavery movement in the last-named year. He then removed to New York, where he edited *Human Rights* (1834-35), and the *Quarterly Anti-Slavery Magazine* (1837-38), and was at the same time secretary of the Anti-Slavery Society. Removing to Boston in 1838 he there edited the

*chusetts Abolitionist, the Daily Chrono-* (1845), and *The Commonwealth*, its suc- (1850). He published 'Savings Banks Insurance' (1872); 'The Politics and ries of Life Insurance' (1873), etc., and (1858-66) insurance commissioner of chusetts. He wrote an introduction to ier's poems (1844), and published a trans- in verse of 'La Fontaine's Fables'

**RIGHT, Fanny.** See D'ARUSMONT, ES.

**RIGHT, George Frederick,** American or and geologist: b. Whitehall, N. Y., 22 338. He was educated at Oberlin College Theological Seminary, and held Con- onial pastorates at Bakersfield, Vt., 1861- d Andover, Mass., 1872-81. He was pro- of New Testament literature in Oberlin e 1881-92, and of the harmony of science eligion 1892-1907, when he became pro- emeritus retired on Carnegie pension. as connected with the United States gical Survey 1884-92. His works include 'Logic of Christian Evidence' (1880); 'es in Science and Religion' (1882); 'Relation of Death to Probation' (1882); 'Glacial Boundary in Ohio, Indiana and cky' (1884); 'The Divine Authority of ble' (1884); 'The Ice Age in North ca' (1889; 5th ed., 1911); 'Man and the l Period' (1892); 'Aspects of Christian ces' (1898); 'Asiatic Russia' (2 vols., ; 'Scientific Confirmations of Old nent History' (1906); 'Origin and Anti- of Man' (1912); 'See Ohio First' ; 'Story of My Life and Work' (1916). s edited the *Bibliotheca Sacra* since 1884.

**RIGHT, Harold Bell,** American novel- . Rome, N. Y., 4 May 1872. He was ed in the painting and decorating busin- 1887-92; was a landscape painter in 7, and in 1897-1908 he was a pastor in ristian (Disciples) Church. He later de- himself wholly to the writing of fiction, ing novels of great popular appeal and reached a unusually wide circulation. include 'That Printer of Udell's' (1903); 'Shepherd of the Hills' (1907); 'The z of Dan Matthews' (1909); 'The Win- f Barbara Worth' (1911); 'Their Yester-' (1912); 'Eyes of the World' (1914); 'a Man's a Man' (1916); 'The Re- on of Brian Kent' (1919), etc.

**RIGHT, Horatio Gouverneur,** American y officer: b. Clinton, Conn., 6 March d. Washington, D. C., 2 July 1899. He raduated at West Point in 1841, was atending engineer of the building of ackson at Tortugas, Fla. (1846-56); light- engineer in Florida (1852-53); and as- to the chief of engineers in Washington 61). He was active throughout the Civil ecame brigadier-general of volunteers in iber 1861, and took command of the De- nt of Ohio in August 1862. He com- d a division at the battle of the Wilder- corps at Spottsylvania Court House and arbor, 3 June; served as major-general battle of Opequon Creek, 19 Sept. 1864, ntributed to the decisive victory at Cedar 19 Oct. 1864. He was brevetted major-

general in the United States army for his serv- ices at the capture of Petersburg, 13 March 1865, and was mustered out of the volunteer service 1 Sept. 1866. He then returned to regular army duty as lieutenant-colonel of en- gineers, becoming brigadier-general and chief of engineers 30 June 1879, retiring 6 March 1884.

**WRIGHT, John Henry,** American classical scholar: b. Urumyah, Persia, 4 Feb. 1852; d. 25 Nov. 1908. He was graduated from Dart- mouth in 1873, and studied at Leipzig 1876-78. He was associate professor of Greek at Dart- mouth 1878-86, professor of classical philology at Johns Hopkins 1886-87, and after 1887 pro- fessor of Greek at Harvard and dean of the graduate school from 1895. He was editor-in- chief of the *American Journal of Archaeology* from 1897, and edited several important works, including Collingnon's 'Manual of Greek Archæology' (1886), and 'History of All Nations' (24 vols., 1902).

**WRIGHT, Joseph,** American artist: b. Bor- dentown, N. J., 16 July 1756; d. New York, 1793. He obtained his art education in England and Paris, in 1783 returned to America, and in that year painted a portrait of Washington. Sub- sequently he executed another for the Comte de Solms, and still later a miniature profile. Among his other portraits were those of Jay and Mad- ison. In 1792 he was made first draughtsman and die-sinker in the mint newly established at Philadelphia. He was the designer of the first coins and medals struck by the national govern- ment.

**WRIGHT, Joseph,** English philologist: b. 31 Oct. 1855. From 1891 to 1901 he was deputy- professor of comparative philology in the Uni- versity of Oxford, and in 1901 was made pro- fessor. Among his publications are a render- ing of Brugmann's 'Grundriss der vergleich- enden Grammatik der Indogermanischen Spra- chen' (Vol. I); textbooks of Middle Old High German, and a grammar of the dialect of Windhill in the West Riding of Yorkshire. But he is known for his 'English Dialect Dic- tionary' (6 vols., 1896-1905). In 1899 he was given a civil-list pension of \$1,000 per annum.

**WRIGHT, Luke E.,** statesman, diplomat: b. Tennessee, 1847. He has taken a prominent and active part in the affairs of his State, es- pecially in Memphis, where he has practised law. For eight years he was attorney-general of Tennessee, and during the epidemic of yel- low fever in 1878 he did much to relieve the suffering. From 1900 to 1904 he served on the United States Philippine Commission, of which he was president in 1903-04. In the latter year he became Civil Governor of the Philippine Is- lands, and was appointed Governor-General soon after. This position he held until 1906, when he became Ambassador to Japan, but re- signed soon after to become Secretary of War (1908-09).

**WRIGHT, Mabel Osgood,** American writer on nature, daughter of Samuel Osgood (1812-80) (q.v.): b. New York, 26 Jan. 1859. She was married in 1884 to J. O. Wright, and has made her home in Fairfield, Conn. She is contributing editor to *Bird Lore*, and has published 'The Friendship of Nature' (a series of outdoor studies, 1894); 'Birdcraft'

(a book on New England birds, 1895); 'Tommy-Anne: A Natural History Story' (1896); 'Citizen Bird' (with Dr. Coates, a book for beginners, 1897); 'The Dream Fox Story Book' (1900); 'The Flowers and Ferns in Their Haunts' (1901); 'Dogtown' (1902); 'The Garden, You and I' (1906); 'Gray Lady and the Birds' (1907); 'Princess Flower Hat' (1910); 'The Stranger at the Gate' (1913); 'The Hymn of the Flag' (soldier marching song, 1917); 'Captain of the Watch' (1918).

**WRIGHT, Marcus Joseph**, American soldier, brother of J. V. Wright (q.v.); b. Purdy, Tenn., 5 June 1831. He studied law, was admitted to the bar and practised his profession in Memphis till the outbreak of the Civil War, when he entered the Confederate army as lieutenant-colonel of the 154th Tennessee regiment. He was promoted brigadier-general in 1862, and was wounded at Shiloh. He has written 'Life of Gen. Winfield Scott' in 'Great Commander' series (1894); 'Life of Governor William Blount'; 'History of McNairy County, Tenn.'; 'Sketch of the Life of the Duke of Kent'; 'The Social Evolution of Woman'; 'Sketches of Confederate generals in Appleton's 'Cyclopedia of American Biography.' In addition he was also co-editor of 'Memoirs of Robert E. Lee' (with Gen. A. L. Long, 1886); 'Library of American History' (1900); 'General Officers of the Confederate Army'; 'Colonel David Crockett of Tennessee'; 'Life of Gen. John Peter Muhlenberg'; 'Tennessee in the War of 1861-65.' In 1878 he was selected by the Department of War as agent for the collection of Confederate records for the United States government.

**WRIGHT, Mary Tappan**, American novelist; b. Steubenville, Ohio, December 1851; d. 1917. She was a daughter of Eli Tappan, a president of Kenyon College, and in 1879 was married to John Henry Wright (q.v.). Her work in fiction which displays much keen characterization and charm of style, includes 'A Truce and Other Stories' (1895); 'Aliens' (1902); 'The Test' (1904); 'The Tower' (1906); 'Charioteers' (1912).

**WRIGHT, Orville**, American aviator and inventor; b. Dayton, Ohio, 19 Aug. 1871. He was educated in public and high schools until 1888. He became interested in kites and gliding machines and did much experimental work, together with his brother Wilbur (q.v.). From 1903 he devoted his attention mainly to developing a biplane. The first test was made at Kittyhawk, N. C., in 1903, and the first successful long distance test took place near Dayton, Ohio, in 1905. He afterward made numerous flights in the United States and abroad. He was awarded a gold medal by the French Academy of Sciences in 1909. He received the honorary degree of B.S. from Earlham College in 1909, and LL.D. from Oberlin College in 1910. In 1915 he sold his holdings in the Wright Aeroplane Company of Dayton.

**WRIGHT, Robert Ramsay**, Canadian biologist and educator; b. Alloa, Scotland, 23 Sept. 1852. He was graduated at Edinburgh University in 1873, removed to Canada in 1874, and in that year was appointed professor of natural history at University College, Toronto. He was professor of biology at the University

of Toronto in 1887-1912, and in 1901-12 he was also vice-president of the university and dean of the faculty of arts. Since 1912 he has been professor emeritus of biology. He was assistant director of the biological station of Canada after 1901. He served at different times as president of the Canadian Institute, the American Association of Anatomists and of the Royal Society of Canada.

**WRIGHT, Silas**, American statesman; b. Amherst, Mass., 24 May 1795; d. Canton, N. Y., 27 Aug. 1847. He was graduated at Middlebury College, Vermont, in 1815, studied law, was admitted to the bar in 1819, and established himself as an attorney at Canton, N. Y. In 1823 he entered the State senate, where he steadily opposed the political advancement of De Witt Clinton, which he regarded as dangerous to the Democratic party, of which throughout his life he was a firm adherent. He sat in Congress 1827-29, and there advocated and voted for the protective tariff of 1828. He also voted for the appointment of a committee to enquire into the expediency of abolishing slavery and the slave trade in the District of Columbia. He was comptroller of New York 1829-33, and a United States senator 1833-44. He supported Clay's compromise bill in 1833; voted against receiving a petition for abolishing slavery in the District of Columbia, and in favor of excluding from the mails all "printed matter calculated to excite the prejudices of the Southern States in regard to the question of slavery," voted for the tariff of 1842, though most of his political associates in the Senate voted against it; and voted for the annexation of Texas to the Union. In 1844, against his will, he was nominated by his party to be governor of New York, and was elected. President Polk offered him the office of Secretary of the Treasury in 1845, but he declined it, as he had previously declined a seat on the Supreme Court bench. As governor he vetoed a bill appropriating money for works on the canals, on the ground that the effect of the bill was to resume the enlargement of the canals which had been suspended by law in 1842, out of regard for the financial safety of the State; recommended legislation against the anti-renters, and on occasion of disturbances produced by them in Delaware County in 1845 proclaimed the county to be in a state of insurrection and called out a military force. Nominated for reelection in 1846, he was defeated by the Whig candidate. When the application of the Wilmot proviso to the territories obtained from Mexico was under discussion, Wright emphatically declared that the arms and the money of the Union ought never to be used to acquire territory then free for the purpose of slavery upon it. On the expiration of his term as governor he returned to his farm at Canton. Consult 'Lives' by Jenkins (Auburn 1848); Hammond (Syracuse 1848); Gillet (1874).

**WRIGHT, Thomas**, English antiquary; b. Tenbury, Shropshire, 23 April 1810; d. Chelsea, London, 23 Dec. 1877. He was graduated at Trinity College, Cambridge, settled in London, and devoted himself to the study of English history, literature and antiquities. He was one of the founders of the Camden Society, and of the British Archaeological Association.

Journal he edited 1843-50. Of the Percy and the Shakespeare Society he was active member, and in 1842 he was corresponding member of the French of Inscriptions. He edited a great of rare works connected with Early literature and history which have been in England by the societies above, and also published 'Queen Elizabeth Times' (1838); 'Essays on the Literary Superstitions, and History of the Middle Ages' (1846); 'Narrative of Magic' (1851); 'The Celt, the Saxon' (1852); 5th ed., 'Vanderings of an Antiquary' (1854); 'History of Ireland' (1857); 'Dictionary of Provincial English' (1858); 'of France' (1858-60); 'Essays on Historical Subjects' (1861); 'Manners and Customs in English During the Middle Ages' (1865); 'History of Caricature and the Grotesque' (1865); 'Womankind in Western Europe' (1869).

**WRIGHT, Thomas**, English biographer: Buckinghamshire, 16 May 1859. He was educated at Buxton College, Forest Gate, several years has been principal of the school at Olney. He is the founder of the Olney Society, and has published 'The Life of William Cowper' (1886); the novels 'The Life of Carden' (1889); 'The Blue Fire' (1892), and 'The Mystery of St. Dunstons' (1892); 'Life of William Cowper' (the biography of the poet, 1892); 'Life of Defoe' (1894); 'The Correspondence of William Cowper' (4 vols., 1904); 'The Story of a Lace Pillow' (1917), and several others.

**WRIGHT, Wilbur**, American aviator and inventor: b. near Millville, Ind., 1867; d. Dayton, Ohio, 29 May 1912. With his brother Orville he experimented with kites and balloons, and in 1903 constructed a successful airplane with which they made four flights. On 17 December at Kittyhawk, N. C. he constructed a number of biplanes in 1904-1905; the latter year went to France, where he won the Michelin prize for a successful flight in 1909 during the Hudson-Fulton celebration. In New York he flew from Governor's Island to the Hudson to Grant's Tomb and back. The Wright machine was afterward purchased by the United States army and the patents were sold for \$100,000. Wilbur was awarded a gold medal from the French Academies in 1909. See AERONAUTICS.

**WRIGHT, William Aldis**, English scholar: b. 1914. He was a contributor to 'Smith's Dictionary of the Bible' (1860-63), secretary of the International Testament Revision Company in London from 1868, the year of its establishment of the *Journal of Philology*. In 1871 became vice-master of Trinity College, Hartford, Conn. With W. G. Clarke he collaborated on 'The Cambridge Shakespeare' (1863-66) and the 7th edition of Shakespeare's complete works (1864). Among his other publications are 'The Letters and Literary Remains of Edward Fitz-Gerald' (1889); of the MSS. of Milton's 'Minor Poems' (1890); 'Fitz-Gerald's Miscellanies' (1900); 'The Letters of Edward Fitz-Gerald' (1901);

'Literary Remains of Edward Fitz-Gerald' (1902-03), and 'Milton's Poetical Works' (1903); 'English Works of Roger Ascham' (1904); 'The Hexaplar Psalter' (1911).

**WRIGHT, William Burnet**, American Presbyterian clergyman: b. Cincinnati, Ohio, 15 April 1838. He was graduated from Dartmouth in 1857; was four years pastor of the South Congregational Church, Chicago; 20 years pastor of the Berkeley Street Church, Boston, and three of the First Congregational Church, New Britain, Conn., and subsequently of the Lafayette Avenue Presbyterian Church, Buffalo, prior to 1901. In 1902 he retired from the active pastorate and has been occupied with lecturing and writing on various historical and literary themes. He has published 'Ancient Cities from the Dawn to the Daylight' (1887); 'The World to Come' (1887); 'Master and Men' or 'The Sermon on the Mountain Practised on the Plain' (1894); 'The Cities of Paul' (1906); 'The Heart of the Master' (1911).

**WRIGTIA**, an apocynaceous genus of small trees and shrubs, with long, loose branches, named after William Wright (1740-1827), a Scotch botanist resident in Jamaica. The flowers are salver-shaped, white, yellow or red, usually in terminal cymes, and have a short corolla-tube, five or more scales at the throat, and an exerted cone of sagittate anthers. *W. tinctoria* is a small tree, a native of Burma and Southern India. The wood resembles ivory in its hard, close grain and exquisite whiteness, and like that other species of the genus, is used for small articles of turnery. The tree is also known as ivory-tree, Pala and palay. The seeds are said to be used in dyeing, and the leaves, with the seeds of *Cassia tora*, yield a blue dye known as pala-indigo, but inferior to the genuine indigo. *W. tomentosa*, a small, deciduous tree, growing in India and Burma, has a yellow juice, which, mixed with water, produces a permanent yellow dye. It is used by the Nepalese to stop bleeding, and the bark is given as an antidote to snakebite. *W. antidysenterica*, a small tree found in India and Burma, is a most valuable remedy for dysentery; the Arabs and Persians consider the seeds as carminative, astringent, tonic and aphrodisiac. This tree is now classified under *Holarrhena*, and is a principal source of conessi- or pala-bark.

**WRIGHTSVILLE**, York County, Pa., on the Susquehanna River, 31 miles southeast of Harrisburg and 11 miles northeast of York, was the farthest point east reached by the Confederates during the Civil War. In the campaign preceding Gettysburg General Early was ordered to seize the bridge across the Susquehanna at this point, a wooden structure over a mile long, resting on stone piers. Included in the structure was a railroad bridge, a pass-way for wagons and also a towpath for the canal which here crossed the Susquehanna. On 28 June 1863 the bridge was defended by the 27th Pennsylvania militia, a few companies of the 20th and some other organizations and convalescents hastily collected, in all numbering about 1,200 men, under command of Col. J. G. Frick, 27th militia. Frick held an entrenched line about a half mile west of Wrightsville. General Gordon's brigade, with Capt. W. Tanner's

battery and White's battalion of cavalry, marching through York, appeared before Frick's position on the evening of 28 June and began skirmishing, under cover of which Gordon endeavored to cut him off from the bridge by a flank movement, but failed, and then opened fire with Tanner's artillery, to which Frick could not reply, being without guns. His rear threatened, Frick retreated across the bridge and fired it, leaving 18 or 20 prisoners in Gordon's hands. Gordon attempted to follow, but was checked by the flames. The bridge was totally destroyed and the flames communicated to the town of Wrightsville, consuming several buildings, but the further progress was arrested by Gordon's men. The destruction of the bridge was a keen disappointment to Early, who had hoped to cross it and attack Harrisburg from the east side of the river. On the 29th Gordon marched back to York.

**WRIT.** In general understanding a writ is a mandatory precept issued by the authority of and in the name of the executive branch of the State for the purpose of compelling the defendant to do some particular thing mentioned in the instrument. Writs are generally classified as mandamus, habeas corpus, summons, error, quo warranto, certiorari or review. Writs are further distinguished as original and judicial. Original issued without any order of the court in the particular case, judicial issued in pursuance of a decree or order or judgment of the court. A writ of mandamus is a command issuing from a court of law of competent jurisdiction, in the name of the State, directed to some inferior court, officer, corporation or person, requiring them to do some particular thing therein specified, and which appertains to their office or duty. In order to secure a writ of mandamus it is necessary to show (1) that the petitioner has a legal right to have the thing done which it is sought to be done; (2) that it is the duty of the respondent to perform it; (3) that the writ is the only plain, speedy and adequate remedy. A writ has a purely personal effect. An injunction—either mandatory or prohibitory—is a writ framed according to the circumstances of the case commanding an act which the court regards as essential to justice or restraining an act which it esteems contrary to equity and good conscience. Quo warranto is an order to show by what authority a given act is done or office held. A writ of error is a commission to a superior court by which they are authorized to examine the record in a case on which judgment has been given in an inferior court. Habeas corpus is an order issued by a magistrate to an officer in charge of the person of the defendant and designed to give summary relief against illegal restraint of personal liberty. Summons is a demand made to a person to appear at a given time before a court or officer. Certiorari or review is an order to a superior court to review the evidence presented before an inferior court. Consult Blackstone, 'Commentaries on the Laws of England'; Hallam, 'Constitutional History' (New York 1872); Hurd, 'On the Right of Personal Liberty' and 'On the Writ of Habeas Corpus' (2d ed., Albany 1876); Pollock and Maitland, 'History of the English Law' (2d ed., Boston 1899).

**WRITERS' CRAMP, or SCRIVENERS' CRAMP, or PALSY,** an occupation-neurosis to which those who do much writing, especially with the hand too tightly contracted, are very liable. A person with this trouble has no complete control over the muscles of the thumb and middle and forefingers, brought into use in writing, although other manual operations are performed without difficulty. The affection seldom manifests itself until toward middle age. The various methods of treatment that have been proposed have not been very successful. Small surgical operations have been performed with occasional but far from general good results. The application of electricity to the adductor of the thumb, and the kneading of the muscles of the ball of the thumb and the lower part of the forearm, so as to promote the circulation in those parts, are said to be beneficial, but the only way to obtain perfect relief is for the patient to abstain from writing altogether. If he is obliged to write he will do so with more ease if he uses a pen with a very thick handle. For extreme cases several contrivances have been devised for assisting the patient to write by altering the movements of the fingers in writing, and giving support to the ball of the hand. The typewriter has proved the best resource of those who suffer from the ailment. See NEUROSIS.

**WRITERS TO THE SIGNET,** in Scotland, where lawyers generally are called writers, an incorporated legal society dating from an early period of Scottish history. Originally, the name probably applied to clerks in the office of the Secretary of State, where was deposited the seal by which the king's letters and writs for the purposes of justice were authenticated. This duty was monopolized by this close society of practitioners, members being appointed, not by public officials, but by the organization. Thus the Writers to the Signet came to control admissions to the bar, like the English Inns of Court. They still retain a certain prestige at the bar, but their former monopoly has been taken away by recent statutes.

**WRITING,** the art of recording ideas by means of characters or figures of some sort impressed upon some kind of material substance. History, though it does not throw complete light on the origin of writing, suffices to show certain stages in its progress, and upon these a classification has been founded, which is, however, incomplete and unsatisfactory. The simplest classification and perhaps at an initiatory stage the best, is that which divides all writing into ideographic and phonographic, or signs representing the things symbolized by words and signs representing sounds, that is, words themselves. Less satisfactory is the classification of writing into three historical stages, the figurative, the transitional or conventional, and the alphabetic. In the first of these, to which hieroglyphic writing belongs, writing is supposed to be pictorial or immediately representative of objects. After this, in the transitional period comes symbolical writing, in which abbreviated pictures are transformed into arbitrary symbols, first of things and afterward of sounds and words. Lastly, with the prevalence of phonetic writing sounds are represented first in syllables and afterward

The course of writing is generally in the direction thus indicated, but it is inaccurate in misleading to represent these stages as they are in its progress. As the most modern writing contains traces of the first of these stages, so the earliest contains traces of the last. The majority of the letters in modern alphabets can be traced to symbols or abbreviations pictorially representative of things, but as writing originally represented is usually an object whose name begins with the sound represented by the letter, there is no evidence that writing was not originally intended in a double sense and used as a phonograph. In Egyptian hieroglyphics we have ideographs and phonographs mixed together. This, however, does not prove the absolute precedence of ideographs, but only the imperfection of the phonographic system in that system. The same thing occurs in the Mexican picture writing, which was supposed to be purely ideographic. Its pictorial signs are syllabic, not alphabetic. In the Chinese system we use figures and other symbols. Pictorial phonographic signs are too slow for any purpose, and with a less perfect phonographic system this would naturally occur much more frequently. It does not appear, moreover, that any transition from pictorial to phonetic writing is necessary through arbitrary non-pictorial symbols. Both of these modifications no doubt proceed simultaneously from independent causes. Pictorial signs not phonetized are abbreviated as well as phonetized, and when the phonetized abbreviations prevail the non-phonetized abbreviations would be phonetized also, thus producing the appearance of a transition from arbitrary pictorial signs to phonetic signs.

The reason why writing has had to pass through various stages of pictorial and more or less arbitrary symbolical representation before reaching the more perfect development of the alphabetic form is not very difficult to discover, and has an important bearing on the order of development. It is not because the representation of words is in itself more difficult to construct than the representation of things, or because when the desire for writing as a means of communication is excited the human hand is inadequate to the task of forming an entire phonetic system. Had phonetic writing in alphabetic representation been the only means of constructing a written symbol, the difficulties would doubtless have been overcome by one sustained effort, as they have been by many partial ones; but as the process was to be found and would suggest itself as a means of meeting the immediate demand, the more elaborate process was excluded and prevented by this process being performed. Nothing is easier than to see a rude pictorial representation of certain objects. To draw something resembling a word would be easier than to agree on a sign to represent the word man, hence ideographs naturally precede phonetic symbols. But for the same reason the earliest systems of writing would not be purely ideographic but mixed. There are many things which form the basis of the least sophisticated human communications which cannot be represented pictorially. When writing was first practised these were already represented by words, and

the idea would naturally occur to form a sign to represent the word, that is, a phonetic sign. These signs could not be directly pictorial, but they might be allegorical or symbolic, and in the absence of analysis of sound they probably would take that form, although the direct intention was to suggest conventionally a specific word by the symbol. This sort of symbol might be called a mnemonic. From such symbols to merely arbitrary syllabic and alphabetic symbols the transition would be easy.

It is generally agreed that writing was introduced to the western nations by the Phœnicians, and it is commonly believed that the Phœnician system was based on the Egyptian but the comparative antiquity of the Egyptian and Assyrian or Akkadian, the hieroglyphic and cuneiform systems, cannot be definitely determined. The Egyptians attributed their writing to Thoth, and the first characters are said to have consisted of portraits of the gods. The cuneiform writing, which is cumbersome and exceedingly difficult to read, has been adapted to several languages, the Akkadian, the Assyrian, the Persian, etc., in a variety of ways, ideographic, syllabic and alphabetic. The Egyptians had three distinct kinds of writing, the hieroglyphic, the hieratic and the demotic. The first is a mixed system, containing large numbers of signs of various characters, ideographic and phonetic. It is used chiefly for inscriptions on monuments and public buildings. The hieratic is a cursive hand abridged from the hieroglyphic for use on papyrus. Both these forms were sacred, and the priestly caste only were initiated in them. The demotic was introduced much later than the other forms. It was used for trading and common purposes, and in civil documents. The hieratic writing was more phonetic than the hieroglyphic, and the alphabetic character prevailed in the demotic. The first was written in any direction according to the form of the surface; the hieratic was at first written in columns, but afterward always in horizontal lines. The hieratic and demotic are read from right to left, but the individual letters are formed from left to right. The connection between the Egyptian and the Semitic writings, to which the Phœnician belongs, is by no means unanimously admitted, many scholars holding that the resemblances between them may be explained by the independent adoption of common principles. The leading Semitic forms are the Samaritan or ancient Hebrew, the Chaldee or East Aramaic, the Syriac or West Aramaic, and the Kufic or early Arabic, which continued to be used in manuscript for several centuries after the Mohammedan conquest, after which it was replaced by the Neshki or modern Arabic, which, with some slight modifications, is the same with the modern Persian. The Hebrew alphabet now in use, the Babylonian or East Aramaic, is entirely consonantal, the vowel points being of modern origin. The Phœnician which forms the basis of the western languages was of a similar character. Phœnician writing was anciently represented to have been brought by a Cadmean colony to Bœotia about the 16th century B.C. (see CADMUS); and a certain number of the Greek letters are undoubtedly of Phœnician origin. (See the section on language and writing in the article GREECE). The

Greeks at first wrote from right to left, and afterward adopted the method called *boustrophedon*, from the motion of the ox in plowing, that is, alternately from right to left, and from left to right. Writing from left to right was said to have been introduced in the time of Homer by Pronapides of Athens. The various modifications which the Phœnician or Pelasgian forms underwent in Italy are to be found by comparison of the Oscan, Etruscan, Umbrian and early Latin inscriptions. In the ancient Greek and Roman writing, and even for a time in the mediæval writing of Europe, the words were not separated by spaces, and no punctuation marks were used. The present cursive characters with modifications occur in Greek inscriptions of the age of Augustus. In mediæval manuscripts a variety of styles were adopted in different epochs and countries and for different uses, to describe which in detail would require a separate treatise. In France the various styles were called after the dynasties under which they prevailed: Merovingian, Carolingian, Capetian, Valesian and Bourbon. There were also a variety of styles used for different purposes distinguished by such names as *majuscule* and *minuscule* (great and small letters), diplomatic minuscule and many others. Capitals were not then used as now to distinguish prominent words, but whole manuscripts were written in large or small capitals. There were also a variety of mixed styles. From the 8th to the 11th centuries writing with *tremblements* was affected in France. The diplomatic minuscule was a mixture of minuscule and cursive characters distinguished by an unusual prolongation of the long letters. Uncial letters, which prevailed from the 7th to the 10th centuries, were rounded capitals with few hair-strokes. The practice of ornamenting pages began in the 8th century, and the earliest manuscripts are also without title pages. The so-called Gothic characters, in reality of scholastic origin, are merely fanciful deviations from the Roman types, such as the rounding of straight limbs, the substitution of angular facets for rounded forms, with hair-lined projections from the extremities contrasting with massive body-strokes. They became common in inscriptions from the 13th to the 15th centuries, and were employed in church-books from the time of Saint Louis. The Gothic cursive was introduced about the middle of the 13th century. The modern German alphabet was also introduced in the 13th century. In England a variety of styles called Saxon prevailed in the early Middle Ages. An elegant mixed style was formed of a combination of Roman Lombardic and Saxon characters. The Norman style of writing came in with William the Conqueror. The old English form of Gothic dates from the middle of the 14th century. The English "court hand," an adaptation of Saxon, prevailed from the 16th century to the reign of George II. In regard to the antiquity of writing in other parts of Europe, it was known to the Gauls before the time of Cæsar; but no traces of the ancient writing remain, and whether it was derived from the Greeks or the Phœnicians is doubtful. There are slight traces of writing in Britain previous to the Roman period, but if it were employed by the Druids, as Cæsar says, it may have existed without leav-

ing remains. The Germans claim the knowledge of writing previous to their contact with the Romans; but in their case also we are without early remains. The Runic alphabet used for many centuries in Denmark, Norway, etc., may have been employed long before the Christian era.

In the East we find one of the most striking contrasts in the history of language. The Chinese, who have an ancient system of writing which they attribute to Fou-hi, have never reached the alphabetic system. Their characters are syllabic, and as Chinese words are monosyllabic, they are strictly ideographic. They have been adopted in this way by peoples speaking not only different dialects, but different languages, who apply the signs to words of different sound but of the same signification as the original. The Chinese system is said to contain 40,000 characters. They were originally hieroglyphic, but from difficulty of interpretation have become conventional. There are, of course, certain general principles of combination and construction, but to master the whole system is said to be the work of a lifetime. Only a limited portion of it can, therefore, have any real existence as a medium of communication. Sanskrit, on the other hand, possesses the most perfect known alphabet. The Hindus claim to have derived it from the gods, and call one form of it *devanāgarī* (divine city). It is wholly different from the Semitic, and is founded on a much more complete and subtle analysis of sound. Its consonant signs number 33, its vowel signs 14. They are applied with an analytical method which gives a power of distinction vastly superior to that of European alphabets, and which is greatly admired by scholars. Sanskrit is written from left to right. By means of its derivatives it is widely diffused in the East. The Pali, which forms the sacred language of the Buddhists, has carried it far beyond India. The Burmese Pā character is square, the Siamese round. To complete the vagaries which have prevailed in the direction of writing, the Mexican picture writing was written from bottom to top. See ALPHABET; CUNEIFORM WRITING; ETYMOLOGY; HIEROGLYPHICS; LANGUAGE, SCIENCE OF; PALEOGRAPHY; SPEECH.

**WRONG, George Mackinnon**, Canadian educator: b. Ontario, 25 June 1860. He was educated at University and Wycliffe colleges in Toronto, took orders in the Church of England 1883, but has since devoted his entire time to academical work, and in 1894 succeeded Sir Daniel Wilson as professor of history in the University of Toronto. He has published 'The British Nation: a History' (1903); 'The Earl of Elgin' (1905); 'A Canadian Manor and Its Seigneurs' (1908); 'The Fall of Canada' (1914). He is co-editor with H. H. Langue of the annual *Review of Historical Publications Relating to Canada*, founded in 1897.

**WRYBILL**, an extraordinary plover (*Archynchus frontalis*) of New Zealand, which is unique in having a bill bent sideways near the tip, always toward the right. By this peculiarly adapted instrument it seems to be able to reach and obtain many small crustaceans, etc., which are able to creep under stones out of reach of all the other shore-birds of the region, which have only the ordinary straight kind of

The questions and inferences which arise in the mind of the evolutionist in view of this will be found treated in Newton's 'Dictionary of Birds,' with references to other authorities. See PLOVER, and consult Buller, 'Birds of New Zealand' (London 1888).

**RYNECK**, a European bird (*Iynx or torquilla*), related to the woodpeckers, has a habit of twisting its head in a peculiar manner. This bird visits Great Britain annually, arriving in April, usually with or before the cuckoo, and hence is named the cuckoo's mate." The food consists of insects, chiefly of ants and their pupæ. It is also fond of eating elderberries. The tongue is long and extensible, like that of the woodpeckers. The nest is formed in the holes of trees, and the number of eggs varies from six to ten.

**RYNECK**. See TORTICOLLIS.

**U-CHANG**, woo'ch'ang', or **WU-CHANG**, China, a city of the province of Hunan, on the Yang-tse-kiang, opposite the city of Yow. The latter is in effect but a suburb of U-chang, another portion on the north bank of the river being Hanyang. It is the great emporium for the tea exported by way of Shanghai. It has a government college and mint, sugar, cotton mills and an electric-lighting plant. Pop. variously estimated from 500,000 to 1,000,000.

**U-HU**, woo'hoo', China, a treaty-port, opened in 1877, in the province of Ngan-hwei, on the right bank of the Yang-tse-kiang River, 200 miles west of Shanghai and 60 miles from Nanking. Some manufactures and a considerable trade are carried on. Canals connect it with a large productive region. Cutlery and cord are its principal products. Its commerce now aggregates about \$22,000,000. U-hu suffered severely in the Tai-ping rebellion. Pop. about 92,000.

**LI TING-FANG**, Chinese statesman and diplomatist: b. Singapore, 1842. He was educated at Saint Paul's College, Hongkong, and studied law at Lincoln's Inn, London. He was in the service of the colonial government as a magistrate in the law courts in 1862-74, and on his return from England in 1877 he entered into law practice in Hongkong. In 1882 he was appointed to the official staff of Li Chang, at that time governor-general of China and Grand Chancellor of China. He was one of the peace commissioners who, under the leadership of Li Hung Chang, negotiated the Treaty of Shimonoseki at the close of the Sino-Japanese War, and he occupied high governmental offices at Peking. He was appointed Minister to the United States in 1896, but in 1902 he was recalled to aid in the negotiation of several commercial treaties. He was appointed to the new department of commerce in 1903; was Minister of the Department of Punishments in 1905-06, and in 1907 he remodeled the Penal Code. He was Minister to the United States in 1908-10. He was one of his broad statesmanship, deep learning and great diplomatic talent gained for him the respect and liking of the United States. He was made a member of the permanent Court of Arbitration at The Hague. He published 'America Through My Spectacles' (1914).

**WUCHOUSEN**, the great wind eagle, a mythological character, universally believed in by the numerous tribes of Algonquin Indians. Of him many fabulous stories are told. According to the Passamaquoddy legend, in which he is called The-Bird-who-Blows-the-Winds, Wuchousen lives far in the north, on a huge rock whose top reaches up into the region of the cloudland, at the very end of the sky. When he flaps his wings the winds blow over all the earth and all the cloudland. In the olden days Wuchousen was so fond of blowing, of flapping the wind with his monster wings, that men could not live in peace, for the fear of the tempest was ever upon them. So terrible were these tempests that even Kulóskap, the Master of Men and Beasts, was often afraid to venture out upon the sea to fish as was his pleasure. At last he made up his mind to bring the wind eagle to time and make the earth safer for all. So he made a long journey into the far northland, on the very outer border of the world. There he found Wuchousen flapping his mighty wings and screeching louder than the howling tempest he was winging up. Kulóskap protested against this, representing to the wind eagle that he had already made the world uninhabitable and requested him to modify his tempest-making. To this Wuchousen replied that since time began he had blown always in this way, that his wings needed exercise and that he proposed to go on flapping them no matter what happened to the rest of creation. In a rage, Kulóskap, changing himself into a monstrous giant, higher than the clouds, seized the wind eagle and, tying his wings together, cast him down from his high cliff into the sea thousands of feet below. Unable to move, the eagle exercised all his magic power and made the waters so putrid that they poisoned all the streams and the rain that fell from the clouds, so that Kulóskap was forced to release him, for being a spirit, he could not kill him. But that he might not again become incommode and endanger the world, he left one of his wings tied, when he replaced him on top of his high cliff. Since that time, in the long past, Wuchousen has been able to raise a wind only half so strong as he used to; and though he often raises a tempest, yet, flapping only one wing, he soon grows tired and then the tempest subsides.

**WULFENITE**, native lead molybdate. It is generally admitted that the best specimens of this mineral are among the most beautiful minerals known. It crystallizes in hemimorphic tetragonal crystals. They are usually in square tabular plates, sometimes very thin and transparent, but occasionally in elongated pyramidal forms and nearly opaque. The mineral also occurs in crystalline masses. It is very brittle, has a hardness of about 3 and is very heavy, its specific gravity ranging from 6.7 to 7.0. Its lustre is resinous to adamantine, and colors are various shades of yellow, orange, red, grayish or greenish. It is associated with other lead ores at many localities, as in Austria-Hungary, and New South Wales, but the United States localities are far more important. Magnificent specimens occur in the Red Cloud and Mammoth mines of Arizona, in the Organ Mountains,

New Mexico, at Eureka, Nev., and Tecorra, Utah. It was named in honor of the Austrian mineralogist, Wulfen, and has been used to a limited extent as an ore of molybdenum.

**WULFSTAN**, wulf'stān, **WULSTAN**, or **WOLSTAN**, (1) Anglo-Saxon prelate: b. Long Itchington, Warwickshire, about 1007; d. Worcester, 18 Jan. 1095. Educated at Evesham and Peterborough, he became a monk in the monastery of Worcester and in 1062 was consecrated bishop of Worcester. He was one of those who submitted to William the Conqueror at Berkhamstead in 1066, and was allowed to retain his see. The crypt of the present Worcester cathedral represents the church which Wulfstan caused to be erected between 1084 and 1089. He was a man of saintly character and loyal devotion to his work, and he is credited with having induced the merchants of Bristol to stop their traffic in slaves. He assisted in the Domesday survey, and led the defense of Worcester against the rebellious nobles, commanded by Roger de Montgomery. He was buried in Worcester cathedral, and was canonized in 1203, his day being 19 January. Consult 'Life,' by William of Malmesbury, 'De Gestibus Pontificum.' (2) Wulfstan: b. about 950; d. 1023. He was archbishop of York, and has been regarded as the author of 'Wulfstan's Homilies,' first printed in 1701. (3) Wulfstan of Winchester, a monk of the 9th century, who wrote metrical lives of Saint Swithin and Saint Ethelwold.

**WUNDT, Wilhelm (Max)**, German physiologist, psychologist and philosopher: b. 16 Aug. 1832, near Mannheim. During the years 1851-56 he studied at Tübingen, Heidelberg and Berlin. In 1857 he became privatdozent, and in 1864 assistant professor of physiology at Heidelberg where he remained until 1874. Here he wrote his first important books 'Die Lehre vom der Muskelbewegung' (1858), 'Beiträge zur Theorie der Sinneswahrnehmung' (1858-62), 'Vorlesungen ueber die Menschen- und Tierseele' (1863; 4th ed., 1906), 'Lectures on Human and Animal Psychology,' trans. by J. E. Creighton and E. B. Titchener, 1894), 'Lehrbuch der Physiologie des Menschen' (1865; 4th ed., 1878), 'Grundzüge der physiologischen Psychologie' (1874; 6th ed., 1908-11). In the 'Vorlesungen' and the 'Grundzüge' Wundt points the way to a new psychology, one defined not by a differentiation of objects, but by point of view, one that is experimental in its method, and one capable of including much of the psychology of Herbart and Lotze, the psychophysics of Weber and Fechner, and the sense-physiology of J. Müller and Helmholtz. In 1874 Wundt went to Zürich as professor of philosophy, and in the following year was called to a similar chair at Leipzig where he has since remained. In 1879 he established the first psychological laboratory and in 1883 the *Philosophische Studien*, devoted chiefly to the contributions of the Leipzig school. This ceased publication with the 20th volume in 1903, but a new series, the *Psychologische Studien* was begun in 1906. In 1886 appeared 'Grundriss der Psychologie' (Outlines of Psychology, trans. by C. H. Judd, 1897; 3d ed., 1907), and in 1900 the first installment of his 'Völkerpsychologie' (Vol. V of the 2d ed.,

completed in 1914), the development of language, custom and religion from the psychological point of view.

Meanwhile he found time also for philosophy. 'Logik,' an inquiry into the theory of knowledge and the methods of scientific investigation, was published in 1880-83, 'Ethik,' an investigation of the facts and laws of the moral life, in 1886 (Eng. trans. by E. B. Titchener, J. H. Gulliver and M. F. Washburn, 1897), 'System der Philosophie,' in 1889, 'Einleitung in die Philosophie,' in 1901 and 'Kleine Schriften,' Vol. 1, philosophical essays, in 1910. Wundt's system of philosophy has been characterized as the science of the sciences. He attempts to "unite into a consistent system the general knowledge contained in the various sciences, and to trace back to their principles the general methods and presuppositions of science in general." As regards his success, Külpe says, "Wundt's ability to familiarize himself thoroughly with all fields of knowledge, and to enrich them all by his ingenious combinations, by his inspiring ideas and researches, and by a rare gift for systematic-architectonic analysis, has made him not only the greatest all round scholar of our time, but also the most successful representative of those who aim at a mediation between philosophy and the special sciences. In this respect he may be called a modern Aristotle or Leibnitz."

(London 1915); Külpe, O., 'The Philosophy of the Present in Germany,' trans. by Patrick, M. L. and Patrick, G. T. W. (New York 1913); Titchener, E. B., Geisser, L. R. and Foster, W. S., 'A Bibliography of the Scientific Writings of Wilhelm Wundt,' in *American Journal of Psychology*, XIX, 1908 and subsequent volumes.

**HARRY P. WELLS**,  
Assistant Professor of Psychology, Cornell University.

**WUOTAN**, the High German name of the Teutonic god of the winds and storms. See ODIN.

**WUPPER**, woop'për, Germany, a river in the governments of Cologne and Düsseldorf of the Prussian province of the Rhine. It rises on the Westphalian frontier, and flows first northwest and then southwest, joining the Rhine between Cologne and Düsseldorf after a course of about 60 miles. It is not navigable for vessels of any size, but it provides considerable power for manufacturing purposes. Its valley is the most populous in Germany, and contains the important industrial towns of Barmen, Elberfeld and Solingen. In its upper course it is called the Wipper. Consult Schmidt, A., 'Die Wupper' (Lennep 1902).

**WURDHA**, wūr'da, India. See WARMA.  
**WURMSER**, woorm'zër, Dagobert Altmur, Count von, Austrian general: b. Almt. 22 Sept. 1724; d. Vienna, 22 Aug. 1797. He served three years in the French army, but

for the Austrian service, where he commanded a hussar regiment during the Seven Years' War, attaining the rank of major-general. During the Bavarian war of succession he commanded a special corps of the army in Italy, and after the peace was made commanding general in Galicia, and in 1787 general of cavalry. By the outbreak of the French Revolution his family lost their estates in Alsace. In May 1796 the critical conjuncture of affairs in Italy after the defeat of Napoleon led to the appointment of Wurms as the commander of the second Austrian army destined to act against Bonaparte.

At the head of 60,000 men he obliged Bonaparte to raise the siege of Mantua; but the defeat of his main body at Castiglione, Bassano and Bassano, rendered his situation very critical. He finally forced his way into Mantua, of which the blockade was relieving him; and at length, in February 1797, seeing the impossibility of any longer continuing the defense, Wurms surrendered to Napoleon and was himself allowed freedom.

**URORA**, India. See **WARORA**.

**WURTS, John**, American educator and writer: b. Carbondale, Pa., 10 July 1855. Was educated at Yale and after traveling in Asia as a newspaper correspondent (1876-77) graduated from the Yale Law School in 1880 and practised his profession in Jacksonville, Fla., 1884-96. From 1897 he was professor of law of real property and equity at Yale as lecturer on law of contracts at West in 1916. In 1914-15 he was exchange professor at the University of California. He is author of 'Minor and Wurts on Realty' (1910); 'Complete Revision to Date Florida Index Digest' (1910); and author of the Anti-Slavery Movement with its Relation to the Federal Constitution' (1883); 'Burn on Real Property' (1902); 'Cases on Real Property' (1905); 'A Bit of Judicial History' (1911); 'Jury System Under Changing Conditions' (1912).

**WÜRTTEMBERG**, würt'tēm-bēry, or **WÜRTTEMBERG**, until 1918 a southwestern and kingdom of the late German empire between Bavaria, Baden, Hohenzollern, the Lake of Constance, which separates it from Switzerland; area, 7,534 square miles. It is formerly included in the territory of Swabia (q.v.). Except a few tracts in the north, the surface is hilly and even mountainous. In the west the Schwarzwald, or Black Forest, forms part of the boundary, and the Rauh Alp, forming part of the Franconian Jura, covers an extensive tract. The Danube belongs in large part to the basin of the Rhine, being drained northward into that by the Neckar, while the Danube flows through the southern districts. A part of the Lake of Constance is also included in Württemberg. The climate is temperate. In the lower and more favorable districts the fig and melon grow in the open air, and the vine, cultivated on an extensive scale, produces several first-class wines; maize, wheat, hops, tobacco and which is employed in cider making, are

chiefly cultivated. About a third of the country is under forests, which consist mainly of oaks, beeches and pines. Of minerals, the most valuable are iron and salt, both of which are worked by the government; the others are limestone, gypsum, alabaster, slate, mill-stones and potter's-clay. The manufactures consist chiefly of cotton, woolen and linen goods, paper, wooden clocks, toys, musical instruments and chemical products. The government until November 1918 was a hereditary constitutional monarchy, the executive power being lodged in the sovereign, and the legislative jointly in the sovereign and a parliament, composed of an upper and a lower chamber. The yearly revenue from all sources is about \$32,000,000, and the public debt, the bulk of which was incurred in constructing the state railways, was, previous to the war of 1914-18, about \$160,000,000. There was no exclusively established religion under the monarchy, but the king was invested by the constitution with the supreme direction and guardianship of the Evangelical Protestant Church. Education is generally diffused and the centre of the educational system is the University of Tübingen. Besides Stuttgart (the capital), the chief towns are Ulm, Heilbronn and Esslingen. The history of the state is of little general interest. Previous to the Napoleonic era the rulers had the title of duke, but in 1806, by the favor of Napoleon, the then duke gained a great accession of territory, as well as the title of king. In the subsequent arrangement of the European states by the Congress of Vienna the territorial accessions were confirmed and the kingly title formally recognized. In the war of 1866 Württemberg sided with Austria against Prussia. It became a member of the German empire on its foundation in 1871. After the collapse of the German imperial armies on the western front in November 1918 and the establishment of a republic in Berlin, the Württemberg monarch abdicated the throne and Württemberg became a constituent state of the Republic. Pop. 2,437,574. Consult Gaupp, 'Das Staatsrecht des Königreichs Württemberg' (Freiburg 1895); Hirschfeld, 'Württemberg's Grossindustrie und Handel' (Leipzig 1889); Belschner, 'Geschichte von Württemberg' (Stuttgart 1902); Schliz A., 'Urgeschichte Württembergs' (Stuttgart 1909).

**WURTZ**, wurts, **Charles Adolphe**, French chemist: b. Strassburg, 26 Nov. 1817; d. Paris, 12 May 1884. He went to Paris in 1845, in 1851 became professor at the Agronomic Institute, Versailles, in 1853 was made professor of organic chemistry at the Sorbonne and professor of toxicology at the Ecole de Médecine. From 1866 to 1876 he was dean of the Sorbonne faculty of medicine. He made important discoveries in connection with compound ammonias, glycol and alcohol; and rendered a valuable contribution to theoretical chemistry in distinguishing the atomic relations of organic compounds. Among his numerous works on chemistry are 'La théorie atomique' (1878); 'Leçons élémentaires de chimie moderne' (1868); 'Traité de chimie biologique' (1885). Consult Friedel, 'Notice sur la vie et les travaux de C. A. Wurtz' (1884).

**WURTZ**, **Henry**, American chemist: b. Easton, Pa., 5 June 1828; d. 10 Nov. 1910. He was graduated from Princeton in 1848, studied

further at the Lawrence Scientific School of Harvard, was State chemist of New Jersey 1854-56, chemical examiner in the United States Patent Office 1859-61, and from 1871 to 1875 edited the *American Gas Light Journal*. He was closely identified with the earlier investigations of natural and artificial gas and the use of petroleum as fuel. He proved the existence of gold in sea water. In 1888 he entered the employ of T. A. Edison (q.v.), as chemist, and afterwards made several important chemical discoveries, chief of which is that of the geometrical laws of the condensation of chemical molecules. Other important investigations are described in his scientific monographs. Author of 'Obtaining Potash Compounds from Greensand Marl' (1850); 'Geometrical Chemistry' (1876); 'Discovery of Lake Superior Silver Minerals, Hunttilite and Animikite' (1878), etc.

**WURTZILITE**, an asphalt (claterite) mined extensively in Wasatch County, Utah, and used for roofing material, waterproof felts, building paper, rubber substitutes and paving materials. Color black, but deep red in thin plates. Practically insoluble in gasoline (76°) and only partly soluble in ether, carbon disulphide, turpentine and carbon tetrachloride.

**WURTZITE** (named for C. A. Wurtz, q.v.), in *mineralogy*, a dimorphous form of zinc blende. Crystallization, hexagonal; hardness 3.5 to 4; specific gravity, 3.98; lustre, resinous; color, brownish black; streak, brown; composition, a sulphide of zinc, ZnS; occurrence, in a silver mine near Oruro, Bolivia, in Portugal, Peru, and near Butte City, Mont. Its artificial manufacture is accomplished by fusing equal parts of zinc sulphate with calcium fluoride and barium sulphide.

**WÜRZBURG**, Bavaria, city and capital of Lower Franconia, on the river Main, 62 miles southeast of Frankfurt and at the junction of the main railway lines to Nuremberg and Bamberg. The river is crossed here by three bridges, of which the first is a stone structure built in 1474-1607; while the modern bridges were built in 1887 and in 1894. The town is built on both sides of the river, but the main portion of it is on the north bank. The older portion of the city is of quaint and irregular pattern, but the modern suburbs are handsomely laid out, with broad promenades. There are many mediæval buildings in a good state of preservation and several ancient churches. Among the churches are the Romanesque cathedral dating from 1042-1189, with additions of later date; the Marienkapelle, a Gothic structure built in 1377-1441; the Haugerstiffs Church, in Italian Renaissance style, 1670-91; the Neumunster Church, dating from the 11th century, and the church of Saint Burkhard, built in 1033-44. A notable structure is the palace, built in 1720-44 as a residence for the bishops and grand dukes of Würzburg. The bishopric dates from 741, but the town existed earlier. From the 12th century the bishops had ducal authority. The bishopric was secularized by the Peace of Lunéville in 1803, and Würzburg came under Bavarian control. By the Peace of Pressburg in 1805 it became an electorate under Ferdinand III, former grand duke of Tuscany, who took the title of Grand Duke of Würzburg and joined the confederation of the Rhine. It was restored to Bavaria

in 1815. A new bishopric, without ducal authority, was established in 1817. The city was bombarded and captured by the Prussians in 1866.

The University of Würzburg (q.v.) adds considerably to the importance of the town, and there are also schools of agriculture and horticulture, a royal music school and other educational institutions. The city is surrounded by vineyards which produce excellent wine. Manufactures include furniture, machinery, scientific instruments, railway carriages, brick, chocolate, beer, malt and vinegar. It is an important commercial centre. Pop. about 84,406.

**WÜRZBURG**, University of, a German educational institution founded at Würzburg, Bavaria, by Bishop Julius in 1582. An earlier university of the same name existed at Würzburg for a short time after 1403, but passed out of existence. The university was founded as a Roman Catholic institution and its chairs of theology and philosophy were held by Jesuits until the suppression of the order in 1774, but theological instruction remains in Roman Catholic hands. The faculty of medicine early became famous and has remained the most important in the university; taking, with its kindred departments of dentistry and pharmacy, more than half the students enrolled. The university was reorganized after Würzburg passed under Bavarian control in 1803. The library contains nearly 400,000 volumes. There are about 1,400 students and 100 instructors. Here W. K. Röntgen conducted the experiments which led to his discovery of the Röntgen rays in 1896.

**WUSHKUM** (from the name of their chief village), meaning a species of louse or flea, a tribe of the Chinookan stock of North American Indians. They call themselves *Tlaq-luit*, and are the Echeloot of Lewis and Clark and the Wisham, Wishram, etc., of other writers. They occupy the north bank of Columbia River, Washington, from Tenino to the neighborhood of White Salmon River. They subsist largely on salmon, and are not reservation Indians, although they took part in the Yakima treaty of 1855. As they are given to wandering up and down the coast and as they have mixed, to some considerable extent, with neighboring tribes, it is very difficult to estimate their population.

**WUTHERING HEIGHTS**, Emily Brontë's one novel, was published in 1847 under the pseudonym "Ellis Bell." Though an almost complete failure with both the public and the critics it was reissued in 1849 with an introduction by Emily's more famous sister, Charlotte, the author of 'Jane Eyre.' The work is a belated and unconventional specimen of the so-called Gothic Romance or novel of terror, inaugurated by Horace Walpole's 'Castle of Otranto.' Its scene is a bleak mansion on the Yorkshire moors, the home of the Earnshaw family, into which is introduced the founding Heathcliff, picked up by Mr. Earnshaw on the high road. The story deals with the fiercely revengeful life of Heathcliff, who develops under ill usage and neglect an appalling cruelty, coupled with an inflexible will and a strange power of fascination. He gains control of the Earnshaw property and brings up Hareton, an

besotted Hindly Earnshaw, whom he in brutal ignorance. The one redeeming in his distorted and Satanic nature is his love for Hindley's sister, Catherine, which saves both her marriage to Edgar Linton and her death. Thwarted by Catherine's daughter, Earnshaw endeavors utterly to debase Hareton Earnshaw. Heathcliff starves himself to death, and is exhilarated by the spectral presence of a woman who, despite his cruelty, of which he himself felt the effect during her life, had belonged to him in spirit.

Emily Brontë's story is a wild and passionate one, far removed from real life, which Emily Brontë touches scarcely at all. Scenes of domestic violence succeed each other in a way which is too much for the reader's nerves. The characters are the creation of a lawless but extraordinarily vivid imagination, and the whole is written with an energy which triumphs over the obvious limitations of its author's art. The latest edition, with introduction, etc., is that of W. K. Shorter, 'The Complete Works of Emily Brontë' (Vol. II). Consult also, W. K. Shorter, 'Charlotte Brontë and her Works'; and the essay on Emily Brontë in 'The Miscellanies.' JAMES H. HANFORD.

**WYANDOT**, or **HURON** (English adaptation of the French *Ouendat*, or *Houandate*, written *Guyandotte*, from the native *Gendat*, signifying, "They are islets"). A tribe composed of the remnants of several politically independent Indian tribes and confederacies whose political integrity was destroyed by the introduction of the middle of the 17th century. These peoples may be mentioned the *Andagouandats* (or *Houandate*), or *Huron* confederacy, which was composed of four tribes, the *Attigneenongnahac*, the *Attignawanan*, the *Arendahronons* and the *Tohontaenrat* (*ohontakenrat*), and also, later, the affiliates known as the *Ataonchronons* (*Ataronons*), the *Wenrohronons*, and the *Atonchronons* (*Muskra* people), the last being *Wyandot*; and the *Tionontateronons*, the *Atlaronk* (*Attioendarankhronon*) or *Neutonen*, and lastly, the *Eries*. To the *Atlaronk* may be added the small affiliate known as the *Aondironon* and the *Ongnion* (*Ongmarahronon*). The first known members of these several peoples was south and west of the Lakes Huron and Erie, in the present territory of Ohio and Pennsylvania and western Ontario, Canada, and the northern shore of the Saint Lawrence River as far as the site of Quebec. To-day the *Wyandots* are called live in Oklahoma, where they number about 300; and at Lorette, Quebec, where some *Hurons* who are in fact *Wyandots*, dwell, numbering about 400; the aggregate about 700. All these tribes were first encountered by Europeans were introduced into well-governed communities. The social and political organizations were based on bloodkinship, real or fictitious. Fictitious kinship was obtained through the rites of adoption. These peoples dwelt in lodges constructed of bark, which were long in figure, the lodges having as many as 10 or 12 families with a family on two sides of each fire. The lodges were usually collocated into villages, some of which were quite strongly palisaded.

For their sustenance they depended chiefly on agriculture, raising corn and beans of several varieties, squashes and sunflowers for oil. They tanned and dressed the hides of the animals which they killed. The prepared skins they neatly and skilfully utilized in the preparation of their raiment and their bedding. Reeds and barks of various kinds were useful in making mattresses and other needed articles. The title to their lands was vested solely in the mothers of the people. The choice of a candidate for chief for either of the two grades of this office was solely a prerogative of the mothers of the clan to which the chiefship belonged. The chief held his office during his good behavior.

**WYANDOTTE**, Mich., city situated in Wayne County, about 10 miles southwest of Detroit, on the Detroit River and on the Grand Trunk, the Lake Shore and Michigan Southern, the Michigan Central and the Detroit, Toledo and Ironton railroads. Wyandotte is a thriving industrial centre, having chemical and salt works, ironworks, shipyards, fur-coat and robe factories, sash and door works, and stove factories. Internal combustion engines, automobiles and their accessories are also manufactured here. The Eilbert Memorial Hospital is at Wyandotte and there are a public library, churches, schools, etc. The commission form of government is in operation. The city's receipts from all sources in 1918 amounted to \$53,398.81, of which \$22,923.17 was an unexpended balance from the year previous. The total disbursements for the same period were \$41,682.01. The real property valuation is \$12,547,610, and the personal \$3,222,070. Pop. 12,000.

**WYANDOTTE CAVE**, in Crawford County, Ind., a natural formation, five miles northeast of Leavenworth, second in size to Mammoth Cave (q.v.), but having a greater number and variety of stalactites and stalagmites than any other cave in the United States. It has been explored for a distance of 23 miles. The chambers and galleries are numerous, some about 350 feet long and 180 feet high. Some of the remarkable features are Monument Mountain, about 175 feet high, and 75 feet above its crests is the grand dome. The Pillared Place contains several clusters of stalactites, and the Pillar of the Constitution, a large stalagmite 30 feet high and 75 feet in circumference. There are 144 places of unusual interest named. Consult Hovey, H. C., 'Celebrated American Caverns' (1896); and Indiana State Geological Reports.

**WYANT**, wí'ánt, **Alexander Helwig**, American artist: b. Port Washington, Ohio, 11 Jan. 1836; d. New York, 29 Nov. 1892. After trying the saddlery business, he turned to art, became a painter of landscapes at Cincinnati, exhibited in the National Academy of Design in 1865, was elected associate of the academy in 1868, and academician in 1869. In 1865 he went to Europe, becoming a pupil of Hans Gude at Karlsruhe. He attained high rank in landscape art, painting almost exclusively American scenes, and being particularly successful in views from the Adirondack wilderness. His chief characteristics are subtle tones, the evanescent moods of nature that he was quick and able to catch, and a delicate

quality of workmanship. His work is well represented in the Metropolitan Museum, New York. He was a founder of the American Water-Color Society. Among his works are 'Scene on the Upper Susquehanna' (1869); 'Pool on the Ausable' (1871); 'In the Adirondacks' (Metropolitan Museum); 'A North Woods' Brook'; 'An Old Clearing'; 'Pool in the North Woods'; 'New Jersey Meadows' (1872); 'Sunset on the Prairie' (1876); 'Reminiscence of the Connecticut' (1878); 'Evening' (1885); 'Sunset near Killarney' (1886); 'October Day' (1892).

**WYATT**, wíat, **James**, English architect: l. Burton Constable, Staffordshire, 3 Aug. 1746; d. Marlborough, Wiltshire, 5 Sept. 1813. He was taken to Rome in 1760 by Sir William Bagot, and during the next six years studied architecture in that city and in Venice. Returning to London, he brought himself into notice by his designs for the Pantheon, in Oxford street, a building for many years famous as the rendezvous of the fashionable world. He received innumerable commissions for private residences in all parts of the kingdom; but his designs, for the most part in a sort of Græco-Italian style, have little at the present day to recommend them. About 1782 he turned his attention to Gothic architecture, being one of the first to attempt its revival; and for many years was employed as a restorer of cathedrals and parish churches, in the course of these labors making sad havoc, at Salisbury, Hereford, Durham and elsewhere. It must be said, however, that his imperfect conceptions of Gothic art were shared by his contemporaries and approved by the taste of his time, in large measure. His most famous work in this style was Fonthill abbey, erected for Beckford in 1795. He held the position of surveyor-general subsequent to 1796, and in 1802-03 was president of the Royal Academy. George III employed him at Windsor. Wyatt is often referred to as "The Destroyer."

**WYATT**, SIR **Matthew Digby**, English architect and art writer: b. Rowde, near Devizes, Wiltshire, 1820; d. London, 21 May 1877. He made a diligent study of the architecture of Italy, France and Germany, returning to England in 1846 to publish his 'Geometrical Mosaics of the Middle Ages' (1848). In 1856 he was appointed architect to the East India Company, and made many important designs for public works in Great Britain and India; in 1866 was awarded the royal gold medal of the Royal Institute of British Architects; and in 1869 was knighted and made Slade professor of fine arts at Cambridge. His chief books are 'Metal Work and its Artistic Design' (1852); 'Industrial Arts of the 19th Century' (1853); 'Art Treasures of the United Kingdom' (1857); 'Fine Art' (1870); 'Architect's Handbook in Spain' (1872).

**WYATT**, SIR **Thomas**, English poet: b. Kent, about 1503, d. Sherborne, Dorsetshire, 11 Oct. 1542. He was graduated from Cambridge in 1518, may have studied at Oxford, and subsequently went on his travels to the Continent. After his return to England he appeared at court, where the reputation he had already acquired as a wit and a poet introduced him to the notice of Henry VIII, who retained him

about his person and knighted him in 1537. He was employed on several diplomatic missions to different powers, and was a friend of Thomas Cromwell (q.v.), in whose fall he ran some risk of being involved. In 1542 he was returned to Parliament as knight of the shire for Kent. A close student of foreign literature, Wyatt introduced the sonnet into England from Italy. In this he is commonly associated with Henry Howard, Earl of Surrey, but is more correctly to be regarded as the pioneer. None of Wyatt's verse, sacred or secular, appeared in his lifetime. Some of the secular poems were printed (96 are assigned to Wyatt) in the 'Songes and Sonnettes' (1557) of Richard Tottel, commonly known as 'Tottel's Miscellany.' There are among the extant works 31 sonnets, and satires in heroic couplets, imitated from Persius and Horace. Wyatt's poems evince more elegance of thought than imagination, while his mode of expression is far more artificial and labored than that of Surrey. Consult Nott's edition of Wyatt and Surrey with the elaborate memoir prefixed thereto (1816); also the article by Churton Collins in T. H. Ward's 'English Poets' (1883), and Simonds' 'Sir Thomas Wyatt and his Poems' (1889). Consult also Foxwell, A. K., 'Study of Sir Thomas Wyatt's Poems' (New York 1912) and Padelford, F. M., 'Early XVth Century Lyrics' (London 1907).

**WYCHERLEY**, wích'er-ll, **William**, English wit and dramatist: b. Clive, Shropshire, about 1640; d. London, 1 Jan. 1716. About 1655 he went to France for his education, but he returned to England a short time before the Restoration, and was entered a gentleman commoner of Queen's College, Oxford, which he left without a degree, and took chambers in the Middle Temple. He paid, however, little attention to the law, but became a man of fashion in the town, and made himself known as author of 'Love in a Wood, or Saint James's Park' a comedy, published about the end of 1671. This piece brought him into much notice, and his popularity was increased by comedies that soon afterward followed: 'The Gentleman Dancing-master,' published in 1673; 'The Country Wife,' produced in 1672 or 1673, and 'The Plain Dealer,' 1674. He became a favorite of the meretricious Duchess of Cleveland, and was much regarded by Villiers, the witty and profligate Duke of Buckingham. About 1680 he improved his circumstances by marrying the Countess of Drogheda, a young, rich and beautiful widow. At her death soon afterward she settled her fortune upon him; but, his title being disputed, the costs of law and other encumbrances produced embarrassment, which ended in arrest. He remained in confinement seven years, until released by James II, who, it is said, was so pleased with his comedy of 'The Plain Dealer' that he ordered his debts to be paid, and added a pension of £200 per annum, which he lost at the revolution. The succession to his father's estate, which was strictly entailed, does not appear to have relieved him from the embarrassments in which he had again fallen, and from which he found a deliverance only a few days before his death in marrying a young woman with a fortune of £1,500. Besides the plays already mentioned he wrote poems of no value.

His plays are excessively licentious. a friend of Dryden, and in his later of Pope, but Pope's statements regarding connection are not much to be depended among latest editions of his plays is that C. Ward (London 1893); Hazlitt, *Wills Lectures on the English Comic Writers* (19); new ed., New York 1910); Lans- Lord, *Memoirs of the Life of William rly, Esq.*; with a character of His Writ- London 1718).

**WYCKOFF**, wi'kōf, **Walter Augustus**, an sociologist: b. Mainpuri, India, 12 1865; d. 15 May 1908. He was gradu- Princeton in 1888, and after further n Europe began in July 1891, the life of aborer, working his way from Connecti- California and spending 18 months in this . His aim was to study from the inside omic conditions surrounding American arners, and the immediate outcome of his nent was his three sociological works: *Workers — the East* (1897); *'The Work- her West'* (1898); *'A Day with a Tramp her Days'* (1901). In 1893-94 he went the world twice as a private tutor, in as made a lecturer on political science at on, and in 1898 became an assistant pro- of political economy there. His works idely read and aroused considerable dis-

**WYCLIFF**, wik'lif. See WICLIF, JOHN.

**WYE**, wi, a river partly in Wales, partly gland, with its source in Plynlimmon, omeryshire. After a circuitous and g course of about 130 miles, having through Radnorshire, Herefordshire and ed Monmouth from Gloucestershire, it to the Severn below Chepstow. It is dis- hed for the beauty and variety of its , especially in the neighborhood of Tin- bhey. The tide at Chepstow sometimes 5 feet. Large vessels cannot ascend be- chepstow Bridge, but barges of from 18 ns reach Hereford. A canal from Here- connects the Wye with the Severn at ster. Other towns on the river are Mon- Ross and Builth. Tintern Abbey, one noblest ruins of England, is on the banks Wye.

**WYETH**, John Allan, American physi- n, Marshall County, Ala., 26 May 1845. eived his education at the University of lle, and at Bellevue Hospital Medical . During the Civil War he served as te in Company I of the Fourth Alaba- Cavalry. After practising as attending 1 to Mount Sinai and Saint Elizabeth ls, he founded the New York Polyclinic l School and Hospital, the pioneer organ- for post-graduate medical study in the States. For a number of years he was nt of the faculty, and surgeon-in-chief institution. He has been president of merican Medical Association, the New Academy of Medicine, the New York Medical Association and the New York ological Society. In 1878 he was awarded st and second prizes of the American l Association, and the Bellevue Alumni tion Prize in 1876. He has published *Text-Book on General Surgery* (1888);

*'Osteo-Plastic Operation for Correction of Deformities of the Nose and Palate'* (1892); *'Life of Lieutenant-General Nathan Bedford Forrest'* (1899); *'With Sabre and Scalpel'* (an autobiography, 1915).

**WYKEHAM**, wik'am, **William of**. See WILLIAM OF WYKEHAM.

**WYLIE**, wi'li, **Robert**, American artist: b. Isle of Man, 1839; d. Pont Aven, Brittany, France, 4 Feb. 1877. He was brought to this country when a child, and after some study in the Pennsylvania Academy was sent by his trustees to study in France in 1863. Settling at the village of Pont Aven he was presently surrounded by a colony of artists. In the Paris Salon of 1872 he obtained a second-class medal, but not till after his death did his paintings attract much attention. His *'Death of a Ven- dean Chief'* (1876) hangs in the Metropolitan Museum, New York.

**WYMAN**, wi'man, **Jefferies**, American anatomist: b. Chelmsford, Mass., 11 Aug. 1814; d. Bethlehem, N. H., 4 Sept. 1874. He was graduated from the Harvard Medical School in 1833, was professor of anatomy and physiology at Hampden-Sidney Medical College, Richmond, Va., 1843-47, and Hersey professor of anatomy at Harvard from 1847 until his death. He established there the Museum of Comparative Anatomy and for many years was indefatigable in efforts for its increase, was president of the Boston Society of Natural History 1856-70, became curator of the Peabody Museum, Cambridge, in 1866, and published over 175 scientific papers, including *'On the External Habits, Characters and Osteology of the Gorilla'* (1847); *'On the Nervous System of the Bull-Frog'* (1853); *'Observations on the Develop- ment of the Skate'* (1865); *'Observations and Experiments on Living Organisms in Heated Water'* (1867); and *'Fresh-water Shell- Mounds of the Saint Johns River, Florida'* (1875). He was one of the earliest American supporters of the theory of evolution. Consult biographical sketches by Asa Gray, O. W. Holmes, S. Weir Mitchell, F. W. Putnam, and Burt G. Wilder.

**WYMAN**, Robert Harris, American naval officer: b. Portsmouth, N. H., 12 July 1822; d. Washington, D. C., 2 Dec. 1882. He entered the navy in 1837, and while attached to the Gulf Squadron during the Mexican War, took part in the siege and capture of Vera Cruz and the expeditions that captured Tuspan and Tam- pico. He was stationed at the naval observa- tory in Washington in 1848-50 and 1853-54, and in the Civil War commanded the *Yankee* and *Pownee* and the Potomac flotilla in 1861; and the *Santiago de Cuba* on blockading duty in 1862-64. He became commodore in 1872, and rear-admiral in 1878; and was commander-in- chief of the North Atlantic Station in 1879-82.

**WYMAN**, Walter, American surgeon: b. Saint Louis, Mo., 17 Aug. 1848; d. 1911. He was graduated at Amherst in 1870, and at the Saint Louis Medical College in 1873; served in city hospitals 1873-75, and after 1876 was in the Marine Hospital service, being made assist- ant surgeon in 1876, chief medical purveyor of the quarantine division in 1888, and supervising surgeon-general in 1891. He was an earnest

advocate of the sanitation of ports not only in the United States, but in the West Indies and South America, holding that if this were enforced yellow fever would be entirely eradicated from the Western hemisphere. On his recommendation the government set apart a large tract of land at Fort Stanton, New Mexico, for a hospital whither all consumptive patients in the United States marine hospitals could be transferred.

**WYMORE**, Neb., city in Gage County, on the Big Blue River, 45 miles south of Lincoln, and on the Chicago, Burlington and Quincy Railroad. There are railroad machine shops and the city is a shipping centre for grain and livestock. Pop. about 2,613.

**WYNANTS**, wīnānts, or **WIJNANTS**, Jan, Dutch painter: b. Haarlem, between 1615 and 1620; d. about 1680. Very little is known of his life except that he was master of Adrian Vanderveelde, Wouwerman and other eminent painters, and that he was naturally indolent and given to pleasure. His works are consequently few, but are highly valued for their technical merits. They consist of landscapes of small size, the figures and cattle in which were often executed by other hands. He is represented in the galleries of Amsterdam, The Hague, Munich and in the National Gallery, London.

**WYNDHAM**, SIR CHARLES, English actor: b. Liverpool, 23 March 1837; d. London, 12 Jan. 1919. He was the son of a physician, studied medicine and surgery in Germany and passed all his examinations brilliantly. During the Civil War he enlisted with the Union forces in the United States and served continuously until the close of the war, being present at the battles of Chancellorsville, Fredericksburg and Gettysburg and through the Red River campaign with General Banks. On quitting the army he made his initial American stage appearance in 'Brothers and Sister' and two years later returned to England, where he supported Henry Irving and Ellen Terry in many plays. When he reappeared at the Wallack Theatre, New York, in 1869 he made an excellent impression as a light comedian, and organized a touring company of his own, which went to all of the larger cities of the United States. His repertory was extensive. 'The School for Scandal,' in which he appeared as Charles Surface, was one of his greatest successes, and 'Pink Dominoes' which he produced in 1877, ran for 500 nights. For 20 years Sir Charles successfully managed the Criterion, New and Wyndham's theatres in London. He was knighted by King Edward in 1902. Consult Scott 'The Drama of Yesterday and Today' (1890).

**WYNDHAM**, George, English cabinet officer: b. London, 29 Aug. 1863; d. 1913. He was educated at Eton and Sandhurst Royal Military College. He served through the Suakim campaign and at Cyprus in 1885, and was private secretary to A. J. Balfour (q.v.) 1887-92. He also sat in Parliament for Dover from 1889, was Parliamentary Under-Secretary of State for War 1898-1900, became chief secretary for Ireland in 1900 and entered the Cabinet in 1902. In March 1903 he introduced the Irish land purchase bill subsequently passed. His resignation as chief secretary was brought

about by the Orange Unionists. He published an edition of 'North's Plutarch' in the 'Tudor Classics' (1894); 'Shakespeare's Poems' (1898); 'Ronsarde and La Pleiade' (1906).

**WYNDHAM**, SIR WILLIAM, English statesman: b. Orchard-Wyndham, Somerset, 1667; d. Wells, Somerset, 17 June 1740. He was educated at Oxford and entering the House of Commons for his native county, identified himself with the Tories, became secretary of war in 1711, and in August 1713 was transferred to the office of Chancellor of the Exchequer. He was suspected of treasonable relations with the Pretender, and lost his office on the death of Queen Anne. On the outbreak of the rebellion in Scotland under the Earl of Mar in 1715, an order for Wyndham's confinement was issued, and he was arrested at his house in Somerset, but escaped. A reward of \$5,000 was offered for his apprehension. After lurking for some time in disguise he surrendered himself and was committed to the Tower. Released without a trial, he remained until his death a leader of the Parliamentary opposition to the ministry of Sir Robert Walpole. He was a very graceful, clear, forcible and spirited orator. One of his sons, Percy, took the name of O'Brien and in 1756 was made Earl of Thomond.

**WYNNE**, win, Charles Whitworth. See CAYZER, SIR CHARLES WILLIAM.

**WYNNE**, Ark., county-seat of Cross County, on the Missouri Pacific Lines, Little Rock, Ark., to Memphis, Tenn., and Saint Louis to New Orleans, 45 miles west of Memphis. It is the trading centre of a rich farming country with good department stores, wholesale grocery houses, railway division headquarters, a flour mill, cotton gins, a stove factory, hoop factory, electric lighting and water systems, automobile garage and repair plants. Its educational facilities are excellent and it has a good courthouse and high school building. The town is administered by a mayor and council. Pop. 5,000.

**WYNTOUN**, win'ton, Andrew of, Scottish rhyming chronicler: b. about 1350; d. after 1420. He was a canon regular of the priory of Saint Andrews, and was in 1395 prior of Saint Serf's Inch, in Lochleven, probably holding this office until his death. Wyntoun's 'Orygynak Cronykil of Scotland' is the first historical record in the Scottish vernacular. It received little attention until 1795, when David McPherson published an annotated edition of a part of it. David Laing edited a complete edition of this work (3 vols., Edinburgh 1872-79) and an edition from the Wemyss Manuscript was prepared for the Scottish Text Society (1906). Wyntoun's 'Chronicle' bears the usual character of the historical writings of the age in the indiscriminate mixture of tradition with history. But he appears to have been faithful to his authorities, whom he sometimes literally transcribes. Wyntoun's scholarship appears to have been considerable and the candor and generosity with which he speaks of the enemies of his country are commendable.

**WYOMING** (Indian, *Mangwocwans*, "big plains"), a State of the United States, in the Rocky Mountain region, between the parallels, lat. 41° and 45° N., and between long

104° 3' and 111° 3' W. Portions of the Louisiana Purchase, the Oregon claim, the Texas annexation and the Mexican cession are included in the State. It is bounded on the north by Montana, east by South Dakota, south by Colorado and Utah, and west by Utah, Idaho and Montana. The boundary lines are all straight. The greatest extent is from east to west, 355 miles (north to south, 276 miles). Area (excluding Yellowstone National Park), 97,575 square miles. Wyoming ranks eighth in size among the States of the Union.

**Topography.**—The State averages from 5,000 to 7,000 feet above sea-level and is traversed by the main chain of the Rocky Mountains. From the plateau lands rise a number of lofty ranges and peaks, some of them approaching 14,000 feet in altitude. The largest mountain masses are in the southern, northwestern and north central parts of the State. In the extreme northeast, the Black Hills of South Dakota project into Crook and Weston counties. Other conspicuous groups of outlying hills in this region are the pine-clad Hartville Mountains, north of Guernsey, and the Bear Lodge Mountains. The principal mountains in the south are, first, the Laramie Mountains, which rise to an average height of 1,000 feet above the plain, culminating in Laramie Peak (9,020 feet) and the Medicine Bow Mountains, called locally the Snowy Range, a lofty mass on whose western slopes gather the waters of the North Platte. The highest point in this range is Medicine Bow Peak (12,005 feet). The western watershed of the North Platte is formed by the Sierra Madre Mountains, projecting north from Colorado. In the extreme southwestern corner of the State are the lofty Uintah Mountains. The general trend of all these is northwest and southeast, save the Uintah Mountains, which run east and west. The entire northwest portion of the State comprises a lofty mountain mass broken here and there by small valleys. The Absaroka Range (partly in the Yellowstone National Park) forms the Continental Divide. To the west lie the Teton and Snake River ranges near the Idaho boundary. The highest point is the Grand Teton (13,747 feet). To the south and east of these lie the Gros Ventre, Salt River, Wyoming and Wind River ranges, the latter projecting well into the west central portion of the State and including such lofty peaks as Fremont (13,730 feet), Gannett (13,785 feet), the highest in the State, and Atlantic (12,700 feet). In north central Wyoming are the isolated Big Horn Mountains, culminating in Cloud Peak (13,165 feet). Other minor ranges cross south central Wyoming, prominent among them being the Green, Ferris, Seminole, Shirley and Rattlesnake mountains. These are small separated groups lying a little east of the Continental Divide, but indicating the general course of the Rockies. In this region also are the huge bare granite heaps and domes rising from the sandy plains north of the Sweetwater, known collectively as the Granite Mountains. The Continental Divide extends from the middle of the southern boundary in a northwesterly direction through Yellowstone National Park.

Lofty plateaus characterize all portions of the State and include the Cheyenne Plains and Goshen Hole in the southeast and east, the Laramie Plains (7,000 feet) and Red Desert in the

south, lower Wind River Valley in the west central and Big Horn Basin in the northern part of the State. These are either level or rolling and lie mainly between 4,500 and 7,000 feet elevation. The eastern plains are grassy, the western and higher plateaus are covered with the characteristic sage brush. Within the mountain ranges are many small sheltered valleys or parks, the most noteworthy being Jackson's Hole in the northwest. There are several gaps in the Continental Divide of varying accessibility. Bridger's Pass (used by the Union Pacific Railroad) in southern, and South Pass in central Wyoming are the most available for railroad construction. North of these lie Union Pass and Two Ocean Pass, which are suitable only for wagons and pack trains. Hot springs are found in the region included in and adjacent to the Yellowstone National Park, at Thermopolis and elsewhere. The Thermopolis Springs (135° F.) are of medicinal value and annually attract thousands seeking the cure.

**Hydrography.**—The general drainage in the eastern two-thirds of the State is from south to north; in the west from north to south. The State is included within four distinct drainage areas. The major portion lies within the Missouri Basin, comprising the valleys of the North Platte, Sweetwater, Wind, Big Horn, Powder, Belle Fourche and Cheyenne rivers. The western part of the State is cut by Green River, an affluent of the Colorado, and hence within the Gulf of California drainage system. North and west of Green River rises Snake River, a tributary of the Columbia and hence within the Pacific drainage area, while through the extreme southwestern part of the State flows Bear River, the principal affluent of the Great Salt Lake, and, accordingly, a water of the Interior Basin. The water surface of the State totals only 320 square miles. The largest lakes are Yellowstone, Jackson and Shoshone, all in the northwest. There are many small lakes amid the mountains, small bodies of clear water surrounded by wooded mountains.

**Geology.**—Wyoming lies partly in the Great Plains and partly in the Rocky Mountain provinces, thus presenting the three chief divisions of land forms, namely, plains, plateaus and mountains. The salient structural features of the region are great anticlinal folds separated by deep synclinal basins, some of which are 100 miles long and 20 to 50 miles wide. Formations of pre-Cambrian age are exposed along the crests of the major mountain ranges, namely, the Laramie, Medicine Bow, Wind River, Big Horn and Black Hills. The rocks which compose these formations constitute a complex group of metamorphosed sediments and associated igneous intrusives. The Paleozoic is but slightly developed. Formations of Cambrian, Ordovician, Mississippian, Pennsylvanian and Permian age are found over the northern and western portions of the State. The Mesozoic is represented by slight developments of the Triassic, Jurassic and Lower Cretaceous, while the Upper Cretaceous attains a thickness of several thousand feet. The Cenozoic is characterized by a great thickness of continental Tertiary formations rich in mammalian fossils. Volcanic eruptives of Tertiary age cover large areas in and adjacent to the Yellowstone National Park. Wyoming's chief contributions to

geology are found in the rich reptilian fauna from the Cretaceous and the mammalian fauna from the Tertiary and in the unsurpassed geysers of the Yellowstone. The chief resources thus far developed are oil from the Pennsylvanian and Cretaceous, and coal from the Cretaceous and Tertiary.

**Minerals and Mining.**—The mineral resources of the State are annually attracting greater notice. Fourteen out of the 22 counties are producers of metallic minerals. The relatively small quantities of gold, silver and copper, the metals for which the State has been prospected, have led to an underestimation of the State's resources. Placer gold was found at Atlantic City in west central Wyoming in 1842 and subsequently in small quantities in the Grand Canyon of the Snake. Lode deposits have been worked in the north Laramie Mountains and elsewhere intermittently since 1871. The veins are not phenomenally rich but are believed to persist in depth. The future of gold mining here depends on increased capital investment, modern methods of ore treatment and improved transportation and power facilities. In 1915 Wyoming ranked 15th among the States in gold production. To 1911 the total placer yield was estimated at \$1,725,000; the lode yield at \$4,137,000. The following table shows the production in recent years:

YEAR	Fine ounces
1913	847
1914	324
1915	672
1916	4,054

Silver is usually found in conjunction with gold especially in the western part of the State. The following table shows the value of the silver mined in the State during the past few years:

YEAR	Value
1912	\$200 00
1913	2,254 00
1914	100 00
1915	1,400 00
1916	3,092 00

A considerable portion of Wyoming is underlaid with bituminous coal of excellent quality. The best fields are those near Newcastle and at Hanna, Rock Springs, Kemmerer and Dietz. Other rich deposits exist in the north and northwest but have not been developed to any extent. In 1914 the State produced 6,475,293 tons; in 1915, 6,554,028 tons; and in 1916, 7,500,000 tons. In 1915 Wyoming ranked sixth among the States in the production of iron ore, yielding in that year 908,845 gross tons. Copper is found in central Wyoming and in the Medicine Bow Mountains in the south. The production in recent years has been as follows: 1914, 165,023 pounds; 1915, 1,020,926 pounds; 1916, 2,569,000 pounds. Petroleum is already one of the most important mineral products and the State gives every promise of becoming a leader both in production and in quality of output, some geologists even having gone so far as to say that Wyoming is literally underlaid with a sea of oil. The existence of petroleum has been known for years, but among the first to call attention to its commercial possibilities was the late Prof. Wilbur C. Knight of the State University. The cretaceous shales that have been drilled contain oils with both a paraffine and an

asphalt base. Many of the former surpassed quality. The principal fields developed are the Salt Creek, Powder River, Big Muddy, Basin, Lost Soldier, 1 Crow Creek, Torchlight, Lovell, 2000 ft. and Rock Creek. The largest oil fields are the Salt Creek and Big Mt. In 1918 the bringing in of a well on the 50 miles north of Laramie, gave great quantities of rich oil with a base in a hitherto little exploited nearly all the fields the oil lies at a 1,500 to 4,000 feet. The difficulties countered include lack of transportation and detailed geologic studies of and the danger of litigation. The following table shows the production since 1912:

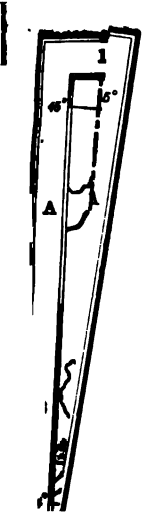

YEAR	Production
1912	.....
1913	.....
1914	.....
1915	.....
1916	.....
1917	.....
1918	.....

Natural gas has been encountered in oil fields and is used locally. In the Salt Creek field the conservation of the natural gas is being made a model for the country.

**Climate.**—The extremes of temperature exist for a short period each year. The maximum is 116° above zero; the minimum, 45° below zero. The mean temperature for January in Cheyenne is 25.1°; in the northern part of the State, 18.1°. The mean temperature for July is 67°. The extreme is not severe because of the dryness of the atmosphere. The precipitation varies from 18 inches, the average being 12.5 inches. Heavier rainfall in the Bear Lodge Hill district is not unusual. The lofty timbered mountain ranges receive a great amount of moisture both in the form of wind and, during the summer, as frequent dashing rains. High winds prevail in parts of the State, especially in spring. The climate is uniformly salubrious and points are becoming prominent as health resorts.

**Soil.**—The soil of nearly all the valleys is a dark loam and most fertile. The higher lands and mountain slopes are sandy loam, most of which is produced by irrigation. In the eastern counties irrigation has been practised on the whole. The Red Desert is the only arid area in the State. Extreme aridity, combined with alkali deposits. The high mountain intervals are partly rich and, although at too high an altitude for cereal crops, produces large yields of native hay.

**Flora and Fauna.**—In Wyoming widely-varying types of animal and plant life. This is due largely to the diversified conditions occasioned by extremes of climate and a wide range of local physiographic conditions. The lower portions of the State (one-third the total area) are marked by broad-leaved cottonwood, juniper, and yucca. A little higher, in the Transition Life zone, covering about

**Agriculture and Stock Raising.**—Agricul- as made rapid strides during the past few

In many ways it is still in the exper- l stage and its possibilities limited by a :imate due to low average base level. are, however, certain areas of compara- low elevation and moderate climate where iety of crops and some of the hardier have proved decidedly successful. A spe- lue attaches to these low-lying districts ich as they are immediately surrounded or ed by extensive non-agricultural areas mining, lumbering and stock raising are incipal industries. The melting snows of ountains furnish a never-failing supply of for irrigation purposes and Federal, and private irrigation projects have al-reclaimed considerable sections. In 1910 the total number of farms (10,987) 6,297 wholly or in part under irrigation, the total ed acreage being 1,333,302, an increase of r cent over 1900. The largest proportion gated farms is in Park County (96.5 per but in four other counties the propor- over 80 per cent. Of the various irriga- nterprises in the State, 71.8 per cent are ed by individuals or partnerships; 7.8 nt by commercial concerns; 10.3 per cent -operative enterprises, leaving only 10.1 nt controlled by the various governmental ts. In 1910 there were 13,231 miles of ir- n ditches. In that year about one-eighth total area of the State was in farms or s. The average value of farm land was

\$10.41 per acre though in Big Horn County the average rose to nearly \$50. An indication of the tendency for agriculture to supplant stock raising is seen in the fact that in the decade 1900 to 1910, there was an increase of 80.3 per cent in the total number of holdings but a decrease of 41.7 per cent in the average number of acres per holding. In the same period the value of farm lands increased 279.4 per cent, being placed in 1910 at \$88,908,276, while the average value of farm land per acre increased 261.5 per cent. Tenant farming is growing though not alarmingly. Much valuable agricul- tural land in the valleys and basins awaits development. The following table shows the acreage, yield and value of the principal crops in 1916:

CROP	Acreage	Production	Value
Hay (tame).....	580,000	1,044,000 tons	\$12,528,000
Wheat.....	170,000	3,670,000 bu.	5,322,000
Oats.....	250,000	8,750,000 "	5,250,000
Potatoes.....	18,000	2,340,000 "	2,995,000
Barley.....	25,000	825,000 "	718,000
Corn.....	23,000	550,000 "	495,000
Rye.....	16,000	248,000 "	268,000

The raising of orchard and small fruits and of sugar beets though at present slight is annually increasing. There are three sugar factories in the State, at Lovell, Sheridan and Worland.

Both northern and southern Wyoming is still in large measure devoted to stock raising, though beef cattle are shipped from every county in the State. In 1917 there were on the ranches 825,000 head as compared with 750,000 in 1916. Sheep grazing has become a very important industry. Only the best breeds of sheep are kept, and the wool is of superior quality and its yield above the average. The following table indicates the extent of sheep grazing:

YEAR	Sheep of shearing age and number of fleeces
1910.....	4,650,000
1911.....	4,000,000
1912.....	3,900,000
1913.....	3,600,000
1914.....	3,560,000
1915.....	3,630,000
1916.....	3,675,000
1917.....	4,381,000

The Agricultural College and Experiment Station located at Laramie, the seat of the State University, have done much, through experimentation and extension instruction, to encourage types of agriculture and stock raising suited to the conditions of the State. At the present time (1919) county agricultural agents are maintained in 17 out of the 22 counties.

**Manufacturing.**—In 1909 the State had 268 manufacturing establishments (169 in 1904) giving employment to 3,393 persons of whom 2,867 were wage-earners. The principal concerns are railroad shops, lumber camps and factories, flour and grist mills, printing and publishing establishments, dairies, sugar factories and oil refineries. The total value of manufactured goods was estimated at \$6,249,000. Eight per cent of the factories were in Cheyenne. Electric power is only slightly used. In 1909, 93.3 per cent of the primary power was derived from steam.

**Transportation and Roads.**—The oldest railroad in the State is the Union Pacific, crossing the southern tier of counties. From Granger in Sweetwater County the Oregon Short Line runs northwest through Lincoln County into Idaho. A number of subsidiary lines connect with the Union Pacific, chief among them being the Colorado, Wyoming and Eastern and the Saratoga and Encampment. From Cheyenne the Union Pacific has a line to Denver. The Chicago, Burlington and Quincy enters the southeast corner of the State to Cheyenne. Its main line, however, runs diagonally across the State from Nebraska to Montana through Goshen, Platte, Converse, Natrona, Fremont, Hot Springs, Washakie and Big Horn counties. A branch line runs to Cody in Park County. The Burlington also runs across the northeast corner of the State from South Dakota to Montana through Weston, Crook, Campbell and Sheridan counties. A branch runs to Buffalo in Johnson County. The Chicago and Northwestern, crossing the eastern boundary of the State in Niobrara County, parallels the main line of the Burlington through Converse and Natrona counties and terminates at Lander in Fremont County. The Colorado and Southern, running north from Denver through Cheyenne, connects with the Burlington at Wendover and the Northwestern at Orin Junction. There is a lack of north and south lines. Most of the railroads run in general east and west, tending thereby to divide the economic interests of the State into horizontal belts or zones.

Wyoming is rapidly developing a system of excellent highways. The Lincoln Highway parallels the Union Pacific and the Oregon Trail the Oregon Short Line. In general these roads are kept in good condition. An improved highway runs north from Cheyenne through Laramie, Platte, Converse, Natrona, Johnson and Sheridan counties into Montana, serving as one of the approaches to the Yellowstone National Park. Other roads leading into the northeastern counties, and from Rawlins and Green River and Lander into Jackson's Hole and the Yellowstone National Park are available for automobile traffic. In 1917 the legislature created a State Highway Commission to co-operate with the Federal government under the act of Congress of 11 July 1916, entitled "An Act to provide that the United States shall aid the States in the construction of rural post roads, etc." State funds for the construction of highways are provided for by a tax of one-fourth mill on the dollar of valuation.

**Wealth and Taxation.**—In 1913 Wyoming's total receipts of income amounted to \$1,529,474. Of this \$849,277 was appropriated for strictly governmental costs and the balance for other purposes. The principal sources of revenue are the general property, business and license taxes and amounts derived from interest, leases and rents, and from grants and earnings of general departments. The total value of State property in 1913 was estimated at \$897,500.

**Charitable and Penal Institutions and Public Health.** There is a State Board of Charities and Reform, comprising five ex-officio members. This board has general oversight over all State-supported charitable, re-

formatory and penal institutions, including the State Hospital at Rock Springs, the branch hospitals at Sheridan and Casper, the Soldiers' and Sailors' Home at Buffalo, the School for Defectives at Lander, the Wyoming Industrial Institute at Worland, the Insane Asylum at Evanston, the State Penitentiary at Rawlins. At Laramie is located the Cathedral Home for Children, maintained by the Protestant Episcopal Church.

The State Board of Health, appointed by the governor with the confirmation of the senate, comprising three persons, one of whom must be a physician, appoints the county health officers, inspects public institutions in the interest of health and sanitation, makes quarantine regulations and advises counties and municipalities regarding drainage, water supply and general problems of sanitation. The State dairy and food commissioner is charged with the enforcement of all laws touching frauds, adulterations and impurities in foods. The practice of medicine, dentistry, pharmacy, nursing, embalming and optometry is regulated by laws the administration of which is in the hands of a series of State appointed boards.

**Education.**—Provision for public education was made at the first session of the Territorial assembly in 1869. Owing to the low density of population the problem of elementary education has been largely the problem of rural education. Educational facilities, however, have more than kept pace with the growth in population. The increase in the number of schoolhouses was slow to 1905, but since 1909 the number has doubled, reaching, in 1914, a total of 879. The number of teachers has likewise shown a marked increase. In 1894 there were 407; in 1904, 763; in 1914, 1,488. Less than 12 per cent of the teachers are men. The cost of education in 1914 was 37.93 cents per pupil per day. In 1914 there were 29,155 pupils enrolled. Since 1901 free textbooks have been provided. Certification regulations were first adopted in 1876. Various changes were made in the law till, in 1917, the whole matter was carefully gone over and an entirely new system of certification was adopted. In 1916 there were 26 four-year high schools in the State with a total enrolment of 1,648 pupils. At first public education was surpassed in importance by private education. The situation is now quite the reverse. In 1872 was established the short-lived Wyoming Institute, a Baptist school at Laramie. Two years before, Saint Mary's School, a Roman Catholic institution, had been established at Laramie, but made little headway till after a decade. In 1885 this was supplanted by the much larger and better equipped school in Cheyenne established by the Society of the Holy Child Jesus. The first kindergarten in Wyoming was privately established in Cheyenne in 1886. In 1894-95 the Wyoming Collegiate Institute was founded at Big Horn but lasted only a short time. In 1905 was opened the Cheyenne Business College, and in 1909, under the auspices of the Christian Church there was established Jireh College at Jireh, Niobrara County. The State University at Laramie, the creation of which was urged as early as 1878 by the governor of the Territory, was not established till 1887. In 1870 the Protestant Episcopal Church opened an Indian

school among the Shoshones. In recent years the task of educating the Indians has been undertaken more seriously both by the churches and the government. The *Wyoming School Journal*, a periodical devoted to educational matters, issued under the auspices of the State Teachers' Association, was published for a time in the 90's. In 1904 it was re-established. There has been steady improvement in the standards of education and in school administration. In 1917 was created the State Board of Education, comprising seven members appointed by the governor for six years. The board prescribes educational policies for the State, exercises general supervision over public education, prepares outlines of study, establishes standards of work and rules for the certification of teachers. The general administration of the rules and regulations of the board is in the hands of the commissioner of education, appointed by them. Each county elects a superintendent of schools on a non-partisan basis and each school district elects its own trustees. Teachers' institutes are provided by law. At the 1917 session of the legislature the State accepted the terms of the act of Congress providing for Federal aid in vocational education.

**Government.**—The Territory of Wyoming was created in 1868; the State in 1890. Equal suffrage was adopted by the first session of the Territorial assembly, making Wyoming the first Territory or State to permit full woman's suffrage. This provision was incorporated in the State constitution drawn up in 1889 and afterward ratified. In general, women voters in Wyoming have not aligned themselves with any one party or on any single issue but divide as the male voters divide. The principal executive officers are the governor, secretary of state, treasurer, auditor, commissioner of taxation, superintendent of public instruction, attorney-general and examiner. The governor receives \$4,000. The salaries of the remaining range from \$2,400 to \$3,600. Besides the above there is a State fish commissioner, game warden, food commissioner, highway engineer, commissioner of labor, geologist and adjutant-general. There are three justices in the Supreme Court, each receiving \$5,000. There are seven judicial districts, the judges in each receiving a salary of \$4,500. The State legislature, which meets biennially for not more than 40 days, comprises 27 senators and 57 representatives. The salary of each is \$5 a day and mileage. The capitol is at Cheyenne. Wyoming has but one representative in Congress. There are 22 counties with the usual county officials. In 1910 there were 48 incorporated cities and towns. Most cities have the mayor-council type of government. In 1911 an act of the legislature made the commission form permissive. Only one city adopted this type of municipal government and afterward abandoned it. A bill to provide for the city-manager type was introduced in the 1917 session of the legislature but was defeated. A list of the Territorial and State governors appears elsewhere on this page.

**Population.**—The census of 1910 gave a total population of 145,965. In 1916 the population was estimated at 179,559. Of the population in 1910, 29.6 per cent was urban. There was a sex ratio of 168.8 males to 100 females. Among the native whites the ratio was 147.1 to 100, and among the foreign-born whites,

287.2 to 100. Of the total native-born population only 27.2 per cent were born in Wyoming, the remaining 72.8 per cent being natives of other States in the Union. Of the foreign-born, 14.6 per cent were Austrians, 11 per cent English, 9.7 per cent Germans, 9.2 per cent Swedes, 7.2 per cent Italians, 6.7 per cent Scotch. The counties of Albany, Laramie and Sheridan had, in 1910, a density of two to six to the square mile. All the other counties had less than two to the square mile.

\* Acting Governor.

**History.**—Wyoming was the meeting point of a number of Indian tribes. In the south-east were the Arapaho and Cheyennes of Algonquin stock; in the north and east, the Crows and Sioux; and in the west and south-west, the Utes of Shoshonean stock. There are ancient traditions of Spanish exploration into southern Wyoming at a very early date but no adequate proof has been offered of their presence prior to the 19th century, although somewhat earlier the Indians seem to have been familiar with the Spaniards and to have had commercial intercourse with Santa Fé. The first white man to enter Wyoming of whom there is definite record was de la Verendrye, who, in 1743, advancing from Lake Nepigon, penetrated the eastern portion of the State to within sight of the Big Horn Mountains. This was an isolated venture, however, and was not followed up by further exploration on the part of the French. The expedition of Lewis and Clark did not touch Wyoming although a number of the men who accompanied it subsequently joined the various fur-trading expeditions that were quick to take advantage of the information about the west brought out by these earliest American explorers. A number of these companies operated in Wyoming, including that of Manuel Lisa, who set out from Saint Louis in 1807 and established a post at the mouth of the Big Horn River in Montana. That fall or early next spring, John Colter set out southward up the Big Horn and entered Wyoming. He advanced perhaps as far south as the site of Lander where he turned north-west and, in the course of his wanderings, probably penetrated the wonderland of Yellowstone National Park. Others of Lisa's men or the employees of the Missouri Fur Company (established 1808-09) may also have penetrated Wyoming from the north about this time. In the summer of 1811 the overland company

sent out by John Jacob Astor to engage in the fur trade with headquarters at the mouth of the Columbia, traversed central Wyoming, crossed the Wind River Mountains by the Union Pass, entered the upper drainage of Green River, and thence, by another pass in the divide, followed down the Hoback River to its confluence with the Snake. They crossed the Snake and journeyed over the Teton Pass into Idaho. The following year the returning Astorians crossed the western boundary of the State, traversed once more the upper reaches of Green River and, after circuitous wanderings, crossed the Continental Divide by or near South Pass to the valley of the Sweetwater and the Platte, which they followed eastward into Nebraska. The next white men to enter Wyoming, of whom there is definite information, were a detachment sent out in 1824 from a post established at the mouth of the Big Horn by the firm of Ashley and Henry. In the spring of this year, Thomas Fitzpatrick and probably Andrew Henry, himself, one of the partners, led a division of the company up the Big Horn to Wind River and thence through South Pass to the waters of Green River. Henry probably returned by the same route, while Fitzpatrick, turning back later, descended the Sweetwater and the valley of the Platte. There is an unsubstantiated tradition that Etienne Provot, in the fall of 1823, preceded Fitzpatrick through the South Pass. In the fall of 1824 two other detachments of the Ashley-Henry men were sent through South Pass, one under command of Jedediah Smith to operate northwest into Idaho and the other under William Sublette to operate westward into Utah. Ashley, himself, was the first white man to penetrate southern Wyoming, entering the State some 20 miles south of the city of Laramie. He moved northward along the eastern slopes of the Medicine Bow Mountains and then northwest across Great Divide Basin to Green River which he descended in boats into Colorado and Utah. After 1825 the fur traders criss-crossed the State in every direction. The firms of Smith, Jackson and Sublette, of Fitzpatrick, Sublette and Bridger and the American Fur Company were among the more prominent operating in this State. The summer rendezvous of these companies was usually conducted in Green River Valley or in Wind River Valley, near the eastern end of South Pass. In 1827 the Yellowstone National Park was again penetrated. The fur-trading operations of Captain Bonneville took him into this State. The first scientific explorations of the State were made by Fremont in 1842 and 1843, who examined the southern portion, and by Brevet Brig.-Gen. W. F. Reynolds, who, in 1859, examined the northern portion. The first white settlement was at Fort Laramie on the Platte in 1834. This fort was purchased by the American Fur Company in 1835, rebuilt by them and subsequently sold to the United States government. In 1843 James Bridger, the fur trader, scout and guide, established Fort Bridger on Black's Fork in the extreme southwestern corner of the State. Forts Laramie and Bridger were stations on the famous Oregon Trail, which crossed the State by way of the North Platte, the Sweetwater, South Pass, the Sandys, Green River, Black's Fork and Bear River. Over this trail moved Rev. Marcus

Whitman and his wife and Rev. and Mr. Spalding, the Oregon missionaries, in 1830, and soon after the Oregon pioneers. In 1847 came the first Mormon migration and, following them, thousands of others of their faith. The ill-fated Donner party crossed by the same route. With the discovery of gold in California other thousands poured over this first great trans-continental highway. About 1850 the Overland Trail through southern Wyoming (the route in general followed by Ashley in 1825) began to supplant in large measure the Oregon Trail. This soon became an excellent highway used by the overland stage and the pony express. In 1861 a telegraph line paralleled it. Six years later the Union Pacific entered Wyoming near Cheyenne and the following year completed its line across the State.

In 1851 an important treaty had been concluded at Fort Laramie with the plains Indians by which they were confirmed in their right to roam pretty much at will north of the Oregon Trail on their promise not to interfere with the government's project of building roads across the plains and establishing military posts at convenient points. This treaty or series of treaties rendered the overland trails safe for a number of years. In 1864 occurred the Sand Creek massacre in Colorado which started an Indian conflagration that spread next year to Wyoming. The mines of Montana and Idaho lay off the beaten line of travel and in 1865 the government undertook to construct a branch road north from the Oregon Trail, in the vicinity of Fort Laramie, to Bozeman in Montana. This road was to run through the territory reserved by the Treaty of Fort Laramie to the Sioux. Under the guidance of "Jim" Bridger a detachment under General Connor tried unsuccessfully to open the road. Despite the fact that the Sioux of this region, under their leader, Red Cloud, had refused to yield the ground or even to treat concerning it, Col. Henry B. Carrington, in 1866, was ordered to proceed with the task of opening the road and erecting and garrisoning posts along the way. Moving north to Fort Reno (later Fort McKinney) on Powder River and using this as a base, he orders called for the establishment of a garrison here and the erection of forts on Powder, Big Horn and Yellowstone rivers and the protection of the road. The last-named site was afterward eliminated but Fort Phil. Kearney and Fort C. F. Smith were located during July and August, the former near the site of Buffalo, Johnson County. The Sioux were consistently hostile and on 21 December the wood train was attacked a few miles from Fort Phil Kearney. Brevet Lieutenant-Colonel Fetterman went to their relief, enabled the wood train to reach the fort in safety, but was himself with all his officers and men, 81 all told, massacred by the Indians. In the summer of 1866 the Fetterman massacre was avenged by Maj. James Powell. War with the Cheyennes and Sioux, however, dragged on until in the spring of 1868 a treaty was concluded at Fort Laramie by which the government agreed to withdraw its garrisons from the Bozeman road and abandon the country to the Indians. This same year another treaty, concluded at Fort Bridger, created the Wind River Reservation for the Shoshones to whom were later added the Arapaho. Peace continued in Wyoming but only

through the continued relinquishment of the northern part of the territory by the whites. In 1870 a number of citizens of Cheyenne organized a mining and prospecting company to explore the Big Horn country. The Sioux were apprehensive, however, and the expedition was abandoned. Four years later, this deferred reconnaissance took place but this time as an official expedition under General Custer, again causing great uneasiness among the Sioux. Actual war broke out in 1876 in which Custer lost his life. The Sioux, however, were crushed and Wyoming made safe for the whites.

In 1854 Wyoming had been a part of Utah Territory, Oregon Territory and the newly-created Nebraska Territory. In 1859 Washington Territory was set off, including part of western Wyoming. In 1861 a part of the southern portion was included within the newly-formed Idaho Territory. In 1865 a bill was introduced into Congress to create the Territory of Wyoming and in 1867 voters of Laramie County, including the city of Cheyenne, sent a delegate to Congress. He was not permitted to take a seat but his presence in Washington did much to hasten the actual creation of the Territory by act of Congress, under date 25 July 1868. At that time there were four counties, Laramie, Albany, Carbon and Carter (Sweetwater), each running the entire length of the State from north to south. Agitation for Statehood was begun in the 80's and in September 1889 a constitutional convention met in Cheyenne. Their work was afterward ratified. By act of Congress 10 July 1890 Wyoming was admitted as the 44th State of the Union.

During the 70's the cattle industry began and continued to be one of the most important in the State. Perhaps the most prosperous years were from 1880 to 1882. Since that time the open range has been gradually but very surely restricted, while several seasons of un-wonted severity, notably that of 1886-87, retarded the industry. With the restriction of the range came a growing feeling of hostility between the large cattle interests and the small settlers, whose homestead locations covered the watering places to which the range cattle formerly had free access. Many of the settlers owned no cattle but eked out a precarious existence by stealing unbranded cattle (mavericks) from the herds of the great stock owners. In portions of the Territory it became impossible to get a jury of settlers to convict anyone of cattle-stealing (rustling). The cattlemen resorted to force and between 1889 and 1892 several supposed "rustlers" were lynched. This aroused an intense hatred against the cattlemen, several of whom were forced to leave Johnson County, the seat of most trouble, under cover of darkness and on swift horses. In 1892, however, the stockmen resolved on a coup and brought up from Texas an armed body of 50 men with the intention of invading northern Wyoming and killing the "rustlers." This culminated in the so-called Johnson County raid. Proceeding by rail to Casper the raiders started north toward Buffalo, learning on the way that several "rustlers" were at the K. C. ranch on Powder River. Most of the K. C. outfit were absent on the round-up and only "Nate" Champion and "Nick" Ray and

two trappers, who had stayed over night, were in the cabin. The place was surrounded, the two trappers captured and Ray shot down as he started out of the cabin. Champion bore Ray into the cabin under a fusillade and then for hours defended himself and his wounded companion, taking time to keep a careful record of the details of his siege, hour by hour. Ray died in the course of the afternoon. Toward nightfall the besiegers fired the cabin and Champion, in undertaking to effect his escape, was shot down and killed. The raiders then started north toward Buffalo, but the alarm had been given and they turned in and fortified themselves at the T. A. ranch on Crazy Woman's Fork, 12 miles south of Buffalo. Here the besiegers became the besieged, holding out for over two days against an infuriated mob of over 400. The leader of the settlers, "Arapaho Brown," finally contrived what he called a go-devil, consisting of a breastwork of logs on wheels, which he proposed to move up toward the log buildings where the raiders were besieged and then to destroy the cabins with giant powder. Just before this prototype of the modern tank was started, in the early morning of the third day, Col. J. J. Van Horn of Fort McKinney, under orders from President Harrison, came to the rescue with three troops of cavalry. The raiders surrendered and were transferred to Cheyenne where they were released on bail on their own recognizance to appear for trial in January. At that time, on Johnson County's inability to pay the costs, the case was dropped.

Trouble has, from time to time, developed between the cattlemen and the sheepmen, in which some blood has been shed, but with the creation of the national forests and the regulation of grazing privileges, an amicable agreement has been arrived at.

In the last two decades the activities of the State have been devoted to developing the abundant natural resources available.

HARRISON C. DALE,

*Professor of Political Science in the University of Wyoming.*

**WYOMING**, Pa., borough in Luzerne County, on the Susquehanna River, five miles north of Wilkes-Barre, and on the Delaware, Lackawanna and Western and the Lehigh Valley railroads. It is situated in an iron and coal-mining district and there are manufac-

tures of paint, shovels and flour. Pop. about 3,010.

**WYOMING, University of**, located at Laramie, Wyo. It was chartered by the legislature of the Territory of Wyoming in 1886, and opened to students in 1887; the first State legislature in 1890 passed an act enlarging the scope of the University and also made the State Agricultural College provided by the national grants a part of the University organization. The State has since doubled its regular appropriation and made several others for special purposes. The University is open to women on equal terms; tuition is free except in the Department of Music. The educational policy of the University was liberal from the first; the preparatory and collegiate departments were the first established; the organization now includes the Preparatory School; the College of Liberal Arts; the Graduate School; the Normal School; the College of Agriculture and the Agricultural Experiment Station; the College of Engineering; the School of Mines; the School of Commerce; the School of Music; the department of secondary education, and a summer school. The College of Liberal Arts offers a classical, a literary and a scientific course and confers the degree of B.S. for the scientific course without Latin, and the degree of B.A. for all other courses. In each course the work of the Freshman year is required, the work of the Sophomore year partially elective, and the work of the Junior and Senior years almost entirely elective. The Graduate School was discontinued in 1914. The regular courses in the Normal School, the College of Agriculture, the College of Mechanical Engineering and the School of Mines are five years in length, including one preparatory year the degree of B. Ped. is conferred for the completion of the normal course; the degree of B.S. for the agricultural, engineering and mining courses. There are also a one year's course in the Normal School, a course in domestic science, a one year's and a two years' agricultural course and a ranchmen's winter course in the College of Agriculture, and a winter course of six weeks in the School of Mines. The School of Commerce offers two two-year courses in bookkeeping and in stenography; the School of Music a seven-years' course in piano. Instruction in military science and tactics is also given. The University has organized a University Extension Association, which conducts extension lectures in all parts of the State; a Correspondence Teaching Department is also conducted, by which some of the work toward a degree may be done. The campus now occupies over 40 acres in the eastern part of the city; the buildings are the Hall of Languages, the Mechanical Building, the Hall of Science, and the Gymnasium; the three first mentioned are built of gray sandstone, which is found near Laramie. The library contains about 35,000 volumes; the students number 603; and 80 professors and instructors.

The University of Wyoming, though in numbers one of the smallest of the State universities, is well equipped and maintains a high standard of scholarship, as the real head of the educational system of the State.

**WYOMING VALLEY**, a crescent-shaped valley in Luzerne County, Pa., traversed by the

northern branch of the Susquehanna River; length, 21 miles. It is a fertile alluvial plain, with rich deposits of anthracite coal, and is noted for its beautiful scenery. The valley was claimed by the colony of Connecticut as early as 1753 and was first settled by people from Connecticut; the ensuing dispute between Pennsylvania and Connecticut over this territory is known as the "Pennamite and Yankee war," and was not finally settled till after the Revolutionary War. (See PENNSYLVANIA; *Boundary Controversies*). In 1782 a commission appointed by Congress decided in favor of Pennsylvania; an attempt was made to drive out the Connecticut settlers which led to a renewal of the war; but in 1788 Pennsylvania confirmed the titles of all actual settlers to their land, and all controversy was ended by 1800. During the Revolutionary War a large proportion of the men of the Wyoming Valley joined the Continental army; but a number of Tories were living in the valley; and in 1778, when they were joined by British troops and Indian allies, an attack was made upon the settlers who had taken refuge in Forty Fort, near Wilkes-Barre. The settlers did not number over 400, chiefly boys and old men; the British force, including the 700 Indians, was about 1,100. After a desperate battle fought on the 3d of July 1778 the settlers were completely defeated, about two-thirds being killed. They were forced to capitulate, and after the surrender many of the prisoners were tortured and killed by the Indians. The greater part of the inhabitants of the valley were compelled to flee to other settlements and endured great hardships. Consult Miner, 'History of Wyoming' (1845); Stone, 'Poetry and History of Wyoming' (1844); Peck, 'Wyoming: its History and Incidents' (1858); Smith, 'Story of Wyoming Valley' (Kingston, Pa., 1906).

**WYOMINGITE**, a rock consisting almost entirely of leucite and phlogopite, abundant in the Leucite Hills in Sweetwater County, Wyoming. Contains so much potash that it may become a source of that material.

**WYON**, wí'on, William, English engraver and designer of coins and medals: b. Birmingham, 1795; d. Brighton, Sussex, 29 Oct. 1851. Having won several prizes for medals offered by the Society of Arts, he went in 1816 to London and was appointed second engraver at the mint, a post which he filled until the close of his life. In 1832 he was elected an associate of the Royal Academy, and in 1838 an academician, being the first of his department who had ever obtained these honors. His works, comprising coins, pattern pieces of coins not used, medals and seals are numerous. His coins cover a period of nearly 30 years, including the latter part of the reign of George IV, the reign of William IV, and the first 13 years of the reign of Victoria. Far more numerous than these are his war, scientific, artistic and testimonial medals, executed from his own or from Flaxman's designs, and in the highest style of art.

**WYSS**, wís, Johann Rudolf, Swiss author b. Bern, 13 March 1781; d. there, 31 March 1830. He was educated at various German universities, became professor of philosophy at Bern in 1806, and later also chief librarian. His

'Schweizerische Robinson' (1812-13), an edition of Defoe, was translated into various languages, the first series appearing in English ('Swiss Family Robinson') in 1820, the second in 1849. Wyss also wrote 'Vorlesungen über das Höchste Gut' (1811), and 'Idyllen Erzählungen aus der Schweiz' (1815-22); 'Der Berner Oberland' (1808); and edited the collection 'Alpenrose' (1811-30). Wyss is the author of the Swiss national anthem, 'Rufst du mich in Vaterland?'

**WYTHE**, with, **George**, American patriot; born in the county of Elizabeth City, Va., a distance from Yorktown; d. Richmond, Va., 1806. One of his ancestors was George Wythe (1639-1716), a Scotch Quaker, distinguished as a mathematician and Oriental scholar; who emigrated to America about 1684. In view of his radical religious views and position to slavery, he was often persecuted. On 15 Oct. 1693 Keith issued an edictation and Caution against buying or selling Negroes," seemingly the earliest Quaker edictation against slavery. These views were inherited by George Wythe. From his mother he received a life-long bent toward classical scholarship. Even at the age of 80 he began to learn a new language. He was trained in the law by an uncle. Wythe's connection with the Virginia Burgesses, in Virginia, began on 27 Feb. 1752, on the eve of the French and Indian War. Hence he knew in a practical way the leading up to the Revolution, whose course he was destined to influence. He was a member of the Continental Congress and one of the signers of the Declaration of Independence. He participated in the Philadelphia Convention of 1787 and exerted himself to secure the ratification of the Constitution by Virginia the following year. For 10 years he was a member of the Virginia Supreme Court of Appeals, and for 20 years sole chancellor of the State. Several important and varied were such positions that he filled, George Wythe is not to be judged chiefly as statesman or jurist. He was first and foremost a teacher, and his most lasting work was the subtle influence of his singularly pure and lofty character. Either in his law office or as professor in William and Mary College, he was the teacher of Thomas Jefferson, John Marshall, James Monroe, Henry Clay and many other men only less prominent than himself.

With Jefferson, in particular, Wythe formed a friendship and interchange of thought which had a bearing upon national affairs. So highly did Jefferson prize the services of Wythe as a teacher, that he exerted himself to establish, in 1779, in the College of William and Mary a chair of law, expressly to secure the occupancy of his "master and friend," and delighted to call Wythe. Wythe was the first professor of law in the United States. His position in William and Mary College was the second in the English-speaking world to have a chair of Law, George Wythe coming to such professorship a few years after Sir William Blackstone. Jefferson, in writing from Paris in 1786 to Dr. Richard Price, an English opponent of slavery, gives striking evidence of the intimate of the services which Wythe was rendering to his country: "The College of William and Mary in Williamsburg, since the

remodelling of its plan, is the place where are collected together all the young men (of Virginia) under preparation for public life. They are under the direction (most of them) of a Mr. Wythe, one of the most virtuous of characters, and whose sentiments on the subject of slavery are unequivocal." Henry Clay, in a letter of 3 May 1851, to B. B. Minor, says in reference to Wythe: "To no man was I more indebted, by his instructions, his advice, and his example, for the little intellectual improvement which I made, up to the period when, in my twenty-first year, I finally left the city of Richmond." "The most remarkable instance," says Munford, "of his genuine patriotism, to which I confess I am rendered most partial perhaps by my own experience of its effects, was his zeal for the education of youth. Harassed as he was with business; enveloped with perplexing papers, and intricate facts in chancery, he yet found time for many years to keep a private school for the instruction of a few young men at a time, always with very little, and often demanding no compensation." That Wythe conceived the training of publicists to be his true task appears from this sentence in a letter on 5 Dec. 1785, to John Adams: "A letter will meet me in Williamsburg, where I have again settled, assisting, as professor of law and police in the University there, to form such characters as may be fit to succeed those which have been ornamental and useful in the national councils of America." In three signal instances Wythe was a forerunner. As early as 1764 he wrote Virginia's first remonstrance to the House of Commons against the Stamp Act, taking so advanced a position in regard to that ominous act as to alarm his fellow-burgesses. He was perhaps the first judge to lay down, in 1782, the cardinal principle that a court can annul a statute deemed repugnant to the Constitution, thus anticipating by a score of years the classic decision of his great pupil, John Marshall, in the case of *Marbury v. Madison*. He was an ardent advocate for the emancipation of the slaves, not only infusing his students with his abolition sentiment, but actually freeing his own slaves and making provision for them in his will. His death occurred in Richmond, Va., in 1806, from poison administered by his great-nephew, who hoped to come thus into the inheritance of his estate. "No man," says Jefferson, "ever left behind him a character more venerated than George Wythe. His virtue was of the purest kind; his integrity inflexible, and his justice exact; of warm patriotism, and devoted as he was to liberty and the natural and equal rights of men, he might truly be called the Cato of his country, without the avarice of the Roman; for a more disinterested person never lived. Temperance and regularity in all his habits gave him general good health, and his unaffected modesty and suavity of manners endeared him to every one. He was of easy elocution, his language chaste, methodical in the arrangement of his matter, learned and logical in the use of it, and of great urbanity in debate. Not quick of apprehension, but with a little time profound in penetration, and sound in conclusion. His stature was of middle size, well formed and proportioned, and the features of his face manly, comely, and engaging. Such was George Wythe, the honor of his own and

the model of future times.<sup>p</sup> Wythe was the author of 'Decisions in Virginia by the High Court of Chancery' (1795; 2d ed., with 'Memoir' 1852).

SAMUEL C. MITCHELL,  
*President of Delaware College.*

**WYTHEVILLE**, with'vil, Va., town, county-seat of Wythe County, on the Norfolk and Western Railroad, 130 miles west of Lynchburg and 215 miles southwest of Richmond. It is in a stock-raising and mining region and has considerable lumbering interests. It has iron works, woolen and knit goods factories, flour and lumber mills. The town has a county courthouse, Trinity Hall Female College (Lutheran), Wytheville Seminary (Protestant Episcopal), Academy of the Visitation (Roman Catholic), public elementary schools and two libraries. Pop. about 3,054.

**WYTHEVILLE, Military Operations at.** During the Civil War the lead mines and works near Wytheville assumed much importance. On 13 July 1863 Col. John T. Toland, with the Second West Virginia cavalry and 34th Ohio mounted infantry, about 800 men, started from Fayetteville, W. Va., to damage the lead works and destroy the railroad near Wytheville. On the evening of the 18th Toland arrived within five miles of the town and detaching two companies to destroy a railroad depot and track, 10 miles west, marched his remaining force into the town, which was defended by less than 200 men, under Major Bowyer, most of them distributed in houses and some in the streets supporting two guns. There was an obstinate fight in the streets, lasting an hour, when the town was taken and eight or 10 of the best houses burned. The two guns and many small arms were captured and some prisoners taken, but all were abandoned when the return march was taken up next morning. The command reached Fayetteville on the 23d after a march of about 300 miles. The expedition had failed of its object, with the loss of 78 killed, wounded and missing, of whom 17 were killed, including Colonel Toland and two other officers. Colonel Powell, commanding the Second West Virginia cavalry, was severely wounded and captured. The Confederates report a loss of six killed and 12 wounded. On 2 May 1864 General Crook started from Charleston on the Kanawha to destroy the Virginia and Tennessee Railroad and join General Sigel in the Shenandoah Valley. One of his columns of 2,600 cavalry, under General Averell, was directed upon Saltville to destroy the salt works, and then rejoin the main column under Crook at Dublin Station. After a very difficult march through the mountains and some sharp skirmishing Averell reached Tazewell Court House on the afternoon of the 8th, where he learned that Saltville was defended by earthworks and artillery, and was held in strength by Gen. W. E. Jones, upon which he abandoned the idea of attack and turned toward Wytheville, near which he arrived on the afternoon of the 10th and encountered Col. John H. Morgan, who had fol-

lowed him from Saltville and by a detour first gained the town with a brigade and two battalions. A detachment of Morgan's command had been pushed out to a small gap in the mountain, through which alone Averell could approach the town from the road on which he was marching. The detachment was immediately attacked and Morgan marched to its assistance with all his command, and Averell fell back to a commanding ridge 800 yards from the gap. The contest continued four hours, or until nightfall, in a succession of attacks on the one side and retreats on the other, when Morgan fell back a short distance and Averell withdrew and next morning marched for Dublin, where he arrived in the evening and, resuming his march, joined Crook at Union on the 15th. Averell had 114 killed and wounded, and lost nearly 100 in prisoners. Morgan had 50 or 60 killed and wounded. When General Stoneman made his raid into southwestern Virginia in December 1864 he captured Wytheville on the 16th, partially burned it and next day sent a detachment to destroy the lead mines, which was done without loss. On Stoneman's second raid in southwest Virginia and western North Carolina in March 1865, Col. J. K. Miller, with 500 picked men of his cavalry brigade, captured Wytheville 6 April and destroyed the depot of supplies at that point and the bridges over Reedy Creek and at Max Meadows. At Wytheville, Miller was attacked by Confederate infantry and cavalry, but after hard fighting repulsed them, and withdrew with a loss of 35 killed, wounded and missing, and rejoined the main column on its march for Salisbury, N. C.

**WYTENBACH**, wít'ten-bah, Daniel Albert, Dutch scholar: b. Bern, Switzerland, 7 Aug. 1746; d. Osgest, Holland, 17 Jan. 1821. He studied at Marburg, Göttingen and Leyden; became professor of Greek at the Remonstrant Gymnasium at Amsterdam in 1771, of philosophy at the Athenæum: in 1779, and succeeded in 1799 to Ruhnken's chair of rhetoric at Leyden. His greatest work is the edition of Plutarch's 'Morals,' with copious annotations and an admirable 'Greek Index to Plutarch's Works' (1795-1830). Other works are 'Epistola Critica' (1769); 'Præcepta Philosophiæ Logici' (1782; new ed., 1821); 'Eclogæ Selectæ Principum Historicorum Capita' (1793; 1829); 'Vita Ruhnkenii' (1800); Plato's 'Phædo' (1810; new ed. 1825). He retired in 1816, and died after some years of blindness. His 'Opuscula' appeared in 1820. Consult Mahne, 'Vita D. Wytenbach' (1823) and Sandys, J. E., 'History of Classical Scholarship' (Cambridge 1908).

**WYTENBACH, Johanna Gallia**, Dutch writer: d. Leyden (1830). She was married to D. Wytenbach (q.v.) when he was 72, and after her husband's death lived at Paris and was given the degree of doctor in philosophy by Marburg, in 1827. Among her writings were 'Theagenes' (1815); 'Leontes' Banquet' (1812); and the romance 'Alexis' (1823).

# X

**X** the twenty-fourth letter and nineteenth consonant of the English alphabet: it is a superfluous letter since it stands for no sound that cannot be signified by other letters. When it occurs in the beginning of a word it is always pronounced in English as *x*: *Xenophon*, *zenophon*, *xiphoid*, *ziphoid*; in the middle of a word it is usually equal to *ks*: *axis*, *aksis*, *Saxon*, *sakson*; but when in a word it ends a syllable, more especially an initial syllable, if the syllable following it is open or accented, the *x* has often the value of *gz*, as in *luxury*, *lugzury*, *exhaust*, *egzhaust*. Final *x* is always equal to *ks*. As an initial letter *x* does not occur in English save in words mostly technical and derived from Greek, and in a few words, mostly proper names, of Spanish origin.—The power of *x* in English, as in Latin, is that of the Greek letter *xi* (Ξ ξ). It has been suggested that its form is that appropriated in the Greek alphabet to the guttural aspirate *chi* (Χ, χ). Before the introduction of *x* (ξ) the Greeks represented the sound of *x* by ΞΞ, ξξ and the Latins at first did the like, writing *Maxsumus*, *proxsumus*; but as *x* had in their writing no function but that of representing, with *s* the sound of Greek *xi*, the very sight of the *x*, even before the eye came to the *s*, may have raised in the mind the idea of a sibilant, and thus rendered the sibilant letter itself superfluous, so that before long it was omitted and *x*, standing alone, represented the two characters *χ* and *s*. However, the evidence in favor of this view is not conclusive, and there are alternative opinions. In the popular pronunciation of Latin in the later period of the empire, *x* seems to have been sounded like *s* or *ss*: some inscriptions of that period have *visit* for *vixit*, and *milesx* for *miles*: this change in the sound-value of *x* has persisted in the modern language of Italy in which *ss* or *s* is regularly substituted for the Latin *x*: *saxum* becomes *sasso*, *experimentum*, *esperimento*, *maximus*, *massimo* and so on. In French, in words derived from Latin, the *x* occurring in the middle of a word is often changed to *ss*: *laxare* becomes *laisser*; or Latin *x* is changed to the sound of *sh*: *vexare* becomes *facher*, and the word *soixante* is pronounced *soissante*. *X* scarcely occurs in German words of native origin; its sound is usually represented in that language by *chs*, examples: *ochs* (ox), *wachs* (wax), *Sachse* (a Saxon). *X* stands for 10 in the Roman symbolism; *x* is often used in mathematics for an unknown quantity or the abscissa of a point. See ALPHABET.

**X-RAY**, The, a ray proceeding from a glass-bulb from which air has been highly exhausted and through which an electric charge is being passed. It was discovered by Röntgen in

Wurtzburg, 1895. Hundreds of others had experimented with Crookes tubes, glass bulbs exhausted to one millionth of an atmosphere and enclosing the terminals of high tension electric wires. These had all produced X-rays now called Röntgen rays, but Röntgen was the first to detect their presence. They are invisible and are supposed to be vibrations of a similar character to those of light but much more rapid than even the invisible ultra violet rays in sunlight. The extremely short wave length accounts for the fact that every substance regardless of its color is more or less transparent to the X-rays; and that the X-rays are not ordinarily reflected or refracted. In fact it was about 23 years after their discovery that it was found out that the cleavage surfaces of crystals, smoother than any artificially polished surface, would produce these two effects upon the X-ray which are so easily produced upon ordinary visible light. Excellent pictures are often taken through aluminum one-quarter inch thick, while denser substances like lead and gold arrest most of the X-rays even in much thinner layers. The modern X-ray tube contains a cathode or negative terminal from which the cathode stream of negative particles or electrons traveling at an average velocity of 20,000 miles a second starts under the influence of from 50,000 to 100,000 volts; also a target or anticathode upon which these particles impinge, setting up the extremely rapid vibrations called the X-ray or Röntgen ray. There is a positive terminal, the anode, which may or may not be used as the target. The gas filled X-ray tube contains air or some gas exhausted upon an air pump to a vacuum of about one-millionth of an atmosphere. It is provided with a regulator by which the degree of vacuum may be raised or lowered.

The electron discharge X-ray tube, such as the Coolidge tube, is exhausted to as complete a degree of vacuum as possible and even the highest voltage fails to send any electricity through it unless a low tension current is first sent through a tungsten filament forming part of the cathode. During the time that this filament is incandescent, it liberates electrons which are ready to form the cathode stream when the high tension current is turned on. Arrangements are necessary for regulating the strength of the low tension current so as to vary the incandescence of the tungsten filament.

The rays are made perceptible by looking through a fluoroscope or dark box enclosing a screen of some fluorescent substance like barium platino cyanide which becomes brilliantly illuminated. If the whole room is darkened the fluoroscope may consist simply of the flat screen. Anything held between the X-ray tube

and the screen casts a shadow upon this illuminated surface and parts of the object which have different densities become distinguishable in the image upon the screen by reason of differences in the darkness of the shadow. Looking at a person's chest, the ribs look moderately dark and the lungs very light, while the heart is seen as a pale shadow expanding and contracting.

X-ray pictures are very often made without ever looking at the patient with the fluoroscope and not really seeing the part under examination, such as the bones of the leg, until the plate or film is developed. The latter is in a cassette or plate-holder made of aluminum which is opaque to ordinary light, but very transparent to the X-ray. Thin wood or thin hard rubber serve equally well. Or the plate may be simply wrapped in black and orange paper to protect it from ordinary light. No camera is required and the plate is not usually uncovered during the X-ray exposure. It is possible, however, to make an X-ray picture upon a completely uncovered plate providing the room is absolutely dark and the X-ray tube is surrounded by a covering opaque to ordinary light but transparent to the X-ray; it being desirable to protect the uncovered plate from ordinary light rays produced by the tube in addition to the X-rays.

A special property of the X-ray is one also possessed by the rays from radium. It is that of ionizing the air and so rendering the air a conductor of electricity as may be demonstrated by the discharge of an electroscopes. This property is made the basis of measuring the radio-active power of radium and has been occasionally used to measure the intensity or the dosage of the X-ray.

The X-ray is ordinarily made up of different rates of vibrations having as different properties as the different rates of vibration in ordinary light. X-rays of very rapid vibration are highly penetrating and are called hard rays; they are produced when the tube presents a high resistance to the passage of electricity and it takes a high voltage, perhaps 90,000, to send a current through the tube. This high resistance occurs when the vacuum of a gas-filled X-ray tube is high, that is most of the gas is removed; with an electron discharge X-ray tube like the Coolidge tube the resistance is high when the filament is at a low degree of incandescence. Rays of a low degree of penetration or soft rays are produced in greatest abundance by an X-ray tube whose resistance is so low that about 40,000 volts will send electricity through the tube. As a rule, the rays are not all of the same wave length, but the radiation is mixed. The average penetration is determined by the regulation of the resistance of the tube. Under special conditions, however, homogeneous X-rays are obtainable. The parallel spark-gap is the distance that the high tension current will pass across in the open air in preference to passing through the X-ray tube. It is frequently employed as a means of measuring the resistance of the X-ray tube. In a rough way, each inch of parallel spark gap corresponds to 10,000 volts of high tension current required to excite the X-ray tube and very roughly to one Benoist unit of penetration. Direct measurement of the average degree of

penetration of the rays generated by an X-ray tube is generally by the Benoist Radiachromometer. There is a central disc of silver 0.11 millimeter thick, surrounded by sectors of aluminum from 1 to 12 millimeters thick. The number of millimeters of aluminum which cast a shadow of the same density as that of 0.11 millimeters of silver gives the degree of penetration. Soft rays are number three or four Benoist, and very hard rays number 10 or 12 Benoist. X-rays are partly absorbed by every substance through which they pass. The denser the substance and the softer the X-rays the greater proportion is absorbed by a layer of a given thickness. Very soft rays are so absorbable that even the petals of flowers cast shadows and produce beautiful pictures, while extremely hard rays are employed to look for flaws inside of steel rails. Medium degrees of penetration produce X-ray pictures of the human body in which the bones cast a darker shadow than the flesh, air spaces like the pneumatic sinuses of the face and like the lungs cast a lighter shadow and dense foreign substances like a bullet in a wound or an opaque meal in the stomach and intestines or a stone in the kidney cast dense shadows. Except in the case of a broken bone or a bullet, the interpretation of a radiograph requires a knowledge of the normal X-ray lights and shadows of the part depicted.

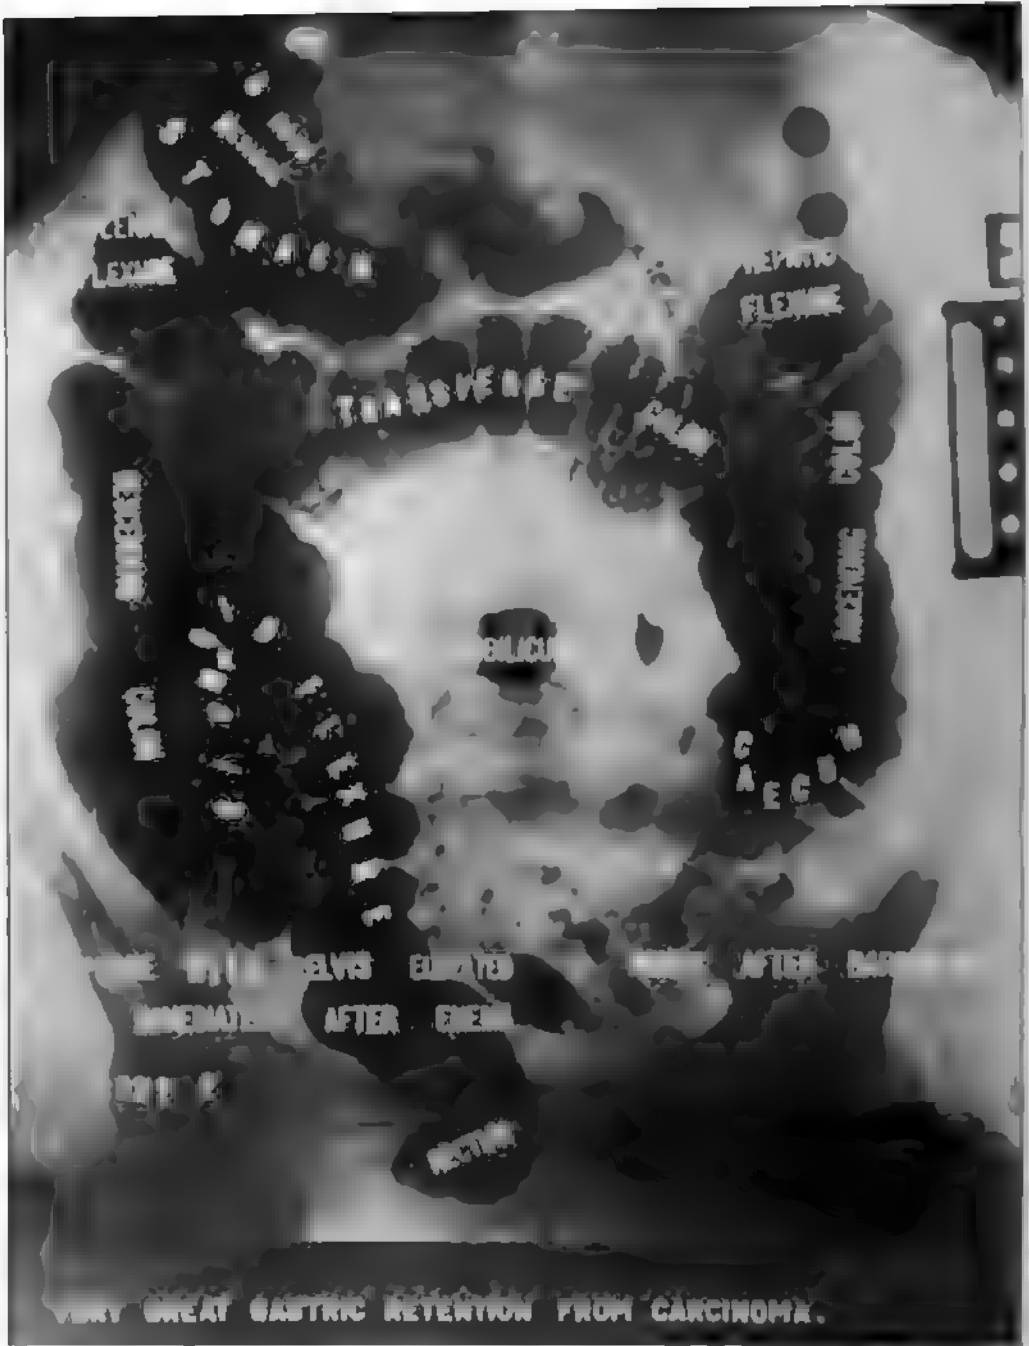

The effects of the X-ray upon the human body were first noticed as X-ray burns and loss of hair. Later it was found that these could be prevented and that the X-ray had marvelously beneficial effects upon cancer and leucemia and tubercular glands and other diseases. Skin cancers are usually permanently cured without the necessity for an operation and moderately soft rays are employed which will be absorbed by the skin with very little deep effect. Deep-seated lesions require rays of great penetration so that a large fraction will reach the deep tissues. This is partly accomplished by regulating the X-ray tube to a high resistance so that it generates chiefly hard rays and also by interposing a filter between the X-ray tube and the patient. An eighth of an inch or more of aluminum will arrest many rays which would be absorbed by the skin with danger of burning, and which would greatly limit the quantity of the accompanying penetrating rays that could be safely applied. The intensity varies inversely as the square of the distance, so even rays of the proper penetration are much stronger at the surface toward the X-ray tube than in the deep tissues considerably further away. And even the penetrating rays are rapidly weakened by passing through the tissues. To secure sufficient effect upon a deep-seated organ without too much effect upon the skin a cross-fire system is necessary. One exposure is made shielding the skin with heavy lead except for an opening through which the X-ray passes to the deep organs. For another exposure, the person is in a different position and the X-ray reaches the same deep organ through a different part of the skin. Sometimes as many as eight different ports of entry are employed, the deep-seated organ receiving eight times the quantity of X-rays that could have been safely applied from a single direction. And so though the

X-RAY

Lateral radiograph of the head; showing frontal sinus, ethmoid cells, antrum, sphenoidal sinus and sella Turcica. The antrum on the side away from the photograph in plate is magnified and less distinct. It is seen through the cervical vertebrae

X-RAY

Radiograph of the stomach and intestine in a case of cancer of the stomach

1 Radiograph of the Human Hand (Dead) Made by Radium

2 Radiograph of the Human Hand (Living) Made by X-Rays

is weakened by distance and by absorption passing through the overlying tissues, the beneficial total dosage is applied to the deep organ. All but the successive ports must be shielded by thick lead. It is sufficient to merely change the position of the X-ray tube and the patient.

The cumulative effect of the X-ray is reversible. A certain number of minutes exposure has the same effect whether applied at once or in divided doses extending over three weeks. This is what makes it so dangerous to the operator if he is frequently exposed to the X-ray. Even though each exposure is for a picture or treatment may be beneficial to the successive patients and although the operator's being at a greater distance, he is exposed each time to a much smaller dose than any of the patients, the cumulative effect upon him is disastrous. Many X-ray operators died from cancer originating from this cause.

The only safety for the operator lies in shielding from the rays by a brick wall or heavy lead. An operator is very foolish to think that he is going to use the X-ray so that he does not need to be shielded. If he does good work he will soon find that he has benefited many patients at the expense of irreparable injury to himself.

The period of incubation is another interesting feature of the X-ray effect upon the human body. In treating skin cancers, a reaction is observed somewhat similar to a slight sunburn and this does not appear at the time of exposure but all the way from four to 20 days afterward.

The dosage of the X-ray necessarily implies an appropriate quality as represented for instance on the Benoist scale of penetration and the appropriate quantity of X-rays measured as applied at the surface of the skin.

One unit of quantity is the Holzknacht dose and about 5H is an erythema dose. Another unit is Tint B, Sabouraud, which is the same erythema dose. Another is Kien-

X unit and 10X is an erythema dose. An erythema dose is that amount of X-ray which will produce redness of the skin with hyperkeratization. It first became a standard of dosage in Sabouraud's treatment of ring worm of the scalp. In that disease the germs are difficult to kill because they are adherent to the roots of the hairs deep down in the hair follicles. A single erythema dose causes the hairs to fall out carrying the germs with them. To insure an antiseptic lotion must be employed to prevent reinfection of other hairs whose roots which have fallen out. After a correct dose the disease is permanently cured and the hair all returns. Repeated doses

X-ray are sometimes employed for the permanent removal of superfluous hair but not authorities recommend this use of the X-ray. The X-ray has led to one of the most important discoveries in modern medicine. It is known that many diseases of the type of osteoarthritis, arthritis, neuritis and myositis, also dermatitis, digestive troubles including ulcer of the stomach and many other symptoms and diseases of a varied character frequently have their origin in tooth infection. A blind abscess may exist for years at the apex of the fang of a tooth and poison the system all that

time. It may give no pain or swelling and its presence may be unknown to the patient or the dentist and still be the cause of painful or even fatal illness. Such infection is readily disclosed by an X-ray examination and easily cured by the dentist. The patient is fortunate if this is done while the systemic infection is slight and of a nature to certainly get well after the discovery and elimination of the dental infection. Of course after the onset of a fatal illness is not the time to discover that it was caused by an infected tooth. There are almost always mild indications which suggest the desirability of an X-ray examination of the teeth in time to prevent the more serious effects of tooth infection. One of the effects of a great many mild exposures in the case of X-ray operators is sterility. This is an additional reason why the operator should be shielded. And one of the diseases in which X-ray exposures are curative is fibroid tumor of the uterus with hemorrhage as a serious symptom. The cases of this disease which are most successfully treated are those in which the X-ray exposures bring on an artificial menopause.

X-ray operators who are not shielded are liable to blood changes resembling anemia or leucæmia, but this effect is not so generally produced as the X-ray keratoses with a tendency to change into cancer, and the sterility.

SINGLAIR TOUSEY, M.D.  
New York City.

**X. Y. Z. CORRESPONDENCE**, in United States history, the name given to the dispatches of the three commissioners to France in 1797-98, Marshall, Pinckney and Gerry. These commissioners reached Paris in October 1797, but were refused recognition by the Directory. They were, however, notified by the secretary of the Marquis de Talleyrand, Minister for Foreign Affairs, that agents would be sent to conclude negotiations. The first of these, Hottinguer, stated that a "loan" of \$1,200,000 would be the necessary means of placating the Directory; the other two, Bellamy and Hauteval, urged that in case the American government would buy at par stock amounting to 32,000,000 livres, but whose market-value was really about one-half that amount, the transaction would be viewed as a loan. The intimation was that in default of money war would ensue. These terms were promptly rejected. The dispatches sent by the commissioners were submitted in copy to Congress, X., Y., and Z., having been substituted for the respective names of the French agents. A great stir was caused at the time. Preparations for hostilities were made, and war on the sea actually broke out. Consult for the text of the correspondence 'American State Papers, Foreign Relations,' Vol. II (Washington 1832), also Adams, C. F., 'Works of John Adams' (10 vols., Boston 1850-56); Bassett, J. S., 'Federalist System' (Boston 1906), and Morse, J. T., 'John Adams' (Boston 1908).

**XANTHENE DYESTUFFS**. See COAL-TAR COLORS.

**XANTHIAN** (zan'thī-an) **MARBLES**, a large collection of marbles of various ages (from 545 B.C. onward) discovered near Xanthus, in 1836.

**XANTHINE**, an organic base,  $C_8H_{10}N_4O_2$ , occurring in small amounts in many animal secretions, in the blood, urine, liver, in some urinary calculi, and in tea extract. It may be readily made by the action of nitrous acid on guanine. A white amorphous powder slightly soluble in water, and forming crystalline compounds with both acids and bases. It is closely related to theobromine and caffeine, the alkaloids found in cocoa and coffee respectively. Caffeine may be considered as xanthine in which three hydrogen atoms have been replaced by three methyl ( $CH_3$ ) groups.

**XANTHIPPE**, zán-thíp'è, the wife of Socrates, the Greek philosopher. Her shrewish temper has become proverbial, but many of the stories about her are probably false, for in ancient Athens gossip was cultivated to the perfection of a fine art, the point and not the truth of the story being the chief consideration. Xanthippe's natural inequalities of temper were heightened by the peculiarities of her spouse, especially his indifference to the common place duty laid on the head of the house to make both ends meet. The philosopher received her reproaches with such good-humored indifference that it is not surprising she sometimes resorted to other weapons beside her tongue; as on the occasion when she is said to have finished up a tirade by sousing the philosopher, though his remark, as he moved dripping from the scene, that when Xanthippe thundered she watered, must have shown her that here, too, she was powerless. Consult Zeller, E., 'Vorträge und Abhandlungen' (Vol. I, 1875).

**XANTHOCONITE**. A silver ore  $3Ag_2S.As_2S_6$ , containing 61.4 per cent of silver. Formerly mined in Santa Fé County, N. Mex.

**XANTHUS**, zán'thūs, Asia Minor, (1) an ancient city, the capital of Lycia, on the Xanthus River, about eight miles above its mouth. Its ruins near modern Gunk were discovered in 1838, and have yielded a large collection of marbles, now in the British Museum. (2) The river now known as the Kedja Ak rises in Mount Taurus, and falls into the Mediterranean a little to the west of Patara. Consult Behndorf and Niemann, 'Reisen in Lykien und Karien' (Vienna 1884); Smith, 'Catalogue of the Sculptures of the British Museum' (Vol. I, London 1892).

**XAVERIAN BROTHERS**. See ORDERS, RELIGIOUS.

**XAVIER**, zäv'i-ër, Sp. hä-vè-är'; Saint Francis. See FRANCIS XAVIER, SAINT.

**XEBEC**, zè-bèk, a small three-masted vessel, employed in the Mediterranean, distinguished from other European vessels by the great projection of the prow and stern beyond the cut-water and stern-post. In this respect it resembles the felucca, from which it differs only in having the fore-mast square-rigged. The xebec is constructed with a narrow floor for the sake of speed, and of a great breadth, so as to be able to carry a considerable force of sail without danger of overturning.

**XENIA**, Ohio, city, county-seat of Greene County, on the Shawnee Creek, and on the Pennsylvania, the Cincinnati, Hamilton and Dayton, and the Chicago and Saint Louis railroads, 55 miles southwest of Columbus. It is

in the Little Miami Valley, in the midst of a productive farming region. It is well laid out and has 11 miles of first-class pavement and a complete storm sewer system. The chief manufacturing establishments are shoe factories, powder works, an ice factory, a flour mill, two factories, cigar factory, machine shops, one automobile factory, saw and planing mills, marble and granite works, canneries, candy kitchens. The county courthouse is in a park in the centre of the city. Other prominent buildings are the municipal building, the Ohio Soldiers and Sailors' Orphans Home and several business blocks. Outside the city limits are the county infirmary and children's home. The educational institutions are the Xenia Theological Seminary (United Presbyterian), opened in 1794; three high schools, the Central, established in 1850, one for colored pupils, and the Ohio Soldiers and Sailors' Home High School; public and parish schools, a public library and school libraries. Willberforce University, in Willberforce village, is for colored pupils. It has departments of law, theology, science and literature, and a training school for nurses. There are several churches. The banks have a combined capital of over \$250,000, and other resources about \$2,400,000. The government is vested in a commission of five and a city manager. Xenia was settled in April 1803 by John Marshall. In 1808 it was incorporated. Pop. 8,711.

**XENOCLES**, zèn'ò-klèz, Greek tragic poet, b. Athens, 4th century B.C., in the time of Philip of Macedon. He obtained a prize for four plays, 'Edipus,' 'Lycaon,' the 'Bacchantes,' and 'Athamas.'

**XENOCRATES**, zè-nòk'ra-tèz, Greek philosopher: b. Chalcedon, 396 B.C.; d. 314 B.C. He was a pupil and friend of Plato, and though of a dull and sluggish disposition, supplied the defects of nature by unwearied attention and industry. He succeeded Speusippus in the school of Plato about 339 B.C., presiding over the academy till his own death 25 years later. He was famed for his integrity and it is said that when he appeared in the court as a witness the judges dispensed with his oath. His philosophy followed the teachings of Plato but was modified by Pythagorean tendencies. He measured the value of philosophy and ethics according to their effect upon conduct; and while not a great or original thinker, his personal influence through his purity and integrity, was enormous. He converted Polemon from dissolute habits to a life of high and pure purpose. Among his followers were Phocion, Chaeron, Zeus and Epicurus. He was the author of numerous works, none of which, however, are extant.

**XENOLITHS**, inclusions of the wall rock caught in an intrusion, as in a dike (q.v.) of silt (q.v.), or batholith (q.v.); and there frozen into the igneous mass as it cools. See METAMORPHIC STOPING.

**XENON**, a gaseous chemical element discovered by Ramsey and Travers (1898) in the residue left after the evaporation of a large quantity of liquid air. It is the heaviest of the elementary substances present in the atmosphere in gaseous form. It can be condensed to a liquid boiling at  $109^{\circ}$  C., and to a solid which volatilizes without melting. Its volume in atmospheric air is about one in 170,000,000. Sym-

or Xe; atomic weight 130.2. It is an chemical element having a spectrum some-resembling argon.

**XENOPHANES**, zē-nōf'ā-nēz, Greek philosopher and poet; founder of the Eleatic school of philosophy; b. Colophon, Asia Minor, about c.; d. about 480 B.C. He was a contemporary of Pythagoras and Anaximander, and had been banished from his native city, went to Italy, and thence to Magna Græcia. He set up about 536 B.C., at Elea (Velia), whence he derived his name, and the school which he founded, called after their name. Of his poems, in which he treated of philosophical and other subjects, only fragments are preserved in the works of Athenæus, Plutarch and others. Portions of his didactic poem, 'Peri physikōn' (On Nature) have been collected by G. L. Fisher in his 'Commentationes Eleaticæ' (1830), and by Karsten in his 'Philosophorum veterum reliquiæ' (Vol. I, 1830). He was an ardent monotheist and declared that the gods and Herodotus attributed actions to the gods that were "a shame and a reproach among men." Consult Ueberweg, 'History of Philosophy' (English trans. (1872); Zeller, 'Philosophie der Griechen,' 4th ed. (1900). See also **XENOS**.

**XENOPHON**, zēn'ō-fōn, ancient Greek historian and general; b. Athens, about 434 B.C.; d. in Corinth, about 355 B.C. He lived during a period in which the greatest political and intellectual excitement existed at Athens, and in the midst of the most distinguished men, of whom he was one, he appeared on the stage. Xenophon was a pupil of Socrates. He was said to have parted with his teacher in the Peloponnesian War, and to have had his life saved by Socrates at the battle of Delium (424 B.C.), but this is now generally accepted. When the Persian prince, Cyrus the Younger, contended with his elder brother Artaxerxes Memnon for the throne, the Athenians sent him auxiliaries, among whom Xenophon served as a volunteer. Cyrus defeated and lost his life on the field of Artaxerxes (401 B.C.). The principal officers of the auxiliary army having been likewise killed, he, or taken prisoners by artifice, and then, on the death of Xenophon was apparently selected to command the Greek forces, 10,000 men. They were in a most critical situation, in the midst of a hostile country, without cavalry, surrounded by enemies and innumerable difficulties; but Xenophon was able to inspire confidence, to repress insubordination, and to lead them in their return march of several miles to the Black Sea. Xenophon himself described this retreat, and at the same time the whole expedition of the younger Cyrus, in 'Anabasis,' the most famous of military narratives. There is no means of verifying the events of this work. On their arrival at Opis (opposite Byzantium) a number of mutinies, with Xenophon at their head, ended the service of Scythus, king of Thrace. Xenophon joined the Spartan general Leonidas or Thibron, who was then conducting a war against the Persian satraps, Pharnabazus and Tissaphernes. There is no reason to suppose that Xenophon left Asia Minor before he returned to Greece with Agesilaus, king of Sparta, after his expedition against the Persians. In that year he fought on the side

of the Spartans against the Athenians at Coroneia. As a consequence he was found guilty of high treason and exiled. After that he settled at Scillus, a small town in the neighborhood of Olympia, in Elis. In this solitary retreat he dedicated his time to literary pursuits; and as he had acquired riches in his Asiatic expeditions, he began to adorn the country which surrounded Scillus. He built a magnificent temple to Artemis in imitation of that of Ephesus, and spent part of his time in rural employments, or in hunting in the woods and mountains. He does not appear ever to have returned to Athens, although the sentence of banishment passed on him was afterward repealed. He remained for about 20 years at Scillus, but was ultimately expelled from it (371 B.C.) by the Eleans. Thereupon he retired to Corinth, where he died. Besides the 'Anabasis,' Xenophon wrote the 'Apomnemoneumata,' more commonly known as the 'Memorabilia Socratis,' in which there is no doubt that we have a faithful representation of the moral and practical side of the Socratic teaching, although he makes no attempt at interpreting its metaphysical aspects; the 'Cyropædia,' in which, under the guise of a life of Cyrus the Elder, there is an exhibition of Xenophon's views respecting the best form and methods of government; the 'Symposium' (Banquet), in which Socrates is brought before us under his social aspect; the 'Hellenica,' which continues the history of Thucydides, and which, while open to criticism for its political bias, is nevertheless honestly written and is highly valuable as the only contemporary account of the period 411-362 B.C.; and of several minor works on hunting, agriculture, politics and the science of war, all of great interest as giving an authentic presentation of the ordinary life of the Greeks of that period. The style of Xenophon is in general a model of simplicity. The Greeks esteemed his merit as a writer so high that they called him the "Attic bee" and the "Attic muse." Later criticism has found that in both vocabulary and syntax he frequently deviates from the best Attic usage. His works have been often published separately and together. Among the best editions of the complete works of Xenophon are those by Schneider and others (1791-1849), Sauppe (1865), and Dindorf (1875). There is a complete English translation by H. G. Dakyns, with introductions and notes (1890-93). Consult also the studies by Croiset (1873), Roquette (1884), and Lange (1900); Bury, J. C., 'Ancient Greek Historians' (1909); Wright, W. C., 'A Short History of Greek Literature' (1907).

**XENOPHON OF EPHEBUS** ("XENOPHON THE YOUNGER"), Greek writer who flourished in the 2d century A.D. One work of his has been preserved, a story in five books, called 'Ephesiaca,' or 'The Loves of Abrocomas and Anthia.' The story is written in a style simple and elegant. It was translated into English by Rooke,—and into German by Bürger.

**XENOS**, zē'nōs, Stefanos Theodoros, Greek author. From 1855 he was a merchant and general broker in London, and in 1858 was naturalized as a British citizen. He published 'The Devil in Turkey' (1850), a three-volume English translation from the author's unpublished Greek manuscript; in Greek, 'The Heroine of the Greek Revolution' (1861), trans-

lated as 'Andronike' (1897); 'East and West: A Diplomatic History of the Annexation of the Ionian Islands to the Kingdom of Greece' (1865); and 'Depredations: or Overrend, Guiney and Co.C. and the Greek and Oriental Steam Navigation Company' (1869).

**XENOTIME**, a tetragonal mineral occurring in crystals of the same forms as zircon. It is essentially an yttrium phosphate, YPO<sub>4</sub>, but much erbium is frequently present, and also sometimes the cerium metals, and small quantities of thorium and silicon. It is usually found in minute crystals of resinous or vitreous lustre, yellow or brown color and having a hardness of 4 to 5 and specific gravity of about 4.5. It occurs as an accessory constituent in many granites (see Derby in *American Journal of Science* 41, 308, 1891), in large crystals in the granitic rocks of Norway, in the auriferous gravels of North Carolina and Georgia, and in choice crystals in the gneiss of New York City. When obtainable in sufficient quantities it will be an important ore of yttria and erbia.

**XERES**, há'rás, or **XEREZ**, or **JERES**, Francisco de, Spanish historian: b. Seville, about 1500; date of death unknown. He accompanied Pizarro, as his secretary, to Peru, about 1530, returned to Spain with the first shipment of gold taken from Atahualpa. At the direction of Pizarro he wrote a detailed history of the expedition and the conquest down to the death of Atahualpa, entitled 'A True Account of the Conquest of Peru' (1547). The work was translated into Italian by Ramusio, and into French by Ternaux-Compan and is still valued as a source of information.

**XERES DE LA FRONTERA**. See JEREZ DE LA FRONTERA.

**XEROPHYTES**, zér'ô-fits, plants which have guarded themselves by structural means against excessive transpiration. The term was originally applied to plants living in dry and sandy soil, or on rocks, and to those inhabiting deserts; but it is now extended to plants existing in localities where, for one reason or another, they cannot readily obtain water, as in the case of the vegetation in salt marshes, arid bogs and moors and of cold regions where water is present but not available for the use of the plants, which have consequently adapted themselves to prevent the waste of the moisture which they have. This result is obtained in various ways. In some, the transpiring surface is greatly reduced, and the foliage is nearly or wholly dispensed with, the stems themselves taking its place, as in switch plants and cacti; and this habit is frequently combined with the storage of water in succulent tissues. Other plants, like the eucalyptus trees predominating in the dry forests of Australia, by a vertical arrangement of their foliage, or a similar disposition of the branches themselves, when foliage is wanting, as it is in the casuarinas, avoid presenting broad surfaces to the sun and hot winds. Some erophytic plants close their leaves just before the dry season; the whole existence of others begins and ends during the continu-

ance of a rainy season; and in the bulbous and tuberous plants we see still another common arrangement for passing the dreaded dry months, the plants growing vigorously and completing their above-ground existence, while the weather is still favorable, and storing up food in their roots or rootstocks, so that they may rest uninjured in the ground during the heated term, and be ready to spring into activity as soon as the rains begin. An extensive development of ligneous tissue is characteristic of xerophytes and so also are such modifications of tissue as the matted hairs, mineral, waxy and varnish-like encrustations on the epidermis, the closing or concealing of stomata, etc.

**XERXES I**, zérk'séz, king of Persia: b. about 519 B.C.; d. 465 B.C. He was a younger son of Darius, the son of Hystaspes, and began to reign in 485. He was preferred to his elder half-brothers, born before his father was raised to the throne; Xerxes was born after that event, and was the son of Atossa, daughter of Cyrus. After having suppressed a revolt in Egypt in a single campaign, he thought himself able to execute the plan of conquering Greece, already conceived by his father, and collected for this purpose an immense army, estimated by the historians as containing 1,000,000 men. In all probability the Greeks greatly exaggerated the number of their enemies; and the train of women and slaves who followed the army made at least half of its numerical amount; still the numbers of the Persians were beyond all comparison superior to those of the Greeks. By means of a bridge of boats Xerxes crossed the Hellespont (480) while the Greeks awaited him on the frontier of their country, in the pass of Thermopylae. After the heroic Leonidas had fallen with his Spartans (see LEONIDAS), Xerxes burned Athens, which had been forsaken by its inhabitants. The first naval battle between the two powers at Artemisium had been indecisive; but it inspired the Greeks with new confidence; and the second naval action at Salamis, in which, if we believe the Greek historians, 2,000 Persian vessels were engaged against 380 Greek, terminated in the defeat of the Persians (28 Sept. 480). Xerxes now quitted Greece, leaving behind him his best general, Mardonius, who, not long after, was routed at Platæa. Xerxes now gave himself up to debauchery; his conduct offended his subjects and Artabanus, the captain of his guards, conspired against him, and murdered him in his bed. The personal accomplishments of Xerxes have been commended by ancient authors; and Herodotus observes that there was not one man among the millions of his army that was equal to the monarch in comeliness or stature, or as worthy to preside over great and extensive empire. He was succeeded by his son Artaxerxes I.

**XIMENA**, hē-má'ná, in Spanish legendary history, the wife of the Cid (q.v.).

**XIMENA**, or *The Heroic Daughter*, an English adaptation of Corneille's 'Cid,' by Colley Cibber, first played in London in 1712 and printed in 1718.

**XIMENES**, zī-mé'néz, Sp. hē-má'nás, or **XIMENES** (or **XIMENES**) **DE CISNEROS**, Francisco, Spanish ecclesiastic, prime minister and regent: b. Torrelaguna, Castile, 1436; d. Roa, near Valladolid, 8 Nov. 1517. He was graduated in civil and canon law at Salamanca in 1456, became a priest and going to Rome practised in the courts of the consistory 1459-65. He obtained a papal bull, which secured to him the first vacant benefice in Spain, but the archbishop of Toledo refused to give him any place, and, Ximenes having taken possession of a vacant benefice, the archbishop caused him to be imprisoned. Ximenes, nevertheless, recovered his freedom and the Cardinal Gonzalez Mendoza, bishop of Sigüenza, appointed him his grand-vicar. He entered the Franciscan order in 1482, and for several years practised the most rigid asceticism. In 1492 he became confessor to Queen Isabella of Castile, to whose notice he had been recommended by Cardinal Mendoza, and in 1495 was made archbishop of Toledo. He did not accept this dignity till after many refusals, and an express command from the Pope. As an archbishop he was very zealous, behaving as a father toward the poor, abolishing a multitude of abuses, and adhering steadfastly to his resolution that public offices should be filled with honorable and well-qualified men. In spite of all opposition he effected a reform in the mendicant orders of Spain, founded in 1499 a university at Alcalá de Henares, and undertook in 1502 the Complutensian Polyglot Bible. His activity was also displayed in other ways. Dissensions prevailed in the royal family. Philip of Austria, son of the Emperor Maximilian I, had married Joanna, the only daughter of Ferdinand and Isabella, and on the death of the latter Philip received Castile, in right of his wife, the sole heiress of her mother. This gave rise to disputes between him and his father-in-law, which were composed by Ximenez. After Philip's death (1506) Ferdinand became regent of Castile for his grandson, afterward the Emperor Charles V, who was a minor. On this occasion he had been much assisted by Ximenez, who in 1507 was made cardinal and grand-inquisitor of Spain. The conversion of the Moors now particularly occupied his attention. With this view he formed the project of passing over to Africa, in order to take the fortress of Oran, and in May 1508, landed on the coast of Africa. A battle soon followed in the neighborhood of Oran, in which the Moors were defeated. The fortress was immediately taken and the garrison put to the sword. Ximenes caused Oran to be fortified anew, changed the mosques into churches, and returned as a conqueror to Spain. When Ferdinand died in 1516, his grandson Charles being still a minor, Ximenes became regent of Spain and during his regency of two years brought the finances into order, paid the crown debts and restored the domains which had been alienated, caused the laws to be observed, and placed the Spanish military force upon a respectable footing. Consult Fléchier, 'Histoire du Cardinal Ximenes' (1693); Hefele, 'Der Kardinal Ximenes' (1844; English trans. 1860); Barrett, 'Life of Cardinal Ximenes' (1813);

Prescott, 'Ferdinand and Isabella' (1838); 'Life,' by Ulrich (1883).

**XIMÉNEZ DE QUESADA**, dā kā sā thā, Gonzalo, Spanish explorer and conqueror: b. Granada, about 1498; d. Mariquita, New Granada, 16 Feb. 1579. He came to America in 1535 as a judicial functionary in the suite of Pedro Fernández de Lugo, governor of the province of Santa Marta, who chose him to head an expedition against the Chibchas, supposed to number more than 2,000,000 souls, on the great plains of Tunja and Bogotá, and the neighboring regions about the head-waters of the river Magdalena. He set out 6 April 1536 from Santa Marta, but at the end of eight months had made no more than 450 miles. After great hardships the expedition reached the mountains and in the following March progress was resumed.

The first Indians he met were so terrified by the sight of his horses that they instantly submitted. Approaching at Tunja the court of one of the great chiefs of the Chibchas, he was allowed to enter the palace, but was treacherously attacked as he was about to embrace the chief. The latter was taken, after much slaughter, and Ximénez became possessed of vast riches. From Tunja he marched upon Iraca, the sacred city of the nation. Here two Spanish soldiers, in pursuit of plunder, accidentally set fire to the great temple of the sun, which had been captured by Ximénez, and it perished with the city after burning several days. Returning toward Tunja, he fought a desperate battle at Borja against 12,000 natives, whom he defeated, after which he made treaties with several caciques, who voluntarily submitted. A usurping chief was then proclaimed king; but was required to deliver the treasures of his predecessor to the Spaniards. After a short imprisonment he promised within 40 days to fill a room with gold and emeralds, but not keeping his promise, was put to death with cruel tortures. On 6 Aug. 1538 Ximénez founded the city of Santa Fé de Bogotá.

He was presently joined by Benalcazar, the lieutenant of Pizarro, and Federmann, who presently conspired against Ximénez but without much success. The three then returned to Europe to lay their claims before Charles V, but while Benalcazar was made governor of Popayán, Federmann and Ximénez gained nothing. Later, however, Ximénez was made marshal of New Granada and returning to Bogotá in 1551, seems to have protected the people against the rapacity of Spanish officials. About 1561 he was named by the Spanish government *adelantado*, or governor-in-chief of the kingdom of New Granada, and induced to fit out an expedition in search of El Dorado, beyond the territories of Pauto and Papamene. To this enterprise he devoted three years, spending immense sums in fitting it out, but returning with only a handful of followers. In 1572 he founded the city of Santa Agueda, 21 miles from Mariquita. He died of leprosy and by his will declared himself poor and forbade the erection of any but the simplest monument over his grave. His remains were removed to Bogotá in 1597. He left a manuscript work entitled 'Sermones' and a 'Compendio historial,' both of which have been

lost. Consult Acosta, J., 'Historia del descubrimiento y colonización de la Nueva Granada' (1849); de Plaza, Antonio, 'Memorias para la historia de la Nueva Granada' (Bogotá 1850).

**XIMENIA**, a genus of plants of the family *Olacaceæ*, represented by large shrubs or small trees, often spiny. Leaves entire, leathery; calyx very small, petals four, hairy inside; stamens eight; ovary with four one-seeded cells. *X. americana*, the false sandalwood, is a straggling shrub, or low spreading tree producing dull-white fragrant flowers, smelling like cloves, succeeded by small, oval, red or yellow pulpy fruits, an inch long, aromatic, but somewhat astringent. They contain a white globose nut with a kernel which tastes like a filbert. Its wood is very tough and heavy. This shrub is known in Florida as the hog-plum or wild lime, and in the West Indies as mountain or seaside plum.

**XINGÚ**, shên-goo', a river of Brazil, one of the chief tributaries of the Amazon. It is formed by the junction of several head-streams which rise near Lat. 15° S., Long. 55° W. Chief of these is the Tamitatoaba, which flows from a small lake about 75 miles in circumference. After flowing north for 1,200 miles through a densely forested and little explored region, the Xingu forms a large lake which is connected with the Amazon estuary by a number of deltaic channels 240 miles west of Pará. Steamers ascend the river to the Cataract and Fall of Itamaracá. The river was unexplored until 1884-87, when it was descended from Cuyabá by Von den Steinen.

**XIPHODONTIDÆ**, zif-ô-dôn'ti-dé, a family of primitive forerunners of the ruminants, whose remains occur in the Upper Eocene rocks of western Europe. Some of them are the largest and most slender artiodactyls of their age, and the only feet hitherto discovered are two-toed, with mere rudiments of the lateral digits. See OREODONTS.

**XIPHOSURA**. See HORSE-FOOT CRAB; MERMOSTOMATA.

**XUARES**, hoo-ä'räs, Gaspar, Paraguayan botanist, historian and biographer: b. Santiago del Estero, Paraguay, 1731; d. Rome, Italy, 1804. Entering the order of Jesuits, he devoted himself to teaching philosophy and theology; and after the suppression of his order he removed to Italy, where he occupied himself with botanical researches. He wrote 'History of Buenos Ayres,' and 'Dissertations,' which remain in manuscript; 'Life of Saint Francis Xavier,' etc.

**KULLA**, shoof'lä, or **ZORELLA ISLANDS**, East Indies, a group in the Molucca Sea, south of the Molucca Passage, and east of Celebes. The largest islands of the group are Taliabo, Mangola, and Nulla Besi. The first is about 60 miles long and 15 miles wide.

**XUREL**. See HORSE-MACKEREL; JUREL.

**XYLANDER**, ksi-län'dér, **Gullielmus**, German scholar: b. Augsburg, 20 Aug. 1532; d. Heidelberg, 10 Feb. 1576. His real name was Wilhelm Holzmann. He was educated at Tübingen and Basel and in 1558 was appointed professor of Greek at Heidelberg. His numerous Latin translations from the Greek have been of much service to later students.

**XYLENE**, or **DIMETHYL BENZENE**, in chemistry. Three isomeric hydrocarbons are known by this general name, orthoxylene, metaxylene, and paraxylene. They all have the composition  $C_6H_4(CH_3)_2$ ; and are dimethyl derivatives of benzene. Commercial xylene or xylol, found in coal tar, is a mixture of the above three. It is a colorless, oily liquid, boiling above 140° C., not soluble in water, and used as a solvent in various chemical operations.

**XYLOGRAPHY**. See WOOD ENGRAVING.

**XYLOIDIN**, or **XYLIDINE**, in chemistry, an explosive probably of the composition  $C_6H_4NO_2O_4$ , known also as pyroxylam and nitrostarch. Discovered by Braconnet in 1833 and prepared by dissolving one part of potato starch in eight parts of fuming nitric acid and then pouring this solution, well cooled, into 16 parts of concentrated sulphuric acid. It is a white hygroscopic powder, insoluble in water and alcohol, but soluble in ether. It is not used to any considerable extent.

**XYLOPHONE**, a musical instrument of percussion consisting of bars of wood or glass graduated in length and resting on belts. The notes are produced by striking on the bars with small hammers and have a range of two or three octaves. Called also "aigelira," "stuccada," and "straw-fiddle."

**XYLOPIA**, a genus of anonaceous trees or shrubs, natives of tropical regions, with coriaceous leaves, commonly two-ranked, and flowers in axillary clusters or solitary. The corollas have six petals, the outer three elongated, boat-shaped, curving over and partially enclosing the other three. The receptacle is conical, with the stamens outside and the carpels in its excavated interior. The fruits are elongated berries. *X. sericea*, the pindaiba of Rio Janeiro, bears a highly aromatic fruit, which may be used as pepper, with which it agrees in flavor. Good cordage is made from the fibres of its bark. The wood, bark and berries of *X. glabra*, the "bitter wood" of the West Indies, taste like orange seeds, and impart a similar flavor to the wild pigeons which feed on them. It is said to be useful in colic and for creating an appetite. Martius believes the fruit of *X. grandiflora* to constitute a valuable febrifuge used by the South American Indians. The dry, black and quill-like fruits of *X. aromatica* form the *Piper arthiopicum* of commerce, used as pepper by the West African negroes. They are sold in the native market as a stimulant and condiment. *X. polycarpa* is the yellow dye-tree of tropical Africa, with a bitter bark, that contains berberine and which yields a yellow dye, of extensive use; it is also employed for the treatment of bad ulcers.

# Y

• the 25th letter of the English alphabet, derived from the Greek through the Latin, is both vowel and consonant.

It came into Latin in Cicero's time in words borrowed from the Greek; for its language has no sound like that of the Y (upsilon); the y found in some Latin as *lacryma, satyra, sylva*, is due to an error of modern editors; those words were in Latin always written *lacrima, satira*. The modern Italian alphabet has no y, the e y of Greek words adapted into Italian changed to i: *sinfonia, symphony, sindaco*.

In Dutch, y stands for ij, and represents the diphthong long i of English as in *yield*. In English, y is a superfluous letter, so it stands for a vowel sound; as such, it may be represented by the vowel i. The letter Y, v, in Greek, was that of French u or German ü. This sound does not exist in English: it is heard when, with lips and tongue

in positions for pronouncing the vowel oo, one tries to give the English vowel of e in *he*. In early English or Anglo-Saxon, y represented this peculiar vowel sound; has so far dropped out of English speech in a person whose only speech is English cannot pronounce it untaught. At the time of the Norman Conquest it had taken the place of this sound soon both the sound and the letter went into English use. But when Norman words

are used by the English the French u was retained in many words, as *muse, duke*, and they were pronounced with the sound of u; this sound gradually developed into the spelling remained unchanged: this is the sound of u in *muse, duke* as now pronounced. In the beginning of syllables and followed by a vowel, y is a palatal consonant formed by bringing the middle of the tongue in contact with the palate, nearly in the position for g hard; hence Old-English g hard then been softened into y, as in *day* from Old-English *dag*. Y also often stands for the letter pronounced in the same manner but written in the other Germanic tongues. Until comparatively recent times it was customary to write *the ye* and *that y*, and those forms were used in typography. In those cases the letter resembling y or identical with it, not for y but for the Old-English letter s, a mere ignorantism to read "ye year," as though y here stood for the consonant y, and not for the digraph th. As an abbreviation Y stands for yttrium. Y is used in mathematics for the second of two unknown sides or the ordinate of a point in Cartesian coordinates. See ALPHABET.

**YACHTING RECORDS.** See SPORTS.

**YACHTS AND YACHTING.** A yacht, distinguished from a boat or ship, is a vessel designed for pleasure, not commerce, usually built for both comfort and speed, and often luxuriously equipped. It may be either a sailing vessel of one, two or more masts, or a steam or gasoline-power craft. Small, very swift pleasure craft, with gasoline power, are called motor-boats, and slow-going but more or less well-cabined boats for shore and private use are house-boats (q.v.). Yachts are further distinguished from merchant vessels in that they are free to go between coast ports without registering at a custom house, although in going to a foreign port registration is usually required. Visiting yachts of other countries are commonly extended the privileges granted to local yachts.

**English Yachting.**—The word *yacht* is of Dutch origin, being from the Dutch *jagt*, a swift vessel, from *jagen*, to chase, to hunt. It seems to have been introduced into England in 1660 when the Dutch presented Charles II with a yacht. The first recorded yacht race was between Charles II and his brother, the Duke of York, which took place on the Thames in 1661, but from that date none is on record till 1796, when 10 boats started on a 50-mile race in the Bristol Channel under the auspices of the Bristol Sailing Society. For a long period, extending well into the 19th century, yachting was closely connected with naval defense, and private yachts were generally constructed to carry guns and to be used in case of need for naval purposes. Private individuals of means were thus able to contribute to national defense not only directly by forming a kind of minor volunteer fleet, but also indirectly by leading the way in the development of naval architecture. In 1832 the *Emerald*, the fastest cutter in the Royal navy, was defeated in a racing and sailing contest with the *Paddy from Cork*, a yacht belonging to a member of the famous Water Club of Cork, and in consequence the head of the government school of naval architecture in Portsmouth was deputed to measure several private yachts with a view to improving the construction of vessels for the navy. In the following year the *Water Witch*, a vessel similar to the 10-inch gun brigs of the navy, built for Lord Belfast, proved herself faster than any vessel in the Royal navy, and better than any of her kind for purposes of warfare. Of the many yacht clubs now in existence only the Royal Cork Yacht Club and the Royal Thames Yacht Club can trace their history back to a period before the last century. While the modern yacht clubs have promoted a vast number of sailing races, wealthy yachtsmen have come to own numerous steam pleasure yachts devoted to summer cruising. The premier yacht club of Great Britain, the Royal Yacht Squadron, with headquarters at Cowes, dates back to 1815 in its formal capacity. In 1820 it

became the Royal Yacht Club, and in 1833 its name was changed by royal order to Royal Yacht Squadron. The Royal Northern Yacht Club, with headquarters at Rothesay, was founded in 1824.

In 1909 Lloyds Registry of yachts showed a total of 2,250 craft, of which 1,443 belonged in the United Kingdom, 137 were colonial, 182 French, 86 German and Austrian, and other countries totaled 332. The United Kingdom tonnage totaled 190,000, the French 6,745, the German and Austrian 6,602, the other countries about 72,000. Perhaps the most elaborate steam yacht was the *Hohenzollern*, the private yacht of the former kaiser. There was a marked increase in 1915, the last year before the war changed conditions. In that year the English, French, Continental and colonial yachts registered in Lloyds showed 10 of from 2,000, to 5,000 tons, 33 from 1,000 to 2,000 tons, 71 from 500 to 1,000 tons, 535 from 100 to 500 tons and 3,125 below 100 tons; total, 3,774 craft. The number of yacht clubs in Great Britain at the same date was nearly 200. With the coming of the Great War and the U-boat campaign, British and Continental yachting were almost forgotten. Races ceased and the larger and finer steam and pleasure yachts were loaned or sold to their respective governments. The typical sailing racers are of little practical use, but the steam pleasure yachts made splendid dispatch boats and were also useful for hospital purposes.

Among pioneer British sailing yachts of the first half of the 19th century the most notable were the *Menai*, in which the hollow bow was first introduced; the *Mosquito* (1848), an iron vessel built on the Thames in accordance with Scott Russell's theories; and the *Tiara*, built at Renfrew in 1850. The victory of the *America* from the United States in 1851 marked an epoch in British yachting. It secured the triumph of the views represented in the *Mosquito* and the *Tiara* and revolutionized the practice of British yachtsmen. For about a quarter of a century the schooner was the popular form of racing yacht, among the most notable being *Cambria* and *Miranda*. Gradually the schooners were displaced by cutters and yawls. The more famous of the early racing cutters were *Kriemhilda*, *Oimara*, *Cythera*, *Vol-au-Vent* (1875) and *Neva* (1876); and the leading yawls of that period were *Florinda* (1873) and *Jullanar* (1877). *Formosa*, a big cutter built in 1878, was supreme in her class till 1880, when G. L. Watson's first large yacht, the *Vanduarda*, came on the scene. Another famous designer, Mr. Fife, scored a great success with the 40-ton yacht *Annasona*, which began to compete in 1881. *Marjorie*, from Watson's lines, a vessel of 68 tons, was the chief new cutter of 1883; and to the following year belong *Irex*, designed by Mr. Richardson, and *Genesta*, an America Cup competitor designed by Beaver Webb. The *Galatea*, another cup challenger, was a complete failure in home waters in 1885; but the challenger of 1887, *Thistle*, from Watson's design, met with great success before crossing the Atlantic. *Thistle* was the first large yacht constructed under the length-and-sail-area rule. *Varuna*, another Watson boat, was the chief novelty of 1888, and in 1889 the same designer produced *Valkyrie I* for Lord Dunraven. The old *Irex* continued racing with consider-

able success down to 1889 and was succeeded in 1890 by *Iverna*, by the same designer. In the latter year *Thistle* reappeared and thus the leading yachts of that season were the *Varuna*, *Valkyrie I*, *Thistle* and *Iverna*. These were rated at 60, 77, 121 and 118 respectively. The *Valkyrie I* was ultimately sold to an Austrian archduke and the *Thistle* to the German emperor, who renamed it *Meteor*. The years 1891 and 1892 were chiefly remarkable for smaller vessels, such as Watson's *Queen Mary* and *Varuna* and Fife's *Thalia* and *Luis*; but 1893 was rendered memorable in the annals of yachting by fine contests between *Valkyrie II*, designed by Mr. Watson for Lord Dunraven; *Britannia*, designed by Watson for the Prince of Wales; *Satanita*, *Calluna* and *Norahor*, an American yacht, designed by Mr. Herreshoff. *Valkyrie II* proved to be the best of these cutters, but *Britannia* was a good second. In 1894 these yachts competed with *Vigilant*, a Herreshoff vessel which had defeated *Valkyrie II* in the contest for the America Cup. *Valkyrie II* was sunk by *Satanita* in the Clyde while manoeuvring for a start, but *Britannia* repeatedly beat the *Vigilant*. The *Ailsa*, from the lines by Mr. Fife, Jr., and the *Valkyrie III*, designed by Mr. Watson for Lord Dunraven, appeared in 1895. The third *Valkyrie* went to America to contest the cup and the honors at home fell to *Britannia* and *Ailsa*, especially the former. Mr. Fife, however, scored in the 40-raters with *Isolde*, which was distinctly better than Mr. Watson's *Caress*. A new *Meteor*, designed by Mr. Watson for the German emperor, competed in 1896 against *Britannia* and *Ailsa*, the result for the season being: *Ailsa* (60 starts, 21 firsts), *Britannia* (58 starts, 14 firsts), *Meteor* (22 starts, 13 firsts). The principal first-class cutters since that date are *Bona*, by Watson (1897), for the Duke d'Abruzzi; *Shamrock I*, built for Sir Thomas Lipton to contest the America Cup in 1899; and *Shamrock II*, built for Sir Thomas Lipton to contest the America Cup in 1901.

**American and International Yachting.**—The *Jefferson*, built in 1801, is regarded as the first yacht built in America; but the first American yachts of importance were those designed by George Steers, notably the *America*. In 1857 the *America* beat all the English yachts in their own waters and established an American interest in yachting that has proved permanent. The *America* was a schooner of 208 tons and entered along with 14 other vessels for a race round the Isle of Wight. Five of the vessels were schooners, nine were cutters, the remaining one being a bark (*Brilliant*), and though they varied in tonnage from 47 (*Aurora*) to 311 (*Brilliant*) no time allowance was given. The *America* won the race and the cup presented by the Royal Yacht Squadron, the *Aurora* coming second, 18 minutes behind. In 1857 the cup was set aside by the owners of the *America* as a perpetual international challenge. This was the origin of the contest called America Cup. In 1866 three American yachts, *Henrietta*, *Fleetwing* and *Vanderbilt*, crossed the Atlantic, the first-named winning the race with a time of 13 days, 21 hours, 56 minutes. In 1870 the English yacht *Cambria*, which had challenged for the America Cup, beat the American *Dauntless* in a transatlantic race, but she was beaten by the *Alagic* and several

other boats in a race for the cup. In 1873 Mr. Ashbury, who owned the *Cambria*, again challenged for the cup, but his yacht *Livonia* was defeated by the New York Club's vessels *Columbia* and *Sappho*. Major Charles Gifford, a Canadian, challenged for the America Cup in 1876 with the *Countess of Dufferin*, but his yacht was beaten by the defender, *Madeline*. Another Canadian vessel, the *Atlanta*, contested the cup in 1881, her opponent being the *Mischief*, but the result was the same as before. Sir Richard Sutton sent the next challenge in 1885 and his yacht *Genesta* was pitted against the *Puritan*, but without success. The *Puritan* was designed by Edward Burgess, as was also the *Mayflower*, which successfully defended the cup against the English *Galatea* in 1886. The *Thistle* met another Burgess boat, the *Volunteer*, in the same contest the following year, but like all preceding challengers, she failed to gain the cup. Mr. Herreshoff scored his first great success as a designer with *Gloriana* in 1891, and soon afterward he produced the *Vigilant*, which defeated *Valkyrie II* in the America Cup contest of 1893. The cup contest of 1895 between Lord Dunraven's *Valkyrie III* and the American *Defender* had an unsatisfactory result. Two races were awarded to the latter on purely technical grounds, and in consequence Lord Dunraven withdrew from the competition. In the same year a Canadian yacht named *Canada* defeated the United States yacht *Vancedor* in a competition for an international cup. The next challenges for the America Cup came from Sir Thomas Lipton, whose yachts *Shamrock I* and *Shamrock II* were beaten by the American *Columbia* in 1899 and 1901 respectively. Sir Thomas again challenged for the cup in 1902 and 1903, and lost to the Americans.

In 1914 Sir Thomas Lipton having challenged again for the America Cup, his yacht *Shamrock IV* crossed the Atlantic, but because of the war the races were indefinitely postponed, and at last accounts his splendid craft was lying in dry dock in Erie Basin, Brooklyn. The American yachts, *Resolute* and *Vanitie*, one of which would have defended the cup, sailed 15 trial races in 1914. While the *Vanitie* won a few times, the *Resolute* was declared the better boat. The smaller sailing yachts in the United States kept up some racing, mostly under the management of those under and over draft age, but the most of the racing was suspended until after the war. Lloyds Register of American Yachts includes also those of Canada and the West Indies. There are 383 yacht clubs proper and many motor-boat clubs, some of which are miscalled yacht clubs. In 1917, 3,590 yachts in all were registered, and considering U-boat sinkings of British yachts, it is probable that the American total is now the greatest in the world. In 1917 probably half of the largest and best pleasure yachts were loaned to the United States government and some were sold outright. Many of the more commodious yacht clubhouses were also turned over to the United States navy for recruiting purposes and patrol squadrons.

**Racing Rules.**—The ordinary rules of the road at sea apply in the main to yacht-racing. Yachts sailing with the wind free must clear those sailing close-hauled. Yachts on the port

tack must give way to those on the starboard tack, and an overtaking yacht must clear the overtaken vessel. The start in a yacht race is now always a flying one, but prior to about 1860 yachts started from anchor. Frequently much depends upon the start, and accordingly manœuvring for initial position is of considerable importance. At the start, as throughout the race, the skipper counts for a good deal. The course to be traversed is marked out by buoys, light-ships or flag-boats. The time allowances corresponding to differences in rating are determined in accordance with a scale prepared by the Yacht Racing Association. Vessels always start together, the time allowance being made at the end of the race. Handicapping is also practised to some extent in yacht-racing. Pleasure yachts are supposed to carry ensigns when in commission, also a burgee (swallow-tailed pennant) and a private signal flag. Sailing yachts fly the ensign at the main peak; power yachts hang it on a staff at the stern. All yachts when at anchor in the daytime are expected to fly an ensign from a staff at the stern. Yachts in commission usually hoist their colors at 8 A.M. and lower them at sunset. Amateur yachtsmen sailing on the coasts and Great Lakes may obtain from the Bureau of Lighthouses at Washington a "List of Lights and Fog Signals" and a "List of Buoys, Beacons and Day Marks," together with maps, which are very important in navigating.

**Racing Yachts.**—The designing and construction of a racing yacht require no small amount of scientific and technical knowledge besides large experience, and consequently the yachts entered for the leading races, at least in the higher classes, are the work of a very few designers and builders. In a yacht intended for racing, speed is the primary essential, and to it accommodation and convenience are in large measure sacrificed. Moreover, a designer has to take into account the circumstances under which his vessel is to be run or the competitors which she has to meet, because a yacht that does well in fine weather and a smooth sea will usually be of little account in boisterous weather and a rough sea. The rating rules of the Yacht Racing Association (formed in 1875) also condition the designer's work, and it will be necessary, therefore, to give some account of them here. The object of rating regulations is to secure that all competitors shall start on practically even terms in any given race, and this is achieved by the classification of yachts in well-defined groups according to certain measurements, and also, especially among large yachts, by means of time allowances corresponding to differences in these measurements. In the early days of racing, yachts were grouped according to tonnage, the tonnage being determined, as for other vessels at that time, by multiplying the length by the breadth and the depth and dividing by 96 (afterward 94). This was replaced by what is called builder's measurement or old measurement, which is still in use for some purposes connected with yachts. The formula for tonnage

according to this system is  $(L - \frac{1}{2}B) \times B \times \frac{1}{2}B$

94

where L and B denote length and breadth respectively. The Thames measurement rule,

introduced in 1854, made tonnage equal to  $\frac{(L - B) \times B \times \frac{1}{2} B}{94}$ ; but in 1881 the Yacht

Racing Association introduced the 1730 rule, according to which the tonnage was equal to  $\frac{(L \times B)^2 \times B}{1730}$ .

These rules were found to have the effect of encouraging the construction of yachts of very narrow beam, especially after about 1871, when designers learned the use of outside ballast on the keel. A great change was effected in 1886, when the length-and-sail-area rule came into force, and yachts were classified according to rating determined by the formula  $\text{Length} \times \text{Sail Area}$  in sq. ft.

6000

The present linear rating rule was adopted in 1896, but it cannot be said that finality has yet been reached. Linear rating is expressed in feet and is determined by the formula

$$\frac{\text{Length} \times .75 \text{ Girth} \times .5 \sqrt{\text{Sail Area}}}{2}$$

2

In 1903 the rule was altered to  $\text{Rating} = \frac{L \times \sqrt{S}}{18}$  where  $L$  = load water line;  $S$  =

sail area;  $D$  = displacement in cubic feet. Limitations are added to prevent excessive listed length.

For the smaller vessels wood is the cheapest and lightest material, but larger ones are made of steel or of steel frames with a wooden skin, the latter class being called composite. Other metals, notably aluminum, have also been used for the construction of yachts. Practically all large composite vessels and also many small ones have a copper sheathing to protect the submerged parts of the wood from the action of the water. The sails of racing yachts are generally made of cotton, mostly of the finest Egyptian variety; but ramie fibre is coming into use for this purpose, and a mixed cotton and ramie material is also in use. Up till a comparatively recent date flax was generally used for the sails of racing yachts, though it does not produce a sufficiently smooth and close-textured cloth.

**Speed.**—The speed of a racing yacht of given size may be regarded as the result of a compromise between stability, which determines sail-carrying power, and resistance. The stability depends upon well-known hydrodynamic principles, and may be roughly said to be determined by breadth of beam, the lowness of the centre of gravity of the vessel and the quantity and position of the ballast. Resistance at low speeds is due chiefly to surface or skin friction, but at higher speeds it is principally caused by wave-making, a phenomenon too intricate to be discussed here. An increase in beam increases stability, but at the same time increases skin friction. Wave resistance is less in vessels whose displacement is obtained mainly by breadth than in those where displacement is principally determined by depth. Various means of lowering the centre of gravity have been adopted with advantage, such as the use of

hollow masts and booms, the use of aluminum for the upper part of the vessel's sides, etc. Stone ballast was used in the early days of yachting, but it was superseded by iron, and that in turn by lead. The lead ballast was afterward carried on the keel, and later the keel consisted of a plate of lead, hung horizontally below the hull. The fin-keel followed, this being a fin or extension of thin metal for carrying a lead keel to a lower position. The *America* was a keel boat, and beat out the English boats because it had a deeper draft, and because the weight of the keel was so centred as to bring the effort of the sails well aft. When other designers had profited by this idea, and further improvements were demanded, the centre-board was introduced. Many claim this to be an English invention, although it was developed to success by American designers. The centre-board is nothing more than an adjustable keel that may be raised or lowered as conditions make it best. When set low the boat can be steered much closer to the wind. The centre-board boat is very fast in smooth water and down wind. It was used on the *Magic* in 1870, the *Columbia* 1871 and on down to the *Vigilant* in 1893. American yacht builders then returned to keel designs, depending on other proportions. The *Defender*, *Columbia* and *Reliance* were all keel boats. Probably the *Madge*, of Scotch design, built in 1881, influenced designs more than any other except the centre-board. Her ballast was in one piece of lead, she was full amidships, with heavy displacement but a very light hull; though cramped in beam she was practically non-capsizable. In 1885 Sir Richard Sutton, observing the success of the *Madge*, built the *Genesta* on these lines and challenged. Burgess designed the *Puritan* on a somewhat similar model, but wider and shallower than *Genesta*, and won. In 1891 the agreed waterline length for cup-racers was 46 feet, and Herreshoff designed the *Gloriana* on new principles, giving her an overhang of some 25 feet, so that she was 71.9 over all. When the *Gloriana* heeled over she gained in waterline, and the more she leaned the more she gained. As a result, in a stiff breeze she had all the best of it and won easily. This boat was also Herreshoff's first cup-racer with a fin keel. This design was later penalized and nothing radically new in type has developed since.

**Steam and Gasoline Yachts.**—Pleasure yachts adopted steam power in the early days, and after the motor-boat appeared the gasoline or gas-engine was naturally adapted to nautical purposes and has become highly developed for use on the water. The typical steam yacht is the light, swift, graceful craft, more often under than over 100 feet, and frequently with most luxurious appointment. Coast yachting and world-cruising became fashionable with millionaires on both sides of the Atlantic, and very many of them have maintained floating palaces, on which they could come and go among the coast cities without dependence on public vessels or trains, and free of all hotel annoyances, for they carried kitchens and cuisines of their own. Bathrooms, electric lights, push buttons and all sorts of comforts were provided, and to be wealthy enough to own a half-million dollar yacht was the ambition of many aiming to

climb into the most exclusive wealthy circles. Gasolene was first adapted to yacht engines in 1885. It is singular to record that naphtha was then a by-product, often thrown away, as there was little use for it. The standard gas engine was studied by Carl F. Riotto and others, and developed so as to be suitable for use on yachts. It was essential to get much higher horse power than had been obtained at that time for marine work. Riotto's motor came to be known as the Standard, and in 1903 he produced a six-cylinder of 110 horse power. This was so successful that it was followed with a 300 horse-power engine next year. Craig, Seabury and other builders took up the construction of large gasoline engines, following the principles of the high-powered automobiles, and soon they were common. The Diesel engine also became available for yacht power early in the present century. Yachts built for ocean trips are called cruisers, and if swift, express cruisers. The most expensive and luxurious are usually express cruisers, though some owners have preferred less speed in order to have large accommodation for parties. A fair idea of the proportions of such boats can be gathered from the dimensions of the following: N. G. Herreshoff's *Helianthus* is 65 feet over all, 61.6 on the waterline, with 17.1 feet beam and four feet draft. She carries two Standard eight-cylinder engines. Murry Guggenheim's *Leonie* is 106 feet over all, six inches less in water-line, 20.9 feet beam and four feet draft. Her gas engines are six-cylinder. (See NAVIGATION; SHIPBUILDING). Consult 'Coast Pilot,' published by the United States Coast and Geodetic Survey; Lloyd's Register, both British and American.

**YADKIN RIVER**, North Carolina. See GREAT PEDEE.

**YADRINTSEF**, Nikolai Michailovitch, Russian author: b. Siberia, 1842; d. Barnaul, Altai Mountains, 29 June 1894. Accused in youth of conspiring for the independence of Siberia, he was exiled to Archangel, but later was permitted to return and was appointed on the staff of Governor-General Kaznakof. Between 1865 and 1875 he traveled extensively in Siberia, publishing the results of his explorations and in 1882 founded at Petrograd (later removing to Irkutsk), the *Eastern Review*, a strong popular weekly devoted to the interests of Asiatic Russia. In 1891-92 he made careful explorations in Mongolia, discovering the ruins of the ancient capital of the Tartar Khans and forming archaeological collections of great value. In 1893 he visited the United States. He was the founder of the Siberian University and a promoter of universal education. Among his works are 'The Russian Commune in Prison and in Exile'; 'Siberia as a Colony' (1882); 'The Culture and Industrial State of Siberia,' etc.

**YAGUARONDI**, yā-gwā-rūn'dē. See JAGUARONDI.

**YAHOO**, yā-hoo', a name given by Swift in his 'Gulliver's Travels' to a race of brutes, described as having human forms and degraded propensities. They were subject to the Houyhnhnms, or horses endowed with human reason. Hence, the term is applied to a rough, low, boorish, or uneducated person.

**YAJUR VEDA**, yā'joor vā'dā. See VEDIC LITERATURE.

**YAK**, the native name for the wild ox (*Bos grunniens*) of the mountainous regions of Tibet. There are two races: the wild yak, generally black, which is found near the snow line, descending into the valleys in winter, and a domesticated race, usually half-breeds, of various colors, black and white being most common. The yak is about the size of the common ox, to which it has a general resemblance, but it is covered with a thick coat of long, silky hair, hanging down like the fleece of a sheep, completely investing the tail, and forming a lengthy fringe along the shoulders, flanks and thighs. This fringe, which exists in both races, was apparently developed as a protection to the animal in its alpine haunts, as the long hair forms a sort of mat which defends the body from the effects of the cold when the animal is reposing in the snow.

The domesticated race is of great importance to the natives of Tibet. The yak is employed as a beast of burden, but never for tillage or draught; the milk is very rich and yields excellent butter; the flesh is of the finest quality, and that of the calves far superior to ordinary veal. The hair is spun into ropes and made into coverings for tents, and the soft fur of the hump and withers is woven into a fine strong cloth. The tails, often dyed red, are made into the chowries or fly-flappers, used in India. Yaks are often seen in zoological gardens and menageries and have repeatedly bred in Europe. It is probable that they might be advantageously introduced into the northern parts of the continents of America and Europe. They have, however, the disadvantages of not eating corn and not being able to live at a low elevation.

**YAKIMA**, yāk'ī-mā. See SHAHAPTIAN INDIANS.

**YAKIMA**, a river of the State of Washington, rising in the Cascade Mountains and after a southeastward course of about 175 miles, flowing into the Columbia about six miles north of Paséo and Kennewick, and 10 miles above the confluence of the Snake River. It flows through an important coal-mining region and its valley and those of its numerous short tributaries are among the most fertile in the State. The Northern Pacific Railway traverses the whole length of the valley of the Yakima, almost to its source.

**YAKIMA**, or **STAMPEDE PASS**, a defile over the Cascade Mountains, in the State of Washington, near the source of the Yakima River (q.v.). Its highest point is 3,600 feet. It is crossed by the Northern Pacific Railway, which at an elevation of 2,800 feet, between Martin and Stampede, passes through the Stampede Tunnel, 9,850 feet long.

**YAKOBA**, yā-kō'bā, or **YAKUBU** (native *Bauchi*), West Africa, a town in northern Nigeria, finely situated on a plateau partly surrounded by mountains, 140 miles southeast of Kano, and on a caravan route. It is walled and the interior is finely diversified with gardens and ponds. The climate is healthful. Pop. 70,000.

**YAKONAN** (from *yakwina*, "spirit"). A linguistic stock of North American Indians, consisting of the Alsea, Yakwina, Kuich and Siuslaw divisions. They were physically of the type of the Northwest Coast Indians and were the southernmost tribe practising artificial deformation of the head. Their mythology and traditions were chiefly of the North but were somewhat modified by contact with the Indians of the California coast. Slavery existed among them until they came under the control of the United States. The home of the Yakwina was along Yaquina River, Oregon, from the site of Elk City to the sea; they were formerly numerous, occupying 56 villages in early days, but the tribal distinction of the Yakwina, as well as of the other Yakanan divisions, was gradually broken down through their preference for marriage outside the tribe; there are only a few Yakwina left and these reside on Siletz reservation, but their number is unknown. The Alsea formerly dwelt in villages along both sides of Alsea River, Oregon, and on the adjacent coast; they are now on Siletz reservation, and perhaps a few are on Grande Ronda reservation. The Siuslaw were also village dwellers, inhabiting Siuslaw River as late as 1857; they are probably extinct. The Kuich or Lower Umpqua, villages were on both sides of Umpqua River from its mouth upward for 30 miles; a few survivors still reside on Siletz reservation. The entire population of the Yakanan Indians probably does not exceed 400.

**YAKUB BEG**, *yā-koob' bēg*, surnamed **ATTALIK GHAZI** ("leader of the champions of the faith"), amir of Kashgar: b. Russian Turkestan early in the 19th century; d. 31 May 1877; He distinguished himself in the defense of Khokan against the Russians. But he first rose to great eminence after the recovery of Kashgar from the Chinese in 1864, when he acted as lieutenant to Buzurg Khan, whom he soon supplanted. For 12 years this remarkable man conferred on a large part of Central Asia the benefits of a settled though rigorous government. He drilled and disciplined a large civil staff, while his army contained the best native soldiers in Central Asia. In his foreign policy he was strongly anti-Russian, and ultimately friendly to Great Britain. China, however, set out to recover its lost Mohammedan provinces and had gained some victories when Yakub died — by assassination, some said. His realm at once fell in pieces. The Chinese armies overran the country (1878), and Kashgar again came under Chinese rule.

**YAKUB KHAN**, *khān*, ex-amir of Afghanistan: b. 1849. He was a son of the amir Shere Ali; was appointed governor of Herat by his father and became extremely popular, but in 1870 broke into open revolt, and in 1874 was imprisoned at Kabul. On the death of Shere Ali he was proclaimed amir (1879) and concluded a treaty of peace with the British at Gandamak. By the terms of this treaty he was to receive a British resident, and on his side to obtain from the British government a subsidy and aid in case of foreign attack. The murder of Sir Louis Cavagnari, the resident, with staff and suite, occurred in the following September. Yakub was suspected of complicity. Lord Roberts (then Sir Fredrick) defeated

the Afghan force 6 October and seized Kabul on the 12th. Yakub abdicated and fled to the British camp. In December he was sent to India as a deposed ruler.

**YAKUTSK**, *yā kootsk'*, Asiatic Russia. (1) A town of Eastern Siberia, capital of the government of the same name, on a plain surrounded by lofty heights, on the left bank of the Lena. The streets present a singular aspect, being composed of about 400 houses of European structure, standing apart, while the intervening spaces are occupied by winter *yurts* or huts of the northern nomads, with walls of cow-dung, earthen roofs, and doors covered with hairy hides. The principal buildings of the town are a large stone cathedral, other churches, a synagogue, a market-house and several educational institutions. Inundations are frequent and the town is consequently unhealthful. The trade is important, Yakutsk being the chief commercial emporium for the whole of Eastern Siberia. The principal articles of native produce are furs and fossil ivory, which are exchanged for European produce. Important fairs are held. Pop. about 8,209. (2) The government of Yakutsk has an area of 1,533,397 ('Century Dict.' and 'Encyc. Brit.') give 1,530,253; other authorities, 'Standard Dict.' Lippincott, Longman, agree with International') square miles, or about two-fifths of that of Europe. The surface is generally low in the north, but rises toward the interior, and in the south and east is covered by the Yablonoi or Stanovoi Mountains and their offshoots. A noteworthy feature of the country is the *tundra*, immense boggy plains, which stretch along the north. Farther south there are good pastures, and wheat and rye are successfully cultivated, even where the ground is frozen to a depth of 600 feet, the summer heat being strong enough to thaw it sufficiently deep for cultivation. There are a number of large rivers teeming with fish, the principal being the Lena. There are valueable forests in the south, frequented by numerous fur-bearing and other animals. Gold and salt are mined but other mineral wealth, including coal, is practically untouched. Caravans with Chinese and European goods collect the produce of the whole line of coast on the Polar Sea between the parallels of 70° and 74°, from the mouth of the river Lena to the farthest point inhabited by the Tchukchis. The towns are chiefly inhabited by Turks and Cossacks, but the great body of the people are nomads, consisting of Yakuts, Tunguses, etc. Frosts of 79.5° F. are recorded and the period free from frost is only about 37 days. The climate is the coldest in Siberia. Pop. about 325,000.

**YALE**, *Elihu*, English philanthropist: b. in or near Boston, Mass., 5 April 1648; d. London, England, 8 July 1721. His father was Thomas Yale, one of the original settlers in New Haven, Conn., in 1638, but who removed to Boston soon afterward and to England in 1651, followed by his family the next year. The son was educated in England, engaged in trade in India in 1672, and in 1687-92 was governor of the East India Company's fort at Madras. He returned to England in 1692 and, although he never revisited New England, he displayed his interests in the Collegiate School founded at Saybrook in 1700 by sending gifts of money and books to the amount of some £600 in 1715, 1716

721. The largest gift, that in 1718, following a suggestion from the college authorities the college building then being erected in New Haven might be named for him. In the whole institution received the name of College in his honor. Yale's latest years passed at Wrexham, Denbighshire, North Wales, and his body is buried in the magnificent church there.

**YALE, Linus**, American inventor: b. Salisbury, N. Y., 4 April 1821; d. New York, 24 Dec. 1887.

In 1851 he patented a safety lock, and for the rest of his life was a recognized authority on all matters pertaining to locks and keys.

Becoming convinced of the necessity of improving the use of a keyhole as affording a means of introduction to the lock mechanism he was led to the adoption of the permanent pin and shaft as used in the combination locks, and subsequently to the perfection of what is known as the "clock" lock. His most notable invention was the double lock, which comprised two locks within a single case, and was operated by the same or different combinations. He received gold, silver and bronze medals as first prizes at various expositions.

**YALE UNIVERSITY**, New Haven, Conn.

At the time of the first settlement of the New Haven Colony in 1638, the establishment of a college there was contemplated. It was not until 1700-01, however, that definite action was taken by 10 ministers of Connecticut, and a charter was obtained in 1701 for the establishment of the Collegiate School of Connecticut. The school was first located at Saybrook and Samuel Pierson was the first rector. In 1716 the school was removed to New Haven, and in 1718 the name was changed to Yale College, in honor of Elihu Yale (q.v.), who had given his name to the Collegiate School. The first charter was also completed in 1718. In 1745 the State charter was granted making the full name of the corporation "The President and Fellows of Yale College." Until after the incorporation the college received occasional grants of money from the colonial government; but the State made a grant of about \$30,000, and the governor, lieutenant-governor and six ministers were made members ex-officio of the corporation. In 1795 Timothy Dwight (q.v.) became president, and during his administration the college attained a higher degree of prosperity than ever before; the college grounds were extended; permanent professorships were established and the formation of separate professional schools planned. The Medical School, the first, was the only one established (1813) during President Dwight's lifetime. The Divinity School was organized in 1822 and the School of Law in 1824, though instruction in the latter had been given since the beginning of the college and instruction in law for some time prior to 1824. The Sheffield Scientific School was established in 1847 and the School of Fine Arts in 1866. The elective system was introduced during the administration of Noah Porter, and from 1886-99 the college still further extended its course and doubled its number of students; the name was changed to Yale University in 1887. In 1872 provision was made by the State legislature for the substitution of trustees in the place of the six State senators

in the corporation, so that the corporation now consists of 10 Congregational ministers, the successors of the founders, six representatives of the alumni, the governor and the lieutenant-governor of Connecticut. In October 1901 the bicentennial anniversary was celebrated with appropriate ceremonies on the university grounds. There were 4,691 Yale graduates present at the anniversary ceremonies and in addition 311 former students, not graduates; and 147 holders of higher degrees from Yale. The President of the United States, representatives from every leading American university and college and from many foreign universities were also present. The exercises included addresses by alumni and distinguished guests, a procession in which graduates and undergraduates took part, the "Dramatics," scenes in the history of the university given by the students' Dramatic Society, and the dedication of Woodbridge Hall, the administration building.

The university includes in its schools of instruction Yale College or the Academical Department, the Sheffield Scientific School, the Graduate School, the School of Fine Arts, the School of Music, the Forestry School and the schools of Religion, Medicine and Law. The university library, the Peabody Museum of Natural History, the Astronomical Observatory and several other adjuncts to the university are organized independently of the separate departments. The undergraduate course in the college covers four years. During the years 1917-18 the individual courses stood arranged in 24 numbered groups, in four main divisions, as follows: (1) Language, Literature and the Arts; comprising (i) Latin; (ii) Greek; (iii) Classical Archæology; (iv) Biblical Literature and Semitic Languages; (v) French; (vi) Italian; (vii) Spanish; (viii) German; (ix) English (including English Literature and Composition); (x) The Fine Arts and (xi) Music. (2) Mathematics and the Physical and Natural Sciences: comprising (xii) Mathematics; (xiii) Physics; (xiv) Chemistry; (xv) The Geological Sciences and (xvi) The Biological Sciences. (3) Philosophy, Education, History and the Social Sciences: comprising (xvii) Philosophy; (xviii) Theory and Practice of Education; (xix) History; (xx) Anthropology; (xxi) Economics and (xxii) Law. (4) Military and Naval Sciences: comprising (xxiii) Military Science; (xxiv) Naval Science.

Sanskrit, Norwegian, Danish, Swedish, Russian, Elementary Japanese and Chinese, and also general and religious pedagogy are included in the curriculum.

The Sheffield Scientific School was first organized in 1847, and received its present name in 1860; from 1863-92 it was the State College of Agriculture and Mechanic Arts, and received the national grants for such institutions. It offered, until the past year, undergraduate courses of three years; French and German, English and general science are included in all courses, and the work of the freshman year is much the same for all.

Lately, the courses most distinctly marked out are in civil, mechanical, electrical, municipal and sanitary engineering; also those in engineering preparatory to mining, in chemistry preparatory to metallurgy, in natural history, in mineralogy and other studies preparatory to

geology, in biology preparatory to medicine, in forestry preparatory to a forestry course, and in select studies preparatory to other higher studies. One of the most elaborate additions to the courses in recent years is provided for by the Hammond Mining and Metallurgical Laboratory, the gift of John Hays Hammond of the Sheffield class of 1875.

The School of Fine Arts offers both technical courses and courses in art, history and criticism; the regular course is three years in length for the completion of which a diploma is conferred. The degree of Bachelor of Fine Arts is conferred on the completion of certain advanced studies and the presentation of a thesis. The School of Music offers both theoretical and practical courses. The degree of Bachelor of Music is conferred for the completion of advanced courses. The Yale Forestry School was established in 1900; it offers a two years' course, the work of the second year being largely field work. The degree of Master of Forestry is conferred on those who have received a bachelor's degree or have had the equivalent of college training. A Summer School of Forestry is also maintained at Milford, Pa. The Graduate School was organized as a separate school in 1847, the professors of the other sections of the Department of Philosophy and the Arts constitute the faculty of the Graduate School. Graduate courses are offered in the Academic Department, the Scientific Department, the School of Fine Arts and the Department of Music. The degrees conferred are A.M., M.S., Ph.D., C.E. and M.E. In addition to regular class and laboratory work of the school there are numerous voluntary associations of professors and students for the advancement of graduate work in the several departments of study. The Divinity School offers a regular course of three years leading to the degree of B.D. Seniors in the college may elect such courses in the Divinity School as to shorten the course to two years. A fourth year of graduate work is also provided. The work includes both prescribed and elective courses; elective courses in sociology, and in the study of missions are included in the curriculum. The Medical School offers a four years' course leading to the degree of M.D. Ample provision for clinical work is made in the New Haven Hospital, the State Hospital for the Insane at Middletown and the Springside Hospital. The Law School course covers three years. Previous to 1896 it was two years in length. The degrees of Bachelor of Laws and Bachelor of Civil Law are conferred, the same amount of work being required in each course. Students in the college may so arrange their course as to receive the degrees of arts and laws in six years. Graduate courses are provided, leading to the degree of Master of Laws and Doctor of Civil Law. The school was the first in America or England to establish a course leading to the latter degree.

Women are admitted to the School of Fine Arts, the Department of Music, and the Ph.D. courses of the Graduate School, and public school teachers are admitted to some of the regular courses. Numerous scholarships and fellowships are provided in the Academic Department, the Scientific School, the Divinity School and the Graduate School. A Bureau

of Self Help\* is maintained, through which students are aided in obtaining employment. The university maintains a public lecture course, and provides several series of lectures in the different departments; prominent among the latter are the Lyman Beecher lectures on preaching, the Dodge lectures on the responsibility of citizenship, the Bromley lectures on journalism, literature and public affairs and the Silliman Memorial lectures, of which 12 volumes have been published by the Yale University Press. In 1918 Silliman lectures commemorated the 100th anniversary of the founding of the *American Journal of Science* by Professor Benjamin Silliman in July 1818. They were published as a full volume-number of the Journal entitled 'A Century of Science in America,' with special reference to the *American Journal of Science*. The Journal has for the full century of its existence been edited by three Yale men, Silliman and the elder and younger Dana. It is, however, not directly a Yale institution, though in a sense a Yale reflex of the development of scientific research in America. In scope and influence it has continued national throughout the century of its existence. The University Library in 1919 contained over 1,000,000 volumes, exclusive of pamphlets. It is supplemented by a series of special libraries. There are the Linonian and Brothers Library, the Dwight Hall Library, the Law Library, the Scientific School Library, the Trowbridge Reference Library of the Divinity School, the Lowell Mason Library of Church Music, the Library of Foreign Missions and several other department and club libraries. The Peabody Museum was established in 1866 by a gift of George Peabody (q.v.) and in it were accumulated excellent collections in mineralogy, geology and paleontology and zoology. As part of the building now under way, however, the old building has been removed, and these collections, in part unique, are at present inaccessible to the public, awaiting the erection of a new museum or new geologic and paleontologic laboratories to take its place.

During the war Yale closed the regular courses, turning her dormitories into quarters and developing a Reserve Officers Training Corps and a Naval Training Unit. Her war activities constitute an important chapter in the history of American participation in the great conflict. With the resumption of normal work its following the war, a far-reaching reorganization has been effected, involving the status of governing boards and more or less all departments and all students. New university offices have been created. There is now in addition to the president, a provost. The undergraduate schools are more closely co-ordinated, entrance requirements changed, and a complete undergraduate Freshman year adopted. An important decision has also been reached in the degree of Bachelor of Philosophy shall be awarded to students who enter Yale without Latin, the B.A. degree being reserved for those offering Latin at entrance. All Sheffield undergraduates become candidates for the degree of B.S. Inasmuch as these changes are so recent and have not yet had catalogue announcements they are not further outlined here. They are in a full measure epochal, coming as they do at the time of the great Stirling bequest of some

**YALE UNIVERSITY**

**1 Woolsey Hall** **2 Osborn Memorial Laboratories**

YALE UNIVERSITY

1 The Mason Laboratory of Mechanical Engineering

2 Woolsey Hall — Interior

\$15,000,000, as well as in a period as distinctly formative as that following the Civil War and the passing of the old Campus group of buildings. The buildings of the university known as the Bicentennial buildings include Woodbridge, Woolsey, Memorial and University halls. They were erected by the graduates in 1900, 1901 and 1902 in commemoration of the 200th anniversary of the founding of Yale College. The buildings were designed by Carrere and Hastings of New York and cost about \$1,000,000. They are of Indiana limestone with granite foundations. Memorial Hall, in the centre of the group, is becoming the regular place for tablets and other memorials to graduates of the university. The following collections are on exhibition in Memorial Hall; Autograph Letters and Engravings of Eminent Yale Men; the Morris Steinert Collection of Musical Instruments, and the Rebecca Darlington Stoddard Collection of Greek and Etruscan Vases.

The Yale Roll of Honor, containing the names of 192 Yale men who gave their lives in the Great War, is also in this hall.

Woolsey Hall (see illustration of interior, Plate II, photograph 2) is a part of the group of Bicentennial buildings erected by the graduates at a cost of over \$1,000,000 in commemoration of the 200th anniversary of the founding of Yale. The hall holds 2,700 people and is acknowledged to be one of the best auditoriums in America. The organ, which is unsurpassed in America and is the third largest in the world, was designed by the Hutchins-Voltey Company of Boston, and is the gift of the Newberry family of Detroit. In 1916, through additional gifts of the Newberry family, the organ was entirely rebuilt by the J. W. Steere and Son Organ Company of Springfield, Mass. The organ now contains 22 stops in the great organ, 22 stops in the swell organ, 11 stops in the choir organ, 16 stops in the solo organ, 13 stops in the orchestral organ and 11 stops in the echo organ. There are, in total, 163 draw-stops, 32 couplers and 78 other piston and pedal accessories. There are more than 7,000 pipes.

The Osborn Memorial Laboratories (see illustration, Plate I, photograph 2), accommodating the departments of Zoology, Comparative Anatomy and Botany, were erected by means of funds paid over to the university by the executors of the late Mrs. Miriam A. Osborn, being the portion of her residuary estate which was bequeathed to the university. The cost of these laboratories amounted to about \$500,000. During her lifetime Mrs. Osborn erected Osborn Hall in memory of her husband. The Mason Laboratory of Mechanical Engineering (see illustration) was built in 1910 by William Smith Mason and George Grant Mason, both of the Class of 1888, Sheffield. Constructed of brick, with a limestone façade on Hillhouse avenue, it extends through to Temple street in the rear. There is here installed one of the most complete machine testing plants in the country, with large units affording unusual opportunities for experimental work and practical instruction.

A panorama of Yale is scarcely satisfactory. But the buildings facing the "Green" (see Plate I, photograph 3) are in the near sense Yale's "front row." Through the Phelps Gate-

way (at the centre) is entered the old campus, with its "old fence," the Nathan Hale statue and the "Old South Middle" now nearly all that remains of the old Yale. On the southwest corner of the campus are Vanderbilt Hall, the School of Fine Arts (where is housed the famous Jarvas collection of 13th to 17th century Italian paintings, "primitives") and the libraries. On the northwest are Dwight, Wright and Durfee Halls. Back of the campus group of dormitories on the site of the old Peabody Museum and taking up the entire block between High and York streets, there is now in course of erection a magnificent Memorial Quadrangle, the gift of Mrs. Stephen V. Harkness. Across the way (Elm street) is the gymnasium. The main extension of Yale is, however, to the right and northerly from Battell Chapel. There follow, in the order named: (1) The Berkeley Court—Blount avenue series of buildings; (2) the Bicentennial group of buildings (Plates I and II); (3) the Sheffield Scientific School (on Prospect street and Hillhouse avenue); (4) the Sachem's Wood or Pierson-Sage square group, including the Osborn Laboratories (Plate III), and the Sloan Physical Laboratory (with probably the site of new geologic-paleontologic laboratories); (5) continuing on Prospect street, the Forestry School and Botanic Garden, and (6) the Astronomical Observatory. The latter are about one mile northerly from the Phelps Gateway. The Medical Hall and the Medical School Laboratory lie to the west of the campus; the University Clinic Building is opposite the New Haven Hospital; the Forestry School occupies Marsh Hall, the house of the late Professor Marsh in the Botanical Gardens. The old athletic field of 30 acres is situated about a mile and a half west of the campus, and adjoining is the new field of 100 acres, including the Yale Bowl which covers 25 acres, and seats over 60,000 spectators. In this great amphitheatre are held the football games and various open air spectacles and pageants more or less closely associated with university life and interests. The gun club range and Armory are near by. The Adee Boat House is on the harbor, and at Gale's Ferry on the Thames River are quarters for university and freshman squads and equipment for crew training for the final races. The students maintain a Christian Association, an Athletic Association; numerous literary, dramatic and technical societies, and social and special literary and technical clubs. In addition to the university dormitories, a number of student fraternities have fine homes for their membership. There are also the chapter houses or "tombs" of these fraternities, of more or less individualistic architecture, and one of the odd attractions of the university zone westerly and northerly from the "Green." Among these are the three senior society tombs, "Skull and Bones," "Scroll and Key" and the "Wolf's Head," with the Sheffield "Book and Snake" and Phi Gamma Delta. They are full of local interest and color, and unfailingly arrest the visitor's attention. A chapter of Phi Beta Kappa is also located at Yale. At the time of entry into the World War in 1917, professors and other

officers numbered 609, and the total number of students was 3,300.

**YA-LU-KIANG.** See YALU.

**YALU**, yá'loo, Chosen, a river forming the boundary with Manchuria. In its upper reaches it is known as the Am-nok or Ap-nok. Its source is in the Paik-tu-san, the highest peak (8,000 feet) of the Shan-a-lin Mountains of Manchuria. It flows into Korea Bay, near Wi-ju, after a southwesterly course of about 300 miles, and has numerous tributaries, chief of which is the Chang-jin River. It is navigable for sea-going vessels 30 miles from its mouth and by smaller vessels 145 miles to Wiwen. On 17 Sept. 1894 its mouth was the scene of the battle in which a Chinese fleet of 12 warships, some of them powerful ironclads, and 16 other vessels, was defeated, with the loss of four vessels, by a Japanese force of 11 war vessels and two others. During the Russo-Japanese War of 1904 its banks witnessed much skirmishing and fighting. The Japanese have renamed it Oryoku. See MANCHURIA.

**YAM**, a popular name for various species of the genus *Dioscorea* of the family *Dioscoreaceae*, and loosely applied to certain varieties of the sweet potato. The true yams belong to a genus consisting of more than 150 species widely distributed throughout the tropics. They have herbaceous, twining or creeping stems; broad, alternate or opposite, usually simple leaves; and small diceous flowers, followed by three-winged capsular fruits containing winged seeds. The fleshy roots of some species are widely eaten in the tropics. One of the best-known species is *D. alata*, a native of India and the South Sea Islands, but distributed throughout the tropics. Its tubers usually attain a length of three feet and a weight of 30 pounds, but specimens three times as large are not uncommon. They are black or brownish externally and pink within, and are rich in starch. When boiled their acidity is dispelled and they become of pleasant flavor. It is claimed that this species is the parent of most of the edible so-called species such as *D. sativa*, *D. aculeata*, *D. rubella*, *D. globosa*, etc. The air-potato (*D. bulbifera*) is an Asiatic species cultivated to a small extent in the southern United States, and in conservatories, for its odd, angled tubers, which are borne in the axils of the leaves. They often exceed two pounds in weight and are sometimes eaten like potatoes. The Chinese yam, Chinese potato, or cinnamon vine (*D. divaricata*), is a native of the Philippine Islands, whence it has been introduced into the gardens of temperate as well as tropical climates for ornament. It bears cinnamon-scented white blossoms and aerial tubers which

are used for propagation. As far north as New York the plants have proved hardy.

**YAM-A-MAI**, an Oriental kind of silk-worm (*Atheraea jama-mai*), which feeds on the oak, and produces a silk, known by the same name, with peculiar, but useful qualities, extensively utilized in Japan and somewhat elsewhere. See SILKWORMS.

**YAMA**, yā-mā', a Hindu god, the judge of the dead, whose good and bad actions are read to him out of a record, and who according to their merits and demerits are sent to the celestial or to the infernal regions. Hindus offer to him daily oblations of water. See also LAMAISM.

**YAMADA.** See UJI-YAMADA.

**YAMAGATA**, yā-mā-gā'tā, Aritomo, Prince (early name KYOSUKE) Japanese soldier and statesman; b: Chōshū (or Nagato) province, 22 April 1838. He was educated by the patriot Shōin Yoshida; was active in the overthrow of the shogunate, and was made second vice-minister of war under the new government. In 1869 he visited Russia and France for study of their military institutions. In 1876-77 he ably directed the Satsuma rebellion campaign. In 1878 was made commander of the imperial guard and chief of the general staff. He was Prime Minister in 1889-91, in which post he greatly strengthened the army and navy; and Minister of Justice in 1891-93. He was appointed to command the first army corps in the war with China in 1894, and quickly expelled the Chinese from Korea. His policy was throughout one of study of Western methods. He was a skilful strategist, and was made field-marshal in 1898, receiving also the title of marquis. He was again Prime Minister in 1898, and was chief of staff in the Russo-Japanese War. He became president of the Privy Council in 1905, and was raised to the rank of prince in 1907.

**YAMAGATA**, Japan, a town in the island of Hondo, capital of a prefecture of the same name, 200 miles north of Tokio, Pop. (city) 42,234; (prefecture) 938,014.

**YAMAGUCHI**, yā-mā-goo'chē, Japan, city, capital and chief city of the prefecture of Yamaguchi, in the southwestern part of the island of Hondo, 15 miles back from the coast, and 220 miles west of Osaka. It was formerly the residence of the lords of Chōshū, a Mori family, and became the seat of the local government in 1860. In 1550 a church was established here by Francis Xavier, but was finally destroyed. Pop. (city) 21,100; (prefecture) 1,068,935.

**YAMAJI**, yā-mā-jē, Motoharu, Viscount, Japanese soldier; b. Tosa province, island of Shikoku, about 1840; d. 1903. He won distinction in the campaign against the unsuccessful revolt in Satsuma province (island of Kiusiu) in 1877; and was promoted lieutenant-general. In the Chinese-Japanese War of 1894-95 he had the immediate direction of the attack on Port Arthur, which was finally taken on 22 Nov. 1894. This won for him a great reputation in Japan, where, in allusion to his loss of an eye, he is known as the 'One-Eyed Dragon.'

**YAMAMA MOLTE.** See SILKWORMS.

W. L. YANCEY

**YAMANOUCHI GUN.** See **ORDNANCE.**

**YAMASKA**, yā-mās'ka, Quebec, Canada; village and railway junction of Yamaska r., on the Yamaska River, 31 miles north of Hyacinthe. The river affords power for several mills. Pop. about 900. (2) A bay bordering on Lake Saint Peter; area, 500 acres. Capital, Saint François du Lac, drained by the Yamaska, Nicolet and Francis rivers. Pop. 16,204. (3) A bay flowing from Brome Lake, Brome r., west, then north, and after a course of about 100 miles through a fertile country, empties into the Saint Lawrence River at Saint Peter.

**YAMBO**, yām'bō, **YAMBU**, yām'boo, or **BO-EL-BAHR**, yēm'bō-él-bār, Arabia, a town on the Red Sea, in the province of Suez, 115 miles west of Medina, of which it is the harbor. Marking the end of the third stage of the caravan journey from Cairo to Suez, the town bears the title "Gate of the City." The town consists of a long row of white houses built of limestone and coral, standing on the edge of an arid plain. It has considerable imports and transit trade between Suez, Jidda and Medina. Pop. about

**YAMBO** (also **LLAMEO**, **LAMA**, **LAMA** or **LHAMEOS**), South American tribe of northeastern Peru, living along the Marañon (Upper Amazon), the lower Ucayali and Javery rivers, and formerly between the Tigre and Napo rivers. Physically they are smaller than the other tribes of the region. They have a distinct language, and were formerly warlike as now in the main they are agriculturists and weavers. The portion of the tribe living farthest to the east retains its primitive customs, but the larger portion of the tribe has become merged in the Peruvian country population. Franciscan missionaries brought most of the tribe under the influence of civilization. Consult Brinton, *D. The American Race* (New York 1891).

**YANA** ("people"), a small tribe, forming a man (or Noje, or Nozi) linguistic stock with American Indians, whose former habitations were bounded on the east by a mountain a little west of Lassen Butte, and terminated near Pit River, in northern California; on the north by a line running northeast to Redding, passing near the northern side of Round Mountain, three miles from Pit River; on the west by a line extending from Redding toward an average 10 miles to the east toward Sacramento River; north of Redding they approximate twice that distance. They were first recorded by the miners of the neighboring region in August 1864, all but 50 being killed. The tribe and stock were represented in 1884 by 100 individuals divided into two groups — one at Redding, the other in their original habitations at Round Mountain and in 1902 but maintained. They have a tradition to the effect that they came from the East and it is at present in physical traits they differ markedly from all the northern California Indians.

**YANA**, yā'nā, or **JANA**, Eastern Siberia, a bay which rises in the Verkhojanskii Mountain and after a northerly course of about 750 miles enters the Arctic Ocean through Yana

Bay, near Ustjansk, by seven large and many small mouths.

**YANCEY**, William Lowndes: American political leader and orator: b. Ogeechee Shoals, Ga., 10 Aug. 1814; d. 27 July 1863. He was the son of Benjamin Cudworth Yancey, a political leader of the South, who died at the age of 36. His stepfather was Rev. Nathan Benden of New York. Yancey studied at Williams College, but lack of funds arrested his course there before he was graduated. He entered the law office of B. F. Perry at Greenville, S. C., was admitted to the bar in 1834, and began to publish the *Greenville Mountaineer*, which was opposed to nullification, and supported the Union. In 1835 he married Miss Earle of Greenville, who was possessed of a considerable fortune in negro slaves. Yancey resolved then to abandon law and undertake cotton planting at Catawba, Ala. However, a local feud resulted in the poisoning of the Yancey wells and the consequent death of the slaves, and he was forced to abandon the plantation. He re-entered his profession, resumed his journalistic efforts, and became a commissioner in bankruptcy. At Wetumpka, near Harrowgate Spring, Yancey owned and edited a weekly newspaper, and established a flourishing law practice. He sat in the Alabama legislature, and was active in reform measures (1841-44). After a vigorous campaign he was elected to Congress for the term 1844-46. After a duel with Representative Clingman of North Carolina, Yancey resigned from service in Congress, disappointed in that body. He moved to Montgomery, Ala., where he entered the firm of Elmore and Yancey, and soon recuperated his lost fortune. He now began a career of unofficial political leadership, peculiar to himself. At the National Democratic Convention at Baltimore Yancey led the movement which resulted in the adoption of the "Alabama Platform." This instructed the delegates not to vote for any candidate opposed to government protection of slavery. In spite of this organized effort, General Cass, the nominee of the Baltimore convention, received the electoral vote of Alabama.

When the question of secession was under consideration in 1851, Yancey favored withdrawal from the Union. When the State refused to summon the legislature to submit the question of convention to the people, he summoned a non-partisan mass State convention which sent representatives independently to the Democratic convention at Cincinnati. Yancey now became the controlling force in the radical politics of the State. He also made a canvass of the North, speaking eloquently in favor of secession and slave owners' rights, after the meetings of the Charleston Democratic Convention. The election of Lincoln was partly due to the split in the Democratic party which Yancey led. After the secession he was sent by the Confederacy to secure the recognition of the various European governments. His efforts at London and Paris were unsuccessful and he returned in 1862, when he was elected senator of the legislature of Alabama. He served in the Confederate Senate until his death. Consult Du Bose, J. W., *Life and Times of William Lowndes Yancey* (Birmingham 1892).

**YANES**, yā'nēs, **Francisco Javier**, Venezuelan diplomat: b. Caracas, Venezuela, 6 May

1861. From 1892 to 1897 he was vice-consul and acting consul-general of Venezuela at New York and in 1901-03 served as Spanish secretary and chief of the translations division of the United States Philippine Commission, Manila. From 1905 to 1910 Señor Yanes was secretary of the governing board of the International Bureau of American Republics and since 1910 has been assistant director and secretary of the governing board of the Pan-American Union, Washington, D. C. At the Jamestown Exposition of 1907 he represented the International Bureau of American Republics and was a member of the jury of awards. He is a member of the American Academy of Political and Social Science, the American Society of International Law, and of many other learned bodies. Señor Yanes is a writer on literary and political subjects.

**YANG-BAN** (two divisions, civil and military). The name first given to the privileged classes in Korea, during the Korai dynasty (918-1392), when the inhabitants were classified as nobles, commoners and slaves. The nobles, owing allegiance to the king, exercised within their own domains both civil and military authority. In time, these functions and classes were separated, the civil officers being called East Division and the military, West Division, according to their place at court. After 1392, under the new dynasty, when Buddhism fell and Confucian ethics and Chinese ideas prevailed, many able commoners entering politics, the ruling classes numbered five, nobles, local yang-ban, middle-class men, common people and slaves. In this new classification, the noble yang-bans held the chief government offices and were immune from taxation. If not earning a living, they lived off the people. The chief families or clans were the Kim, Chwe, Pak, Li, Chong and An (the Six Families), and later the Min and Cho. The stories of their bitter feuds make up the substance of modern Korean history, culminating in the murder of Kim Ok Kun and Queen Cho. With other clans and their subdivisions, numbering over a score, there were, in 1910, 54,000 yang-ban families, comprising one-fiftieth of the households in Korea; two central provinces having a total of 35,630 families; though the yang-ban are scattered all over the peninsula. Without domains or fixed stipends, the yang-bans, despising labor and looking only to official positions and income — when there are but 17,000 offices of any and all sorts open to Koreans — the condition of 37,000 families in this proud class is that of poverty. In old days, a man in high office would have 200 or 300 hangers-on to look after, the public looking on his supporting so many relatives as a great virtue. When Korea, in 1912, for the third time in its history, was given the name of Chosen, apart from the creation of a new class of nobility pensioned by the Japanese government, all the old class distinctions and privileges of amazing and curious variety were abolished. Yet as social ideas, habits and customs die slowly, the yang-ban, like the old samurai of Japan, still enjoy, locally, much of the old-time prestige. The history of Korea, especially in its modern phases, cannot be understood without some understanding of the social influence of the yang-ban and their feuds. Consult Hul-

bert, 'The Passing of Korea' (1906); Griggs, 'Korea, the Hermit Nation' (1907), the official Annual Reports on Reforms and Progress in Korea (1917-18), and the Eastern Asia Official Guide Book: Vol. I, Manchuria and Chosen.

**YANG-TSE-KIANG**, yāng'tsè-kè-āng, the name generally given to one of the greatest rivers of China throughout its entire course, although this name is only applied in China to the lower course of the river, the entire river being called simply Kiang, or Ta Kiang (river or great river), while in the various provinces it traverses it is generally known by special names. It rises in the Tangla Mountains in mid-Tibet, about lat. 35° N. and long. 89° E., at an altitude of from 16,000 to 19,000 feet, and is first known by the name of Muru-Ussu. In its upper course it is sometimes called the Kincha-kiang. Its upper course through the mountainous region of Tibet extends to about 1,100 miles, during which its windings and falls present numerous striking scenes of natural beauty. It crosses the Chinese frontier in the province of Sze-chuan, then flows southward and eastward through Yunnan and northeast back through Sze-chuan Yunnan. Between the town of Li-kiang in this province and Hui-li in Sze-chuen, for a course of about 250 miles, it flows in an easterly direction through a winding channel or mountain gorge of imposing grandeur. Traversing the whole province of Sze-chuen in a northeasterly direction and passing in southeasterly direction into the province of Hu-peh, it reaches at King-chau the great Chinese plain, and traversing the provinces of Ngan-hui and Kiang-su, and passing the cities of Han-Yan, Han-kau, and Wu-chang, a great seat of the tea exporting trade, Ngan-king, Nanking, and Chin-kiang, it enters the Tung-hai, or Eastern Sea, above Shanghai. Its direct course from its source to its mouth is estimated at 1,800 miles; its course with windings is about or considerably over 3,000. It receives numerous affluents, and is crossed by the Grand Canal, which forms a junction between it and the Hwang-ho. The summer rains combined with the melting snows of the mountains in Tibet cause the river to rise at times as much as 40 or 50 feet at Hankow and Chin-kiang, resulting in great loss of life and serious damage to crops and other property. The drainage area is about 650,000 square miles, and it is estimated that the river annually carries away 6,428,000,000 cubic feet of sediment; the volume of water is 770,000 cubic feet a second. Steamers of 5,000 to 6,000 tons burden easily reach Hankow, 680 miles from the sea, except at low water in winter. The river and the ports of Chin-kiang and Han-kau were opened to foreign navigation in 1860, I-chang (1,000 miles up), and others since. A British squadron sailed up the river in 1861 for more than 800 miles. The last 200 miles of its course is through practically level land, and in the first 1,000 miles the rise of the river is only 130 feet. It constitutes a most important waterway, carrying about one-half of the sea-borne traffic of China; and it is equally valuable commercially as a means of intercommunication throughout the country. The navigation above the confluence of the Tung-ting is interrupted by rapids. The tides

ice reaches in February to Lake Po-436 miles from the sea. Consult Gill, 'The River of Golden Sands' (1883); 'Through the Yang-tse Gorges' (1896).

**YANG AND YIN**, in Chinese philosophy, employed to indicate the two phases, light and darkness, under which the supreme principle of the universe, *Tai-ki*, displays itself in the world of phenomena, Yang and Yin being, in various proportions, blended in all forms of life.

**YANKEE**, a cant name for Americans belonging to the New England States. During the Revolution the name was applied by the British to all the insurgents; and during the Civil War it was the common designation of Federal soldiers by the Confederates. The word Yankee is sometimes improperly used generally to natives of the United States. The most common explanation of the name seems also the most plausible, namely, that it is a corrupt pronunciation of English or French "Anglais" formerly current among Massachusetts Indians. See **NICKNAMES**.

**YANKEE DOODLE**. The air of Yankee Doodle is said to have been a British air played in the time of Cromwell by the name of Yankee-Doodle, and played with derisive effect to the similarity of this name to that used by the British troops in evacuating New York. The Americans took it up and made it their national air. See **NATIONAL HYMNS**.

**YANKEE GANG**, a term used in Canadian lumbering for a method adapted for sawing logs 12 inches in diameter and under. It consists of two sets of gang saws, connected by a chain of ways. The slabbing gang reduces the log to a balk and slab boards after which the balk is transferred to the stock gang, which cuts it into lumber.

**YANKTON**, S. Dak., city, county-seat of DeWitt County, on the Missouri River and about 100 miles from Chicago, Milwaukee and Saint Paul, Great Northern, and the Chicago and North Western railroads, 60 miles northwest of Omaha and 135 miles northwest of Omaha. The city is the commercial and industrial centre of a large agricultural and stock-raising region. The chief industrial establishments are Portland cement works, flour mills, sawmills, yards, grain elevators and stock yards. The city owns and operates the waterworks. Educational institutions are Yankton College (Congregational), opened in 1882; Saint Benedict's Academy, a public high school, public parish elementary schools. It has the Yankton Dakota Hospital for the Insane, and a modern fireproof hospital in charge of the Sisters of Saint Benedict. Yankton's water supply is obtained partly from artesian wells. There are two national and two State banks, a loan and trust company; the five have assets of over \$3,000,000. The city has many streets of concrete paving, and has raised \$1,300,000 to construct a combination railroad and a bridge across the Missouri River. Yankton was settled by Eastern people in 1862, and in 1883 received a city charter. Until 1883 it was the capital of the Territory of Dakota. It is the commission form of government. Pop. 5,500.

**YANKTON COLLEGE**, located at Yankton, S. Dak. It was established by the General Association of Congregational Churches of Dakota in 1881, opened to students in 1882, and is the oldest institution of higher learning in the Dakotas. The college is non-sectarian and is open to both men and women. The organization includes the following departments: (1) the College; (2) the Academy; (3) the Normal Department; (4) the Conservatory of Music; (5) the Department of Art; (6) the Department of Expression; (7) the Commercial Department. The college offers a four years' course leading to the degree of B.A. The work of the freshman year gives an option between Greek or Latin and Mathematics. Bible study is not required, but there are a number of electives; courses in education are included in the curriculum. The Conservatory of Music offers courses of three to eight years in pianoforte, pipe organ, voice and violin. The course in commercial studies covers two years. Gymnasium work is required of both men and women, and there is an athletic park, and ample provision for athletic sports. The students maintain Young Men's and Young Women's Christian associations, literary societies, a branch of the Inter-Collegiate Oratorical and Debating Association and athletic associations. The college has an attractive campus of 25 acres, including the Athletic Park (five acres) to the north of the main Campus and Observatory Hill to the south. The buildings are Middle College, Young Women's Dormitory, the Ward Hall of Science, the Clarke Observatory, the gymnasium, the library and a central heating plant. A Summer School was established in 1903. The students in 1919 numbered 517, of whom 174 were in the College.

**YAO**, or **YAU**, ancient Chinese emperor; reigned about 2357-2258 B.C. He was the first of the three model emperors extolled in the 'Shu-king' or 'Canons of History,' the oldest Chinese source of pre-Confucian history, supposed to have been edited by Confucius himself. In the works of Confucius Yao is celebrated as the embodiment of all the virtues requisite for his high position. His patronage of astronomical works and of engineering are highly emphasized, and his government is described as a model of good organization. The great Chinese flood occurred in his reign, and when after several years' endeavor the engineers failed to check it, Yao decided to abdicate. He chose for his successor not his son, but a young man named Shun, who was famed for his piety and who became the second of the moral emperors. Consult Hirth, Friedrich, 'Ancient History of China' (New York 1911).

**YAP**, an island of the Caroline group, about 500 miles southwest of Guam. According to the Treaty of Versailles Yap went to the United States under a mandatory, while other German islands north of the Equator went to Japan. Yap is a cable station of the Commercial Pacific Cable Company. A cable is laid direct from Shanghai to Yap and there joins the main cable between Celebes and San Francisco. See **CAROLINE ISLANDS**.

**YAPOCK**, or **YAPOK** (also called **YAPACH** and **OYAIPOCK**), a small, rat-like marsupial (*Chironectes variegatus*) of the opossum family (*Didelphidae*), which is found in Central and South America. It is rather larger than a common rat, with large, naked ears, and a long nearly naked tail; fur brown above, with three transverse bright gray bands, interrupted in the middle, white below. It differs from the opossums in having webbed hind feet and being an expert swimmer and diver. Its habits closely resemble those of the otter, and it feeds on fish, crabs and other aquatic animals.

**YAPURA**, *yā-poo-rā'*, or **JAPURA**, *zhā-poo-rā'*, also known as **CAQUETA**, a river in Columbia and Brazil, South America, a tributary of the Amazon. It rises in the Andes near Popayan and flows in a southwesterly direction, is about 1,800 miles long, and for about 620 miles of its course is navigable for steamers. At lat. 1° 10' S. and Long. 72° 20' W. navigation is interrupted by a large cataract.

**YAQUI**, or **YAKI**, a North American Indian tribe of Piman stock and of the Cahita division, living in the state of Sonora, Mexico, along the Yaqui River. They are industrious and are generally engaged in agricultural occupations and in weaving, although there are miners and pearl divers among them. They have the clan system of government and have always been determined enemies of the Mexican government, against which they have waged long and bitter warfare. Repeated wars have reduced the tribe from numbers which once reached 40,000 to about 13,000.

**YAQUI**, a river in Sonora, northwestern Mexico, with two head streams, both bearing the same name, one rising in New Mexico and one in Chihuahua. The confluence of the two streams occurs about 200 miles from the coast and the river then flows in a southwesterly direction and empties into the Gulf of California. It is about 500 miles long and is navigable at but few points, owing to the rugged, mountainous country and many cañons through which it flows. There are two rivers of the same name in Santo Domingo.

**YARD**. (1) As a nautical term, a spar slung from a mast and serving to extend a sail. Yards are either square, lateen, or lug sail; those for square sails are suspended across the mast at right angles, and are of a cylindrical form, tapering from the middle, which is termed the "slings," toward the extremities, which are called the "yard arms." (2) A standard measure of length, equal to three feet or 36 inches, the foot in general being made practically the unit. As a cloth measure the yard is divided into four quarters, equaling 16 nails. A square yard contains nine square feet, and a cubic yard 27 cubic feet. It was legalized in England in 1855, the previous legal measure, established in 1760, having been destroyed in the Houses of Parliament fire, 16 Oct. 1834. A legend, exists to the effect that the original English yard was established by Henry I, and was the length of his arm. See **WEIGHTS AND MEASURES**

**YARKAND**, *yār-kānd'*, Central Asia. (1) A city of Eastern or Chinese Turkestan, situated on the oasis of Yarkand, on the north side of, and at a little distance from, the river Yarkand, about 100 miles southeast of Kashgar, 3,900 feet above sea-level. It is enclosed by a ditch, and a thick mud wall with towers at intervals. The houses in general are built of sun-dried bricks. Those of the rich are in large open squares surrounded by high walls and well stocked with fruit-trees. The streets are in general too narrow to permit carts to pass. They are intersected by numerous canals, and where three or four streets meet there is always a tank for water. There is a large covered bazaar wide enough to admit carts. The inhabitants, like those of Kashgar, are very mixed in regard to race. The prevailing religion is Mohammedanism. There are 120 mosques and some caravan-series. During the period in which Eastern Turkestan was severed from China a commercial treaty was concluded at Yarkand in 1874 between Sir Douglas Forsyth, representing Great Britain and Yakub Beg, who was then the independent ruler of Eastern Turkestan. Commercial intercourse with India sprung up in consequence. The chief trade at present is carried on with Russia. Pop. 60,000 to 100,000. The oasis of Yarkand is one of the richest in Eastern Turkestan. It yields gold and precious stones and is rich agriculturally. It manufactures leather and saddlery, carpets, silk fabrics, and woolen and cotton goods. (2) A river of Eastern Turkestan, which rises in the Karakoram Mountains, flows generally in a northeast direction and unites with the Kashgar and Kotan-daria rivers to form the Tarim which flows east and enters the Lob Nor Lake, or series of shallow lakes.

**YARMOUTH**, Canada, a town and port of entry of Yarmouth County, Nova Scotia, on the Bay of Fundy, the Atlantic Ocean and the Dominion Atlantic Railroad, 90 miles south of Saint John, N. B. The town has extensive fishing, shipping and manufacturing interests, electric lighting and street railways. At the head of its educational institutions is Yarmouth Seminary. It is known also as a summer resort. Pop. about 6,600.

**YARMOUTH**, Me., town in Cumberland County, on Casco Bay, the Royals River and on the Grand Trunk Railroad; 10 miles northeast of Portland. It contains four villages and has a foundry, paper and cotton mills and granite quarries. The town has six churches, North Yarmouth Academy, a high school, graded schools and a public library. Pop. 2,338

**YARMOUTH**, Great, England, a seaport town in the county of Norfolk, 22 miles east of Norwich, and 121 miles by rail northeast of London, on a narrow slip of land between the Yare and the sea. It is connected by a bridge over the Yare with Little Yarmouth, or South Town, in Suffolk, and is on the Great Eastern and the Midland and Northern railroads. The older part, near the river, is remarkable for its 145 narrow lanes at right angles to the main streets, known as the "rows" in which the houses were once the homes of the wealthy burgesses. Between the older part of the town and the sea is the modern part, with a marine

and other attractions. The parish, founded in 1101, is the largest parish in England, being 230 by 112 feet; and market-place is also of great size. There is an excellent town-hall, a large custom-house, a public library and museum, a borough jail, a Nelson monument, the royal hospital, a royal naval lunatic asylum, the aquarium, a pier and an ancient jetty. The North Quay stretches along the river for two miles. The harbor is in the Yare, accessible by vessels drawing 18 or 19 fathoms. Immediately off Yarmouth, and parallel to the shore, is a great range of sand-banks, on which and the land is the safe anchorage for Yarmouth Roads. Yarmouth is the seat of the English herring-fishery, in which about 300 vessels and 3,000 hands belong to the port are employed; many are engaged in the mackerel fishery, and others in cod and other whitefish. Most of the herring are cured, the herrings known as "Yar-bloaters" being highly esteemed. There are salting-houses, boat-building yards, rope-making, silk-crape factories, trawl-net works, and Yarmouth has risen into considerable importance as a watering-place. It suffered from air and sea raids during the European War, 1914-18. Area, 3,568 acres. Pop. about 55,905.

**YARN**, any textile before woven into cloth. Yarn is numbered according to the number of "hanks" contained in a pound of 7,000 yards. Each hank, or skein, measures 840 yards. Worsted yarn has 560 yards to the skein and woolen yarn has 1,600 yards to the skein. Linen yarn is wound upon reels, and spun up into leas, hanks and bundles. Flax yarn is numbered according to the number of leas of 300 yards per pound.

**YAROSLAV**, yā-rō-slāv', or **JAROSLAV**, (1) a city, capital of the government of Yaroslavl, at the confluence of the Kotorosl and Volga rivers, 173 miles northeast of Moscow. It is the see of an archbishop. The Uspenskij Cathedral was begun in 1215, and there are many other old churches, several monasteries, schools, gymnasia, a theological seminary and a lyceum with a law faculty. The bank of the Volga is the suburban and residential portion of the city and contains many fine dwellings. The city is chiefly engaged in manufacturing and commerce, the right bank of the Volga being lined for two miles with warehouses. There are numerous cotton and linen mills, silk factories and bell foundries. The city was founded in 1226-36 and was the chief town of a municipality in 1218-1471, then considered the rule of Moscow. The village of Selo, included in the city, was the center of the linen manufacture of Russia, and had an annual output valued at \$3,000,000. Pop. 118,766. (2) The government had an area of 13,751 square miles, and is bounded by the governments of Novgorod, Vologda, Kostroma, Vladimir and Tver. It was one of the most thickly populated governments in Russia. The surface is level and well watered by the Volga and its tributaries, the Tver and Sheksma. The western portion has many ponds and marshes, the largest being the Nero, near Rostov, from which the Weska flows. The Volga is connected with the Neva

by two canals, through which considerable commerce is carried on. Market gardening, timber cutting, mining, flax, livestock and poultry raising and manufacturing are the chief occupations. There are extensive linen and cotton mills, and factories for the manufacture of chemicals, machinery, metal ware, flour, tobacco and spirits, making Yaroslavl one of the principal manufacturing governments of Russia. Considerable commerce is carried on by the two railway lines, the Rybinsk-Petrograd and the Yaroslavl-Moscow-Vologda. Its principal commercial cities are Rybrush and Yaroslavl; while Rostov, Mologa, Romanovo and Poshekhon are important trade centres. Pop. about 1,239,300.

**YARRA-YARRA**, yā'ra-yā'ra, or **RIVER YARRA**, Australia, (1) river of Victoria on which Melbourne (q.v.) stands. It is about 100 miles long, but is not navigable above Melbourne, owing to its falls. (2) A lake of Western Australia, east of Darling Range and 150 miles north of Perth.

**YARRELL**, yā'rēl, William, English naturalist: b. London, 3 June 1784; d. Yarmouth, Norfolk, 1 Sept. 1856. Led to note carefully the habits of birds and fishes in 1825 he sent his first contribution to the *Zoological Journal*, a notice of some rare British birds observed in the years 1823-25. The same year he became a Fellow of the Linnæan Society, to whose *Transactions* he repeatedly contributed interesting papers on the subject of birds, and in 1849 became its vice-president. His chief work is his 'History of British Birds' (2 vols., 1839-43; 4th revised edition 1881-85). He also published 'The History of British Fishes' (2 vols., 1835-36).

**YARROW**, Harry Crecy, American physician: b. Philadelphia, Pa., 19 Nov. 1840. He was educated in the schools of his native city and at Geneva, Switzerland, and in 1861 was graduated from the Medical Department of the University of Pennsylvania. His first service in connection with the Union Army was as examining surgeon for the Pennsylvania reserve corps. On 18 July 1861, he was regularly mustered in as assistant surgeon of the Fifth Pennsylvania cavalry, known as the "Cameron Dragoons." He was in action at Dranesville, Va., in December 1861, and several minor engagements, and the following month resigned to accept a position of acting assistant surgeon and executive officer in the United States army general hospital at Philadelphia, where he remained late in the year 1864, when he was detailed, with other surgeons, for service at Hilton Head, S. C., in anticipation of the fall of Fort Sumter. In July 1872 he resumed service with the Engineer Corps as surgeon and naturalist with the expedition for explorations west of the 100th meridian. In 1876 Dr. Yarrow was ordered to the Centennial Army Hospital at Philadelphia and in 1878 was assigned to duty, in the Army Medical Museum at Washington, where he remained until 1887. He was then attached to the Army Dispensary in Washington and was connected with that institution until 1898, when he resigned. In the meantime he was for 15 years honorary curator of the Department of Herpetology in the National Museum at Washington. He has been a member

of the medical faculty of the George Washington University for over 20 years, and was a trustee of that organization. Dr. Yarrow is a member of various medical and scientific associations. He is the author of 'Study of Mortuary Customs among the North American Indians,' and has written a number of valuable papers on biological, medical and ethnological subjects.

**YARROW, or YARROW WATER,** Scotland, a celebrated pastoral stream in Selkirkshire, which rises at Yarrow Cleugh, and, running east a few miles, forms a beautiful lake, called the Loch of the Lowes, which discharges its water into Saint Mary's Loch. Issuing from the latter, the river, after a course of 16 miles through the district of Etrick Forest, flows into the Etrick, a tributary of the Tweed, near Selkirk, its total length being about 25 miles. It is famous in Scottish song, and has been celebrated in poems by Scott, Wordsworth and others.

**YARROW,** an erect, hairy composite herb (*Achillea millefolium*), sometimes called milfoil. The terminal corymbs of small white, or occasionally rose-colored flowers, are large, compound and fastigiate. The leaves are from two to four inches long, and are cut into numerous fine segments, which are very pubescent. Yarrow is a common plant of roadsides, and has been introduced from Europe. It has been used for a long time as a tonic and astringent, and enters into an ointment for dressing wounds. Several species of *Achillea* are garden plants. Sprigs of yarrow plucked from a young man's grave, by lovesick maidens, who repeat meantime a mystic formula, are expected to invoke the images of their lovers, in dreams.

**YARUMAL,** yá-roo-mál, Colombia, a town in the department of Antioquia, on the Cauca, 50 miles northeast of Medellín. Gold mining and stock-raising are the chief industries. Pop. about 21,250.

**YATAGHAN,** yát'a-gán, the Turkish name for a sort of dagger-like sabre with double-curved blade, about two feet long, the handle without a cross-guard, much worn in Mohammedan countries.

**YATES, David Gilbert,** American physician: b. New Jersey, 1870. He was graduated M.D. at New York University in 1898 and specialized thereafter in affections of the eye, ear and throat. He was senior assistant surgeon at the New York Eye and Ear Infirmary; was aural surgeon to the New York City Children's Hospital and Schools, and assistant surgeon at the Manhattan Eye, Ear and Throat Hospital. He is a contributing editor of the *Medical Critic* and author of numerous medical papers.

**YATES, Edmund Hodgson,** English journalist and author: b. Edinburgh, 3 July 1831; d. London, 20 May 1894. After a secondary education he obtained a post in the secretary's department of the general post office in 1847, and in 1862 became head of the missing-letter department. Meanwhile he was also active in various literary work—writing dramatic critiques for the *Court Journal* and the *Daily News*, contributing to numerous periodicals, editing short-lived humorous journals, *Comic Times* and *The Train*, and doing some successful farces. In

1855 he instituted a gossipy personal news column in the *Illustrated Times*, the first of the sort, and elaborated the idea when in 1858 he became editor of *Town Talk*, in which he soon made an attack on Thackeray which resulted in his expulsion from the Garrick Club; in 1860 he became acting editor of *Temple Bar*, of which he was editor-in-chief in 1863-67; and for a time he was also editor of *Tinsley's Magazine*. Among his subsequent ventures were *Time: A Monthly Miscellany* (1879-84), and *The World*. He served seven weeks' imprisonment in 1885 for a libel against the Earl of Lonsdale, published in *The World* in 1883. He lectured in the United States in 1872, and in that year withdrew from the post-office department. In 1873-74 he was special correspondent for the *New York Herald*. The best of his works in fiction are probably 'Broken to Harness' (1864), originally published in *Temple Bar*, and 'Black Sheep' (1867). His 'Edmund Yates: His Recollections and Experience' (1884; 4th ed. 1885) contains much interesting material.

**YATES, Lorenzo Gordin,** American naturalist: b. England, 8 Jan. 1837; d. 1909. He came to the United States in 1853, and after teaching in Wisconsin, he later studied medicine and dentistry. He served in the geological survey of California under Prof. J. D. Whitney (q.v.), and had charge of the scientific department of the Froebel Institute, Los Angeles, Cal. He has published 'California Digest of Masonic Law' (1867); 'Charm Stones' (1886); 'The Ferns of Ceylon' (1887); 'Notes on Hawaiian Ferns' (1887); 'The Channel Islands' (1890); 'The Mollusca of Santa Barbara County and New Shells from the Santa Barbara Channel' (1890); 'All Known Ferns'; 'Aboriginal Weapons of California' (1900); 'Prehistoric California' (1903).

**YATES, Richard,** American politician: b. Warsaw, Ky., 18 Jan. 1818; d. Saint Louis, Mo., 27 Nov. 1873. He was graduated at Illinois College, Jacksonville, in 1838; practised law at Springfield, Ill., sat in the State legislature 1842-49, and was sent to Congress as a Whig in 1850. In 1860 he was elected governor of Illinois and was re-elected in 1862, becoming one of the notable "war-governors." He was a strong opponent of slavery, and an ardent supporter of the government during the Civil War, taking an active part in the organization of volunteer regiments. He was United States Senator in 1865-71; and afterward United States railroad commissioner.

**YATES, Richard,** American politician, son of the preceding: b. Jacksonville, Ill., 12 Dec. 1860. He was graduated from Illinois College in 1880 and from the law department of the University of Michigan in 1884. After being city attorney of his native place, 1885-91, he was judge of Morgan County, Ill., 1894-97, and United States collector of internal revenue at Springfield, Ill. (1897-1900). In 1901 he was elected governor on the Republican ticket of Illinois for the term ending 1905. In 1913 he was appointed by the governor of Illinois a member of the State railroad commission and in 1914 a member of the new Illinois State public utilities commission, to which position he was reappointed in 1915.

**YATES, Robert**, American statesman and lawyer, b. Schenectady, N. Y., 17 March 1738; died, Albany, 9 Sept. 1801. He was educated and practiced law in New York, and after his admission to the bar in 1760 settled in Albany, where he took part in the commencement of the Revolutionary War. He was a member of the committee of safety in 1775-77, and also a member of the provincial congress of New York. He was a member of the convention that framed the Constitution of the State in 1776. In 1777 he was appointed judge of the Supreme Court of New York, and in 1787 was a member of the convention that framed the Constitution of the United States. His notes of the secret proceedings and debates of this convention were published after his death (1839). In 1790 he was elected chief justice of the State of New York.

On his retirement from the bench in 1795 he was appointed a commissioner to settle land titles to lands in the "Military Tract" in Massachusetts and Connecticut.

**YATES, William**, English Baptist missionary, b. Loughborough, Leicestershire, 15 Dec. 1761; died at sea, 3 July 1845. He studied for the ministry at Bristol College, was ordained in 1784, and sailed for Calcutta the next year. He ministered at Serampore, preaching for a time and subsequently devoted himself entirely to education. He translated the whole Bible into Bengali; the New Testament, the Pentateuch, the Psalms, the Proverbs, the Song of Solomon, Ecclesiastes, Isaiah and Daniel into Sanskrit and the New Testament into Hindee and Bengali. He also prepared in Sanskrit a dictionary, grammar, vocabulary, several school books and an expurgated edition of the 'Hitopadesha' and 'Nalodaya,' numerous school books in Bengali, Hindustanee, Arabic and Bengalee; translations of Bunyan's 'Pilgrim's Progress' and Baxter's 'Call to the Unconverted.'

**YATES CENTRE**, Kan., city, county-seat of Sedgewick County, on the Missouri Pacific and Chicago and Santa Fé railroads, 90 miles east by north of Wichita. It is a productive farming region. It has industries connected with farm and dairy products, raising and marketing of wheat, corn and hogs. There are six churches, a high school, elementary schools and a school library. It has three banks, one national and two State banks. Pop. about 1,910.

**YAWL**, a small ship's boat, propelled by six oars. Also applied to a jolly boat, a fishing boat, and to a sailing boat similar to a cutter, but having a small sail at the stern.

**YAWNING**, or **GAPING**, an involuntary opening of the mouth and inhalation of air, generally produced by weariness, indigestion causing an involuntary interruption of full breathing, or by an inclination to sleep; sometimes by hunger, sympathy, etc. It precedes the fit in some intermittent fevers, hysteria and spasmodic asthma, and in some instances, by the frequency of its recurrence, becomes a real disease. Persons suffering from heart disease may be liable to yawning. It is supposed by some to be determined by an interruption of the pulmonary circulation. It is performed by expanding the chest, drawing in the lungs, by drawing in, gradually and slowly, a large quantity of air, and gradu-

ally and slowly expiring it after it has been retained for some time, the muscles of the chest being restored to their natural state. Its effect upon the muscles brought into play is sometimes very restful. When yawning is troublesome, long, deep respiration, or drawing in the air at long intervals, relieves it. It also occurs in certain animals. It often seems contagious or sympathetic, the sight of another person yawning frequently inducing the act.

**YAWS**, a disease occurring in Africa, America, Samoa, Java and tropical regions in many parts of the world. It is almost wholly confined to the African races. It is characterized by cutaneous yellowish tumors, numerous and successive, gradually increasing from specks to the size of a raspberry, one at length growing larger than the rest; core a fungous excrescence; fever slight, and probably irritative merely, and less noticeable in adults than in children. It is contagious, and cannot be communicated except by the actual contact of yaw matter to some abraded surface, or by inoculation, which is sometimes effected by flies. It is also called framboesia, from the French *framboise*, a raspberry. Some authorities regard it as a form of syphilis.

**YAZD**. See **YEZD**.

**YAZOO** (an Indian word meaning "River of Death"), a river in Mississippi, formed by the junction of the Yallobusha, Tallahatchie and Coldwater rivers, and several bayous thrown out by the Mississippi River in the northwestern part of the State. Its general direction is southwest; it is a deep, sluggish stream; the total course nearly 300 miles, and very irregular. It enters the Mississippi about 11 miles above Vicksburg. It is navigable all the year. The Tallahatchie River receives part of its waters from the Mississippi; so that small boats from the Mississippi can enter the Yazoo at its source and re-enter the Mississippi not far from Vicksburg.

**YAZOO CITY**, Miss., city, county-seat of Yazoo County, on the Yazoo River, and on the Yazoo and Mississippi Valley (Illinois Central) Railroad, about 44 miles northwest of Jackson and 60 miles northeast of Vicksburg. It is in a fertile agricultural region in which the chief products are cotton, farm crops and lumber. The chief industrial establishments are a cotton factory, a lumber mill, cottonseed-oil mills, cotton gins, cotton compresses, machine shops and brick, lumber, ice and coal yards. The principal public buildings are the county courthouse, opera house, and library. There are five church buildings valued at \$100,000, and eight churches for colored persons, valued at \$40,000. The educational institutions are Saint Clara's Academy (Roman Catholic), and public schools for both white and black races. The three banks have a combined capital of \$450,000; and the annual business amounts to \$3,500,000. The government is vested in a mayor and a council of eight members, four of whom are elected each year. Yazoo City was settled about 1820. In 1830 it was incorporated, and in 1840 chartered as a city. In 1904 the city suffered heavily from fire; practically all the business portion was destroyed; the five churches, the city hall and Masonic hall were also burned; the loss was estimated between \$1,000,000 and \$2,000,000. Pop. 6,796.

**YAZOO CITY, Military Operations at and near.** Yazoo City was chosen by the Confederates as a site for a navy yard, at which were constructed some formidable iron-clads. Upon General Grant's approach to Vicksburg from the rear, in May 1863, the Confederates abandoned Haynes' Bluff, near the mouth of Yazoo River, upon which Lieut.-Commander John G. Walker, of the United States navy, went up the river with a small gunboat fleet to destroy all the works at Yazoo City. As the expedition approached the city, Lieut. Isaac N. Brown, of the Confederate navy, set fire to and destroyed three powerful rams which he had nearly completed, and upon which the Confederates were placing great dependence. Walker set fire to everything else of a public character, including the navy yard, containing five saw-mills, planing-mills, machine-shops, etc., and the expedition then returned. Early in June, Kimball's Union division was sent up the Yazoo to destroy the railroad bridge over the Big Black near Canton; but upon arriving at Mechanicsburg, Kimball found a large Confederate force in his front at Yazoo City and Liverpool, and as the river, on which he depended for supplies, was rapidly falling, he returned to Haynes' Bluff. After the surrender of Vicksburg, 4 July 1863, a report reached General Grant that Gen. J. E. Johnston was fortifying Yazoo City, and that a number of steamers were at the place, employed in supplying his troops. A naval and military expedition was organized to capture or destroy the steamers and take the place. Four vessels, under Lieut.-Commander Walker and 5,000 men under Gen. F. J. Herron, in transports, went up the Yazoo from Haynes' Bluff 12 July, and approached Yazoo City at noon next day; the Confederates were reported in force, and the iron-clad gunboat *De Kalb* was pushed ahead and opened her guns to ascertain the number and position of the enemy's guns. The Confederates had a battery of six heavy guns and the town was held by the 29th North Carolina infantry. Finding the defenses formidable, Walker dropped back and notified Herron, who at once landed his troops and a combined attack was made. After a slight skirmish on shore the Confederates fled, previously setting fire to four large steamers. Six heavy guns and one steamer fell into Union hands. Herron captured nearly 300 prisoners. While the *De Kalb* was moving slowly along and firing on the enemy, she ran on a torpedo and sank in 15 minutes. All on board were saved. Herron destroyed all public property, captured about 2,000 bales of cotton and returned to Vicksburg 21 July.

On 3 Feb. 1864, in co-operation with General Sherman's Meridian expedition (q.v.), a combined expedition of gunboats and transports with troops was sent up the Yazoo River from Vicksburg, with instructions for the gunboats to explore Yazoo and Sunflower rivers and all their tributaries. The gunboats were five in number, under command of Lieut.-Commander Owen, United States navy. Five transports conveyed the 11th Illinois and 8th Louisiana (colored) infantry and 35 colored cavalry, in all 982 men, under command of Col. James H. Coates, who was instructed to reconnoitre above Yazoo City and to obtain

corn and forage on the Sunflower or on the Yazoo, and also to seize at least 1,000 bales of cotton and to destroy all flats or boats used to cross from the east to the west. From its start the expedition was annoyed by Gen. L. S. Ross, who, with a brigade of about 1,200 men, was guarding the Yazoo River and the Mississippi Central Railroad, and who, on 3 February, opened fire with artillery upon one of the gunboats when near Liverpool Heights. Coates landed his men, had an indecisive fight with Ross in which he lost six killed, 21 wounded and eight missing, and at night withdrew to his transports. Next morning the expedition, under fire of Ross' artillery and musketry, passed up the river, the gunboats clearing the way to within four miles of Yazoo City, where it remained until 6 February when two gunboats, having been ordered to reconnoitre, reported that the place was occupied in force, with five guns in position and another in course of erection. The guns opened, two shots taking effect on one of the gunboats, and the gunboats and transports fell down the river below Satartia, where, on the morning of 7 February, Coates disembarked his entire command, drove back some Confederate skirmishers and at night withdrew to his transports. On 8th February the expedition again pushed up the river, two gunboats passed the city and the transports landed their men within a mile of it. Next day Coates took possession of the city, and on 11 February moved up the river, arriving at Greenwood on 14 February, where he remained until 19 February, gathering cotton, corn and forage. He then received orders to fall back to Yazoo City. On 28 February when within six miles of the place he ordered his small force of cavalry to move in rear of the city and take possession of all roads leading out of it. That afternoon he landed at Yazoo City and took position in some redoubts commanding the roads. Major Cook, with 50 colored cavalry, was sent toward Benton. When nearly six miles out Cook ran into Ross' brigade, by which he was roughly handled and pursued nearly to the city, losing eight killed, 35 wounded and 10 missing. Coates' pickets were much annoyed and on the morning of 5 March were driven in. Ross had been joined by Gen. R. V. Richardson's Tennessee brigade of about 600 men and at 10 o'clock the two brigades, about 1,600 men, making a determined attack, forced portions of the Union line and gained the streets of the town. At the same time they used artillery upon the redoubt, on the Benton road beyond the town, which, with the adjacent rifle-pits, was held by a part of Coates' command and repulsed all Confederate effort to carry. At 2 p.m. Coates, with those who were not in the redoubt, made a charge through the streets and the Confederates withdrew and gave up the attempt upon the redoubt. The Union loss in the engagement was 19 killed, 80 wounded and 18 missing. The Confederate loss was six killed and 51 wounded. On the evening of 6 March Coates started on his return to Vicksburg. He took with him over 1,700 bales of cotton and much corn and forage. The total loss of the expedition was 31 killed, 121 wounded and 31 missing.

19 April 1864 a small detachment of a d brigade, under command of Col. H. ld, marched from Vicksburg for Yazoo and two gunboats went up the river to rate in an attack on the city. Scofield shed sharply with a part of Gen. Wirt s' brigade and on the night of 20 April cked 15 miles below the city. On 22 the gunboat *Petrel* in attempting to run Yazoo City in order to fire upon the from above, was fired upon by a section illery and a detachment of sharpshooters lams' brigade. The men were driven the guns, the crew from the boat, and of them captured, including Acting Mas- l-Elroy. The Confederates seized the removed her eight guns and burned her. morning the expedition returned to urg.

**ZOO FRAUD**, The, a name given to the f lands in the western part of Georgia orrupt legislature, to certain large com- in 1789. This action caused great ext- and bitter controversy until settled United States Supreme Court in 1810.

**ZOO PASS AND STEELE'S BAYOU** TIONS. In the Civil War after the of Chickasaw Bayou, 29 Dec. 1862, and pture of Arkansas Post, 11 Jan. 1863, al Grant ordered the army to Young's and Millikin's Bend, where he took com- in person 30 January. Work on the pro- canal across the peninsula opposite urg was pushed, but on 4 February questioned its success, and began to or other routes by which the army could the high ground either north or south ksburg. Two projects were considered. nvolved cutting away from the Missis- into Lake Providence from a point 70 above Vicksburg. This lake, a former f the river, was connected by Bayou with Bayou Macon, a navigable stream, led to the Tensas, thence into the Wash- id finally into the Red River. Thus it ped the army could be transported to ver Mississippi to co-operate with Banks t Port Hudson. It is 470 miles by the river from Lake Providence to the of Red River, and much farther by nding bayous. Upon the cutting of the at Lake Providence the water from ver flowed in rapidly and the six miles lake beyond were soon available. But Baxter was found choked for miles allen trees and a thick growth of tim- verhanging it. General McPherson's en- orps was engaged for some time in at- ng to open this channel and those be-

In March this project was abandoned. the east side of the river, a few miles Helena, was Yazoo Pass. This had d the old route of river steamers through oldwater to the Tallahatchie, and the usha to Yazoo City, but it had been for some years by a strong levee. By ing this route it was believed to be pos- o reach the high ground on the Yazoo north of Vicksburg. This Yazoo Pass romised greater success than the Lake lence scheme. Under Lieut.-Col. Wilson

of the engineers, later Maj.-Gen. James H. Wilson, the levee was cut 2 February, a way was cleared to the Coldwater, and the Pass opened to navigation on 24 February. Brig.- General Ross, with 4,500 men, was ordered into the pass upon light draft transports, and, preceded by gunboats, penetrated by that stream to the Tallahatchie, and thence to the Yallahusha, where the expedition, after an advance of 225 miles, was stopped 11 March by Fort Pemberton, near the juncture of the last-named streams. It was a strong work in a bend which commanded both. The fort was found to be so situated that in this time of high water neither troops nor gunboats could reduce it although the gunboats attacked on 11 and 12 March. As it stood only a few feet above the water, attempts were made to flood it by cutting the levee at Austin above Helena, and widening the cut into Yazoo Pass. These were unsuccessful. The expedition, after several attempts on the fort, withdrew. On the way back a reinforcement under General Quimby was met, 22 March, and this officer ordered a return to Fort Pemberton for further efforts. He soon became satisfied that the fort could not be reached, and ordered final withdrawal. The gunboats could not turn in the narrow channels and were forced to back out over a large part of the route. General McPherson's corps had been ordered into the pass, but was delayed for lack of light draft transports and later the intended movement of the army by that route was abandoned. Meantime the Confederates had gathered a strong land force under W. W. Loring, which became first harassing and soon after most threatening. Sherman, preceded by five gunboats of Admiral Porter's fleet, was dispatched in haste 16 March through Steele's Bayou, by which route it was hoped he could reach the Yazoo, relieve Ross, then supposed to be in danger of capture, and at the same time find a practical way for the army into the Yazoo. Sherman had a winding and difficult route of 150 miles before he could reach that stream. From Steele's Bayou, which he entered at Eagle Bend, he passed to Black Bayou and thence to Deer Creek. This opened into Rolling Fork by which he could enter the Big Sunflower, and by this stream reach the Yazoo. Even with the tremendous energy of his advance Sherman was barely in time to save the gunboats which had been attacked in Deer Creek by land forces, and were so hard pressed that Admiral Porter was considering the blowing up of his fleet and re-treating with his crews through the swamps. These several attempts through the bayous east and west of the river had been carried on over hundreds of miles and against the most formidable obstacles of flooded country, dense forests and heavily obstructed streams. They were finally abandoned and the army reassembled at Millikin's Bend and Young's Point. From this position the army subsequently moved in the final campaign against Vicksburg.

H. V. BOYNTON.

**YEAR**, the period in which the revolution of the earth round the sun, and the accom- panying changes in the order of nature, are completed. The accurate determination of the

length of the year, which required great knowledge of astronomy and exact observations, could only be reached by the successive efforts of many generations. (On this subject see **CALENDAR**). There are years of various lengths, according to the principle adopted in measuring them. The sidereal year is the interval that elapses while the sun moves from a star to the same star again (of course this motion is only apparent), a period the length of which is slightly affected by nutation, but on the average is equal to 365 days, 6 hours, 9 minutes, 9.6 seconds. The tropical or civil year, sometimes called the solar year, is the time in which the sun moves from the vernal equinox to the vernal equinox again; its mean length is 365 days, 5 hours, 48 minutes, 49.7 seconds. This is the year as commonly understood. On account of the precession of the equinoxes it is rather shorter than the true period of the earth's revolution. A lunar year is the time required for 12 revolutions of the moon, which is 354 days, 8 hours, 48 minutes, 37 seconds. Bisextile, or leap year, is a calendar year to which one day is added, making 366 days instead of 365. February of a leap year has 29 days. A light year is a linear measure used by astronomers to measure the distances of interstellar space. See also **DAY**; **SIDEREAL TIME**; **SOLAR TIME**.

**YEARDLEY**, yerd'h, or **YARDLEY**, Sir George, American colonial governor: b. England, about 1578; d. 1627. After seeing service in the Netherlands he came to America in command of Sir Thomas Gates' expedition. This was wrecked at the Bermuda Islands, but he reached Virginia in 1610 and was acting governor of the Virginia colony 1616-17. Returning to England the next year he was there knighted and chosen deputy governor of the colony, filling the office in 1619-21. By his instructions was summoned the first legislative assembly ever gathered in America, the House of Burgesses. The company was dissatisfied with his administration and he was succeeded by Wyatt. He remained in the colony where he served on the council and in 1626 Charles I again made him deputy governor.

**YEAR'S MIND**. See **MONTH'S MIND**.

**YEAST**, or **BARM**, is a micro-organism of the vegetable kingdom and belongs in the order of the *Gymnoascæ* to the family of the *Saccharomycetes*, of which there are three classes, namely, *Monospora*, *Saccharomyces* and *Schizosaccharomyces*. The main characteristic of the first class, as its name indicates, is that it only develops one spore in the ascus. Thus far only one type, the *Monospora Cuspidata*, which is parasitic in *daphniada* which it destroys, has been determined. There are many representatives of the second class, while only a few of the third have up to the present time been identified. The second class—the *Saccharomyces*—is generally what is understood under the term yeast, not only in the brewery but also in the distillery and the compressed yeast fabrication. Its structure is very simple; it consists of a single cell, which has few distinguishing characteristics. Each cell of the *saccharomycetes* is more or less globular or ovoid in form and,

just as every other vegetable cell, consists of a colorless, viscous substance (protoplasm), a cell-wall (membrane), and also a nucleus. In the protoplasm there are observed, according to the species of the plant cell, different numbers of spaces filled with cell-juice, which are termed vacuoles.

In young yeast cells the cell-wall, or membrane, is very thin—0.4 to 0.9  $\mu$ —and has almost the same refractive power as the protoplasm which it surrounds. The membrane is thickened through external influences, especially when the yeast-cells must develop in or upon a highly nutritious medium. An increase in the thickness of the cell-wall is also accompanied by greater impermeability and a corresponding decrease in the fermentative capability of the cell. Through the action of acids or alkalis upon the yeast cell the layers of the cell-wall can be shown, which are two, and sometimes three, or even more in number. Chemically the membrane of the yeast cell consists of cellulose (erythro and achroo-cellulose), pectinic compounds, and plasmatic components, for which reason it is very nitrogenous. The cell contents consists of protoplasm with more or less glycogen. (According to Laurent there is 32.28 per cent glycogen in the dry substance.) In the young yeast cell the whole interior is filled with protoplasm; in a short while, however, apparently hollow spaces appear, which are filled with the reserve nourishment necessary for the vitality of the cells. The nucleus furnishes the substances necessary for building up the cell, and, according to its chemical composition, belongs to the albuminoids in the class of the *proteids*, and especially to the nucleins. The form of the nucleus varies considerably; in a young cell it is spheroid, flattens out with increasing age to a disc whose periphery is no longer entire, but is lobed; elliptical shapes were also found.

The nucleus is in some instances of a considerable size; its diameter in some cases being one-third of that of the cell. Concerning the inner structure of the nucleus it was observed that the nucleus of the yeast cell has a pellicle as well as a nucleolus, which is spheroid, and is situated in approximately the centre of the nucleus, the space between the pellicle and the nucleolus being filled with nucleus plasma (*Karyoplasma*), this having a netlike structure through which the nucleolus is suspended. One or more vacuoles were observed in several types of yeast in the *Karyoplasma* under certain conditions, especially when the cells were transferred into fresh nutrient solutions. With the beginning of the propagation of the cell a corresponding development of the nucleus takes place, in either one of two ways, that is, the direct division (Amitosis), or the indirect division (Karyokinesis, Mitosis). The manner in which the nucleus divides itself differs in the various types of yeast. The yeast cell is propagated in one of two ways, either through oxygen spore formation, budding, or through endogenous spore formation, the real sporulation.

In the former case a new cell is detached from the parent cell, while in the latter the new cells (spores) are formed inside the parent cell, which it leaves only upon complete maturity. Several recent investigators are inclined to believe in the sexuality of yeast, and close research

various yeasts, as *Sacch. farinosus*, *Sacch.* etc., has been made.

Two types of yeasts have in the course of become culture plants in the real sense of word, through intentional continuous cultivation for certain definite purposes. These are (1) that known as the bottom yeast manufacture of beer, and (2) that which cause of the fermentation of the top-fermented beers and of the whisky mash. The former is so called because it settles in a thick, yellow layer upon the bottom of the fermenting vessel during the slow fermentation of lager beers at temperatures of 40° to 50° F. (4.5° to 10° C.), the latter is termed top yeast because in more rapid fermentation at 54° to 65° F. (13° to 18° C.) (ale, weissbeer, etc.), it is separated as a yellowish brown foam, which is allowed to rise to the surface by the escaping carbonic gas. It is the last-named species which possesses almost exclusively the material for manufacture of that product known as condensed yeast.

As has been said, there are a number of indefinite species of yeast, which vary not only in their mode of formation and size of the cell, but also in their requirements for the medium in which they live, hence according to their chemical and physical properties. Yeast flourishes luxuriantly only when it finds not only qualitatively but also quantitatively, in the medium all the substances necessary for its nutrition. The brewer, distiller, etc., therefore endeavors to produce as vigorous a yeast as possible, in order to be enabled to conduct fermentation in the manner best suited to the purposes. For such normal nourishment, it is essential that diverse substances are at its disposal.

Yeast thrives well when, besides water, carbon is the form of sugar, nitrogen in albumin-compounds or ammoniacal salts and various mineral components, especially sulphate of ammonia and potassium phosphate, are at its disposal. If the necessary nutriment is lacking, the vitality of the yeast cell may rest, but the yeasts do not perish.

Extensive analytical data are at hand in regard to the composition of the yeast. Dumas found that the yeast contains:

	Per cent
Water	50.6
Starch	7.3
Protein	15.0
Sulphur and phosphorus	27.1

Mitscherlich found top yeast of the following composition:

	Per cent
Water	47.0
Starch	6.6
Protein	10.0
Other	0.6
Total	35.8

The differences found between bottom and top yeasts have been very slight. Wagner experimented upon top and bottom yeasts and obtained the following averages:

	Top yeast per cent	Bottom yeast per cent
Water	49.8	48.4
Starch	6.8	6.0
Protein	9.2	9.2
+ oxygen	34.2	35.8

A yeast may have all the necessary organic substances in the proper form and amount, yet it will not flourish if the salts are lacking. The yeast in this case is the same as any other plant organism, which must perish if it is deprived of its mineral nourishment. Hence a knowledge of the requirements of mineral substances for a yeast is of utmost importance, and many examinations were made to secure data on this point. Mitscherlich found in the ash of

	Top yeast per cent	Bottom yeast per cent
Phosphoric acid	53.9	59.9
Potash	39.8	28.3
Soda + magnesia	6.0	6.0
Calcium oxide	1.0	1.0
Silica	traces	0.0

The most essential substances which the yeast requires for its sustenance are, accordingly, phosphate of potassium and phosphate of magnesia. The above data are from elementary analyses. Naegeli later instituted investigations which should show the amount of the various combinations, which are observed in a yeast. According to his observations the yeast, when treated with water until its soluble components are absorbed, gives up to the water 37 per cent of the total weight of the dried yeast. The bodies thus brought in solution consist of compounds closely related to vegetable slime. The amount of moisture in a yeast is exceptionally large, for if it is completely dried it loses 83 per cent of its weight, so that in 100 parts of yeast only 17 parts are solid components. The mucous part of the yeast cell, the protoplasm, contains more water than the membrane which surrounds it, and consists chiefly of albuminoids, and about 2 per cent of peptone. Accordingly the composition of the yeast with 8 per cent nitrogen is:

	Per cent
Cellulose and vegetable slime	37
Common albumin	36
Easily converted glutine (casein protein)	9
Peptones (precipitable by lead acetate)	2
Fat	5
Ash	7
Extractive substances	4

According to E. C. Hansen of Copenhagen, yeast is divided into two groups, the real Saccharomycetes, which are capable of forming endospores, and the non-saccharomycetes, which never form spores. He subdivides the former into such which separate out sucrose and engender alcoholic fermentation, that is, which vigorously ferment saccharose, dextrose and maltose, as brewer's yeast; and such which ferment saccharose, dextrose, levulose but not maltose, as, for example, *Saccharomyces Ludwigii*; *Sacch. exiguus*, and into such which do not separate out sucrose and do not excite alcoholic fermentation, as *Saccharomyces membranifaciens*.

The non-saccharomycetes Hansen divides into three groups; such which ferment solutions of dextrose and invert sugar, as *S. Rouxii*, *S. apiculatus*; such which separate out no sucrose but ferment saccharose, maltose and dextrose, as *Monilia candida*, and finally such which ferment saccharose, glyucose, galactose and lactose, the lactose yeasts. In practice the division into culture and wild yeasts would be appropriate. The yeasts can also be safely divided according to their power of attenuation, that is,

the decrease in the density of the nutrient medium due to fermentation. The attenuation reached by a yeast in a diastase-free beer wort has been agreed upon as the limit, and in accordance therewith the brewers' yeasts are graded, and we have the Froberg type with high attenuation, and the Saaz with low attenuation. Van Laer has defined a new type, Logos, so that now we have the types Saaz-Froberg and Froberg-Logos, with all intermediate grades. The numerous wine yeasts vary according to their resistibility against heat and acids; the amounts of sugar produced by them, and the amount of fruitesters, which they impart to the liquid. The distillers' yeasts, mostly top yeasts, are known by their resistance against acids, and foreign ferments, through their fermentative capability and the amount of alcohol developed.

No one can deny that yeast induces alcoholic fermentation, but how this is accomplished is still a matter of controversy. Liebig and other chemists maintain that fermentation is called forth by a ferment contained in the yeast cell, while Pasteur deems it the necessary consequence of life without oxygen. Naegeli claims it to be a transferring of the motion of molecules of protoplasm of the yeast to the fermenting liquid. Eduard Buchner and Rudolf Rapp of Munich discovered in the yeast cell a fermentation-inciting enzyme — zymase — which, however, can only induce fermentation once after the cell is completely destroyed. This discovery, which is of much scientific import, has not yet been made applicable in practical arts.

Besides the culture yeasts, there are a number of wild yeasts, which can produce great disturbances in the liquids infected by them. In order to avoid such infection by wild yeasts and also by bacteria, Hansen experimented and succeeded in preparing a pure yeast culture, that is, a culture originating from a single cell. Such a culture is not only free from all wild yeasts and bacteria, but also can and does remain unchanged as all cells are of the same nature. A reliable fermentation process can only be obtained by the use of one single type.

Such pure cultures are variously prepared; the oldest and best known method is that of Hansen, which has recently been modified by Dr. Lindner of Berlin as the droplet-culture. Both investigators employ for the further development of the young vigorous cultures the propagation apparatus, which when once supplied with an absolutely pure culture can be used for a long time if proper care is observed. Upon this pure-culture method a new brewing process is based which permits of entirely sterile work from boiling the beer to the putting it on the market. This process, invented by Nathan, has been called by him in honor of Hansen, the senior in the art of pure culture, the Hansen process. Another method to obtain yeast of a high degree of purity is that in which a mixture of yeast is exposed to definite conditions of temperature, aeration, kind of nutrition, action of light, pressure and motion that one yeast of definite properties develops more and better than the other yeasts in the mixture. If, further, the corresponding layer is removed from the yeast and propagated under the aforesaid conditions, a pure yeast of a uniform character is finally obtained. This process, founded

by Delbrueck of Berlin upon his scientific observations in American breweries, was further elaborated by him. An idea of the importance and value of pure yeast culture can be had from the fact that almost all the larger breweries and distilleries employ apparatus for propagation and endeavor through observing the utmost care to protect their yeast against infection. Beer yeast is not only of great import to the brewer and distiller, but also to the baker, as the quality of his wares depends upon the quality of the yeast used, and in consequence thereof a special industry, that is, the manufacture of compressed yeast, has been introduced. Compressed yeast is chiefly made from distillers' yeasts; but in some instances also, beer yeasts, which must be purified and disemittered, are utilized. The price of compressed yeast in comparison to beer yeast is considerably high, but the baker has the advantage that by using the former his wares obtain a larger size than when the latter is used. The process of fermentation with compressed yeast develops more slowly than with beer yeast, hence the dough requires more time to ripen. Much progress has been made in the compressed yeast fabrication and diverse methods are employed in its manufacture. Many operations must be carefully and accurately observed in order to obtain a salable product. In the main these operations are: (1) Preparation of a fluid in which the yeast can properly develop, either under simultaneous formation of alcohol or without the formation of much alcohol; (2) preparation of a mass, in which there is a corresponding amount of vigorous seed-yeast, which is added to the above-mentioned fluid (preparation of the mother-yeast); (3) bringing together of the nutrient medium with the stock yeast or "setting"; (4) reproduction of the yeast with or without simultaneous fermentation; (5) separation of the newly formed yeast from the fluid by skimming, etc.; (6) washing the yeast, or removing the last traces of the nutrient medium; (7) pressing of the washed and separated yeast mass; (8) forming the compressed yeast into cakes of suitable size; (9) packing of the cakes for the trade and for shipping.

For some time yeast, especially beer yeast, has been used in medicine, and has been successfully employed partly fresh and partly dried in tablet form in cases of furunculosis, lichen, acne, psoriasis, and other skin diseases, dyspepsia and partly in diabetes. See

**YEATS, William Butler, Irish author** b. Dublin, 13 June 1865. He obtained a primary schooling in England and Ireland was three years a student of art, literature in 1886. He was a member of the foundation of the Irish Literary Society, the National Literary Society of Dublin, prime mover in the Irish Independent, thus becoming one of the chief representatives of the Irish Literary Revival. Yeats is superior as a lyric poet in his work, he is perhaps best known as a playwright. A few years spent in the literary circles of London and Paris he returned to Ireland in 1896 and devoted himself assiduously to literature, drawing largely on Gaelic myth and folklore. In 1903-04 and again in 1905-06 he lectured in the United States on art connected with this movement. W

**LOW BAYOU, Engagement at, and Retreat from Alexandria.** General Hunter arrived at Alexandria, La., on his retreat from the Cross Roads, 25 April 1864. Three days later General Hunter handed him an order from General Grant to close up the campaign at Shreveport without delay and return with his troops to General Sherman, for 25 miles east of the Mississippi. Hunter received a letter from Banks to Grant with information that Porter's fleet was above the Atchafalaya Rapids in a critical situation should be abandoned it. As to the further prosecution of the Shreveport and Texas campaign it was not to be thought of, and Banks turned attention to getting Porter's fleet below the falls. These falls were a mile in length, filled with jagged rocks, which at the time were bare. As the vessels needed at least 12 feet of water to float them, they seemed doomed. The plans for their release were devised and executed by Lieut.-Col. Joseph F. Johnston of the Fourth Wisconsin Cavalry. The plan was to dig on 30 April, nearly the entire army spent times being detailed for the duty; 3,000 lumbermen from Maine and the rest cut down trees; others were set to work with stones, bricks, etc., including whole and half sugar-mills with all their machinery, and in a week a dam of timber and brush was built with sunken barges in the centre, had constructed across the river, 758 feet in length. The water from five to seven feet above the rapids. The work had been prosecuted day and night, the men working up to their

waists and exposed to a hot sun. The water having risen, three gunboats and another vessel ran down the rapids on the afternoon of 8 May and lay to just above the dam. Early in the morning of the 9th two of the barges broke loose, making a gap in the dam 66 feet wide, through which the water rushed in a great torrent, and the four vessels went down safely through the opening. Six gunboats and two tugs were still above the rapids, waiting for a higher rise in the water. The damage to the dam was partially repaired and wing-dams were constructed on the upper falls, which shed the water from either side into the channel between them. They were completed by the 11th, when the water had risen to six and a half feet. Meanwhile the heavier vessels had been lightened by stripping from them their armor-plates and landing some of the heavy guns, ammunition, chain cables, anchors and provisions, and on the 12th all the vessels had run down the falls and through the dam into deeper water. Meanwhile the Confederates had gotten in Banks' front, south of Alexandria, and taken position on the river 25 miles below the town, where 1 May they captured and sunk a transport, and on the morning of the 3d captured a transport, on her way up the river with 425 men of the 120th Ohio on board. Some of the men were killed and wounded, all the officers and 270 men were captured. On the evening of the 4th another transport carrying 400 men of the 56th Ohio, while going down the river, convoyed by the gunboats *Signal* and *Covington*, was attacked by artillery and musketry, and the gunboats went to her assistance. About 125 men on the transport were killed and wounded; she was soon disabled; the *Covington*, after losing more than half her men, was abandoned and burned; the *Signal* also was disabled and, with the transport, surrendered. No further attempt was made to run the blockade, and for two weeks Banks' communication with the Mississippi was closed. The fleet having passed below the falls and the river rising insuring a safe passage of all the barges below, the gunboats and transports started on the morning of the 13th of May, and in the afternoon Banks marched out of Alexandria for Simsport. From the start his front, flanks and rear were harassed by cavalry and artillery, and on the 16th he had a severe engagement near Mansura, in which the Confederates were driven from position they had taken across the road to Simsport, which place his advance reached on the evening of the 17th. Here it was found that the pontoon-bridge was too short to span the Atchafalaya and Colonel Bailey again improvised a crossing. The transports were ranged side by side across the river, with the planking of the pontoons laid across their bows, making a level road of about 700 yards, over which the main body of the army with its trains and artillery began passing on the 19th. While this bridge was under construction A. J. Smith's command was drawn up in line at Yellow Bayou, covering the rear of the army and the crossing of the Atchafalaya. Here Smith's troops were attacked on the afternoon of the 18th by General Wharton's cavalry and General Polignac's infantry. Smith's skirmishers were driven in, and at first the Confederates gained some advantage; but General Mower, who was in immediate command of the Union line, made

a counter-charge with two brigades of infantry and one of cavalry and the Confederate attack was repulsed. In endeavoring to follow up his success Mower was checked by a heavy artillery fire, and withdrew to a thicket, where he formed a new line and brought up artillery. The Confederates renewed the attack and were repulsed with some loss. The thicket now took fire and made an impassable barrier between the two sides, and Mower withdrew, leaving his dead and wounded on the field. The Union loss was 38 killed, 226 wounded, and three missing; the Confederate loss, 452 killed, wounded and missing, of whom 180 were taken prisoners. The army had all crossed the Atchafalaya on the 20th. Banks yielded the command to General Canby, who had been ordered to relieve him; the navy and transports passed into the Mississippi; and the Red River campaign, one of the most humiliating of the war, had ended. On the return march from Alexandria the Union loss was about 165 killed, 650 wounded, and 450 captured or missing. General Taylor says the Confederate loss in the entire campaign, from Sabine Cross Roads to Yellow Bayou, was 3,976. Consult 'Official Records,' Vol. XXXIV; Taylor, 'Destruction and Reconstruction'; Mahan, A. T., 'The Gulf and Inland Waters'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

**YELLOW BOOK OF FRANCE**, a government publication issued regularly since 1861, designed to furnish historians and others with official information. It is similar to the British Blue Book and the German White Book. Several publications of this type were issued by the belligerents during the Great War of 1914-18; many of these were merely propaganda designed to influence public opinion in neutral states.

**YELLOW COPPERAS**, a name sometimes used for the mineral copiatite. Crystallization, monoclinic, usually in translucent pearly yellow plates; hardness, 2.5; composition, a basic sulphate of iron; specific gravity, 2.1. Found near Copiapo as an incrustation on coquimbite; also in other places in South and North America.

**YELLOW-EYED GRASS**, the common name of the genus *Xyris*, composed of rush-like plants, with bright yellow flowers produced from the summit of a naked scape, conspicuous in sandy bogs in July and August. They are mostly of tropical distribution about the world. The common yellow-eyed grass (*X. flexuosa*) has a bulbous root; equitant, linear, twisted leaves; an erect, two-edged, twisted scape; roundish, acute heads, supporting a number of small yellow flowers projecting from between the scales, with perianth and other parts of the flowers in threes. Another species with pretty, large petals (*X. caroliniana*), occurs near the sea from Rhode Island southward. *X. fimbriata*, a plant two feet high, the divisions of its calyx conspicuously fringed on the wing-margined keel, and plumose at the summit, is found in the pine barrens of New Jersey and southward. The foliage and roots of *X. indica*, of *X. americana*, and of *X. vaginata*, are used for a remedy for leprosy and the itch, in India, Guiana and Brazil.

**YELLOW FEVER** is an acute infectious disease which is transmitted from the sick to susceptible individuals through the agency of mosquitoes. The yellow fever mosquito (*Stegomyia fasciata*) is found in tropical and semi-tropical regions, and especially in lowlands near the sea or in river valleys. This mosquito serves as "an intermediate host" for the yellow-fever parasite, which is present in the blood of those sick with the disease during the first three days of the attack. After filling itself with blood from a yellow-fever patient a period of 12 days is required for the development of the parasite in the body of the mosquito before it can transmit the disease, by its sting, to another individual.

These facts have been established by the experiments of a board appointed upon the recommendation of the writer, in 1900, for the study of yellow fever in the island of Cuba. The late Maj. Walter Reed, surgeon United States of America, was president of this board, and the success attained is largely due to his carefully made plans and their intelligent and conscientious execution by himself and his associates.

In a "preliminary note" read at the meeting of the American Public Health Association, 22 Oct. 1900, the board gave a report of three cases of yellow fever which they believed to be the direct result of "mosquito inoculations." Two of these were members of the board, namely, Dr. Jesse W. Lazear and Dr. James Carroll, who voluntarily submitted themselves to the experiment. Dr. Carroll suffered a severe attack of the disease and recovered, but Dr. Lazear fell a victim to the disease and to his enthusiasm in the cause of science and humanity. Fortunately no other deaths occurred during the subsequent experiments which Major Reed found it necessary to make in order to establish the fact that yellow fever is, beyond question, transmitted by mosquitoes of the genus *Stegomyia*, and in no other way. In a report made in May 1901, Major Reed says: "We have thus far succeeded in conveying yellow fever to 12 individuals by means of the bites of contaminated mosquitoes." These experiments were made upon individuals who volunteered to submit themselves to the mosquito inoculations with a full knowledge of the possibility of serious and even fatal results. Some of the volunteers were United States soldiers, and some were Spanish immigrants who had recently arrived in Cuba. Further experiments showed that blood drawn from a yellow-fever patient during the first three days of the disease and injected by means of a hypodermic syringe beneath the skin of a susceptible individual gives rise to a characteristic attack of yellow fever in the inoculated individual. But all attempts to demonstrate the specific infectious agent (yellow-fever parasite) in the blood or in the bodies of infected mosquitoes have been unsuccessful. This is probably due to the fact that the yellow-fever parasite is so small as to be practically ultra-microscopic. This inference is supported by experiments made in Cuba by Assistant Surgeon James Carroll, United States of America, a member of the board heretofore referred to. Dr. Carroll found that when blood taken from the circulation of a yellow-fever patient was passed through a Berkefeldt filter

ll quantity of the filtrate injected under in of a susceptible person gave rise to a attack of the disease.

e experimental results obtained by Major and his associates have been fully con- by several independent investigators, ing a board of experts from the Pasteur te of Paris, who were sent o Brazil to researches with reference to the etiology s disease.

ving ascertained that yellow fever is itted from man to man by an intermediate -mosquitoes of the genus *Stegomyia*,

Reed and his associates conducted a of well-planned experiments for the pur- of ascertaining whether the disease may e propagated, as has been commonly sup- by clothing, bedding and other articles have been in use by those sick with the e. The results of these experiments were y negative. That is, all efforts to com- ate the disease to susceptible individuals i the medium of such articles were with- alt.

view of what has thus far been said it is t that the preventive measures which were rly relied upon to arrest the epidemic ex- 1 of this infectious disease were either avail or of comparatively little value.

on of the sick from contact with non- ie individuals is not necessary, but pro- of the sick, by mosquito-bars, from the of mosquitoes is all-important. Disinfect- e clothing and bedding is of no avail, e destruction of infected mosquitoes, by r fumigation or otherwise, is an essential e of prophylaxis. Street cleaning and ipal sanitation generally have no material in preventing the extension of this dis- cept in so far as they result in destroy- e larvæ and breeding places of mosquitoes.

ing the knowledge gained by Major Reed is associates in a practical way, as above ted, the medical officers of the United army stationed in Cuba have been able to etely eradicate yellow fever from the city vana, which had been the principal e-focus of the disease for many years; and rians feel confident that by the application e same methods the epidemic extension of isease within the limits of the United , or elsewhere, may be entirely prevented. as yellow fever, which formerly ranked cholera and bubonic plague,—although ; a more restricted area of prevalence,— of the most fatal scourges of the human een robbed of its power for mischief by instaking researches of scientific investi-

. The limits of the present article only e a brief reference to the history of the e under consideration. It has a compar- e restricted geographic range, but there is e reason to believe that this might be y extended if cases of the disease should e reduced to all of the regions where the ediate host (*Stegomyia fasciata*) of the w-fever germ" is found. That the dis- as not been introduced into regions re- from its principal endemic foci is prob- ue to the comparatively brief duration of tack, to the fact that the infectious agent y present in the blood during a brief (three days) and to the circumstance

that it cannot be transmitted in any other way than by inoculation—either directly, as in the experiments of Reed and his associates, or through the medium of an infected mosquito. Epidemics have occurred in the United States at all of our principal seaports on the Gulf of Mexico and on the Atlantic Coast as far north as Boston. It has also invaded many of the Southern States, prevailing as a widespread epidemic in the interior, and has extended up the valley of the Mississippi as far as Saint Louis. It has been epidemic at all the principal seaport cities of the West Indies, of Mexico, of Central America and of South American countries bordering upon the Gulf of Mexico; also upon the Pacific Coast of Mexico and South America and in the Atlantic-Coast cities of Brazil and also of Argentina. The cities of Havana, Vera Cruz and Rio de Janeiro were long regarded as its principal endemic foci. The climate of these cities is favorable to the survival of the *Stegomyia* throughout the year. Consequently, when once introduced, the disease continued to be propagated through a series of cases, occurring successively without regard to seasons. Thus it was ascertained by the Yellow Fever Commission, of which the writer was a member (1879), that during the 10 years from 1870-79 there was not a single month without some recorded deaths from yellow fever, and this continued to be the case until the disease was eradicated in 1901 by the well-directed efforts of Colonel Gorgas, of the medical department, United States Army. In his report as sanitary officer of the city of Havana for the month of November 1901, he says: "Last year (1900) we had, during this month, 214 cases and 54 deaths. This year the last case of yellow fever occurred on 28 September; that is, we have gone over two months without a single case or death belonging to Havana."

"This result I consider due to the system, introduced last February, of killing infected mosquitoes in the neighborhood of each point of infection as it developed." The introduction of yellow fever into the previously healthful city of Havana is recorded by the historian Pezuela, as follows: "Although Havana is situated on the northern boundary of the torrid zone, it was very justly considered one of the most healthy localities on the island before its invasion, in a permanent manner, by the *vomito negro*, imported from Vera Cruz in the summer of 1761. In May there came from Vera Cruz, with materials and some prisoners destined for the works on the exterior fortifications of Havana, the men-of-war *Reina* and *America*, which communicated to the neighborhood the epidemic known by the name of *vomito negro*. At the end of the following June there were stationed in this fort nine men-of-war, despatched from Cadiz, and sent to the chief of squadron, Don Entienne de Hevia; they brought a reinforcement of 2,000 men. More than 3,000 persons succumbed to the epidemic on this, the first appearance of the *vomito*."

History also records the first introduction of the disease to the city of Rio de Janeiro. The highest medical authorities in Brazil agree that yellow fever was not endemic in the principal seaports of the empire prior to the year 1849, when it was introduced to the city of Bahia by the North American brig *Brasil*,

which sailed from New Orleans, where yellow fever was prevailing, and touched at Havana. Two of the crew of this brig died of yellow fever during her voyage from the latter port to Bahia. Soon after her arrival the disease made its appearance among those who had communicated with the ship. The first case occurred a few days after the arrival of this brig (3 November). From Bahia the disease was carried to Rio de Janeiro, where during the epidemic season of 1850 it caused a mortality of 4,160.

In regions where the winter temperature is so low as to kill mosquitoes, or render them inactive, epidemics of yellow fever terminate upon the occurrence of frost, or of continued cool weather. Under such circumstances the disease is not apt to recur during the succeeding warm season, except as a result of a fresh importation of a yellow-fever case, from which mosquitoes of the new brood may become infected. Thus in the United States, even as far south as the city of New Orleans, a recurrence of the disease after its epidemic prevalence is probably rarely, if ever, due to the survival of infected mosquitoes from the year before. It has been shown, however, by Major Reed, and by others that infected mosquitoes may survive in a warm room for more than two months. Prior to the Civil War yellow fever prevailed almost annually in New Orleans and was generally believed by the residents of that city to be "a disease of the climate" beyond the control of any preventive measures. Later, under a more stringent administration of quarantine restrictions, such success was attained by the health authorities in preventing the introduction of cases of the disease, and consequently of epidemics, that a complete change occurred in public sentiment and it is now generally recognized that the introduction of one or more cases from some foreign seaport—usually Havana or Vera Cruz—is an essential prerequisite for the development of an epidemic in the city of New Orleans. The years of greatest mortality in this city were: 1847, 2,259; 1853, 7,970; 1854, 2,423; 1855, 2,670; 1858, 3,889; 1867, 3,093; 1878, 4,600.

In 1793 the city of Philadelphia, then a town of about 40,000 inhabitants, suffered a devastating epidemic, the mortality being about 4,000, or 10 per cent of the population. This city was again visited by the scourge in 1797, but the disease was less extended and less fatal—total mortality, 1,300. Philadelphia again suffered in 1798, the mortality being 3,645. The disease also prevailed during this year in more Northern seaport cities, although the mortality was comparatively small except in New York, where the deaths numbered 2,080—Boston 200, Portsmouth 100, New London 81. The disease again prevailed in Boston, Philadelphia, Baltimore, Wilmington and Charleston, in the year 1802. Minor epidemics continued to occur almost annually in one or more of our Southern seaport cities until the year 1853, when a fatal and widespread epidemic occurred, involving considerable areas in the States of Florida, Alabama, Louisiana, Mississippi, Arkansas and Texas. The epidemic of 1867 was also notable in the annals of this disease, although the area of prevalence was not so great as in the epidemic of 1853. The disease

prevailed extensively in the State of Texas, causing a mortality of 1,150 in the city of Galveston alone. In Louisiana the city of New Orleans suffered the heaviest loss (3,093). The next great epidemic within the limits of the United States occurred in 1873. The States of Florida, Alabama, Mississippi, Louisiana and Texas were invaded. The mortality in the city of New Orleans (225) was comparatively small, but Shreveport lost 759 of its inhabitants, and the disease extended its ravages to Memphis, Tenn., where there was a mortality of about 2,000.

The last great epidemic of yellow fever in the United States occurred in 1878, when 132 towns were invaded in the States of Louisiana, Tennessee, Alabama, Mississippi and Kentucky. The total reported mortality was 15,934, and the number of cases more than 74,000. Yellow fever has never invaded the populous countries of Asia, which have their own endemic pestilential maladies. It has been introduced from the West Indies to Spain and to Portugal, but is unknown as an epidemic in other countries of Europe. In Africa it appears to be endemic on the west coast and some authors believe that this was the original home of the disease. Others contend that it was originally a disease of the West Indies and that its occurrence on the African Coast resulted from the importation of cases from those islands. The early historians, Herrera, Oviédo, Rochefort and others, make reference to epidemics among the natives which occurred prior to the discovery of the Antilles, and to fatal pestilential diseases among the first settlers of these islands; but their accounts are not sufficiently exact to enable us to affirm that the disease referred to by them was yellow fever. The west coast of Africa was discovered and colonized to some extent before the discovery of America, but the first authentic accounts of the prevalence of yellow fever on this coast date back only to the year 1778, over two centuries after the first settlements had been established. On the other hand, this very epidemic of 1778 at Saint Louis (Senegal) was traced to importation from Sierra Leone, a portion of the African Coast which, according to Hirsch, "appears to be the headquarters of the disease, and the starting-point of its epidemic inroad into the territories lying to the north and south, as well as into the West African islands."

Rochefort, whose '*Histoire naturelle et morale des îles Antilles de l'Amérique*' was published in Holland in 1558, says of the West Indies: "The air of all those islands is very temperate and healthy when one is accustomed to it. The *peste* was formerly unknown there as well as in China and other places in the Orient; but some years since the islands were afflicted with malignant fevers, which the physicians considered contagious. The bad air was brought there by some ships which came from the coast of Africa, but at present we know nothing more of these maladies."

It seems very probable that a pestilential malady which prevailed for a time in usually healthful islands and then disappeared was in fact yellow fever, and that it was introduced by ships from the west coast of Africa is not at all incredible. Indeed, it is almost necessary to look for an original endemic

e disease outside of the West Indies, for reason that, in the comparatively few places : it is now endemic, there is historical ice to show that there was a first im- ion and a previous period of exemption ; on the other hand, the conditions upon : endemicity at the present day seem y to depend, were formerly unknown— ions arising from the aggregation of pop- n at seaport cities, as at Havana, Vera and Rio de Janeiro.

1879 the writer went to Havana, as a er of a commission appointed by the Na- Board of Health, for the investigation of ons relating to the etiology of yellow

One of the main objects in the appoint- of this commission was the discovery, sible, of the specific cause of the disease. ommission was fully equipped with the microscopical apparatus, and with what- else seemed necessary to promote the ac- hishment of the object in view.

a result of investigations made at that and subsequently at Rio de Janeiro in 1887 n Havana in 1888 and 1889, the writer dated the following conclusions in a final :

he specific cause of yellow fever has not een demonstrated.

is demonstrated that micro-organisms e of development in the culture-media y employed by bacteriologists, are only in the blood and tissues of yellow fever ers in exceptional cases, when culture are very soon after death."

bssequent researches by other investiga- ave not invalidated these conclusions. For the researches of Reed and his asso- have demonstrated the fact that the spec- ious agent ("germ") of the disease is t in the blood, they have failed, as her- stated, to isolate or to recognize this e infectious agent, and no one else, up to resent time, has been more fortunate. ous claims have, however, been made to sccovery of the yellow fever germ.

claim to the discovery of the yellow germ was made by Sanarelli, an Italian iologist, who visited Brazil for the pur- of making investigation with refer- o the etiology of this disease. Sanarelli ed from the blood of a certain proportion cases which came under his observation (mortem) a bacillus which he believed to cause of the disease. His standing as a ologist and his published papers relating tails of his experiments led to a general ance of his claims by members of the d profession in Brazil and to some ex- other countries. But the researches of

Reed and his associates have shown that *icillus icteroides* of Sanarelli is a com- nd widely distributed species which has g to do with the etiology of yellow fever, h it may occasionally be obtained in cul- from yellow fever cadavers. It was not t in any instance in the blood obtained atients in the early stage of the disease, his blood was proved by experimental in- ons to be capable of reproducing the in non-immune individuals, nor could obtained from the bodies of infected

mosquitoes which has been proved to be cap- able of communicating the disease.

Yellow fever is a disease in which immu- nity results from suffering one attack, and this immunity usually lasts for many years, or for life. Second attacks may, however, occur, al- though this is rare.

The mortality from the disease differs greatly in different epidemics and among differ- ent classes and races. It has been asserted that the negro race has a congenital immunity from yellow fever, but this is a mistake. The sus- ceptibility of the negro is, however, much less than that of the white race, and among those attacked the mortality, as a rule, is small. This is shown by the statistics relating to white and black troops in the British service at West India stations. "While in Jamaica the annual loss among the former amounts to 102 per 1,000 of the mean strength, the deaths among the blacks did not exceed 8 per 1,000. In the Bahamas the mortality of the whites was 59 in 1,000, that of the blacks 5.6 in 1,000" (La Roche).

In the report of the board of experts ap- pointed by Congress to investigate the epidemic of 1878, we find the following remarks: "Ber- wick City, 40 cases among colored, no deaths." "Morgan City, 21 deaths among colored per- sons." "Brownsville (Tenn.), of 162 colored cases, 21 died." "Chattanooga, of 685 cases, 256 whites, 429 colored; of 164 deaths, 118 whites, 46 colored." "Decatur (Ala.), of 64 white cases, 28 died; of 168 colored, 21 died."

Barton gives the following figures, show- ing the mortality per 1,000 among different races, and those of the same race from different latitudes, in the city of New Orleans in the great epidemic of 1853.

	Per 1,000
Native Creoles . . . . .	3.58
Strangers from West Indies, Mexico, and South America . . . . .	6.14
Strangers from Southern States of the Union . . . . .	13.22
Strangers from Spain and Italy . . . . .	22.06
Strangers from Middle States of the Union . . . . .	30.69
Strangers from New York and New England States . . . . .	32.83
Strangers from Western States of the Union . . . . .	44.23
Strangers from France . . . . .	48.13
Strangers from British America . . . . .	50.24
Strangers from Great Britain . . . . .	52.19
Strangers from Germany . . . . .	132.01
Strangers from Scandinavia . . . . .	163.26
Strangers from Austria and Switzerland . . . . .	220.08
Strangers from Netherlands . . . . .	328.94

There is probably no difference in the sus- ceptibility of the sexes, but males are attacked in greater proportion than females, because they more frequently, and often recklessly, visit infected localities. The mortality is, as a rule, considerably greater among males. Ligon, in giving an account of the pestilence at Barba- dos in 1647, of which he was an eye-witness, says: "The cause was unknown; one could not say if the ships of commerce had imported the scourge, or if it came from bad food, marshy water, the intemperance of the colonists, and, above all, the great quantity of *eau-de-vie* which they drank. . . . It was the most debauched who perished first, and not one woman died for ten men." No doubt Ligon was right in ascribing the difference in the mortality of the sexes largely to the difference in their habits, with reference to the use of *eau-de-vie*. Those who habitually use spirituous liquors are less

likely to recover from an attack than the temperate, and a recent debauch is a recognized predisposing cause.

The mortality among children is considerably less than among adults. This applies especially to children from 5 to 15 years of age. The mortality among children under five is somewhat greater.

The idea which formerly prevailed in New Orleans and Havana that native-born citizens—"creoles"—have an inherited immunity from the disease is not well founded. Whatever immunity they may enjoy is no doubt, to a great extent at least, due to an attack of the disease frequently occurring during childhood and usually unrecognized.

Hinemann writes with reference to Vera Cruz: "Until lately the physicians and people of Vera Cruz supported with fanaticism the dogma that natives were absolutely exempt from yellow fever. But the fearful epidemics of recent years (1875, 1877, 1878) have worked a change; for so many native children and adults suffered, that the truth could no longer be denied that these do not enjoy an absolute immunity."

In Cuba the dogma that creoles are exempt from yellow fever did not withstand the searching investigation made by the Havana Yellow Fever Commission of 1879.

Nevertheless the mortality from this disease among the creole population of cities where it has established itself as an endemic malady is comparatively small, and by far the largest quota of its victims is drawn from among the strangers who visit the infected places, or residents who have recently located in them. Consult Camerer, C. B., 'Resumé of Etiological Factors Concerned in Yellow Fever' (in United States Naval Medical Bulletin, Washington, January 1915); and 'Yellow Fever' (Document No. 822 of the Sixty-first Congress, 3d Session, ib. 1911); Manson, Sir P., 'Tropical Diseases' (1907); Allbutt and Rolleston, 'System of Medicine'; Boyce, Sir R., 'Report on Yellow Fever in Honduras' (1906); 'Health and Administration in the West Indies' (1910); 'Bulletins of the United States Fever Institute'; *Annales de l'Institut Pasteur* (January 1906).

GEO. M. STERNBERG,

*Sometime Surgeon-General, United States Army.*

**YELLOW-HAMMER**, originally, in Great Britain, the common yellow bunting (*Emberiza citrinella*), which is yellow above, varied by dark-brown patches, the under parts being pure yellow, and the wing-feathers dusky black, with brown or yellow edges. The flanks are of a brownish hue. The nest is placed on the ground, and is composed of grasses, moss, roots, etc., and lined with hair. When fat, in the autumn, the birds are much in request for their flesh. They are regarded with superstitious dislike in some districts, and their eggs are broken by boys whenever they are discovered, a foolish saying being current that each egg contains a drop of "devil's blood." The birds are caught and fattened for the table in Italy. In the United States the term is misapplied to the golden-winged woodpecker or highhole. See FLICKER.

**YELLOW JACK**, a quarantine flag displayed at naval hospitals and from vessels in

times of epidemics (see QUARANTINE). Also a common name for yellow fever.

**YELLOW-JACKET**, any species of small American wasp, marked with black and yellow stripes. See WASP.

**YELLOW-RATTLE**, a scrophulariaceous plant *Rhianthus crista galli*, an annual herb with opposite, lanceolate, sessile leaves and terminal, one-sided, leafy-bracted spikes of yellow flowers. The corollas are two-lipped, with an arched upper lip, and three-lobed lower one. The capsule is orbicular and flat, with several round-winged seeds, which rattle about the pod when shaken, and have given rise to other descriptive names, such as rattle, rattle-box, penny-rattle, etc. In European fields it is very abundant and becomes a pest, since it is parasitic and attaches itself by suckers to the roots of living grasses.

**YELLOW RIVER**. See HWANG or HOANG-HO.

**YELLOW-ROOT**, either one of two ranunculaceous plants, one being known as the shrub yellow-root (*Xanthorrhiza apiifolia*). Its long roots and rootstock, leaves, bark and pith are bright yellow, and the root is extremely bitter and astringent, and is used as a tonic. This yellow-root grows in the southern United States and has pinnate leaves clustered at the top of a short stem, giving the plant a fern-like aspect. The foliage turns to gorgeous scarlet and orange in the autumn. The five-parted flowers are wine-colored. The other yellow-root (*Hydrastis canadensis*) is known also as golden-seal, or yellow puccoon; its root is a tonic drug. The plant has abundant reniform, palmately-lobed, basal leaves, and two cauline ones, the uppermost of these subtending the solitary, greenish-white flower. The puccoon is found in woods in the eastern United States and furnished the Indians with a favorite yellow dye.

**YELLOW SEA**, or HWANG-HAI, hwāng-hi, a gulf of the Pacific Ocean, extending between the northeast coast of China and the western coast of Chosen or Korea, northward to Manchuria; length about 620 miles; greatest breadth about 400 miles. North and northwest it terminates in the gulfs of Lia-tung and Pe-chi-li, the latter of which receives the waters of numerous large and important rivers. On the east coast are numerous groups of islets, part of them included in the Korean Archipelago. The Yellow Sea is very shallow, having in no part a greater depth than 300 feet, and is so named from the muddy lemon-yellow color of its waters near the land, caused by the large quantity of alluvium continually brought into it by the Hwang-ho or Yellow River, and the Yang-tse Kiang, which gradually tends to decrease its depth. Sand banks are numerous off the Chinese coast, and there are several islands off the Chosen coast.

**YELLOW-WEED**. See DYER'S ROCKIE.

**YELLOW-WOOD**, a name applied to several timber trees and shrubs, including *Cledonia lutea*. This is an uncommon leguminous tree, known in cultivation as the virgin American or Kentucky yellow-wood, and is indigenous to the United States from Ken-

southwards. The yellow-wood attains eight or 60 feet, with a trunk some two feet in diameter. It usually divides into two or three limbs not far from the ground, which divide into slender and somewhat drooping branches, forming a broad, graceful head. In the smooth, silvery-gray bark of its trunk and red-brown of its delicate leaves are very interesting. The limbs, however, are brittle and break easily. The foliage of the yellow-wood consists of light-colored, alternate leaves, turning to clear yellow in autumn; and fragrant panicles a foot or more long of flowers, pea-like and milk-white, from the ends of the branches. The seeds are linear legumes. A yellow dye was obtained from the hard golden-tinted wood, which is used for fuel and occasionally for gunpowder.

The yellow-root (q.v.) (*Xanthoxylum*); the Osage orange (*Toxylon pomiferum*), a favorite hedge plant; fustic, a dyewood yielded by the wood of *Chlorophora tinctoria*, a West Indian tree with oblong, serrated leaves and an edible fruit; and *Schaefferia rutescens*, the valuable boxwood of the Indies, are all known as yellow-woods. Other yellow-woods are the *Acronychia*, *Hovea longipes* and *Xanthostemon perma*; and the white teak, or Queensland yellow-wood (*Flindersia oxleyana*), also called light yellow-wood, is a tall, slender tree with many branches. Another tree called light yellow-wood is the *Rhus rhodanthema*, bearing red flowers, and growing to 80 feet in height.

It is native to Queensland, and yields cabinet-wood, close-grained, capable of a fine polish, sound and durable. Natal yellow-wood is a tree of about the same height as the *Acronychia* (*arpus elongata*), with a close-grained wood which will not bear exposure out of doors but is extensively used for furniture and house-building. The bastard yellow-wood of the same region is *P. pruinosa*, with a durable wood, also used in house building. Another species (*P. latifolia*), an evergreen about 80 feet high, having an arched top, is the East Indian yellow-wood. Another name is given to the satin-wood (*Oxylon swietenia*). The prickly yellow-wood is *Zanthoxylum caribæum* (q.v.).

**YELLOWBIRD**, any of several familiar birds having a prevailing yellow in plumage. In the United States the name belongs to two small species. One is the goldfinch (q.v.), the other often distinguished as "summer yellowbird" is a warbler (*Dendroica æstiva*), which is in summer throughout all the eastern States and Canada. It is greenish yellow with a bright yellow breast, where it is diversified with salmon-colored streaks. The song is a clear trill, often heard among the roses and bushes of the garden, where the bird is often seen to fix its deep nest of hempen shreds in a fork of a tree. The eggs are pink, with yellow and purplish dots. This nest is one of the receptacles most often chosen by the bird for its surreptitious egg; but the yellowbird frequently defeats the intruder's object by building a new nest on top of the first, thus trying the strange egg.

**YELLOWHEAD**, a yellow-headed blackbird. See **BLACKBIRD**.

**YELLOWLEGS**, a genus (*Totanus*) of birds of the family *Scolopacidae*, large snipe-like species with cross-banded tail-feathers, well-marked gape, long, slender non-sensitive bill and greenish yellow legs, from which they take their common names of yellowlegs, greenshanks, etc., while, because of their constant noisy calling, they are known to gunners as tattlers or tell-tale snipe. The greater yellowlegs (*T. melanoleucus*) inhabits during some part of the year nearly the entire American continent and breeds chiefly north of the United States, in which it is well known as a coast-wise migrant. It is 13 to 14 inches long, with a spread of wings of two feet. Above the color is a mixed dark ashy, varying with the age and season, below white streaked and barred with ashy black. Although chiefly a maritime bird, this species also migrates through the Mississippi Valley and is found about the lakes of the interior; and even along the coast it is fond of frequenting the fresh and brackish pools on the meadows, where it finds an abundance of food in the small fishes, mollusks, shrimps and crabs. It also eats worms, insects and the spawn of fishes, which it catches with great facility. During the migrations, which occur in April and from late August to October through the greater part of the United States, it is commonly seen in small parties of six or eight, often consorting with other species of tattlers, willets and godwits. The flight is swift and often elevated, and in alighting in pools in which they wade leg-deep they keep the wings raised until well settled. They are extremely alert and noisy and thus provoke the indignation of gunners. The nest is a grass-lined depression on the ground and the four, pyriform, greenish yellow, brown and gray blotched eggs measure upward of two inches in length. The lesser yellowlegs (*T. flavipes*) is in form and colors nearly an exact miniature of the last, but is only 10 or 11 inches long, with a spread of 20 inches. Its range and habits are similar to those of the larger species, but it is much commoner in the East, flies in larger flocks and is better known to shooters of shore-birds. The eggs are more variable, the ground-color being clay or buff, and the markings usually very bold and distinct. The European greenshank (q.v.) occasionally straggles to our shores and may be distinguished from *T. melanoleucus*, which it resembles in size, by the distinctly green color of the lower legs and feet. About a dozen related species are found in other parts of the world and the genus *Helodromas*, containing our solitary and green sandpipers, is closely allied. For methods of shooting see **SANDPIPER**.

**YELLOWPLUSH PAPERS**, The, a series of satirical papers by William M. Thackeray, which appeared in *Fraser's Magazine* in 1837-38, as 'The Yellowplush Memoirs,' and in book form in 1841 in the volume entitled 'Comic Tales and Sketches.'

**YELLOWS**, a disease of the peach (q.v.).

**YELLOWSTONE**, formerly **SUBLETTE**, a lake in the Yellowstone National Park (q.v.), at the northeast base of the Rocky Mountain range. It has an elevation of nearly 7,800 feet above sea-level. It is irregular in form, having extensions called West Arm, South Arm

the same time, the presence of a large number of small, unidentifiable insects in the samples was noted. The insects were identified as *Chironomus tentaculatus* (Diptera: Chironomidae) and *Chironomus tentaculatus* (Diptera: Chironomidae). The presence of these insects in the samples is likely due to the fact that they are common in the water bodies of the study area. The insects were found in the water samples collected from the same locations as the sediment samples. The presence of these insects in the water samples is likely due to the fact that they are common in the water bodies of the study area. The insects were found in the water samples collected from the same locations as the sediment samples. The presence of these insects in the water samples is likely due to the fact that they are common in the water bodies of the study area.

YELLOWSTONE PARK

Terraces built by the overflow of Geysers (Mammoth Hot Springs)

are northwest of Pelican Cone. Near Chittenden is Turbid Lake.

**Geysers and Hot Springs.**—The Yellowstone Park is famous for its numerous geysers; one of the four regions in the world; there are groups of large geysers. There are three geyser basins located in the Fire Hole River, at an average height of 7,000 feet above the sea-level; Upper, Middle Geyser and Lower Geyser. The Great Geyser basin, is the most active.

Here are located the great spouters, conus among which are the Giant, Giantess, Saw Mill, Bee Hive, Lion, Grand Conical, and last, but by no means least, Faithful. They are all appropriately named. The Giant and Giantess are so called in count of the immense size of their craters by the force of their action; the Bee Hive is called so because of the peculiar formation of its spout; the Saw Mill and Lion from the roaring noise they make when in a state of activity; and Old Faithful on account of the regular discharges of steam and water at intervals of 64 minutes. One can rely absolutely on Old Faithful giving an exhibition every day and four minutes. The stated intervals of activity have not varied in the memory of the oldest visitor to the park. Other geysers are variable in the time of their action; all subject to changes. The Bee Hive is becoming more active every season. It gives an exhibition two or three times every 24 hours. The Giant and Giantess and Castle cannot altogether be relied upon, but they make a magnificent display when in action. The Giant gives an exhibition about every six days and Giantess about every 11 days. Near the cone of the Giant Geyser is a small cone, which seems to do for the Giant what the pipe does for a large boiler. When the chambers of the main crater become charged, short puffs of steam come hissing through this fissure. The grandeur of the display which follows passes description. Interior forces seem to combine in making a display of power. Accompanying a strong shock, caused by the volume of steaming, a column of water about 10 feet in diameter is thrown up to a considerable height, and emits a dense cloud of steam, so that it is difficult to see what appears in the distance to be a massive marble pillar. But the pillar soon floats away and a column of great height stands revealed in all its grandeur. In a few seconds comes another change, the column is shattered, the law of gravity asserts and the great body of water which went up in a grand column falls in showers of water.

The greater part of the water returns to the crater, and the overflow is carried off by the Fire Hole River, a stream well named, which flows rapidly through three basins fed by many boiling springs and numerous geysers.

There are no cone geysers in the Middle Geyser basin. The great wonder of the Middle Geyser basin is "Hell's Half-Acre." This is a deep on the bank of Fire Hole, and is a deep abyss, about 30 feet deep, in a limestone formation. Four or five times each day, at regular intervals, it gives most astonishing exhibitions. A short distance from "Hell's

Half-Acre" is a boiling lake, the waters of which are a beautiful blue. The blue liquid-overflow winds over formations which for years have been changing in form and color, making a sight the like of which is nowhere else in the world. The reflection of the trees and hills in the colored water adds to the picturesque beauty of the scene. The "Devil's Paint Pot" is a boiling caldron of many colored clays, which bubble and steam and change their colors in a way most interesting. The Mammoth Hot Springs are in the northern part of the park, not far from Cinnabar, the railroad station in Montana. They are somewhat similar to the springs in the Fire Hole basin. The deposits left by the water have built up scalloped terraces. Some of the results of their activity exist in a marked degree on the banks of the Gardiner River. There are places where the water from the geysers is no longer changing the terrace formations, and which seem to be over caverns as indicated by the sound of footsteps. In some parts caverns have been explored, and found to contain many beautiful specimens of stalagmites and stalactites. The springs of this locality are as varied in color and form as in activities. The "Goddess of Liberty" is a mass of limestone, 40 or 50 feet high, and shaped like the cap of the Goddess of Liberty. The Mud Geysers, north of and near Yellowstone Lake, are what their name indicates. At irregular intervals mud and water are shot up quite a distance. The slimy substance falls on the dead cedars which have been killed by the hot substance; but that evergreen cedars grew here shows that vegetation existed long before the present conditions. There are geysers near Heart Lake and in other parts of the park. There are nearly 100 active hot springs and geysers within the park. The geysers change, some becoming extinct and new ones appearing. In 1878 a large geyser made its appearance in the Norris basin, near the headwaters of the Madison River. Hot springs are found everywhere in the park; on mountains, in valleys, in the beds of lakes and rivers, near cañons and near cold water springs. They vary in size, some cover acres, others only inches of surface. There are also a large number of mineral springs and numerous springs of clear cold water. The whole park and much of the adjoining region are volcanic.

**Climate.**—The climate is not as severely cold as in other parts of the Rocky Mountain region of the same altitude. The winter season practically begins with September or the last of August. The mean temperature in January is about 20°; occasionally the temperature falls to 40° below zero. The summers are short; vegetation begins to grow in May and in July has reached its most luxuriant state. In the last of August the change from summer to winter is usually sudden. In July the mean temperature is 62°; sometimes in summer the temperature rises to 96°. A hot day in summer may be followed by a cold night, even frost appearing. On the plateau the average annual rainfall is 20 inches.

**Flora.**—Nearly all the park area is covered with forests, chiefly composed of coniferæ. The treeless regions are the summits of the high

mountains, the marshy bottoms, and the steep rocky slopes. The black pine is the most common; in some places there are forests composed almost wholly of black pine (*Pinus Murrayana*), which here do not attain any great size. The balsam is found on the high plateaus, and varieties of fir and spruce are abundant. Forests exist at an elevation of 9,700 feet. Grasses are found on the plateaus and the herbaceous vegetation found in the Rocky Mountains. Above the timber line the vegetation is about as in other parts of the summits of the Rocky Mountains. The gentian is one of the favorite flowers of this section. Near the hot springs the vegetation is affected by the overflow and other causes; it is stunted and in some places has been killed entirely. Petrified trees are found in the northwest.

**Fauna.**—The wild animals of the park are protected by government laws and as a consequence are becoming more numerous than in other parts of the Rocky Mountains. A herd of buffalo is one of the features of the place. Another wild herd numbering about 50 individuals is glimpsed occasionally. The animals found here are deer, antelopes, elk, mountain lions (pumas), beaver, black and brown bears and moose. Sheep are found on the high lands. Grouse is found in some parts, but there are not many birds in this region. Fish abound; trout are in many streams.

**Government and Improvements.**—Since 1872 the government has had entire control of a portion of what is now the Yellowstone National Park and later took control of additional lands, and now has entire jurisdiction over all the park. The administrative officials are under the Secretary of the Interior. An army officer is the superintendent in direct charge and he has as his aids a detachment of Federal troops. On 1 July 1900 the Secretary of the Interior gave to the public the following instructions:

The following rules and regulations for the government of the Yellowstone National Park are hereby established and made public pursuant to authority conferred by section 2,475, Revised Statutes, United States, and the act of Congress approved 7 May 1894:

(1) It is forbidden to remove or injure the sediments or incrustations around the geysers, hot springs or steam vents; or to deface the same by written inscription or otherwise; or to throw any substance into the springs or geyser vents; or to injure or disturb, in any manner, or to carry off any of the mineral deposits, specimens, natural curiosities or wonders within the park.

(2) It is forbidden to ride or drive on any of the geyser or hot spring formations or to turn loose stock to graze in their vicinity.

(3) It is forbidden to cut or injure any growing timber. Camping parties will be allowed to use dead or fallen timber for fuel.

(4) Fires shall be lighted only when necessary and completely extinguished when no longer required. The utmost care should be exercised at all times to avoid setting fire to the timber and grass and any one failing to comply therewith shall be punished as prescribed by law.

(5) Hunting or killing, wounding or capturing of any bird or wild animal, except dangerous animals, when necessary to prevent them from destroying life or inflicting an injury, is

prohibited. The outfits, including guns, traps, teams, horses or means of transportation used by persons engaged in hunting, killing, trapping, ensnaring or capturing such birds or wild animals, or in possession of game killed in the park under other circumstances than prescribed above, will be forfeited to the United States, except in cases where it is shown by satisfactory evidence that the outfit is not the property of the person or persons violating this regulation, and the actual owner thereof was not a party to such violation. Firearms will only be permitted in the park on written permission from the superintendent thereof. On arrival at the first station of the park guard, parties having firearms will turn them over to the sergeant in charge of the station, taking his receipt for them. They will be returned to the owners on leaving the park.

(6) Fishing with nets, seines, traps or by the use of drugs or explosives, or in any other way than with hook and line, is prohibited. Fishing for the purposes of merchandise or profit is forbidden by law. Fishing may be prohibited by order of the superintendent of the park in any of the waters of the park or limited therein to any specified season of the year, or otherwise ordered by the Secretary of the Interior.

(7) No person will be permitted to reside permanently or to engage in any business in the park without permission, in writing, from the Department of the Interior. The superintendent may grant authority to competent persons to act as guides and revoke the same in his discretion and no pack trains shall be allowed in the park unless in charge of a duly registered guide.

(8) The herding or grazing of loose stock or cattle of any kind within the park, as well as the driving of such stock or cattle over the roads of the park, is strictly forbidden, except in such cases where authority therefor is granted by the Secretary of the Interior.

(9) No drinking saloon or bar room will be permitted within the limits of the park.

(10) Private notices or advertisements shall not be posted or displayed within the park, except such as may be necessary for the convenience and guidance of the public, on buildings on leased ground.

(11) Persons who render themselves obnoxious by disorderly conduct or bad behavior, or who violate any of the foregoing rules, may be summarily removed from the park, and will not be allowed to return without permission, in writing, from the Secretary of the Interior or the superintendent of the park.

Any person who violates any of the foregoing regulations will be deemed guilty of a misdemeanor and be subjected to a fine, as provided by the act of Congress approved 7 May 1894, "to protect the birds and animals in Yellowstone National Park and to punish crimes in said park, and for other purposes," of not more than \$1,000, or imprisonment not exceeding two years, or both, and be adjudged to pay all costs of the proceedings.

Prior to 1870 little was known about the region now included in the park. In 1870 H. D. Washburne, surveyor-general of Montana, and G. C. Doane, an army officer, explored this region and gave the first report of the wonderful springs and geysers. In 1872 the government sent Ferdinand V. Hayden, United States geologist, and a number of assistants, to explore this

**YELLOWSTONE NATIONAL PARK**

**Yellowstone Falls**

YELLOWSTONE PARK

Brinkwood Fall

The place is visited annually by thousands of tourists and accounts of this wonder-land have been published in all languages. The park is reached by the Chicago, Burlington and Quincy Railroad, which operates to Cody, thence by stage to the eastern part of the park. The Northern Pacific takes the traveler to the diner, Mont., to the north of the Park, the Oregon Short Line Railroad reaches the western border at Yellowstone, Mont. It is *Wonderland*, an annual published by the Northern Pacific Railroad; Chittenden, 'Yellowstone National Park,' with bibliography (igo 1915); Hague, 'Geological History of Yellowstone National Park' (Department of the Interior, Washington 1912); Weed, 'Geysers' (1912); Knowlton, 'Fossil Forests of the Yellowstone National Park' (ib. 1912); Richardson, 'Wonders of Yellowstone'; United States Geological Survey; 'General Information regarding Yellowstone National Park' (Circularly, Department of the Interior, Wash- ington).

**YELLOWTAIL**, or **BLANQUILLO**, a cavioid fish (*Caulolatilus princeps*) of the Pacific of Southern California and southward, to the Atlantic tilefish (q.v.), which has a length of 40 inches. It abounds about the parts of the coasts, is good food and is often used as a gamefish. Several other fishes in the same parts of the world are called yellow-tail because of the yellow or orange color of their tail fin.

**YELLOWTHROAT**. See **MARYLAND YELLOWTHROAT**.

**YEMASSEE**, The. 'The Yemassee, a Romance of Carolina' (1835), one of the earliest of the whole perhaps the best of the novels of William Gilmore Simms, deals with the little-known Yemassee War of 1715 in a manner so effective after all the intervening years of fashion in romance. Much of the novel indeed recalls the older romantic romances: the aspen-like heroine Bess Matilda; Gabriel Harrison, irresistible in love war, who turns out to be the Palatine savior Craven, capriciously masquerading as a swaggering pirate; Indians as cruel as the white; and the accustomed paraphernalia of sieges and powwows and heroics. Along with these are such solid realities as the negro slave, obviously studied from Simms' knowledge, and Mrs. Grayson, the heroine's wife, too hard and strong to be a mere ornament. Above either romantic commonplaces or normal realities stands one episode so fully conceived and handled that it ought to secure place in the world of the imagination: the episode in which Matilda, devoted to her mother, kills her son Oconestoga in that he may not suffer the disgrace which she has already decreed for him. The book is packed with varied adventure, breathlessly related in a style often turgid and verbose but capable at times of dramatic economy and clarity. It is accurate as to topography and based upon that traditional lore of Southern Carolina upon which Simms drew for his successes.

CARL VAN DOREN.

**YEMASSEE WAR**. See **COLONIAL WARS** in **AMERICA**.

**YEMBO-EL-BAHR**, yēm'bō-ēl-bār, Arabia. See **YAMBO**.

**YEMEN**, Arabia, a division occupying the southwest angle of the peninsula, and known both to the ancients and moderns as Arabia Felix (Arabia the Happy), from a mistranslation by Ptolemy of *Yemen*, which does not signify happy but the land lying to the right of Mecca. Yemen, in the widest sense, is bounded on the west by the Red Sea, on the south by the Gulf of Aden, on the north by Hejaz and Nejd, and on the east by Hadramaut. It comprises two regions physically distinct: the Tehama or Lowland, lying between a chain of mountains which extends throughout the country and the west coast; and an elevated mountainous tract to the eastward of the former. The Tehama varies in breadth from 10 to 30 miles, and is a barren desert wherever it is not irrigated by the mountain streams. The mountains rise abruptly from the desert plain, enclosing valleys of great luxuriance. The table-land in the interior has an estimated elevation of 4,000 feet, and some of its mountain groups, as Saber, south of Taes, attain a height of 7,000 to 8,000 feet. The loftiest of these mountains are covered with forest to the summit, and the table-land abundantly furnishes coffee, dates, senna, tobacco and other productions of rather a warm temperate than a torrid region. Its approximate area is 77,200 square miles. Yemen, taken collectively, still bears unmistakable traces of its ancient superiority in wealth and civilization. In its numerous well-built towns are many rich merchants, while in the well-populated rural districts the peasantry are generally in easy circumstances. There are two great schools or universities, one at Zehid for Sunnites, and another at Damar for the Zeidés. The principal towns are Sana, the capital, Mocha, and Aden, which last is now in the possession of the British. Pop. 750,000. See **EUROPEAN WAR**; **TURKEY**; **HEJAZ**.

**YEN** (Chinese, *Yuen*, a round thing), a Japanese coin issued in 5, 10, and 20 yen pieces (gold). A gold yen is equal to 49.8 cents in United States gold.

**YENIKALÉ**, yēn-ē-kā'lā, Strait of, called also **STRAIT OF KAFFA** and **STRAIT OF KERTCH**, Russia, connects the Black Sea with the Sea of Azov; it is about 25 miles long and from two and one-half to 20 miles broad, but in some places is so shallow as to leave a channel of little more than two fathoms deep. The channel has been dredged and has now a depth of 24 feet.

**YENISEI**, yēn-ē-sā'ē, Siberia, the longest river of the region, formed by numerous streams from the mountain ranges bordering China and Russia. It has at first a circuitous, and then an almost direct northward course of about 3,260 miles, finally reaching the Arctic Ocean through the long estuary, and gulf of the same name. Its breadth varies from 3,000 feet to 14 miles in its estuary which is 140 miles long, and its depth varies from 11 to 90 feet. The area of its basin is estimated at about 1,000,000 square miles. A canal connects it with the Ob. The principal towns on its banks are Minusinsk, Krasnoïarsk, Yeniseisk and Turukansk; it is navigable to the last-named town for large vessels. The waters of the

Yenisei are clear and rich in fish. They are navigated by paddle steamers, drawing barges, and by a number of five or six cornered flat-bottomed boxes which convey flour down stream, and are broken up at their destinations. The Yenisei receives from the right the Upper Tunguska or Angara (the outlet of Lake Baikal), the Irkut, Middle Tunguska and Lower Tunguska. Nordenskjöld's voyage in the summer of 1875 from Tromsö to the mouth of the Yenisei opened up a trade by sea with northern Siberia, in which a number of vessels are now engaged, finding six weeks in summer when the passage to and from the Yenisei can be made with little difficulty. The Yenisei is exceeded in length by the Amazon, the Nile and the Mississippi-Missouri. It is obstructed by ice for almost six months at Turukhausk and for about seven months at Krasnoyarsk, at which point the river is crossed by the Trans-Siberian Railway.

**YENISEISK**, yén-ě-sá'ík, Siberia, (1) a town in the government of the same name on the left bank of the Yenisei, 200 miles north of Krasnoyarsk. It has several churches, a monastery, museum of natural history and archaeology and a public library. It is in the northern gold-mining region, has a custom-house, an extensive trade, particularly in furs, and an annual fair. Pop. about 13,000. (2) A province in the government of Irkutsk, bordering on the Arctic Ocean, bounded east by Yakutsk and Irkutsk, south by Mongolia, and west by Tomsk; area, 987,186 square miles; capital, Krasnoyarsk. The south part of the province is occupied with the Altai Hills and their off-sets. In the Yenisei valley considerable tracts are under tillage, but north of the town of Yeniseisk this is succeeded first by pasturage, then by stretches ever more and more desolate, to the frozen tundras. The chief river is the Yenisei. Smaller streams are the Taimyr, Kantanga and Anabar, which, like the Yenisei, form great gulfs at their mouths. The gold washings of Yeniseisk occupy 12,000 to 15,000 men and several thousand horses. Of the native tribes, who live by hunting, fishing, and trade in fur, the chief are Samoyedes and Tungus. The mean annual temperature ranges from 8° to 31° F. In recent years flax-growing has increased. There are extensive and valuable forests, in which much damage is wrought annually by fires. Pop. 970,800. Consult Martianor, N., 'Materials for a Flora of the Minusinsk Region' (in *Trudy of the Kazan Society of Naturalists*, Vol. XI, 3, 1882 and Radlov, W., 'Aus Sibirien' (2 vols., Leipzig 1880).

**YEO**, yó, SIR James Lucas, English naval officer: b. Southampton, Hampshire, 1782; d. at sea, 1818. Entering the navy at 11 he was present at the siege of Genoa in 1800, and while in command of a force of English and Portuguese captured Cayenne, French Guiana. In 1813 he became commander-in-chief of the English naval force of the Great Lakes and soon came into conflict with the American ships of war there. An engagement occurred at York Bay, 28 May 1813, in which Yeo received a severe drubbing and was blockaded afterward at Kingston by Chauncey. In the following year Yeo was made commander-in-chief of the English fleet on the west coast of Africa

**YEOMAN**, yó'man, a term of early English origin formerly applied to a feudal attendant or servant, but in the 15th century and subsequently denoting a small freeholder below the rank of gentleman. The term yeoman was given also to the 40 shillings freeholder, and commonly to any small farmer or countryman above the grade of laborer. The term is also familiar in the titles of functionaries in royal households, such as yeoman usher of the black rod, yeoman of the robes, etc., and other appendages to worn-out and useless royalty.

**YEOMAN OF THE GUARD**, in England, a corps of veteran soldiers of stately presence, employed on state occasions in conjunction with the gentlemen-at-arms as the bodyguard of the sovereign. The yeomen were constituted a corps in 1485 by King Henry VII, and they still wear the costumes of that period. The officers of the corps are a captain, ordinarily a peer, a lieutenant, and an ensign—all old army officers. There are also a "Clerk of the Cheque" and four "Exons," besides non-commissioned officers (messengers, sergeant-majors, yeoman bedgoers, yeoman bed-hangers), and 100 privates. The Beef-Eaters or Warders of the Tower are, contrary to common belief, an entirely different corps, but since the reign of Edward VI have been privileged to wear the yeoman's uniform, without the shoulder belt. It is to be hoped that the democratization of peoples, proceeding apace in this 20th century, will soon reach and wipe out these and similar satellites as well as those before whom they bend the knee. See BEEF-EATERS.

**YEOMANRY**, a force of volunteer cavalry first enrolled in Great Britain during the wars of the French Revolution, and consisting to a great extent of country gentlemen and farmers possessing their own horses and requisite equipment. They were liable to be called out in aid of the civil power in case of riot at any time; in case of actual invasion, or the appearance of an enemy on the coast or during a rebellion, they might be assembled for actual service; they were then subject to the Mutiny Act and Articles of War, and might be called upon to serve in any part of Great Britain. During permanent service they received cavalry pay and an allowance for forage. For their services during the Boer War, 1899-1902, they received the title of Imperial Yeomanry. Colonial Yeomanry have been enlisted for the defense of the British colonies. The Imperial Yeomanry became part of the territorial forces in 1907. See GREAT BRITAIN — THE BRITISH ARMY.

**YERBA MATÉ**. See MATÉ.

**YERKES**, yér'kéz, Charles Tyson, American capitalist: b. Philadelphia, Pa., 25 June 1837; d. New York, 29 Dec. 1905. He received a secondary education in Philadelphia at the Central High School, was for a time in the flour and grain business, in 1859 became a stock-broker, and in 1861-86 was in banking, first in Philadelphia, and from 1881 in Chicago. In 1871 he was obliged to make an assignment, but by fortunate investments he soon financially re-established himself, and became prominently connected with the Philadelphia street-railway system. At this time he refused to give preference to the city of Philadelphia for bonds sold on its account. He was thereupon indicted for

propriating city funds, was convicted, and sentenced to 33 months imprisonment. After seven months in prison he was pardoned and soon afterward Philadelphia cancelled her claim against him. After his removal to Chicago he acquired a controlling interest in its street-railway system. In 1892-3 was a prominent member of the board of directors of the World's Columbian Exposition in Chicago, rendering particular service to the department of fine arts, to whose exhibit he made his choice collection of paintings. Among his later enterprises was that connected with the London system of underground railways in 1901. He gave to the University of Chicago funds for the buildings and instruments of the Yerkes Observatory (q.v.), with its 40-inch telescope. This was described by Newhall as "one of the most munificent gifts ever made for the promotion of any single science."

**YERKES, Robert Mearns**, American psychologist: b. Breadysville, Pa., 26 May 1876. In 1897 he was graduated at Ursinus College and at Harvard in 1898, receiving the degree of Ph.D. at the latter in 1901. He began as a lecturer and investigator at Harvard in 1901; assistant professor of comparative psychology from 1908 to 1917 and psychologist at Psychopathic Hospital, Boston, from 1913 to 1917, and since 1917 has been professor of psychology and director of the Psychological Laboratory of the University of Minnesota. In 1918 he was commissioned major in the Sanitary Corps of the National Army and was head of the section of psychology in the War Department's office. He is the author of 'Dancing Mouse, a Study in Animal Behavior' (1907); 'Introduction to Psychology' (1908); 'Methods of Studying Vision in Animals' with J. B. Watson (1911); 'Outline of Psychology of the Self,' with D. W. La Rue (1912); 'A Point Scale for Measuring Mental Ability,' with R. S. Hardwick and J. W. Yerkes (1915); 'Army Mental Tests,' with George S. Yoakum (1919), and papers on research topics in physiology of the nervous system, animal behavior and comparative psychology.

**YERKES OBSERVATORY**, astronomical observatory of the University of Chicago, located on Lake Geneva, near Williams Bay, Wis. It was founded in 1892 by Charles Doolittle Yerkes (q.v.), who presented to the University funds sufficient for its building and equipment. It has a refracting telescope with an aperture of 40 inches, one of the largest in the world. The observatory is used chiefly for spectroscopic work in astronomy, for which its instruments offer exceptional facilities. See **YERKES OBSERVATORY, TELESCOPE**.

**YERMAK, Timofeyev**, Cossack conqueror of northern Siberia: d. Irtysh River, Sept. 1584. As chief of a band of Cossacks which were invited and outlawed by Ivan IV, took refuge in the settlements of the Stroganov family in Siberia. They were undesired guests and the Stroganovs, it is said, devised as an expedient to get rid of them, the project of Yermak's expedition against the marauding forces of the Khan of Sibir, the Stroganovs to furnish adequate supplies for the expedition. Yermak discovered the country in 1580; took Isker, the

residence of the Khan, in 1581 and drove that ruler into the mountains. Yermak turned the conquered territory over to Ivan IV, and for this service received full pardon for past offenses. After his death by drowning in the Irtysh River, his forces abandoned Siberia. He is figured in Russian folk songs, and is the subject of a drama by Khomyakov, 'Yermak' (1832).

**YEW**, evergreen coniferous shrubs or trees of the genus *Taxus*. The leaves are flat needles arranged in two ranks to the right and left of the stem, but in a horizontal plane. The flowers are dioecious, and have no perianth; the male inflorescences are composed of a few stamens partly united at the apex of a scaly, axillary stalk, with shield-shaped bracts forming a spherical head. The female flowers are axillary, naked ovules seated on a fleshy annular disc, which becomes cup-shaped and scarlet, and nearly encloses the bony seed. The European yew, a tree famous in the annals of Old World gardens, is *Taxus baccata*. It is readily recognizable by its lustrous foliage, so dark a green as to appear velvety and almost black in the shadows. When rather young the typical yew has a broadly pyramidal head, but in its old age it becomes ragged and broken, not unlike an aged hemlock. Some trees have attained a great age, and they reach to a height of 100 feet, and sometimes to a diameter of 10 feet. In cultivation there are several varieties of yew, including the Irish, with fastigate branches and columnar habit, and the golden yews, with foliage, which, to a certain extent, is yellow. The dark yew was a favorite tree for planting in church yards. It is even now a common plant in European cemeteries, and has been for centuries a symbol of mourning at funerals, and especially at those of unhappy lovers.

Lay a garland on my hearse  
Of the dismal yew

This couplet in the 'Maid's Tragedy' is an allusion to this custom. In India the yew is a sacred tree, its wood and gum being burned as an incense, and branches of it carried before ceremonial processions. Although the sweet and juicy scarlet aril of yew fruit does not seem to be poisonous, the enclosed seed is regarded with suspicion, especially when eaten by children, in any quantity. Young branches of yew, too, are dangerous to cattle, which are frequently killed by feeding upon them. The trunks of yews are twisted, ridged and gnarled, and the shreddy bark has the rich red-brown tone of an old cedar. The wood is hard, with an orange red or brown heart, which takes a fine polish and is valued for cabinet work and veneers; since it is also fine and close-grained, flexible and elastic, easy to split and durable, yew-wood was the chosen material for the bows of the English archers, and no other wood has ever equaled it for that purpose. The Indian tribes of the northwestern American coast arrived at the same conclusion in regard to the beautiful *Taxus brevifolia*, indigenous to that region and similar in appearance and size to the European tree. It was used by them for bows, spear-handles, paddles and fish-hooks, and is the most durable timber that the white man can find for his fence-posts. There is another arborescent American yew, found in

Florida, a bushy tree (*T. floridana*) with many stout spreading branches and a short trunk. It rarely exceeds 30 feet in height. A Japanese species (*T. cuspidata*), with a bright red bark, is now being introduced to cultivation, and is of bushy habit, and more hardy and successful than the European yew. This is a great favorite with the Japanese, who clip it into fantastic shapes. The most familiar yew in Canada and the eastern United States is *T. canadensis*, a very low, shrubby species with decumbent branches radiating in every direction and forming thickets hard for a man to travel through, but a first-rate cover for grouse. It grows in moist lands under the shade of trees, and is readily recognized by its dark foliage and the glowing, crimson, oblong, cup-like fruits.

**YEZD**, *yēzd*, or **YAZD**, Persia, (1) A town, capital of a province of the same name, in an oasis in a sandy plain, 190 miles southeast of Isaphan. It is about five miles in circuit; consists of an old town, enclosed by a wall and ditch, defended by a citadel, and entered by four gates; and of a larger new town or suburb, which has risen up in a straggling population. Within the citadel are a palace, the principal mosque, several other public buildings, and the residences of the chief men of the district. The bazaars are spacious and well supplied, particularly with the staple manufactures of the town itself, consisting of silk stuffs, velvets, cottons, coarse woollens called *numuds*, loaf-sugar, and sweetmeats. The position of Yezd, on the edge of a desert, at the junction of the principal caravan routes, makes it an important commercial entrepôt for the surrounding countries. Silk, felt goods, opium and sugar are the chief items of trade. Pop. about 45,000, of which about a tenth are Zoroastrians or fire-worshippers. (2) The province has an area of about 20,000 square miles, and its population is estimated at 100,000.

**YEZEDEES**, or **YEZIDIS**, *yēz'ē-dēz*. See RELIGIOUS SECTS.

**YEZO**, *yāzō*, **ezo**, or **HOKKAIDO**, *hōk-ki'dō*, Japan, the northernmost of the four main islands of the empire, separated from Hondo on the south by Tsugaru Strait, from Sakhalin on the north by La Pérouse Strait, while Yezo Strait divides it from Kunashiri, the southernmost of the Kurile Islands; area, including dependent islands, 30,143 square miles. The capital is Sapporo; Hakodate, Mororan, and Otaru are other large towns and open ports. Yezo is curiously like a skate-fish in shape. The centre of the island is but little known, though it has been crossed twice or thrice by Japanese and European explorers. It is traversed by chains of mountains, the principal summits being Tokachi-dake, 8,200 feet; Shrihetsi-yama, 7,874 feet; Ishikari-dake, 7,710 feet; Sapporo-dake, 6,500 feet; and Komaga-dake, 3,830 feet. Much of the island is volcanic, especially in the east. The chief rivers are the Ishikari and Teshio, flowing into the Sea of Japan; and the Tokachi, flowing into the Pacific Ocean. The chief bays are Volcano Bay, in the south; Ishikari Bay, in the west; Shari and Walfish bays, in the north-east. Yezo has a rigorous climate, being for six months of the year under snow and ice, two feet in the south to eight feet in the north. The original inhabitants of Yezo were probably pit dwellers, of whom distinct traces have been found at Sapporo, Nemuro, and elsewhere.

After these came Ainos or Ainus, whose principal settlement is at Piratori, 50 miles east of Mororan. The bear festival in September is the great event of their year. The Ainos number 15,000, a population either stationary or decreasing; they are harmless, lazy and drunken, and live mostly near the mouths of the rivers. The southern corner of the island was wrested from them in the 16th century, and Matsumae, now Fukuyama, in the extreme southwest, became in the next century the headquarters of Japanese rule. From 1600 to 1868 the southwestern portion of the island was in possession of a Daimio named Matsumai, and the Shogun was in possession of Hakodate. At the restoration in 1868 the supporters of the Tokugawa government made a last stand here, and were finally defeated at Hakodate. In 1871 the Japanese began active colonization, fearing aggression on the part of Russia, and a new department—the Colonization Department—was established to further these projects and much development work was done under the supervision of foreigners. This department, however, was abolished in 1881 and the country divided into prefectures, though its inhabitants do not as yet enjoy any electoral privileges. The fauna and flora of Yezo differ materially from those of the main island, the bear being a different species, resembling the grizzly. There are no monkeys; a species of grouse is found. The deer, once very plentiful, are now comparatively scarce. The Yezo pony, originally from Nambu on the main island, is hardy, and foreign blood has been introduced, promising good results. The forests furnish valuable timber. Coal, petroleum and gold are found and worked to some extent. The official name Hokkaido, "Circuit of the Northern Sea," was bestowed in 1870, when it was brought under a special colonization department. An agricultural mission from the United States assisted in founding model farms, laying out roads and building bridges. The capital was changed from Matsumai to Sapporo, which was provided with a railroad to Otaru, its port, and to Poronai, the great coal district inland. An agricultural college, breweries, canning factories, beet-root sugar factories, etc. were established. The coal mines are worked by convict labor. A system of military settlements in late years was put into force, partly with the view of furnishing a militia against possible invasion from Russia, which at that time was supposed to covet the fine harbors of Yezo. The sheltered harbor of Mororan, on Volcano Bay, is now a naval harbor, to which a railway from Poronai mines has been built. The principal products of Yezo are coal, seaweed, sulphur, fish, the catches of salmon on the river Ishikari being sometimes enormous. Kerosene, beer, glass, and other articles are manufactured, and internal communication is facilitated by a system of railways, either constructed or projected, joining all the important coast and interior towns. Pop. (including the Kurile Islands), 1,459,424. See JAPAN.

**YGGDRASIL**, or **YGDRA SIL**, *ig'drā-sil*, in Scandinavian mythology, the giant ash tree overspreading the whole world and reaching above the heavens. It binds together earth, heaven and hell, and its roots stretch out to the Asa or Æsir gods in heaven, to the frost giants, and to the under world. A marvelous fountain

up under each of these three great roots the tree, whose boughs drip continually honey, dwell an eagle and the squirrel skr. At its roots the serpent Nithöggr and between the serpent and the eagle the squirrel constantly endeavoring to prohe two to strife. Certain writers detect myth a distortion of the story of the but the translator of Grimm says, "it far likelier theory, that floating heathens of the world tree, soon after the con in Germany, France or England, at themselves to an object of Christian faith; heathen temples and holy places were ted into Christian ones."

**YIDDISH LANGUAGE.** Yiddish, the sized form of German *Jüdisch* (Jewish), of the names applied to the various Ger dialects spoken by the Jews of German in the diaspora, in Russia, Rumania, l and Austria-Hungary, and in England, a, and South Africa, whither Russian and ian Jews have been emigrating in the last rs. In Russia it is known under the of *Jargon*, while philologically it is gen-spoken of as *Judeo-German*.

literary documents of any consequence pon the condition of this group of dia-revius to the 16th century, and even printed works up to a hundred years ago erary norm seems to have attempted ch to the literary German, though even he deviation was considerable and fairly m. In the last century the spoken dia-ave been asserting themselves in the lit-productions, so that the uniformity no exists, each author writing in the varia-umiliar to him from childhood.

ems that at first, in the Middle Ages, the Jews employed the language of their an neighborhood without any change ver; in their intercommunication with oreligionists they transcribed this Ger-vith Hebrew characters and introduced, nizing them, such Hebrew words as were itated by the observances of the Mosaic When the German Jews, in the 14th and enturies, settled in Poland, they were cut om the rest of the German nation, and so native dialects perpetuated themselves in m in which they were brought from their

They were subjected, however, to the influence of their Slavic neighborhood e language of the Bible and the Talmud, ch the Jews devoted themselves with un-l zeal. In vocabulary, the Yiddish is pre-antly German, less than one-third having lerved from Slavic, Rumanian and He-ources. In pronunciation, the influence of n and Polish is doubtful or less trans-, while Hebrew, instead of affecting it, self affected by the current pronunciation ddish. In syntax and idiom, both the and the Hebrew have considerably modi-e native German, without, however, oblit-; the original German basis. At present, chief varieties may be distinguished in iddish of Russia, the Lithuanian, the , and the Southern; the dialects in Austria ungary are more nearly related to the tter, while the Rumanian is more akin Polish variety. In America all three es may be heard, but they are strongly

influenced in vocabulary by the English, and in the periodic press the Lithuanian variety, affected by literary German, seems to supersede all other dialects. The three varieties correspond to their places of origin in Germany, the Lithuanian issuing from a Middle-German home, the other two from various Upper-German localities. The precise *provenience* has not yet been ascer-tained, as the linguistic study of Yiddish has heretofore been greatly neglected.

The chief differences between Yiddish and the modern German are these: Phonetically, Yiddish represents a mediæval stage of German when, for example, *i* and *ei* were still carefully distinguished, while *u* before a nasal had not yet changed into *o*; on the other hand, the con-sonantism, especially the treatment of *pf*, seems to correspond to a later stage. The vocabulary of Yiddish is rich in words only sporadically found in German dialects and common to the Middle-High-German literary language. The words from the Hebrew are phonetically treated as Yiddish words, while those from Russian and Polish, to some extent, underwent the changes due to the peculiarity of Yiddish, and present some interesting data to the Slavic scholar. In grammar, Yiddish has developed certain peculiarities which are common to va-rious German dialects. Most prominent are the disappearance of final unaccented *e*, of the genitive case in the declension of the noun, of the imperfect tense in the verb. In syntactic structure, Yiddish resembles English, rather than German, and in English-speaking countries naturally adopts some of the English idioms. But, on the whole, Yiddish is an important group of German dialects, well worthy of a thorough study by the Germanic philologist.

**Bibliography.**—There are no good gram-mars of Yiddish; for dictionaries one may use the Russo-Yiddish ones by Lifschiz and Dreisin, and the Yiddish-English and English-Yiddish ones by A. Harkavy. To the student of phi-ology the following works and articles will prove of value: Landau, A., 'Bibliographie des Jüdisch-deutschen,' in *Deutsche Mundarten, Zeitschrift für Bearbeitung des mundartlichen Materials* (herausgegeben von Dr. Johann Willibald Nagl, Vienna 1896, Heft II, pp. 126-132); Landau, A., 'Das Deminutivum der gali-zisch-jüdischen Mundart, Ein Kapitel aus der jüdischen Grammatik' (ib., Vol. I, pp. 46-58); Gerzon, Jak. 'Die jüdisch-deutsche Sprache, Eine grammatisch-lexikalische Untersuchung ihres deutschen Grundbestandes' (Frankfurt a. M. 1902); Loewe, Richard, review of Gerzon's work, in *Anzeiger für indogermanische Sprach- und Altertums-Kunde* (Vol. XVI, 1904, pp. 43-50); Sainéan, L., 'Essai sur le judéo-allemand et spécialement sur le dialecte parlé en Valachie' ('*Extraits des Mémoires de la Société de Lin-guistique de Paris*'), (Vol. XII, première partie, Paris 1902); Landau, A., review of Ger-zon's and Sainéan's works, in *Zeitschrift für deutsche Philologie* (Vol. XXXVI, 1904); and a valuable bibliography of scattered articles by Fränkel, L., in *Litteraturblatt für germanische und romanische Philologie* (Vol. XXII, pp. 386-391).

LEO WIENER,

Professor of Slavic Languages and Literatures,  
Harvard University.

**YING-TSE**, ying'ts'e', a noted sea port in Manchuria. See NIU-CHUANG.

**YLANG-YLANG**, Attar of, a perfume fully as exquisite and as precious as the much-praised attar of roses. The ylang-ylang tree attains a height of 60 feet and has drooping, greenish-yellow flowers three inches long and extraordinarily fragrant. It is common in the Philippines. It is found chiefly in the well-populated provinces and islands, and the natives say that it thrives best near the habitations of man. The propagation in plantations, by seed or cuttings, about 20 feet apart, each way (108 trees to the acre), is easy, and the growth rapid in almost any soil. The first flowers appear in the third year, the eighth yielding as high as 100 pounds, the bloom occurring every month. The greatest yield is from July to December. The process of converting the long, greenish yellow, fragrant petals of the flower into essence is by the simplest form of distillation, using merely water and the choicest flowers. No chemicals of any kind are required.

**YMIR**, e'mir, in Scandinavian mythology, the personification of Chaos, or the first created being, produced by the antagonism of heat and cold in Ginnungagap, the primeval abyss: Slain by Odin and thrown into Ginnungagap, his flesh was transformed into land, his bones becoming the mountains, his blood the rivers and lakes, his hair the forests, while his skull constituted the heavens, and his brains the clouds.

**YOAKUM**, Tex., town in De Witt and Lavaca counties, 80 miles east of San Antonio, and on the San Antonio and Aransas Pass Railroad. It is situated in an agricultural region, has railroad shops, a canning industry, creamery, a turkey abattoir, bottling works and manufactures of ice, flour and corn meal. Pop. about 4,657.

**YOGA**, yō'gā (meaning, in Sanskrit, concentration) one of the six schools or systems of Brahmanical philosophy, that of Patanjali, the essence of which is meditation. It believes in a primordial soul which has had existence from an earlier period than primeval matter, and holds that from the two arose the spirit of life (Mahanatma). Theoretically at least, its devotees can acquire even in this world entire command over elementary matter by certain ascetic practices, such as long continued suppression of the respiration, inhaling and exhaling the breath in a particular manner, sitting in 84 attitudes, fixing the eyes on the tip of the nose, and endeavoring, by force of mental abstraction, to unite themselves with the vital spirit which pervades all nature and is identical with Siva. When this mystic union is effected, the Yoga can make himself lighter than the lightest, or heavier than the heaviest substance, or as small or as large as he pleases; he can traverse all space, can become invisible, can equally know the past, the present and the future, and can animate any dead body by transferring to it his own spirit. It is claimed that the whole doctrine of the Yoga works toward the establishment of the Supreme Being; and that it claims that it possesses the means by which the soul may become finally united with the Creator from whose hand it came. The system is said to have been founded by Patanjali (q.v.), who claimed that eight distinct stages were neces-

sary in the development of the soul before it reached that condition in which it was exempt from further transmigrations. These stages are yama (self-control), niyama (religious observances), prānāyama (breath regulation), pratyāhāra (restraint of senses), dhāranā (making the mind firm), dhyāna (meditation), samādhi (deep contemplation). These correspond generally to the general characteristics of the system given above. Each stage must follow in its order and is dependent upon the attainment of all the stages that precede it; and the great object of the whole is to reach the final stage. Owing to the difficulty of the attainment of all these successive stages of perfection the adherents of the Yoga believe that it is very rarely that any one reaches them all in this life and that consequently most persons must pass through several births and existences in the attainment of the final goal. In the course of this progress, however, one is believed to acquire wonderful powers. He is enabled to make himself light or heavy, at will, to acquire a knowledge of the past and the future, to understand the language of all animals, to penetrate the thoughts of others; to remember all that has happened to him in supposed former stages of existence; and even to transcend all this and to attain to a knowledge of what is going on or has taken place in the stars and in all other worlds. To these powers the believer in the Yoga adds that of the ability to make himself infinitely small or large beyond imagination. These are accompanied by wonderful powers of body and will and the nicest discrimination in all things, together with the ability to transport oneself anywhere suddenly at will. These wonderful powers are gradually acquired and finally result in the complete separation of the soul from the corporal body in the ultimate triumph of the former.

The Yoga system has always had a stronghold on its followers principally because of the great powers which it claims to bestow upon its devotees, and on account of the fears of those living upon earth who are believed to have attained to these powers.

'Outlines of Indian Philosophy' (Berlin 1907); Garbe, R., 'Sāmkhya und Yoga' (Strassburg 1896); Hall, 'Bibliography of the Indian Philosophical Systems' (Calcutta 1859); Johnston, C., 'The Yoga Sutras of Patānjali' (New York 1912); Macdonell, A. A., 'History of Sanscrit Literature' (London 1913); Markus, 'Yoga Philosophie' (Halle 1886); Müller, F. Max, 'Six Systems of Indian Philosophy' (New York 1899); Paul, 'Yoga—Philosophy' (Benares 1851); Vivekananda, 'Yoga Philosophy' (New York 1898).

**YOKE**, a piece of timber, hollowed or made curving near each end, and fitted with bows for receiving the necks of oxen, by which means two are connected for hauling loads, plows, etc. A frame of wood fitted to a person's shoulders for carrying a pail, etc., suspended on each side. The ancients regarded the yoke as a symbol of slavery, and it was

ary for vanquished armies to pass under, formed like a gallows, of two upright and a third fixed transversely at top. ord *subjugate* (*sub*, under, and *jugum*, is a reminder of this custom.

**YOKKAICHI**, *yō-kā-ē-chē*, Japan, a modern port, with spacious harbor, on the lo and fronting the bay of Ise, 23 miles Nagoya. It is connected by railway and steamship service with most of the ports of foreign countries. Its import trade amounts to over \$5,000,000 yearly, with exports of tea, textiles and porcelain. Its manufactures are faience, paper, and striped cotton. It has modern edifices, including churches, and many tall chimneys, a moderate. The healing hot springs of Yunonaka, 12 miles distant, are famous. Pop. 33,812.

**KOHAMA**, *yō-kō-hā'mā*, Japan, the seaport of the empire, on the Bay of Sagami, about 17 miles southwest of Tokio, which it is the port. Yokohama is of rapid growth, its rise being due to the opening of Japan to foreign commerce and to the settlement here of foreign merchants, connected with the adjacent Kanagawa was designated a treaty-port. The dwelling-houses and residences of the foreign residents are of a Western character, and are built on the bluff overlooking the bay. The commercial buildings to the east of the town, the western part of the Japanese town, and the centre being governed by the prefecture, custom-house, post-office and other official buildings. The bay is beautiful, and, though only an open road, affords a good and commodious anchorage, not only to extensive mercantile shipping, but also to the naval squadrons of foreign powers. Work on a large harbor was laid out in 1889-96, the main object of which was to prevent the gradual silting up of the anchorage; it is enclosed by two breakwaters, one and one-quarter miles long, and another, 1,900 feet long, connected with the first by the capital, 17 miles off. Yokohama is a centre for tourists visiting Japan. The steamships into Yokohama are valued at approximately \$120,000,000, mainly sugar, metals and other manufactures, cotton manufactures, opium, raw cotton and woolens; the exports amount to 1,000,000, mainly raw and manufactured goods, paper, tea, fish, cotton goods, fish-oil and other commodities. The number of vessels entered annually amounts to 3,600 with a tonnage of about 11,500,000 tons, including British, Japanese, Russian, American and other vessels. Pop. 428,663.

**YOKOI HEISHIRO**, *yō-kōy' hāy'shē-rō*, a famous philosopher, educator and statesman, born at Kioto 15 Feb. 1869 for his liberal ideas. Born in Kumamoto in Higo, before his fame as a scholar in Chinese and as a philosopher and expounder of the Oyoméi (q.v.) philosophy made the feudal castle lords confer the honor of his presence and the use of his talents (1845-65), many of the makers of the New Japan being his pupils and carrying out his ideas. His best work was done in his later years (q.v.). He opened a new chapter in the relations of the Orient with the Occident, in 1865 he sent his two nephews to America for education at New Brunswick, N. J.

When in 1867, after the *coup d'état* in Kioto, the new government was formed, the aged scholar was called to advise the new men in power, many of them his former pupils. Gaining their confidence, he proposed, after the example of Abraham Lincoln, that the outcasts, "éta" and "hinin" (not human) numbering nearly one million, should be raised to citizenship and that freedom of conscience be permitted. Attacked on his way home by the ronin ruffians in Kioto, he was shot and beheaded "for holding evil opinions," i.e. Christianity. All the assassins, except one, were caught and beheaded. On the proclamation of the Constitution by the Mikado in 1889, Yokoi was awarded posthumous honors. His son Tokiwo Yokoi is a notable writer in English. Consult Griffis, 'The Japanese Nation in Evolution' (1907); and 'The Rutgers Graduates in Japan,' (1916); and Armstrong, 'Light from the East' (1914).

**YOKOSUKA**, *yō'kō-soo'kā*, Japan, town and naval station on the Bay of Tokio, 12 miles south of Yokohama. It is connected with Yokohama by rail and steamer, and with Kamakura and Tokio by rail. It has a spacious land-locked harbor, large dry docks, a naval arsenal, and ship-building yards suitable for the construction of large war vessels. On these works several millions of dollars were spent in the first years of their operation, and their efficiency is being increased yearly. About a mile from the town is the grave of Will Adams (q.v.), the first Englishman to enter Japan. Pop. about 100,000.

**YOKUTS** ("Indians"), a group of about two dozen small tribes, forming the Mariposan linguistic stock of North American Indians, and occupying an irregular area in central southern California from Fresno River in the north to near the southern extremity of Tulare Lake in the south, and between the Sierra Nevada in the east and the Coast Range in the west; also a strip, 10 to 20 miles wide, extending southeastward from Tulare Lake along the eastern base of the latter range to Mount Pinos, about lat. 34° 45', together with an isolated area, occupied by the Cholovone division, in San Joaquin Valley from the Tuolumne northward. The tribes in general were segregated by the natural features of their territory, such as river valleys, and each tribe had its hereditary chief. Their village consisted of a single row of tule-thatched, wedge-shaped houses, with a continuous *ramada* or shelter of brush along the front. In early times, when large game was abundant, hunting formed an important pursuit, but with the coming of the whites and the disappearance of the game they were compelled to resort almost exclusively to the products of the soil, the streams and lakes, although rabbits and quail were always abundant and were commonly trapped. Seeds of various kinds were gathered for use as food, as also were grasshoppers, caterpillars, worms and the larvae of insects. Dogs were raised for the same purpose and even skunks were not despised; but the coyote and the rattlesnake were always tabooed. Their basketry, excellent in shape, design and execution, formed their chief handicraft. The Yokuts women were chaste before

the settlement of their country by the whites. Marriage was perhaps by purchase, the husband residing at the house of his wife; infanticide was practised in cases of deformity and the dead were generally cremated. The Yokuts are now but a remnant of a once comparatively populous group of tribes. Early warfare with the Paiutes, who pressed them closely from the east, and later and more disastrous contact with white ruffians who found the Indians in their way, practically exterminated many of the tribes. Their present population is about 500 of Indian habits and life. But numerous members of the race have been absorbed into the life of the nation and are no longer numerated as members of the Yokuts tribes.

**YOM KIPPUR**, a rabbinical term designating the Jewish Day of Atonement. See **ATONEMENT**.

**YONEZAWA**, yō'nā-zā-wā, Japan, a city in the northern centre of Hondo, which in Japanese annals had a long and interesting feudal history. Shut in on all sides by the mountains, it was a community apart. On the railroad, which strikes the west coast northward, it is famous for its silken fabrics which for over 150 years have had a reputation throughout the empire. Its old castle grounds, centre of song and story, is now a park and its temples are renowned. Pop. about 38,265.

**YONGAMPO**, yōn-gām'pō, Korea, a seaport on the left bank of the Yalu estuary, near Wiju, with a large and important harbor. It was used as a landing place by the Japanese during the Chino-Japanese War in 1894, and just prior to the Russo-Japanese War of 1904 was an important outpost of the Russian advance into Korea and the headquarters of their timber-felling concession. Russia's strong protests against opening the port to foreign trade was one of the many events that hastened the war. See **KOREA**; **JAPAN**—**RUSSO-JAPANESE WAR**.

**YONGE, Charlotte Mary**, English author: b. Otterbourne, Hampshire, 11 Aug. 1823; d. there, 23 March 1901. She received a private education. She made her name widely known by the publication in 1853 of a novel entitled 'The Heir of Redclyffe,' which exercised an important influence on some High Church minds of that time. She devoted part of the proceeds to fitting out a missionary ship, *The Southern Cross*, for Bishop Selwyn. None of her later novels came up to the standard of 'The Heir of Redclyffe.' Among the best of them are 'Katharine Ashton'; 'The Daisy Chain' (1856), the proceeds of which she devoted to founding a missionary college at Auckland, in New Zealand; 'Hopes and Fears'; 'The Little Duke'; 'The Prince and the Page'; and 'The Dove in the Eagle's Nest.' Her staunch attachment to the Church of England more or less colors all these works, and was also manifested, not only in the field of practical effort, but in the choice of the subjects of some other of her works, such as 'Biographies of Good Women' (1862); 'Life of Bishop J. C. Patterson' (1873); 'John Kelle's Parishes' (1898); and 'The Patriots of Palestine' (1898). Her later novels showed her to be out of touch

with the new generation which had cast off the smug manners and pseudo-culture of the Victorian period. Her remaining works include 'Christian Names: their History and Derivation' (1863); 'Cameos from English History' (1869-99); 'History of Germany' (1877); 'History of France' (1879); 'Universal History for Young People.' For 30 years she edited a High Church magazine known as *The Monthly Packet*. An illustrated edition of her more popular works in fiction appeared in 1888-89. Consult Cole-ridge, Christabel, 'Life of Charlotte M. Yonge' (New York 1903) and Romanes, Ethel, 'Charlotte Mary Yonge, An Appreciation' (London 1908).

**YONKERS**, yōnk'ērz, N. Y., city of Westchester County, on the Hudson River, and on the New York Central Railroad, north of and adjoining New York City. It has regular steamer connection, for passengers and freight, with New York and Albany, and is connected by electric lines with New York, Mount Vernon, New Rochelle and many of the villages and cities on the Hudson.

**Industries**.—The good opportunities for shipment of goods by land and water have aided the industrial growth of the city. In 1920 the estimated number of wage-earners in factories is 15,000, and the yearly production approximates \$75,000,000. The carpet and rug mills alone employ over 5,000 people. There are very large foundries and machine shops, electric motor and electrical supplies factories, besides rubber works, large sugar houses, manufacturing of patent medicines, fuels, etc., confectionery, furniture, roofing materials, clothing and hats. There are large coal yards, grain elevators, the Otis Elevator Company works, ship and boat building yards, bridge works, lumber mills, flour and grist mills and carriage and wagon factories. There are three daily and four weekly newspapers.

**Municipal Improvements and Buildings**.—Yonkers is built on a series of terraces which rise from the Hudson to an elevation of 46 feet above tide-water. The view from the elevated portions includes a long distance up and down the Hudson, the Palisades and the beautiful valley to the east. In the residential part of the city are the homes of many New York City business men. The city has a frontage of nearly five miles on the Hudson, and extends along the Bronx River for about seven miles. The streets, covering 115 miles, are broad, many of them paved, and well-shaded. The city owns and operates the waterworks. There are three small public parks maintained by the city, also two public bath houses, and, on the Hudson, a steel pavilion for recreation. There is an excellent sewer system. The principal public buildings are the government building, the library in Washington Park, the churches, schools and charity institutions. The city hall is of considerable historic interest; it was formerly the Philipse Manor and was built in 1752. Since 1868 it has been used as a municipal building. Another noted building is "Greystone," once the residence of Samuel J. Tilden.

**Churches, Charitable and Educational Institutions**.—There are 30 churches, some of which are buildings of considerable archite-

merit. The city has the Homeopathic al, Saint John's Riverside Hospital, Saint's Hospital, Leake and Watts Orphan the Hebrew Home for the Aged and and private institutions. The educational institutions are Lowden and Halsted s. the Spencerian Business College; a public school, established in 1882; public and elementary schools and kindergartens; ic library (building presented by Andrew zie); the Hollywood Inn for Working-with a library of 10,000 volumes; the n's Institute Library, and Saint Joseph's ng School for Nurses. Near the city are Saint Joseph's Seminary (q.v.), and Saint Vincent Academy (R.C.). The is a school for girls.

**Banks and Finances.**—Yonkers has both national and State banks, the combined deposits totaling to approximately \$18,000,000. The litures for municipal maintenance and ions are annually about \$4,000,000.

**ory.**—In 1650 Adrian Van der Donck veral Dutch families settled in what is alled Yonkers. The region around Yonken belonged to the Dutch. It became a f Philipse Manor in 1672 and the town alled Philipsburg. The town of Yonkers ounded in 1788, and in 1855 it was incor- ded as a village. The town was divided 2; the northern part was chartered as y of Yonkers and the southern part was Kingsbridge. In 1874 Kingsbridge be- a part of New York City. Pop. about )

t Scharf, 'History of Westchester y'; Allison, 'The History of Yonkers'

**YONNE**, yōn, France, a northern interior ment bounded by Seine-et-Marne, Aube, l'Or, Nièvre and Loiret; area, 2,892 miles; capital, Auxerre. The surface erally intersected by low hills, sometimes , but usually covered with fruitful vine- which yield the famous Chablis, Joigny, re and Tonnerre wines. Between the ie beautiful and productive valleys. The elevated land is in the southwest, forming iter-shed between the basins of the Loire eine. The small part belonging to the r is drained by the Veille. All the rest s to the latter, which receives it chiefly : navigable Yonne. The climate is tem- , and the air pure and healthful, except ne wet, marshy spots. The minerals in- iron, red and yellow ochre, building-stone, aphic stones, pavement and potter's clay. manufactures are of coarse woolens, n covers, serge, glue, sugar, glass, etc. rade is in corn, wine, vinegar, wood and al, ship-timber, wool, cattle, iron and Pop. 303,889.

**YUSUFZIE**, yoo-soof'zī, or **YUSUFZAI** dren of Joseph<sup>9</sup>), an important Afghan on the northwest frontier of India. Their ry includes about 2,000 square miles the British district of Peshawur and also lls beyond the north boundary, and their number is estimated at 246,000, including soldiers. The crops of the region are , barley, millets, maize, cotton and mus- eed. Iron, cattle and wool are exported

and the transit trade is considerable. See **AFGHANISTAN**.

**YORICK**, (1) The king's fool, whose skull is apostrophized by Hamlet in the fifth act of Shakespeare's tragedy of 'Hamlet,' (2) The pseudohym adopted by Laurence Sterne in 'A Sentimental Journey,' (3) The parson in Sterne's 'Tristram Shandy,' intended as a portrait of himself.

**YORITOMO MINAMOTO**, yō-rē-tō'mō mē-nā-mō'tō, Japanese soldier and statesman: b. 1146; d. 1199. He became about 1159 the leader of the military clan of Minamoto in its feud with that of Taira. In 1180 he assembled an army of considerable strength, and began operations against the Taira, whom in 1185 he completely destroyed in the naval battle off Dan-no-ura, not far from Shimonoseki. He became practically ruler of Japan, though nominally subject to the Mikado, was made (1192) Sei-i-tai sho-gun, established his capital at Kamakura and laid the basis of the feudal system of Japan. See **JAPAN, HISTORY**.

**YORK, Cardinal.** See **STUART, HENRY BENEDICT MARIA CLEMENT**.

**YORK, Duke of**, a title formerly conferred on the second sons of the kings of England. It was first borne, however, by **EDMUND DE LANGLEY**, fifth son of Edward III, who was created Duke of York in 1385, and died in 1402. He was the founder of the house of York, in English history that of the "white rose," while his elder brother John, fourth son of Edward III, created Duke of Lancaster in 1362, was the founder of the rival house of Lancaster, or the "red rose"; and their claims were contested for nearly half a century in the so-called Wars of the Roses. The first Duke of York was succeeded by his son Edward, who fell at Agincourt in 1415, and was succeeded by his nephew Richard, son of Anne Mortimer, who was granddaughter of Lionel, Duke of Clarence, third son of Edward III. It was by virtue of this descent from the Duke of Clarence that the house alleged its superior right over that of Lancaster, which was descended from the fourth son of Edward III. The title was subsequently borne by Edward Plantagenet, afterward Edward IV; by Richard Plantagenet, supposed to have been murdered in 1483 by his uncle, Richard III; by Henry Tudor, afterward Henry VIII; by Charles Stuart, afterward Charles I; by James Stuart, afterward James II; and was conferred by the pretender, James III, on his second son, Henry Benedict, known in history as Cardinal York, the last of the royal family of the Stuarts. After the accession of the house of Hanover to the British throne, George I created his brother **ERNEST AUGUSTUS** Duke of York and Albany (1716). He died in 1728, and the title was held by **EDWARD AUGUSTUS**, the second son of Frederic, Prince of Wales, and **FREDERIC**, second son of George III, who was made commander-in-chief of the British army, but showed little ability. The title was in abeyance until 1892, when it was conferred on Prince George Frederick Ernest Albert, the second son of Edward VII, who in 1910 ascended the throne as George V.

**YORK** (British, *Caer, Ebroc*; Latin, *Eboracum*), England, an archiepiscopal city, county, municipal and Parliamentary borough, capital of

Yorkshire, 196 miles north-northwest from London by rail, at the confluence of the Foss with the Ouse. It consists of the city proper, and of suburbs, some portions of which are situated across the Foss, and communicate with the rest by several bridges. The city, with a circuit of nearly three miles, is enclosed by ancient double walls, originally Roman, but restored by Edward I, and partly repaired at subsequent periods; the portions which still remain have been converted into promenades, commanding a beautiful prospect of the surrounding country. York is entered by four imposing gates; and is built for the most part in narrow irregular streets, many lined with houses of antique appearance. Improvements have modernized many of the older parts of the city, and many handsome ranges of new buildings have been erected. The minster or cathedral dates from the 7th century, but did not begin to assume its present form till 1171, and was not completed till 1472. A square massive tower rises from the intersection to the height of 235 feet, and two other lofty towers of graceful proportion, 196 feet, flank a richly-decorated western front, divided by paneled buttresses into three compartments, of which that in the centre is chiefly occupied by a beautiful window and a splendid portal. Measured without the walls, the whole length, from east to west, is 524 feet, and the width across the transepts, north to south, 222 feet; length, from west door to choir, 264 feet; length of choir, 162 feet; breadth of body and side aisles, 109 feet. The interior consists chiefly of a lofty nave, separated from its aisles by long ranges of finely clustered columns, a still loftier choir, lighted by a magnificent and beautifully blazoned window, and a lady-chapel continuing the choir, and containing some beautiful monuments. The cathedral has twice sustained serious damage and narrowly escaped total destruction from fire, caused in 1829 by an incendiary lunatic, and in 1840 by the negligence of a workman engaged on its repair. The chapter-house, entered from the north transept of the cathedral, is a richly decorated octagon, and near it is a fine old chapel, originally forming part of the old archiepiscopal palace, and now appropriated to the library. York possesses many other places of worship, including a beautiful Roman Catholic pro-cathedral; and collegiate, grammar, blue-coat, gray-coat and board schools. Other notable buildings and establishments are an ancient Gothic guildhall (1446), and spacious mansion-house adjoining; the fine old ruins of Saint Mary's Abbey; Clifford's Tower, part of the city castle founded by the Conqueror; the fine old merchants' hall; county assize courts; city courts of justice in the late Gothic style (1892); the museum of the Yorkshire Philosophical Society, assembly-room, Masonic hall, baths, art-gallery, free library, the Yorkshire Club-house, concert rooms, two theatres, cemetery, lunatic and blind asylums, dispensary, county hospital, cattle market, almshouses and numerous other charities. The railway station is one of the finest in England. The manufactures include iron castings, bottles, leather, flour, cocoa, gloves, glass, flax spinning, linen and confectionery. York ranks second among English cities, its archbishop having the title of Primate of England (see ARCHBISHOP); its chief magistrate takes the title of lord-mayor. It is the headquarters of

the North-Eastern Railway Company and contains their carriage and wagon shops. There is communication by water with Selby, Goole, Hull, etc. York was the early British Caer Eborac of the Brigantes and under the Romans as Eboracum became their principal seat of power in the north, if not in the whole country. Here died the Roman emperors Severus and Constantius Chlorus, and here it is popularly (but incorrectly) supposed Constantine the Great was born. After their departure it so far retained its importance as to become the capital of Northumbria, whose king, Edwin, in 624 made it an archiepiscopal see. In the 8th century its diocesan school attracted students not only from all parts of the kingdom, but from France and Germany, and sent out scholars who afterward acquired European celebrity. Here the first English Parliament was held by Henry II in 1160. In after-times it makes a distinguished figure in almost all the great epochs and events of English history, during the Civil War surrendering to the Parliamentarians after a siege of several weeks, subsequent to their victory at Marston Moor in the vicinity. Among its distinguished natives are Alcuin, the tutor to the family of Charlemagne; Flaxman the sculptor; and William Etty the painter. Pop 82,282. Consult Drake, F., 'Eboracum: or the History and Antiquities of the City of York' (1843); Raine, J., 'York' (1893); Purey-Cust, A. P., 'York Minster' (1897); Rowntree, B. S., 'Poverty: A Study of Town Life' (1901).

YORK, Me., town, port of entry, York County, on York River, and on the Boston and Maine Railroad, about 45 miles south by west of Portland and 100 miles southwest of Augusta. It is in an agricultural region, but is known as a favorite summer resort. It has a number of buildings of historic interest, among which is the jail, which is one of the oldest in the country. It contains several villages in which are many summer cottages. The town was set off, in 1622, from land granted by the Plymouth Council to John Mason and Ferdinand Gorges. In 1624 the place was called Agamenticus. On 1 March 1640 a territory of 21 square miles was incorporated as a borough by Gorges, and chartered as the city of Gorgeana in 1642. This was the first municipal corporation made by the English in North America. On the death of Charles I, in 1649, Gorgeana City, Isle of Shoals, Wells and Kitterytown united and established a confederacy. In 1652 the confederacy and all of Maine came under the control of Massachusetts. The city charter of Gorgeana was revoked, and the name changed to York. The limits of the present town are about as in 1652. In the early years the town suffered from Indian depredations; one attack, in 1692, resulted in the massacre or capture of about one-half the inhabitants. The population is about 3,000. Consult Emery, G. A., 'Ancient City of Gorgeana and Modern Town of York' (Boston 1873); Baxter, J. P., 'Sir Ferdinand Gorges and His Province of Maine' (1890); id., 'Agamenticus, Bristol, Gorgeana, York' (Portland 1904); Bouvé, Pauline C., 'Old York, a Forgotten Seaport' (in *New England Magazine*, July 1902).

YORK, Neb., city, county-seat of York County, on the Chicago, Burlington and

and the Chicago and Northwestern roads, 50 miles west of Lincoln. It was founded in 1787 and in 1880 was incorporated. It is in an agricultural and stock-raising region, and its industries are connected chiefly with the manufacture of agricultural products. It has a flour mill, machine foundry, large stock yards and grain elevators, and a good Federal post office. The educational institutions are York College (U.B.), founded in 1890; a high school, established in 1878; the Holy Family Academy (R.C.); a business college; four ward schools; three Catholic elementary schools and public schools. The State Odd Fellows Home and others Jewels Home (M.E.) are located here. There are two national banks with a combined capital of \$500,000 and two State banks with a combined capital of \$100,000; one daily and three weekly papers. There are several miles of paved streets, four parks with trees and drives, and a paid fire department with modern fire apparatus. Pop. 7,500.

**YORK, Pa.**, city, county-seat of York County, on the Condorus Creek, and on the Pennsylvania, the York Southern, the Northern and the Western Maryland railroads, 28 miles southeast of Harrisburg, and 95 miles west of Philadelphia. It is in a producing section and has considerable manufacturing interests.

In 1914 (government census) the city had 100 manufacturing establishments, capital or \$29,328,000, with an output valued at \$1,000,000. The foundry and machine products are the largest industry, closely followed by the tobacco products. Other manufactures of which there are large and valuable ones annually are agricultural implements, boxes, food products, carriages, wagons, and wagon materials, confectionery, and grist mill products, furniture, iron and steel products (including nails, spikes, wire etc.), lumber products, paper and wood products, and patent medicines. The vast quantity of goods generated at Yorkhaven, 11 miles north of York, has greatly increased the manufacturing industries of York. There is an extensive manufacturing of the manufactured products and in general merchandise which is distributed to the surrounding towns of a large region. The surrounding country is slightly rolling and has sufficient slope for excellent drainage. The streets are well shaded. The city is laid out in blocks, 520 feet long and 480 feet wide.

There are seven beautiful parks, of which the principal are Highland, Farquhar and Green. The principal public buildings are the city hall, the court house, the county building, the courthouse, county jail, the Masonic Temple, four market buildings, an opera house, three public halls and the public buildings. There is an excellent water supply and a good sewerage system. There are over 60 churches, representing 16 different denominations. The principal charitable institutions and hospitals are the city hospital, charity hospital, county almshouse, Jewels Home, Christian Home and private hospitals. The educational institutions are York College (Presb.); York Academy, founded in 1787; two business schools, Saint Patrick's Academy (R.C.); a Catholic high school, founded in 1870; public Catholic schools, a public library, York

County Law Library, and Saint John's Church free library. There are five national, three State and two private banks.

The government is administered on the commission plan, which provides for a mayor, elected for four years, and four commissioners elected for two years.

A permanent settlement was made in 1735 by a German colony; but in 1741 the town was laid out by John, Thomas and Richard Penn, and incorporated as a borough in 1787. In 1887 York was chartered as a city. In 1749 the first Court of General Quarter Sessions was held here. In 1777 the Continental Congress left Philadelphia, fearing capture by Howe's army, and convened in York 30 September. Congress continued to hold sessions in York until 27 June 1778. Pop. 50,543. Consult Gibson, 'History of York County' (Chicago 1886).

**YORK**, a river in Virginia, formed by the confluence of the Pamunkey and Mattaponi rivers. It is the tidal estuary of the rivers, which begins at West Point and flows southeast to the Chesapeake Bay, into which it empties about 18 miles north of the James River. It is 40 miles long and navigable to the head of tide water. At its entrance, on York Spit, is a lighthouse.

**YORK, Battle of, in the War of 1812.** Perry's victory at Lake Erie (q.v.) and Harrison's defeat of Proctor at the Thames (q.v.) successfully concluded one part of the campaign for the invasion of Canada. As the next step Gen. Henry Dearborn (q.v.) planned to capture York (now Toronto), besiege Fort George (q.v.) by land and water, and then move on to Kingston after being joined by the troops at Buffalo, which were to capture Forts Erie and Chippewa. Leaving Sackett's Harbor (q.v.) defenseless, Com. Isaac Chauncey (q.v.), with 14 vessels, carrying 112 guns and 980 men, conveyed Dearborn, Zebulon M. Pike (q.v.) and 1,600 troops to York, which was attacked on the morning of 27 April 1813. The British garrison of 600 regulars and militia under Major-General Sheaffe were driven back toward their main works but when about 60 yards away a powder magazine was exploded by the British causing great havoc and killing about 40 British and 100 American soldiers, Pike being among those mortally wounded. Nevertheless the Americans pressed forward and finally drove the regulars toward Kingston and captured the militia, besides large quantities of stores and a 10-gun brigade. The public buildings were then set afire. The American loss was about 320 killed and wounded and the British 90 killed, 200 wounded and 300 prisoners. This paved the way for the capture of Fort George (q.v.) and the later battles of Stony Creek, Beaver Dam, Chrysler's Farm, Chateaugay, Lacolle Mill, Fort Erie, Chippewa, Lundy's Lane, Plattsburg and Lake Champlain (qq.v.). Consult Wiley and Rines, 'The United States,' Vol. V, pp. 402-405; Roosevelt, 'Naval War of 1812,' pp. 224-230; Whitney, Henry, 'Life of Pike'; 'American State Papers, Military Affairs,' Vol. I, pp. 442-444; Maclay, E. S., 'History of the Navy,' Vol. I; Cooper, J. F., 'Naval History,' Vol. II; histories of the war by Lossing, Brackenridge and Armstrong.

**YORK COLLEGE**, located at York, Neb. It was founded under the auspices of the United Brethren in Christ, and was opened to students in 1890. It is under the control of the board of trustees composed of five members at large and representatives of four conferences of the United Brethren. Its organization includes the College, the Preparatory Department, the Normal Department, the Conservatory of Music, the College of Commerce, the School of Shorthand, the School of Expression, the School of Art, the School of Telegraphy (organized in 1903) and the Summer School. The college offers classical, philosophical, scientific and literary courses, and confers the degrees of A.B. and B.S. The work of each course is in the main prescribed. The normal department offers a course of two years, and a three-years' teachers' course, which is preparatory to it. The degree of bachelor of didactics is conferred on all graduates from the normal course. A model school was established in 1903. The conservatory of music offers courses in piano, voice and violin, and confers the degree of bachelor of music for graduation. The College of Commerce offers a course of one year, and an advanced course of two terms additional; the degree of bachelor of accounts is conferred. The Summer School courses are intended specially for teachers, and a model school is conducted. Instruction in physical training is given, and an organization of college cadets is maintained for military drill; there is also a field for athletic sports on the campus. The students maintain Young Men's and Young Women's Christian Associations, and two literary societies. York College is considered one of the leading institutions of higher learning in Nebraska.

**YORK AND LANCASTER**, Wars of. See ROSES, WARS OF THE.

**YORK VON WARTENBURG**, yörk fön vär'tën-boorg, Hans David Ludwig, Count, a Prussian field-marshal: b. Potsdam, 26 Sept. 1759; d. Klein-öls, near Breslau, Silesia, 4 Oct. 1830. He entered the army in 1772, but was cashiered for insubordination in 1779, and then served the Dutch in the East Indies 1783-84. He, however, was reinstated in the Prussian army in 1785, after the death of Frederick the Great, and was conspicuously successful as a rear-guard commander in the Jena campaigns. He became major-general in 1807 and governor of the province of Prussia in 1811. He commanded the auxiliary corps. Prussia was obliged to send to aid the French in the Russian War of 1812; but finding the Grand Army doomed, he yielded to the overtures made by the Russians and his corps was "neutralized" by the Convention of Taurögen. His action signalized a turning-point in Prussian history and resulted in the alignment of Prussia with the Allies. He was especially distinguished during the War of Liberation and the invasion of France (1813-14), was ennobled in 1814 and made a field-marshal in 1821.

**YORKE**, yörk, Curtis, pseudonym of S. RICHMOND LEE, English novelist: b. Glasgow. She is the daughter of J. J. Long and was married to J. W. Richmond Lee, a mining engineer. Among her numerous works may be cited 'That Little Girl' (1886); 'A Record of

Discords' (1894); 'Because of the Child' (1896); 'A Flirtation with Truth' (1897); 'A Memory Incarnate' (1902); 'Olive Kinsella' (1905); 'Their Marriage' (1908); 'The Vision of the Years' (1913); 'The Alternate Life' (1916), etc.

**YORKSHIRE**, England, the largest county of the kingdom, bounded on the north by the Tees, separating it from Durham, east by the North Sea, south by Lincoln, Nottingham, Derby and Cheshire, and west by Cheshire, Lancaster and Westmoreland; area, 6,067 square miles. Yorkshire is divided into trithings, or three ridings, respectively, the north, east and west, each having a separate lord-tenant, but a single high sheriff for the county. The main portion of the county forms a large central valley stretching southeast to the Humber, flanked on one side by the Pennine range and on the other by the Cleveland Hills, and drained chiefly by the Ouse and its tributaries. Considerably more of the North Riding is pasture than is under cultivation, but it includes the vale of York, with an area of about 1,000 square miles, in which there is much fertile land growing all kinds of crops. It also includes the Cleveland district, with its great bed of iron ore. In the North Riding is the capital of the whole county, York, Scarborough, a favorite watering place, and Whitby, famous for its jet. In the East Riding the area under cultivation greatly exceeds that laid down in permanent pasture. Its industrial activity is centred in the great seaport of Hull. In the West Riding the proportion of land laid down in permanent pasture is larger than in any other, being two-thirds of that under cultivation. The West Riding has long been famous for its woolen and worsted manufactures, of which it is now the chief seat. Their development has been in modern times aided by the proximity of coal and iron. The great coal field of the West Riding yields not only the Silkstone bituminous coal, most valuable as a house coal, but also the Barnsley thick coal, semi-anthracitic. There are important manufactures of chemicals in both the South and the West Ridings. Leeds produces every variety of woolen goods, as well as manufacturing clothing and paper; Bradford, mixed worsted fabrics and yarns; Dewsbury, Batley and adjoining districts, shoddy; Huddersfield, plain goods, with fancy trousering and coatings; and Halifax, worsted and carpets; Barnsley is famous for its linen manufactures, of which Leeds also is a seat, as well as of that of leather. Next to the woolen and other textile industries comes the manufacture of iron and steel machinery, and implements of every description. Leeds is one of the principal seats of all kinds of mechanical engineering, and Sheffield of iron-work and cutlery. The county was a part of the kingdom of Dera from the 6th century until the Danish Conquest in the 9th century; and it suffered severely under the Norman Conquest. It has many ancient castles and fine examples of ecclesiastical architecture. Pop. 3,584,762.

**YORKTON**, Canada, town and capital of Mackenzie District, Saskatchewan, 100 miles northeast of Regina and on the Canadian Pacific, the Canadian Northern and the Grand

Courtesy of the Booklovers Magazine

**VILLAGE STREET IN YORKTOWN**

railways. There are Dominion lands and title offices here. Manufacturing is of increasing importance. Pop. about 2,309.

**YORKTOWN, Va.**, town, county-seat of York County, on the York River, seven miles from its mouth and 68 miles southeast of Norfolk. It has regular connection with the Chesapeake and Atlantic ports by means of the Old Dominion and other lines of steamers. It is one of the oldest settlements of the United States; it contains the oldest custom-house in the country. It is famous for having been the place where Lord Cornwallis surrendered, and a monument has been erected in honor of the event. This was the last important battle of the Revolutionary War. (See YORKTOWN, SIEGE OF, IN THE WAR OF THE AMERICAN REVOLUTION). Yorktown was the scene of a second siege during the Civil War. (See YORKTOWN, SIEGE OF, IN THE CIVIL WAR). 136.

**YORKTOWN, Siege of, in the Civil War.** On April 1862 General McClellan, with 58,000 men and about 100 guns, started from Fort Monroe on the York Peninsula for his campaign against Richmond. His plan of operation was to move in two columns, one on the right directed toward Yorktown and another along the James River westward of and beyond Yorktown to the city of Williamsburg. Should the Confederates at Yorktown and Williamsburg offer serious resistance he designed to land General McDowell's First Corps, reinforced if necessary, on the left bank of the York or on the right bank, and move it on Gloucester and West Point in order to take in reverse whatever force the enemy might have on the peninsula and compel them to abandon his positions. At the close of the first day's march General Heintzelman's Third Corps on the right bivouacked at Fort Mifflin's Bridge and Cocketown beyond, and the 4th and 5th Keyes' Fourth Corps on the left, at Lee's Mill, near James River. On 5 April McClellan resumed his march for the Halfway Run, between Yorktown and Williamsburg, but did not get on the road when it was ascertained that a large force of the enemy, with General Lee's army, was at Lee's Mills, six miles beyond, on the way over the Warwick, concerning the direction of which McClellan was misinformed. Keyes advanced and in the afternoon of the 6th the situation as reported; and after some shelling he encamped for the night. On the 7th Heintzelman advanced to near Yorktown and came under artillery-fire from the works encamped fronting them, where he was ordered to remain a full month. Yorktown, as is the line of the Warwick southward to the York River, was held by Gen. J. B. Magruder with about 11,000 men. For 10 days McClellan remained in front of Magruder, making some demonstrations, but no serious demonstrations, though urged by President Lincoln on 6 April to advance upon and break the enemy's line. McClellan was instead engaged in bringing up his troops and guns preparatory to a regular siege, as asking for heavy reinforcements and heavy siege-guns. He adopted the slow method of a siege because of his exaggerated estimate of the Confederate strength in his front, though he at no time estimated the forces of Magruder at more than 15,000 to 20,000 and his initial strength of 58,000 men had been in-

creased to 100,970 men present for duty according to his report of 13 April. He declared himself seriously weakened by the fact that McDowell's Corps of 33,400 men, which he had proposed using to flank Yorktown, by Gloucester and West Point, had been withheld from him to protect Washington which had been left with a guard of less than 20,000 raw troops. (See PENINSULA CAMPAIGN OF 1862). However, at McClellan's urgent request Franklin's Division was sent him 10 April, but these troops were held aboard their transports until after the evacuation of Yorktown. On 16 April an attempt was made upon Magruder's lines at Lee's Mill (q.v.) by a reconnoitering force of 200 men who were not reinforced, but resulted in failure, and McClellan, giving up the idea of carrying the Confederate position by assault, devoted his attention entirely to siege operations against Yorktown. Under the direction of Gen. Fitz-John Porter, who was made director of the siege, Gen. J. G. Barnard, chief of engineers, and Gen. W. F. Barry, chief of artillery, the operations were conducted elaborately and with great skill. General Barry reports that the siege train consisted of 101 pieces, as follows: "Two 200-pounder Parrott rifled guns, eleven 100-pounder Parrott rifled guns, thirteen 30-pounder Parrott rifled guns, twenty-two 20-pounder Parrott rifled guns, ten 4½-inch rifled siege guns, ten 13-inch sea-coast mortars, ten 10-inch sea-coast mortars, fifteen 10-inch siege mortars, five 8-inch siege mortars, and three 8-inch siege howitzers. Three field batteries of 12-pounders were likewise made use of as guns of position." These guns were mounted on very elaborate works, some 15 in number, established opposite the town, and the works to its right, at ranges varying from 1,500 to 2,200 yards. In number and weight of metal they were far superior to those of the Confederates. On 17 April Gen. J. E. Johnston had been assigned to the defense of the peninsula and Richmond, and he had on the Yorktown and Warwick line not to exceed 50,000 men. He made no strenuous effort to interfere with McClellan's operations, but determined to hold his position until McClellan was ready to attack and then to fall back without waiting to have his troops driven from their works. By 30 April McClellan had present for duty 112,392 men, including Franklin's division that had been sent to him to turn Yorktown by Gloucester Point or West Point. On 1 May McClellan proposed to open fire on the morning of 6 May with all his guns and to press the siege until final assault should be deemed practicable. But on 27 April Johnston had learned that McClellan's batteries were approaching completion and would be ready to open fire in five or six days and he made his dispositions for retreat. On the night of 3 May, leaving some serviceable heavy guns behind, he evacuated Yorktown and fell back to Williamsburg on the way to Richmond.

E. A. CARMAN.

**YORKTOWN, Siege of, in the War of the American Revolution, Lord Cornwallis**

and the British army, a force of 8,000 men, reached Virginia in May 1781 and in the following August invested Yorktown, on the York River, throwing up earthworks and fortifying the town; he also erected fortifications at Gloucester Pond, opposite Yorktown, and was supported by several British vessels in the York River. Washington feigning activity around New York, left his headquarters on the Hudson 19 August, traveled by land to Philadelphia, then to Elkton at the head of Chesapeake Bay and arrived at Williamstown 14 September. His force consisted of 7,000 French under Rochambeau and 9,000 Americans. On 29 September he invested Yorktown, taking over the command from Lafayette. Meantime, on 28 August, the French fleet of Count de Grasse, numbering 28 ships of the line, with nearly 4,000 infantry on board, reached the Chesapeake and came to safe anchor in the mouth of York River. Cornwallis was securely blockaded both by sea and land, the land forces under Lafayette being sufficient to hold him until Washington's arrival with reinforcements. Just after the arrival of Count de Grasse came also Count de Barras, who commanded the French flotilla at Newport. He brought with him into the Chesapeake eight additional ships of the line and 10 transports; also cannon for the siege of Yorktown. By the beginning of September York River was effectually closed at the mouth and the Americans and the French began to strengthen their lines by land. On 5 September the English Admiral Graves appeared in the bay with his squadron, and a naval battle ensued, in which the British ships were so roughly handled that they were glad to draw off and return to New York. The allied armies, now greatly superior in numbers to the enemy, and confident of success, encamped closely around Yorktown and the siege was regularly begun. The first parallel trench was opened 6 October and completed 9 October, when the Americans opened fire and the cannonade became constant and effective. The second parallel was opened 11 October and on 13 October, in the night, the Americans made an assault and the outer works of the British were carried by storm. At day-dawn on 16 October the British made a sortie from their entrenchments with 350 men and succeeded only in spiking a few guns which were promptly restored to action before they were driven back. Cornwallis then attempted a night escape by boat forces, leaving his sick, wounded and baggage behind, but a terrific storm frustrated the plan. On 17 October Cornwallis proposed to surrender, and on the 19th Major-General O'Hara led out the whole British army from the trenches into the open field, where, in the presence of the allied ranks of France and America, 7,247 English and Hessian soldiers laid down their arms, delivered their standards, and became prisoners of war; the garrison forces becoming prisoners of the United States, while the sea forces were prisoners of the French. The allied American and French losses were about 300 killed, wounded and missing. The British losses were about 550. This was the last important battle of the Revolutionary War.

**YORKVILLE**, S. C., town, county-seat of York County, on the Carolina and North-western and Southern railroads, about 85 miles

north of Columbia. It is in an agricultural region, in which are valuable deposits of iron. It has iron works, machine shops, a saddle and harness factory, spoke and handle works, and lumber mill. There are seven churches and two graded schools (including high school departments), one for colored and one for white pupils. The savings bank has a capital of \$50,000. Pop. 2,326.

**YORUBA**, yó-roo-bá, or **YARRIBA**, yá-ré-bá, Nigeria, West Africa, a former independent state situated north and northeast of the colony of Lagos, extending from Benin on the east to Dahomey on the west and north to Borgu, its area being about 25,000 square miles, most of which is now a part of the British Protectorate of Southern Nigeria. Its history in European knowledge dates to the 17th century, at which time it was an empire consisting of six strong confederate states. About 1830 the empire, weakened by Moslem influences and Tula invaders, broke into a number of weak, quarreling states. They came under British protection in 1893, and while only semi-independent have not lost their sense of nationality. They contrive, also, to preserve most of their government and customs. Much of the country is fertile and well cultivated, and the inhabitants have made great progress in the industrial arts. They are of negro stock but many have light skins, probably due to an infusion of Arab and Berber blood. There is a tradition among them of Oriental origin. Their country was repeatedly raided by slave hunters, and many American negroes are said to have come from there. Their houses are well built, those of their chiefs containing great numbers of rooms. They are largely pagans, but Mohammedanism and Christianity have made way among them. Protestant and Roman Catholic missions have long been at work. Ibadan, to which there is a railway from Lagos, is the largest town, having about 200,000 inhabitants; Oyo, farther to the north, is the capital. Population estimated at between 1,000,000 and 2,000,000.

**YOSEMITE**, yó-sém't-té (Indian, "full-grown grizzly bear") **VALLEY**, in Mariposa County, Cal., on the west slope of the Sierra Nevada, about 150 miles, in direct line, east of San Francisco. This valley is one of the natural wonders of America and is unlike any other known valley in the world. It is about six miles long and from half a mile to a mile wide. It is nearly a mile below the general level of the land near it. Entering the valley from the lower end, the two distinct valley types may be seen, the V-shaped and the U-shaped. (See VALLEYS). It has the characteristics of a gorge and also of a cañon and was eroded from the surrounding granite by glacial action. It is nearly 4,000 feet above sea-level and its walls of granite from 3,000 to nearly 5,000 feet higher. On the north side is a huge block of granite called El Capitan. It projects into the valley so that two of its smooth, almost perpendicular faces are visible: the height is 7,042 feet. Opposite El Capitan are Cathedral Rocks and Bridal Veil Rock. From the summit of El Capitan to the summit of Bridal Veil Rock is one mile; but at the base of the rocks the distance apart is not great.

bottom of the valley widens from El Capitan to the "meadows." Other conspicuous peaks of the unbroken wall are called the Three Brothers (4,630, 5,826, 6,740 feet), the Sentinel (6,114 feet), Cap of Liberty (7,072 feet) and Sentinel Dome (8,117 feet).

About 15 miles above is the source of the Merced River, which flows through the Yosemite Valley. The Illouette River which enters the valley from the south, and the Tenaya Fork, to the northeast, are branches of the Merced. There are two falls and about half a mile of rapids in the Merced River, beginning just below the point where the stream enters the valley. Nevada Fall, the upper one, is about 600 feet high, and Vernal Fall is about 400 feet high. Bridal Veil Falls is on the side of Cathedral Rock which faces the entrance. Bridal Creek here falls over a precipice 630 feet high and flows over an irregular bed which is crossed by a series of cascades that combined make a total fall of about 300 feet. The total fall is about 930 feet. The name comes from the appearance of the highest vertical sheet of water at the point when the amount of water in the stream is too great and when the wind sways the surface of the waters." Just below El Capitan is a small waterfall called Virgin's Tears, which is over 1,000 feet high. The waters flow over this precipice for a few months after the summer heat has melted the mountain snows. The Yosemite Falls, nearly opposite Sentinel Rock, is made by the Merced River in Yosemite Creek. The first vertical fall is about 300 feet; then the water descends, in a series of cascades, about 625 feet and again flows over a precipice 400 feet high. In the "meadows" there is a variety of flowers and grasses in the early summer months. The principal trees are the fir, cedar and oak.

In the vicinity are many features of interest; the masses of dome-shaped rocks and the "big trees" of California are nearby. Among the prominent elevations are North Sentinel, Sentinel Dome, Half Dome and Glacier Point. From Sentinel Dome may be obtained a fine view of the Yosemite Valley and the surrounding country. Glacier Point (7,214 feet) affords a magnificent view. Half Dome is a massive, imposing mass, 8,852 feet high.

The Yosemite Valley was discovered in 1851 by prospectors who were located near a mining camp in the vicinity. The Indians had been driving the white settlers and miners, and in pursuit of the band of red men, they discovered this valley. It was named after an Indian chief. In 1864 Congress gave the Yosemite Valley to the State of California, to be held for public use, resort, and recreation, and to be "inalienable for all time." Private lands have been built wagon-roads to the valley and to various points of interest in the vicinity. In 1886 a railroad, 22 miles long, was built from Merced to Yosemite, the Central Pacific Railroad, to which, whence a stage line extends to the valley. This is now reached by branches of the Northern Pacific and the Union Pacific Railroads. In the grant to the State, in 1864, the Yosemite valley proper there was included as a separate territory for two miles around it.

In 1890 it has been a part of Yosemite National Park, then established by act of Congress; and it was re-ceded by California to the United States 3 March 1905 and is under the jurisdiction of the Department of the Interior.

Consult Bunnell, 'Discovery of the Yosemite' (1893); 'Guide to the Yosemite' (California Geological Survey); Muir, J., 'Our National Parks' (1901); Chase, J. S., 'Yosemite Trails' (1911); Johnson, D. W., 'The Origin of the Yosemite Valley' (1912).

**YOSHIHITO**, Emperor of Japan: b. 31 Aug. 1879. He acceded to the throne of Japan, as mikado, on the death of his father Mutsuhito, 30 July 1912, going through the ceremony of "Receiving the Sacred Treasures." He has received a thorough education at the Peers' School in all the learning of modern Japan, as well as in the arts and sciences of the Occident, has spent years in travel and study throughout his realm so that he understands thoroughly the needs of his people and is broad, liberal and democratic. He served in the House of Peers from 1897, when he came of age, until his accession to the throne. He has three sons, of whom the heir, Crown Prince Hirohito, was born in 1901.

**YOSHINOBU**, Prince Tokugawa, Japanese nobleman and political leader, known as "the last of the Tycoons." See HITOSUBASHI.

**YOSHITSUNÉ**, yō-shé'sū-nā, the mirror of Japanese valor and chivalry: b. 1159, d. 1189; brother of Yoritomo and son of Yoshitomo. He was exiled as a child by the rival Taira (q.v.) in the far north of Hondo. He escaped from the monastery in which he was put, accompanied by Benkei, the famous priest, "jack of all trades." In the rising of the Minamoto clan, in 1180, he was field marshal, fought many battles, winning decisive victory and, in the final naval conflict at Dannoura, annihilated the Taira clan. After this, he was cruelly treated by his jealous brother, Yoritomo, after he had exhausted the benefit of his service. He was attacked and slain by official order and his head sent to Kamakura. According to one legend, however, he fled north, to Yezo, where he was deified by the Ainu, crossed over to Tartary and appeared in history as the redoubtable conqueror Genghis Khan (Genghiz Khan). In legend, the theatre, fiction, toy and picture shops and the Festival of Flags for boys, Yoshitsuné is the chief figure. The story of his beautiful mistress, a dancing girl, Shidzuka Gozen, is one of the classic instances in Japan's rich thesaurus of pathos and womanly devotion. Consult Suyematsú, 'The Identity of the Great Conqueror Genghis Khan, with the Japanese Hero Yoshitsuné' (1879); Griffis' 'The Mikado's Empire' (1912).

**YOUATT**, William, English veterinary surgeon: b. Exeter, Devonshire, 1776; d. London, 5 Feb. 1847. Having been educated for the ministry, he preached for a few years in London, but about 1813 established there a veterinary infirmary, lecturing on veterinary practice 1828-35. He published 'Extent and Obligation of Humanity to Brutes' (1839); 'Treatise on Cattle' (1834); 'Treatise on Sheep' (1837); 'Treatise on the Horse' (1831); 'Treatise on the Pig' (1847); and 'Treatise on the Dog' (1842); and was the owner and editor of *The Veterinarian*, established in London in 1828, the first periodical devoted to that class of subjects.

**YOUGHAL**, yá'hal or yál, Ireland, a seaport of County Cork, on the estuary of the

Blackwater, 27 miles east of Cork. The parish church is formed of the nave and aisles of the ancient collegiate church, built by the Earl of Desmond in 1464; the "water gate," the "clock gate" and Sir Walter Raleigh's house, Myrtle Grove, are other notable features. The export of agricultural produce and the fisheries are the chief industries. According to local tradition the potato was first planted at Youghal by Raleigh, who was mayor in 1588. Pop. 5,393.

**YOUMANS, yoo'manz, Edward Livingston**, American scientist: b. Coeymans, N. Y., 3 June 1821; d. New York, 18 Jan. 1887. Partially blind at times through many years of his life, he pursued his studies by the aid of his sister, Eliza Ann Youmans, and became widely known as a popularizer of science. He lectured extensively and in 1872 founded *The Popular Science Monthly*, which he edited till his death and established the 'International Scientific Series,' in which the works of Herbert Spencer and other prominent scientists were presented to American readers. The volumes of this series were published simultaneously in different languages in London, Paris, New York, Leipzig, Petrograd and Milan. Author of 'Chemical Chart' (1851); 'Handbook of Household Science' (1857); 'Culture Demanded by Modern Life' (1867), etc.

**YOUMANS, William Jay**, American chemist, brother of E. L. Youmans (q.v.): b. Milton, Saratoga County, N. Y., 14 Oct. 1838; d. Mount Vernon, N. Y., 10 April 1901. He studied chemistry at Columbia College and at the Sheffield Scientific School, New Haven, and was graduated from the medical department of the New York University in 1865 and practised his profession for a time at Winona, Minn. In 1871 he was called to assist his brother, who had planned to publish *The Popular Science Monthly*, and from that time till 1900 was actively connected with the management and editorship of that periodical. He edited 'Pioneers of Science in America' (1895); Huxley's 'Lessons in Elementary Physiology,' adding a second part, 'Elementary Hygiene' (1867) and was author of 'Pioneers of Science in America' (1895).

**YOUNG, Alexander**, American Unitarian clergyman: b. Boston, 22 Sept. 1800; d. there, 15 March 1854. He was graduated at Harvard in 1820, studied theology at Cambridge, and in 1825 became pastor of the New South Congregational Church in Boston, which office he held till the close of his life. He was famous as a delineator of character and his discourses in memory of prominent men of his acquaintance, among which were 'Nathaniel Bowditch' (1838); 'President Kirkland of Harvard' (1840), and 'Judge William Prescott, father of the historian' (1844), were widely read. He published 'Chronicles of the Pilgrim Fathers of the Colony of Plymouth' (1841); 'Chronicles of the First Planters of the Colony of Massachusetts Bay' (1846); 'Library of Old English Prose Writers' (9 vols., 1831-34), etc.

**YOUNG, Andrew White**, American political economist: b. Carlisle, N. Y., 2 March 1802; d. Warsaw, N. Y., 17 Feb. 1877. He was for many years a newspaper editor, served in the State legislature and was author of 'Introduction to the Science of Government' (1835);

'First Lessons in Civil Government' (1843), 'Citizen's Manual of Government and Law' (1851); 'The American Statesman: A Political History of the United States' (1855); 'National Economy: A History of the American Protective System' (1860).

**YOUNG, Arthur**, English agricultural writer: b. London, 11 Sept. 1741; d. there, 20 April 1820. He was intended for a mercantile career, but early adopted the profession of agriculture, carrying on farms at various places, and especially on his paternal estate, near Bury Saint Edmunds. He soon became famous as a writer on farming and allied topics and especially for his agricultural tours. He also carried on an extensive correspondence with public men both at home and abroad, Washington being one of his correspondents. In 1784 he began the publication of his 'Annals of Agriculture,' of which 46 volumes were issued. This work had the most important influence upon the art of agriculture in England and a considerable portion of it was translated into French under the auspices of the government. In 1793 he was appointed secretary of the newly erected board of agriculture, with a salary of £400 a year. Young not only visited and examined with great attention many parts of England and Ireland, but also made several tours on the Continent. His work was highly important, not only in its service to agriculture but from the standpoint of social and political observation. He became blind some years before his death. Among his numerous works are 'The Farmer's Letters to the People of England' (1767; enlarged edition 1777); 'Six Weeks' Tour through the Southern Counties' (1768); 'Six Months' Tour through the North of England' (1770); 'Farmer's Guide' (1770); 'Farmer's Tour through the East of England' (1771); 'The Farmer's Calendar' (1771); 'Tour in Ireland' (1780); 'Travels in France during the Years 1787-89' (1792-94); treating of agriculture and national resources, the social and political condition of the people, the most trustworthy source of information regarding the state of France on the eve of the Revolution; 'Essays on Manures' (1804); 'The Rise of Prices in Europe' (1815). By order of the French Directory his agricultural works were published in French in 20 volumes entitled 'Le Cultivateur Anglais' (1800-01). Consult Leslie, Stephen, 'Studies of a Biographer' (1898); his Autobiography edited by Miss Betham Edwards (1898); and bibliography by Anderson in Hutton's edition of 'Tour in Ireland' (1892).

**YOUNG, Brigham**, president of the Church of Jesus Christ of Latter-day Saints (commonly called the "Mormon" Church) from 1844 to 1877; b. Whittingham, Vt., 1 June 1801; d. Salt Lake City, 29 Aug. 1877. In early life he moved to Cayuga County, N. Y., where he followed the occupation of carpenter and glazier. In 1829 he moved to Mendon, N. Y., where he obtained from Samuel H. Smith, brother of Joseph Smith, the prophet, a copy of the Book of Mormon. His investigation resulted in his conversion and he joined the Church, being baptized and confirmed 14 April 1832. He was ordained an elder and immediately began active service in the ministry, preaching and baptizing in the regions about Mendon. When the main body of the Latter-day Saints settled

rtland, Ohio, he also made his residence and was actively engaged traveling and ng in the ministry. He also spent much time as a carpenter and builder, assisting the erection of the Kirtland Temple in 1836, and having the supervision of much work on that building. When the Council of the Twelve Apostles was organized in 1835 he was chosen as a member of that body, following the death of David W. Patten, e president of that council, which is the 1st council in the Church. He passed through the persecutions in Missouri in 1838 and led the members of the Church from that state to their refuge of safety in Illinois, during the exterminating order given by Joseph and Hyrum W. Boggs of Missouri. In the fall of 1839 he started on a mission to Great Britain, where, with other members of the Council of Twelve Apostles, he labored until 1841, preaching and organizing branches throughout the British Isles, where thousands of converts joined the Church. Following the assassination of Joseph and Hyrum Smith, in 1844, Brigham Young, by virtue of his position as president of the Twelve Apostles, became the presiding prophet of the Church, and when the Council of the First Presidency was again organized, he was unanimously chosen president, with Heber C. Kimball and Willard Richards as his counselors.

On the forcible expulsion of the Latter-day Saints from Illinois in 1846, he led the Latter-day Saints through toils and dangers, which required but the most untiring energy could have been exerted, over the plains and tablelands to the shores of the Great Salt Lake. Here, in the foothills of the Rocky Mountains, he founded Salt Lake City, 24 July 1847, in a land most uninhabited.

Due to untiring industry and determined perseverance, this exiled people, under his direction, soon made the deserts blossom and the places fruitful and a pleasant habitation. In 1849 an attempt was made to organize a new state to be called the State of Deseret, that the name given by the Latter-day Saints to that region. The United States government refused to sanction the new State, but in 1850 the Territory of Utah was organized and Brigham Young was appointed governor by President Millmore. He served in that capacity until 1858 when he was succeeded by Alfred Cummins of Georgia. A false report having reached Washington that the "Mormons" had rebelled, the court records and were in rebellion, President Buchanan sent out an army to the Territory. President Young declared that the Latter-day Saints had been driven and persecuted by armed forces so many times that they would not be so driven again. If an army with intent entered the Territory they would find it a barren waste, in the condition in which pioneers found it in 1847. The body of the prophet journeyed to the southern portion of the Territory, leaving in Salt Lake City only a few forces to apply the torch to every settlement, including their homes, that would burn. It was discovered that the records were false and that the report of a "Mormon" rebellion was false, the matter was amicably set-

ring the administration of President Brigham Young, the doctrine of marriage for eternity, and the practice of plural marriage, was openly taught. The doctrine was based on a revelation given to

Joseph Smith and recorded in July 1843. The practice of plural marriage brought on opposition, and laws were later passed by Congress against the doctrine, which finally resulted, during the administration of President Wilford Woodruff, in the abandonment of the practice by the Latter-day Saints.

Brigham Young was the friend of true education and with his associates founded the University of Deseret, now the University of Utah; the Brigham Young Academy, now the Brigham Young University in Provo, and the Brigham Young College in Logan, Utah. He encouraged and assisted in the building up of the Union Pacific and Southern Pacific railroads and the telegraph line across the plains, and in various other ways was the prime mover in the great development of the West. See **MORMONS**.

**YOUNG, Charles Augustus**, American astronomer: b. Hanover, N. H., 15 Dec. 1834; d. 4 Jan. 1908. He was graduated at Dartmouth in 1853, was professor of mathematics, physics and astronomy in Western Reserve College (1857-66); and of astronomy and physics in Dartmouth (1866-77). He was professor of astronomy at Princeton 1877-1906. He accompanied the eclipse parties to Iowa in 1869, and to Spain in 1870; the transit of Venus party to Peking, China, 1874, and organized the Princeton eclipse expedition to Denver in 1878. He was the discoverer of the green line of the solar corona in 1869, identifying it with the line 1,474 of Kirchhoff's scale. At the 1870 eclipse he detected the so-called "reversing layer" surrounding the solar photosphere, and in 1872 at Sherman, Wyo., noticed the bright reversal of many lines of the solar spectrum in ordinary sunlight. He was recognized as an authority in spectroscopy and lectured in the courses of the Peabody Institute at Baltimore, the Lowell Institute at Boston, and at many colleges. He wrote 'The Sun' (1882); 'General Astronomy' (1889); 'Elements of Astronomy' (1890); 'Lessons in Astronomy' (1891); 'Manual of Astronomy' (1902).

**YOUNG, Charles Mayne**, English tragedian: b. London, 10 Jan. 1777; d. Southwick, Sussex, 28 June 1856. In 1798 he made his debut at Liverpool as Young Norval and his first appearance in London, in 1807, was as Hamlet. As Hamlet, Iago and Falstaff he was seen at his best, but his repertoire was very extensive. In 1829 he declined an offer of \$50,000 for a 10 months' tour in the United States and in 1832 retired with a fortune of \$300,000. At his farewell benefit at Covent Garden, 31 May 1852, he appeared as Hamlet, with Mathews as Polonius, and Macready as the Ghost. Consult J. C. Young, 'Memoirs of Charles Mayne Young' (1871).

**YOUNG, Clark Montgomery**, American educator: b. Hiram, Ohio; d. 1908. He was graduated at Hiram College and after 1833 was employed in educational work in South Dakota. He was secretary of the Territorial board of education of Dakota in 1889 and of the State board of education of South Dakota, and in 1892 became professor of history and sociology in the University of South Dakota, where he was dean of the faculty from 1902. Author of 'The State and Nation' (with G. M. Smith); 'History and Government of South Dakota'; 'Elements of Pedagogy'; etc.

**YOUNG, Edward**, English poet: b. Upham, Hampshire, 3 July 1683; d. Welwyn, Hertfordshire, 5 April 1765. He was educated at Oxford and in 1708 was nominated to a law fellowship in All Souls College. Befriended by the Duke of Wharton, an annuity of £100 was granted him by the duke. In 1719 and 1821, respectively, appeared his tragedies of 'Busiris' and 'Revenge,' both produced at Drury Lane. In 1725 he began the publication of a series of satires, 'The Universal Passion.' He now took holy orders and in 1728 was nominated one of the royal chaplains. In 1730 the College of All Souls presented him with the rectory of Welwyn, in Hertfordshire, to which the lordship of the manor was attached. In 1731 he married Lady Elizabeth Lee, daughter of the Earl of Lichfield, and after his marriage the poet lived much in retirement at Welwyn, sadly disappointed that church-preference, which he so eagerly desired and so unscrupulously belauded those in power to obtain, was refused him. The work by which he is best known is 'The Complaint, or Night Thoughts on Life, Death and Immortality' (1742-45), a series of argumentative poems in blank verse, intended to prove the immortality of the soul and the truth of the Christian religion—a work displaying great force of pious and somewhat gloomy reflection, and containing many lofty passages, but marred by a straining after antithesis and ornament. The 'Night Thoughts' were translated into French and German and were as popular on the Continent as at home. Of Young's three tragedies, 'Busiris' (1719); 'The Revenge' (1721); and 'The Brothers' (1753), only the second has kept a place on the stage. His 'Night Thoughts' has never since ceased to be popular and many of its sententious lines have become proverbial. The poem is not destitute of real excellence, but a note of insincerity runs through it and the poet too often substitutes pomposity for dignity. Consult Mitford edition of Young's 'Poetical Works' with 'Life' (1854); Thomas, 'Le poète Edward Young' (1901); 'Worldliness and Other-Worldliness,' by George Eliot, in *Westminster Review* for 1857, reprinted in her 'Essays and Leaves from a Notebook' (1884).

**YOUNG, Ella Flagg**, American educator: b. Buffalo, N. Y., 15 Jan. 1845; d. Washington, D. C., 26 Oct. 1918. She was educated at the Chicago Normal School, and took the degree of Ph.D. at the University of Chicago in 1900. She engaged in teaching in 1862, and was married to William Young in 1868. She was appointed superintendent of schools in Chicago in 1887, and in 1899 she became professor of education at the University of Chicago. She served as principal of the Chicago Normal School in 1905-09, and in 1909 she again became superintendent of Chicago schools, resigning in 1915. She was actively connected with various educational associations, and was in 1910-11 the first woman president of the National Education Association. In 1906-09 she edited the *Educational Bi-Monthly*. She published 'Isolation in the School' (1901); 'Ethics in the School' (1902); 'Some Types of Modern Educational Theory' (1902), etc. (consult McManis, John T., 'Ella Flagg Young' (Chicago 1916)

**YOUNG, Franklin Knowles**, American author and inventor: b. Boston, Mass., 21 Oct. 1857. He is the inventor of an automatic breech action for small arms and field artillery. Author of 'The Minor Tactics of Chess' (1874); 'The Major Tactics of Chess' (1898); 'Grand Tactics of Chess' (1898); 'Chess Strategies Illustrated' (1900); 'Napoleon's Campaigns.'

**YOUNG, Sir Frederick**, English publicist: b. London, 21 June 1817; d. 9 Nov. 1913. He was formerly a London merchant and traveled extensively in Greece, Turkey, South Africa and Canada. He was active in securing Victoria Park, London and Epping Forest to the public, and in establishing the People's Palace. He took great interest in emigration and was one of the earliest advocates of imperial federation. He published 'Long Ago and Now' (1863); 'New Zealand: Past, Present, and Future'; 'A Winter Tour in South Africa' (1890); 'A Scheme for Imperial Federation' (1895); 'Exit Party' (1900); 'A Pioneer of Imperial Federation in Canada' (1902), etc., and edited 'Imperial Federation' (1876).

**YOUNG, Frederick George**, American educator: b. Burnett, Wis., 3 June 1858. He was graduated at Johns Hopkins University in 1886; was vice-principal of the State Normal School, in Madison, S. Dak., 1887-90; principal of the Portland High School, Ore., 1890-94; president of Albany College, Ore., 1894-95; and was appointed professor of economics and history in the University of Oregon in the year last named. Since 1908 he has been secretary of the Oregon Conservation Commission. He edited 'Sources of the History of Oregon,' and is editor of the 'Quarterly Journal of the Oregon Historical Society.' Author of 'Exploration Northward' (1898); 'The Lewis and Clark Expedition in American History' (1901); 'Procedure for Tax Reform in Oregon' (1909), etc.

**YOUNG, George Ulysses**, American mine owner and public official: b. Hamburg, Ind., 10 Feb. 1867. His parents emigrated to Kansas in 1880, and two years later, he began teaching school. He was admitted to the bar in 1890, and worked for several years in railroad construction. He was principal of the Williams schools (Arizona) for four years, and while there was owner of the Williams News, with Capt. W. O. O'Neill. Since 1903 he has been in the mining business, becoming vice-president and general manager of the Madizelle Mining Company, and president of the Young Mines Company. In 1916 he was elected mayor of Phoenix, Ariz., the first to serve under the commission form of government. From 1909-12 he was territorial secretary of Arizona.

**YOUNG, James**, Scottish chemist: b. Glasgow, 13 July 1811; d. 14 May 1883. He began his career as a cabinetmaker, but in the evenings studied chemistry under Professor Graham in Anderson's College, Glasgow, and became his assistant both there and afterward at University College, London (1832-38). Receiving appointments in chemical works at Manchester and elsewhere, he discovered a method of distilling oil from bituminous shale, and thus became the founder of the mineral-oil industry of Scotland, besides leading to the development of the petroleum industry in

America and elsewhere. (See **PARAFFIN**). He acquired a large fortune, endowed a chair of chemistry in Anderson's College, and fitted out at his own expense an expedition in search of Livingstone in 1872.

**YOUNG, James Thomas**, American publicist: b. Philadelphia, Pa., 23 Sept. 1873. He was graduated at the University of Pennsylvania 1893, and later studied at German, French and Swiss universities, taking the degree of Ph.D. at Halle in 1896. He is at present professor of public administration, University of Pennsylvania. He is also the author of 'The New American Government and Its Works' (1915), and articles on political science and university training for business.

**YOUNG, Jesse Bowman**, American Methodist clergyman and author: b. Berwick, Pa., 5 July 1844; d. 1914. He graduated at Dickinson College in 1868, but had previously served three years in the Union army during the Civil War, becoming captain in the 84th Pennsylvania volunteers. Entering the ministry in 1868, he held pastorates in Pennsylvania and Kansas City, Mo., and was subsequently editor of the *Central Christian Advocate* (1892-1900). Author of 'What a Boy Saw in the Army'; 'Days and Nights on the Sea'; 'Helps for the Quiet Home' (1900); 'Our Lord and Master' (1903); 'Wellsprings in the Desert' (1905); 'Charms of the Bible' (1910); 'The Battle of Gettysburg' (1913), etc.

**YOUNG, SIR JOHN**, **BARON LISGAR**, English statesman: b. Bombay, India, 31 Aug. 1807; d. Ireland, 6 Oct. 1876. He was graduated at Oxford in 1829, called to the bar in 1834, and sat in the House of Commons in 1831-55. He was lord of the treasury 1841-44; secretary of the treasury in 1844-46; chief secretary for Ireland in 1852-55; and lord high commissioner of the Ionian Islands 1855-59. He succeeded to the baronetcy on the death of his father in 1848 and from 1861 to 1867 was governor to New South Wales. Appointed governor-general of Canada in 1868 he filled this post till 1872, when he was succeeded by the Earl of Dufferin. During his Canadian governorship he suppressed the Riel rebellion in 1870 and was rewarded with the title of Baron Lisgar.

**YOUNG, John Russell**, American journalist: b. Downingtown, Pa., 20 Nov. 1841; d. Washington, D. C., 17 Jan. 1899. In 1857 he was copyholder on the *Philadelphia Press*; and later its news editor. At the outbreak of the Civil War he became war correspondent, and was with the Army of the Potomac from the battle of Bull Run to the end of the Chickahominy campaign, when he returned to Philadelphia and became managing editor of the *Press*. In 1865 he joined the editorial staff of the *New York Tribune*, resigning in 1869; established the *Morning Post* in Philadelphia; and the *Standard* in New York (1869); and was European correspondent of the *New York Herald* (1871-77). As correspondent of that paper he accompanied General Grant in his journey round the world in 1877, and was attached to the editorial staff of the *Herald* 1879-82. He was Minister to China 1882-85; and was appointed librarian of Congress 30 June 1897. Author of 'Around the World with General Grant' (1879); and editor of 'Memorial History of Philadelphia' (1895).

**YOUNG, Julia Evelyn**, American verse writer and novelist: b. Buffalo, N. Y., 4 Dec. 1857. She has published 'Adrift: A Story of Niagara' (1889); 'Glynn's Wife: A Story in Verse' (1896); 'Thistle-Down,' poems; 'The Story of Savilla,' verse (1897); 'Black Evan, A Tale of the Forty-Five' (1901), etc.

**YOUNG, Lucien**, American rear admiral: b. Lexington, Ky., 21 March 1852; d. 2 Oct. 1912. He was graduated at the United States Naval Academy in 1873, was promoted commander in 1902, captain in 1906 and rear-admiral 17 March 1910. He received two gold medals and other signal honors in recognition of his heroism in life saving on several occasions, and was advanced three numbers in rank for his services in the Spanish-American War, in which he commanded the *Hist*. He was captain of the Port of Havana in 1899-1900, and commander of the United States naval station at Hawaii in 1900-01. He commanded the *Bennington* when it was wrecked by a boiler explosion and beached off the coast of San Diego, Cal., 21 July 1905, but was exonerated from blame. He was captain of the Mare Island Navy Yard at the time of the San Francisco earthquake and fire, and distinguished himself in relief work. He was later transferred to Key West, Fla. He wrote 'Simple Elements of Navigation' (1890); 'The Real Hawaii' (1899).

**YOUNG, Robert**, Scottish Biblical scholar: b. Edinburgh 10 Sept. 1822; d. there, 14 Oct. 1888. He became a printer and superintended the Mission Press at Surat, India (1856-61). He subsequently devoted himself to preparing, printing and publishing at Edinburgh a long series of works of somewhat narrow but remarkable Biblical scholarship; among them were an independent translation of the Bible; 'Marginal Readings (10,000) for the English Testament'; 'Concise Critical Comments on the Holy Bible'; 'Grammatical Analysis' of the Hebrew, Chaldee and Greek Scriptures (1885); 'Hebrew Vocabulary'; and a laborious 'Analytical Concordance to the Bible,' giving 311,000 references (1879), which has gone through many editions and remains a highly valuable reference work.

**YOUNG, Robert Anderson**, American Methodist clergyman: b. Knox County, Tenn., 23 Jan. 1824; d. 1902. He was graduated at Washington College, Tenn., in 1844; entered the Methodist ministry, and held pastorates in several cities in Tennessee. He was president of the Wesleyan University, Florence, Ala., 1861-64; financial secretary of the board of trustees of Vanderbilt University, 1874-82; secretary of the board of missions of the Methodist Episcopal Church, South; and secretary of the Tennessee Conference for 21 years. He was editor of the *Advocate of Missions*, and author of 'Personages'; 'Ariel'; 'Twenty Thousand Miles'; 'Celebrities, and Less,' etc.

**YOUNG, Samuel Baldwin Marks**, American soldier: b. Pittsburgh, Pa., 1840. He rendered important service in the Civil War, entering the Volunteer Army of the Union in 1861 as a private, and rose to a colonelcy at the end of the war. He was brevetted major for services at Sulphur Springs (1863); lieutenant-colonel at Amelia Springs (1865); colonel at Sailors Creek (1865) and brigadier-general of volunteers for his share in the final

action against General Lee. At the close of the Civil War he entered the regular army as second lieutenant, took part in the Indian Wars, commanded a brigade at Santiago, and won a decisive victory at Las Guasimas 24 June 1898. In 1899 he was in charge of the cavalry advance of Lawton's Division in its march through northern Luzon, and for his services was appointed military governor of northwestern Luzon; and later commander of the first district of the Department of Northern Luzon. He was then appointed commander of the Department of California. In 1902 he became first president of the Army War College Board, chief of staff and lieutenant-general of the army. He was retired 9 Jan. 1904. In 1909-10 he was president of the Brownsville Court of Inquiry; and since May 1910, has been governor of the Soldiers' Home at Washington, D. C.

**YOUNG, Samuel Hall**, American Presbyterian clergyman: b. Butler, Pa., 12 Sept. 1847. He was graduated at the University of Wooster, Ohio, in 1875, and at the Western Theological Seminary, Allegheny, Pa., in 1878; and ordained in the Presbyterian ministry in 1878. Going to Fort Wrangel, Alaska, as a missionary and explorer in 1878, he organized the first Protestant church in Alaska in 1879; and afterward held pastorates in California, Illinois, Iowa and Ohio. Sent to the Klondike in 1897, he established the First Presbyterian Church in Dawson in 1898; and organized missions in Eagle, Romfort, Nome and Teller. In 1901 he was appointed superintendent of all the Presbyterian missions in Alaska, which office he filled until 1913, when he became special representative for Alaska of the Presbyterian Board of Home Missions with headquarters in New York.

**YOUNG, Thomas**, English physicist and archæologist: b. Milverton, Somerset, 13 June 1773; d. London, 10 May 1829. He was of Quaker parentage, and at the age of 14 possessed a remarkable knowledge of Latin, Greek, French, Italian, Hebrew, Persian and Arabic. He studied medicine at London and Edinburgh, taking his M.D. at Göttingen in 1796 and later studying at Cambridge. As early as 1799 Young wrote his celebrated memoir on the 'Outlines and Experiments respecting Sound and Light,' which speedily conducted him to the discovery and demonstration of the interference of light. This discovery alone, according to Sir J. Herschel, would have sufficed to have placed its author in the highest rank of scientific immortality. He described astigmatism in 1801; formulated a correct theory of color perception; and made important contributions to hæmodynamics. In 1801 he became professor of natural philosophy at the Royal Institution, and in 1802 foreign secretary to the Royal Society—an office which he held for the remainder of his life. The series of lectures delivered in connection with his professorship form the substance of his great work, 'Natural Philosophy and the Mechanical Arts' (1807). In 1811 he was elected physician to Saint George's Hospital. In 1818 he was appointed secretary to the board of longitude, superintending the 'Nautical Almanac.' He became also a linguist of high abil-

ity and is known for his successful pioneer work in deciphering Egyptian hieroglyphic inscriptions and working out the hieroglyphic alphabet. He was author of many scientific papers and of 'An Account of Some Recent Discoveries in Hieroglyphical Literature and Egyptian Antiquities' (1823). Consult Peacock, 'Life of Young,' and 'Miscellaneous Works,' edited by Peacock and Leitch (1855).

**YOUNG, Sir William**, Canadian jurist and statesman: b. Falkirk, Scotland, 8 Sept. 1799; d. Halifax, Nova Scotia, 8 May 1887. He was educated at Glasgow University, and later joined his parents in Nova Scotia, where he was admitted to the bar in 1826. He was elected to the legislature of Nova Scotia in 1832, and in 1839 he was, with Herbert Huntington, delegated to go to England to urge the establishment of a responsible government for Nova Scotia. He was appointed a member of the Executive Council in 1842, and in 1843-54 he was speaker of the legislature. He was Premier and Attorney-General of Nova Scotia in 1854-57, and was again Premier in 1859-60. He then retired from politics, and was appointed Chief Justice of the Supreme Court of Nova Scotia in August 1860. He was knighted in 1868; and in 1881 he retired from the bench.

**YOUNG, William**, American poet and dramatist: b. Illinois 1847. He has published 'Wishmakers Town,' poems (1885-98); and the plays: 'Jonquil' (1871); 'The Rogue's March' (1872); 'Pendragon,' verse (1881); 'The Rajah' (1883); 'Ganclon,' verse (1888); 'The Home of Mauprat,' with J. G. Wilson (1882); 'Joan of Arc,' adaptation in verse (1890); 'If I Were You' (1892); 'Young America' (1894); 'The Princess of Bagdad' (1896); 'Ben Hur,' dramatization (1899); 'Woman's Wiles' (1898); 'The Sprightly Romance of Mersac' (1900); 'Oh, What Riddles these Women Be!,' narrative poem (1900); 'A Japanese Nightingale,' a dramatization (1903); and 'The Sea-Green Man' (1907).

**YOUNG ENGLAND**, a political party active in London about 1844 and led by Mr. Disraeli, after he had begun to oppose the general policy of Sir Robert Peel. Besides its founder it contained some young men of ability and position, prominent among them being Lord John Manners, later Duke of Rutland; George Smythe, afterward Viscount Strangford; and Baillie-Cochrane, afterward Lord Lamington. Its program was the reconciliation of the aristocracy and the Church on the one hand, and the people on the other; and its adherents sought to re-establish the political ascendancy of the aristocracy by demonstrating its ability to govern. Its principles were attractively expounded in Disraeli's two fictions, 'Coningsby' and 'Sybil.'

**YOUNG GERMANY**, a group of literary and political innovators in Germany, headed by Heine (q.v.). Its followers were devoted to the promotion of liberal ideals in literature and in politics, among them being Börne, Gutzkow, Laube, Heller and Kühne. The movement was strongest in the 1830's and collapsed after the failure of the revolution of 1848.

**YOUNG IRELAND**, the name applied to an Irish political group, active between 1840

and 1850. They at first adhered to O'Connell, but soon became very radical in their opinions; advocated physical force, and separated from the conservative Irish politicians in 1844. *The Nation* was their political organ and in this journal the Irish people were constantly incited to revolt. In 1848 John Mitchell (q.v.), one of the leaders of the party, was arrested and sent to Tasmania, and the attempted insurrection which followed soon collapsed, two of the leaders, T. F. Meagher (q.v.), and W. S. O'Brien (q.v.), being sentenced to death, but their sentences were presently commuted to transportation.

**YOUNG ITALY** ("GIOVANE ITALIA"), a society of Italian republicans formed by Giuseppe Mazzini (q.v.) in 1831, whose aims were the emancipation of the Italian peninsula from the control of Austria, and the union of the various portions of the country under a republican rule. Its greatest activity was in 1834, when Mazzini led an unsuccessful invasion of Savoy. The influence of the society soon declined, but it was of service in arousing Italian patriotism and it formed the model for similar organizations elsewhere in Europe, such as Young France, Young Germany, etc.

**YOUNG MEN'S CHRISTIAN ASSOCIATION.** A Young Men's Christian Association is an organization composed of young men who are united together for the purpose of ministering to the spiritual, intellectual, social and physical needs of young men. Any young man of good moral character, regardless of race or creed, may become a member of this organization and enjoy its privileges; but only active members, who must be in communion with a Protestant evangelical church, can vote or hold office. Local associations are usually under the administration of a board of directors, which employs to carry on its work officers known as general secretaries, physical directors, boys' secretaries, etc. Local societies are independent and autonomous in their administration. Local societies are affiliated together into national and sometimes into international unions. These national unions are under the administration of a national committee. The national organizations are further united into a world's organization, having its headquarters at Geneva, Switzerland. The world's organization is administered by what is known as the Central International Committee of Young Men's Christian Associations, 3 Rue Général Dufour. The International Committee of the North American Young Men's Christian Associations is located at 347 Madison avenue, New York City. The chairman is Alfred E. Marling. The vice-chairman for home work is William Sloan and the vice-chairman for foreign work is William D. Murray. The general secretary is John R. Mott.

**History.**—The establishment of the Young Men's Christian Association was occasioned by the growth of the modern city. The city movement which has spread throughout the more industrial parts of the world created an environment which made necessary special efforts in behalf of young men. Without the rise of the city, the parlors, gymnasiums, reading-rooms, educational classes, Bible studies, religious meet-

ings and 1850. They at first adhered to O'Connell, but soon became very radical in their opinions; advocated physical force, and separated from the conservative Irish politicians in 1844. *The Nation* was their political organ and in this journal the Irish people were constantly incited to revolt. In 1848 John Mitchell (q.v.), one of the leaders of the party, was arrested and sent to Tasmania, and the attempted insurrection which followed soon collapsed, two of the leaders, T. F. Meagher (q.v.), and W. S. O'Brien (q.v.), being sentenced to death, but their sentences were presently commuted to transportation.

young men throughout the world with its secretaries, directors, committees, costly buildings and mighty influence would never have been born. The association movement was founded by a young man who came from the country to the city. It was founded primarily for commercial young men living away from home in cities. Without the spread of the city it would have remained a London institution, and never have become a world-wide organization. The city has become the dominant factor in modern life. Young men form the largest and most important element of the large army which is annually invading the city from the country. The proportion of young men in the city is much larger than in rural districts. In the city, the home and the church have a smaller place in the life of the average young man than in the country. The city is full of opportunities to gratify temptation. Contrasted with the country, where life is in the open air and activity is chiefly muscular, life in the city is indoors and far more full of nervous excitement. It should also be said that the city has brought young men together in large numbers, and so made possible an organization among themselves in their own behalf.

The history of the association falls into four periods: (I) The Founding of the Association, 1844-55; (II) The Development of the Association Ideal, 1855-78; (III) The Expansion of the Movement, 1879-1913; (IV) The Work During the World War, 1914-19.

**Period I, 1844 to 1855. Founding of the Young Men's Christian Association.**—The founder of the Young Men's Christian Association, George Williams, later Sir George Williams, who was born at Ashbury Farmhouse, near Dulverton, southern England, in 1821, grew into manhood at the time when the industrial revolution in England was attracting young men from the country to the town. He went to London in October 1841, and became a clerk in the dry goods establishment facing Saint Paul's churchyard, of which he was afterward the proprietor. At that time there were some 80 young men employed in the different departments of the business. Through Mr. Williams' efforts, a Young Men's Christian Association was organized, for the purpose of establishing religious services and Bible classes among the young men employed in various houses of business in London. This organization took effect on 6 June 1844. The name was suggested by Christopher Smith, George Williams' roommate. The constitution provided that the association should seek to promote the spiritual and mental improvement of young men engaged in the drapery trade, that its membership should be young men who gave decided evidence of conversion to God and that its management should be in the hands of a small board chosen from the membership. This movement rapidly assumed important proportions. Prayer meetings and Bible classes were soon established in 14 different business houses, and a missionary to young men was employed in January 1845. In 1848 apartments were rented, in which a library, reading-room, restaurant, social parlors and educational classes were provided; and young men who made no religious profession were invited, upon the payment of a small fee, to use

the privileges of the institution, though they were given no share in its management and were known not as members but associates. A lecture course was established, which soon became the most important lecture platform in London. Branches of the parent society sprang up in different parts of the metropolis, and provincial branches in different parts of the United Kingdom became affiliated with the parent society.

The association was marked by intense religious zeal. Through personal interviews by its members with young men, through Bible classes and evangelistic meetings for men, a persistent campaign was carried on to win young men to lead a religious life. The secular agencies developed considerably during the first seven years. In 1851, in the Central Association, there were 225 members and 425 associates. There were estimated to be 750 members and associates in the other branches in the metropolis. At this time there were eight societies in London, and 16 in various parts of the United Kingdom. The 24 associations enrolled approximately 2,700 young men.

Knowledge of this work came to America in the fall of 1851 at three different centres—Montreal, Boston and New York. The first movement took place at Montreal, where, through the efforts of two young men who had become acquainted with the London work through published copies of the lectures delivered before the London Association, an association was formed on 25 Nov. 1851. In November 1851 George Petrie, who had become well acquainted with the London work during a visit to that city, called together a group of his personal friends in New York. These conferences, however, did not result in organization until encouraged by the success at Boston, where the first association in the United States was established.

A letter published on 30 Oct. 1851, describing in detail the work of the London Association, came under the eye of Capt. Thomas V. Sullivan, who was active in Christian work among seamen, and so impressed him that he determined to establish a society in Boston. His purpose was accomplished at a meeting held on 29 Dec. 1851, in the chapel of the old South Meeting House in Spring Lane. The Boston society laid great emphasis upon the association as a social resort. It introduced the committee system, and inaugurated the plan of restricting voting and officeholding to members who were in good standing in an evangelical church. It was the Boston society which gave character and direction to the American movement. It immediately became one of the leading religious agencies of the city. Twelve hundred young men joined its membership; 10,000 copies of its constitution and by-laws were printed and scattered widely over the eastern part of the United States; representatives of the society assisted in founding associations at other points, and through its influence, by the year 1854, some 20 associations had been established in different parts of the Union.

Through the efforts of Chauncey M. Langdon, a government employee in Washington, and later a clergyman in the Episcopal Church, a convention of the American associations was called at Buffalo in June 1854. This convention

established an alliance of the associations of the United States and Canada, under the supervision of an executive committee which was instructed to call annual conventions, and to do everything in their power to foster and extend the work of the associations. The organization was made international at the suggestion of a delegate from the association at Toronto, Ontario, who had been invited to the convention. This alliance was known as the American Confederation, and it was largely through its influence that the American movement rapidly took pre-eminence among the associations of the world.

In the meantime, through the efforts of George Williams and others, associations had been established at Paris and other points in France, and at Geneva, in Switzerland. Prior to the founding of the association, a movement known as the "Junglingsverein" (Youth's Union) had been started among young workmen in Germany in the year 1834. This had already come into friendly correspondence with the associations in England. The German associations, while not on a strictly interdenominational basis, were invited into alliance with the Young Men's Christian Association, and have always continued in this fellowship. Since uniting with the general movement, they have greatly increased.

The culminating event of the early period was the first convention of the associations of all lands, held at Paris in 1855, at which the memorable statement of belief known as 'the Paris basis' was adopted. This has been called the apostles' creed of the association, and did much to unify the movement. It was proposed by Mr. Frederick Monnier, a layman from Strashurg, and was read before the convention, all the delegates standing, 'in which position it was then solemnly passed by the unanimous vote of the whole assembly. The members present then knelt together, gratefully to acknowledge the mercy of God and to entreat His benediction on the decision at which they had arrived.' The basis was as follows:

The Young Men's Christian Associations seek to unite those young men, who, regarding Jesus Christ as their God and Saviour according to the Holy Scriptures, desire to be His disciples in their doctrine and in their life, and to associate their efforts for the extension of His kingdom among young men.

The reports of this convention showed the estimated strength of the association movement as follows:

	Associations	Members
Continent of Europe:		
Germany .....	130	6,000
Switzerland .....	54	700
France .....	49	700
Holland .....	10	400
Belgium and Italy .....	3	60
Total .....	246	7,800
British Isles .....	47	8,500
United States and Canada .....	36	14,000
Total .....	329	30,300

The period from 1844 to 1855 saw the association founded in the various Protestant countries, an International Alliance established on

the American continent and a uniform basis adopted by the associations of all lands. The fundamental principles of the association began clearly to emerge. Although the movement was at first primarily religious and spiritual in character, the association was led to add secular agencies for ministering to the intellectual and social needs of young men. It recognized the principle that ministering to the needs of a man is one of the surest ways to promote his religious life; and on the other hand, that the Christian religion demands the development of all human powers and their use in the service of God. It is upon these two truths, the power of environment to mold character and the adaptation of the religion of Jesus Christ to redeem man in body, mind and spirit, that the Young Men's Christian Association rests its claim for a place among the agencies of the Church.

**Period II, 1855 to 1878. Period of Development of the Association Ideal.**— During the years from the Paris convention in 1855 to the Geneva convention in 1878, when a central executive committee for the associations of the world was established, with headquarters at Geneva, the Young Men's Christian Associations were gradually developing a world consciousness as an organization, and slowly evolving a method of work for ministering to the needs of young men. During this period, the American associations rose to the place of pre-eminence, and the type of association developed here has in later years spread throughout the world.

The six years preceding the Civil War were remarkable for two results in the American associations, the creation of the International Committee, with its work of supervision, and the great revival which stirred the entire country during the years 1857 and 1858. During these years, the central committee of the confederation was located respectively at Washington, Cincinnati, Buffalo and Philadelphia. This migratory plan was soon found to be a source of weakness, but much good was accomplished. Annual conventions were held, and information regarding the new movement was widely disseminated. Many new associations were founded; and at the outbreak of the war there were 240 associations in North America, with an estimated enrolment of 30,000 members.

In 1856 several members of the New York association established a union prayer-meeting, chiefly for men, at the Dutch Reformed Church, in Fulton street. This was carried on for nearly a year, and in the following September it was given over to Mr. J. C. Lamphier, the city missionary of the Dutch Reformed Church, with the understanding that it should be continued on a union basis. The committee of the associa-

tion arranged to co-operate heartily in this meeting.

In the fall of 1857 came the financial panic which prostrated the business interests of the country. Large numbers of men began immediately to attend this noon prayer-meeting and, under the auspices of the New York association, many more union meetings were established in different parts of the city. Similar meetings were conducted by all the Young Men's Christian Associations throughout the country. It is estimated that over 300,000 persons were added to the evangelical churches of America as a result of this revival.

The years from 1861 to 1866 in America were overshadowed by the cloud of the Civil War. The financial depression and the distractions attending the outbreak of the war brought the association to the lowest point it ever reached. The Boston membership fell from 2,400 to 700. The New York City association, at the beginning of 1862, had but 151 members; it was burdened with a debt of \$2,400, and its work had sadly declined. It is recorded that only 60 organizations survived the war; and yet, in the midst of this depression and apparent weakness, the association performed one of the most heroic tasks ever undertaken by a religious organization.

Through the influence of the association in New York, heartily seconded by those of Boston, Washington, Philadelphia, Chicago and other places, the United States Christian Commission was organized. This was the first organized attempt, on a large scale, to minister to both the spiritual and material needs of soldiers in time of war. This form of effort became later a well-organized feature of the associations. In the Spanish-American War and in the Boer War a service program for the welfare of the soldiers was carried on by the associations. The same effort was made with marked success by the associations of Japan among Japanese troops in the Russo-Japanese War. The association was the only agency with experience and resources prepared to render a similar social service to the Allied armies in the great World War. The plan of work of the United States Christian Commission was to send out delegates with supplies and needed comforts, who should spend some five or six weeks without remuneration, nursing the sick and wounded, distributing literature, conducting evangelistic and religious meetings, bearing messages from home, and in various ways encouraging and helping the soldiers. Over 5,000 of these delegates were sent to the front during the Civil War. The following table shows the vast efforts of this commission in raising money and supplies for the soldiers:

\*RECEIPTS BY THE UNITED STATES CHRISTIAN COMMISSION.

	1862	1863	1864	1865 (4 moe.)	Total
Cash .....	\$40,160	\$358,200	\$1,297,755	\$828,357	\$2,524,472
Supplies .....	191,096	558,637	1,584,592	1,432,298	3,766,623
Totals .....	\$231,256	\$916,837	\$2,882,347	\$2,260,655	\$6,291,095

\* Moss, 'United States Christian Commission,' p. 729.

This was an heroic service, and won for the association the admiration and confidence of the public. In the meantime, the New York City society had secured for its secretary Robert R. McBurney, and for its president William E. Dodge, Jr. It had on its board of directors Hon. Cephas Brainerd, who had been identified with its work from the beginning, and who had early perceived the true mission of the association. Mr. Dodge with his associates set about developing in New York a work specifically adapted to the needs of young men, and introduced a new era in association history. Mr. Dodge was in sympathy with the idea of a clean, home-like social resort for young men, and with the providing of opportunities for physical training. It was at his suggestion that the constitution of the New York City association was altered so as to provide for the erection of a gymnasium. Mr. Dodge was also influential in enlisting large gifts for the association. He was himself the largest donor to the first building.

The years from 1866 to 1870 mark the revival of the American work after the war. In June 1866 an international convention was called at Albany, which outlined a new policy for the associations. The plan of a migratory international committee was abandoned, and the headquarters were permanently established in New York City. Hon. Cephas Brainerd was, a year later, chosen chairman of this committee, a position which he held for 25 years. This convention announced the platform that the work of the association should be limited to young men, although it was some years before this became the actual practice. The convention established a day of prayer for young men in November, which has become a world-wide observance. It also arranged for the organizing of State committees, and the beginning of what is usually spoken of as State work. The great contribution of this convention, however, was the emphasis which it placed on the true field of the Young Men's Christian Association as distinctive work for young men. In his opening address, Mr. Brainerd said: "Our future progress rests upon an unswerving devotion to the primary objects and aims of this association—the social, mental, and religious improvement of young men. As organizations with these avowed objects, we challenge attention. As seeking these ends we are prominently before the world. Because of these things we are what we are. When we deviate from them, we trench upon ground assigned to others."

As yet there was no uniformity among the associations in America as to the conditions of membership. At the international convention held in Portland, in 1869, it was decided that only members of evangelical churches should vote or hold office in the association, and it was stated that:

We hold those churches to be evangelical which maintaining the Holy Scriptures to be the only infallible rule of faith and practice, do believe in the Lord Jesus Christ (the only begotten son of the Father, King of Kings, and Lord of Lords, in whom dwelleth the fulness of the Godhead bodily, and who was made sin for us though knowing no sin, bearing our sins in His own body on the tree) as the only name under heaven given among men whereby we must be saved from everlasting punishment.

In the meantime, in New York City a determined effort was being made to erect a suitable building adapted to the needs of young

men. In addition to the work already undertaken for the spiritual, intellectual and social improvement of young men, it was decided to add a gymnasium for physical training. After an earnest canvass for funds, and a most careful study of plans, the historic building on the corner of 23d street and Fourth avenue, which provided under one roof for the various phases of association activity, was erected. This building cost \$487,000, and was opened to the public in November 1869. Here was developed the modern type of the diversified work for the cultivation of Christian manhood, which has become characteristic of the American associations, and which is spreading throughout the world.

A unique feature of this building, which has been copied in most association structures, was the central reception-room, or lobby, in which was the public office of the secretary, and through which every one must pass upon entering the building. From this reception-room opened the reading-room, the parlors, the amusement-room, the gymnasium, the library, the educational classrooms and the secretary's private office. This enabled the secretary in charge to control the various activities which were housed under one roof, and to keep in touch with the multitude of young men who took advantage of the privileges of the association.

The years from 1870 to 1878 in America may be characterized as a period of adaptation of the work of the association to the needs of young men, and the extension of this work to various classes of young men. It is an interesting fact that, as soon as the organization specialized its work and limited it to young men, it immediately found a large field for service. In 1872, at Cleveland, a branch association was founded for work among railroad men. This met with a hearty response from the men themselves. A secretary was employed, rooms were opened at the railway station of the Lake Shore and Michigan Southern road and an effort made to extend the work elsewhere. Similar societies were also organized at a number of the terminal points, and in the fall of 1875 the attention of Mr. Cornelius Vanderbilt was called to this work. Through his endorsement other railroad officials became interested in this movement. It was soon found that it was worth while for railroad corporations to provide the facilities and attractions of a Young Men's Christian Association for the comfort of their employees.

As early as 1858, at the State of Michigan and Virginia, student Y. Christian Associations had been organized. Early in the 70's, Mr. Robert Weide organized similar societies in a number of States. By 1876 there were 25 college associations with about 2,500 members. Through the influence of Mr. Luther D. Wishard, a student at the University of Louisville, representatives of all college associations were invited to the international convention held at Louisville, Ky., in 1877. This was the inauguration of the intercollegiate work as a department of the work of the association. An extended effort was made during this period among German-speaking young men, and toward its close a similar work was inaugurated among colored young

Of these, 100 general secretaries, 21 assistants, 12 State international secretaries.

other lands, while war, ecclesiastical cons and general conservatism retarded the h of the association, a marked develop- had taken place. Every three years cons of the associations of all lands were n different European cities. To these ican associations since 1872 have regularly epresentatives. During the early 70's, Mr. y made his evangelistic campaigns in the h Isles, and did a great deal to stimulate ork of the Young Men's Christian Associa- n securing money for buildings, in arous- irtual zeal and in calling the attention of hurch to this important work. In 1878 40 representatives of the American asso- ns attended the world's convention, which t Geneva, Switzerland. Up to that time had been no established headquarters for orld's work. General affairs had been ad- tered from London through Mr. W. E. on, the secretary of the London associa-

It was chiefly through the influence of the h and American delegates that the Geneva ntion voted to organize the work of the ations in all lands under an advisory com- e, which should have a quorum located at ra, Switzerland. Col. Charles Fermaud, ficer in the Swiss army, and a man with t business prospects in Geneva, consented e up his calling and accept the position of al secretary of this committee. By the 1878, with the establishment of the world's ittee, the Young Men's Christian Associa- of the world may be said to have devel- their ideal of work for young men.

**Period III, 1878 to 1913. Period of Expansion.**—Expansion has been the striking characteristic of the period from 1878 to 1913. The association ideal of a four-fold work for the whole man had been developed by the American associations under Robert R. McBurney of New York City. This ideal has been promoted throughout America under the supervision of the International Committee. The American type of work for young men in this period of expansion was now to be promoted throughout the world largely by the efforts of the American International Committee.

In North America the associations between 1878 and 1913 increased in membership six-fold, from 99,000 to nearly 600,000 members; in value of property 38-fold, from \$2,300,000 to \$88,300,000; the number of buildings 13-fold, from 56 to 770; the cost of current operation 36-fold, from \$376,000 per year to \$13,725,000.

The three factors which have most profoundly influenced the association movement, during this period, have been (1) the securing of property, (2) of trained secretaries and directors who give their whole time to this service, and (3) the development of State and International committees of supervision. The carrying on of an all-round work for young men—physical, social, intellectual and spiritual—demanded not only experienced and able men to conduct the work, but commodious and properly adapted structures in which it could be housed.

The "discoverer and demonstrator" of the secretaryship was Robert R. McBurney, who was secretary of the New York City association from 1862 until his death in 1898. Under his leadership, this office was developed and the number of employed men increased. Of all the agencies the association movement has brought forth, the most vital is the secretariate. To this may be attributed its permanence and continued power. There are now nearly 5,000 men devoting themselves to this service as a life work. Over twice this number were enlisted for war work among the Allied troops. The pre-eminence of the American associations is chiefly due to this policy of employing salaried officers. About five-sixths of the secretaries employed by the associations of all lands are in the United States and Canada.

Not only have men been employed for supervisory work, but since 1870 there has been an increasing demand for Christian young men to devote their lives to service in the association as physical directors. Seven hundred and fifty-eight such men are now employed. To the Christian physical director, the Young Men's Christian Association owes the development of the physical department, which aims not only to give young men physical training and rugged, vigorous bodily development, but also to develop character. This department has proved a great attraction to young men. In 1896 the Year Book reports 52,672 men as using the physical department of the association. In 1918 there were 242,000 enrolled in gymnasium classes, of whom 118,000 were boys. Much of the progress of this department has been due to the leadership of Dr. Luther Halsey Gulick, who became instructor of physical training at the Association Training School at Springfield

in 1886, in which position he continued until 1900. In 1888 he was also appointed secretary of the International Committee for the physical department, in which office he served until the spring of 1903. He was succeeded at the Springfield school by Dr. James H. McCurdy and on the International Committee by Dr. George J. Fisher. The Young Men's Christian Association is doing the most extensive work in physical training of any agency in the country. It is also interesting that more than 40 per cent of the physical directors in academies and colleges have been furnished by the association. The physical department has proved not only a means for physical well-being, which is much needed under modern city conditions, but also a means of leading young men into lives of personal purity.

In 1878 there were 8 international and 12 State secretaries and 94 secretaries in local associations. At the present time (1919) there are 704 county, State and international employed officers engaged in supervisory work, 30 instructors in the training colleges, 3,245 men serving city associations, 550 with railroad associations, 139 with student associations, 78 with associations for colored young men, 77 with army and navy associations and 113 in other forms of service. There are a total of 4,936 salaried officers employed by the associations of North America.

In 1885, at Springfield, Mass., a school was established for the training of general secretaries for the Young Men's Christian Association. The year following a physical department was added for the training of physical directors. This school at first offered a two-years' course of study, which was later extended to three years. In 1890 a similar school was established at Chicago. This institution also conducts a summer term at Lake Geneva, Wis. In 1902 a summer school was established at Silver Bay, Lake George, N. Y. These educational agencies seek to thoroughly train officers for the Young Men's Christian Association as a life work. About one-sixth of the officers of the association have received training at these institutions. The courses of study cover the Bible, Church history, psychology, sociology, religious pedagogy, physiology, anatomy, anthropometry, physical diagnosis, physiology of exercise, gymnastics, athletics, aquatics, history of the Young Men's Christian Association, methods of work among young men, etc. There are about 500 students enrolled in these two institutions in addition to those attending the summer institutes. The summer schools have attracted so many of the employed officers (over 1,500 in 1919) that six additional summer schools have been established in the South, the West and in Canada. The Southern associations have also established a training college with a two-year course at Nashville, Tenn. The first summer school was held at Lake Geneva, Wis., in 1884.

The building movement in America has developed with increasing momentum. In 1890 there were 205 buildings, valued at \$8,350,000, in the United States and Canada; in 1900 there were 359; in 1902 there were 400. The number has now passed the 1,000 mark, valued with other real estate at \$96,000,000. During the past year 27 association buildings have been erected. There is no greater testimony to the confidence of Christian philanthropists and

business men in the Young Men's Christian Association and its work than the investment of large sums of money in association property. The type of architecture developed by the Young Men's Christian Association is of the club order, its buildings being homelike and social.

One of the striking developments of this period in the city work has been the growth of the educational classes. Immediately upon the erection of the building on the corner of 23d street and Fourth avenue in New York City, evening classes were begun in different subjects for young men. Similar classes were carried on in other cities, and by 1892 20,520 different men were under instruction. In 1892 George B. Hodge was appointed secretary for the educational department of the International Committee, and this work has been systematized and greatly developed. His successor is Mr. William Orr. International examinations are now held annually, in which large numbers of students take part. International certificates are accepted by more than 100 different colleges and institutions. An illustration of the growth of this department is seen in Boston, where the association in 1918 reported 3,843 different students, studying in its educational department. This association has a law school which has been given by the legislature a charter, granting the right to confer degrees. It has the Huntington Avenue school for boys who are preparing to enter college. It has schools of engineering and of certified accountancy. The Boston association has also recently incorporated "Northeastern College," of which the educational director, Frank P. Sparr, is president. This college supervises branch work in the neighboring city associations of Massachusetts and Rhode Island. Nearly every association contains a reading-room, 700 report having libraries and many others are distributing stations for public libraries.

In 1918 the Year Book reports 82,000 students in the day and evening association schools. There were 327 secretaries and assistants supervising this work and 2,203 paid instructors who were giving part-time service.

The religious spirit of the association has been dominant from the beginning. All welfare work for young men — economic, physical or educational — is conceived of as an expression of the religious spirit and as contributing to a many-sided personality and a symmetrical Christian character. This distinguishes the association from boys' clubs, social settlements, boy scouts and many other agencies for the social betterment of young men. There has been a large conservative element in the association which has held theologically to traditional orthodox teaching. The association has, however, made remarkable progress in its distinctly religious work. This is now organized into a system with five features: (1) Religious meetings; (2) individual interviews; (3) classes in religious education; (4) social service; (5) missions. Religious meetings are chiefly held on Sunday afternoon. These were for many years almost exclusively of an evangelistic character but in recent years have in many cases become forums for the community where the great social, civic and religious problems of the day are discussed by prominent leaders from an ethical standpoint. At Springfield, Mass., under

the leadership of Kenneth Robbie, such a Sunday afternoon forum has been maintained for seven years with an attendance often reaching 4,000.

Mr. Fred B. Smith during this period was secretary of the religious department of the International Committee. Under his leadership general evangelistic campaigns for young men were promoted culminating in the Men and Religion Forward Movement of 1912 in 60 North American cities. In 1918 there were reported 1,061,000 auditors at theatre meetings, 2,273,000 auditors at shop meetings. These are held outside association buildings. In the buildings there were reported 2,276,000 auditors at men's meetings and 295,000 at boys' meetings. There were a total of 6,000,000 auditors at these various religious meetings. There were 32,500 decisions for the Christian life reported and 6,434 young men reported as uniting with churches.

In religious education the chief emphasis has been upon Bible classes, but there is an increasing diversity of program which is evolving into a department of religious education. In more progressive associations like the 23d street branch in New York City, there are classes in "Christianity and Modern Thought," led by the secretary, Burt B. Farnsworth, courses in Church history, life problems, sex hygiene and social service.

In spite of the depletion of attendance of young men at colleges and universities during the World War, most gratifying reports come from student associations. In 1917 there were 27,000 students in classes in religious education. These were chiefly in Bible classes, but nearly 3,000 were in mission study classes and 4,000 were in classes studying "North American Problems."

An important phase of the religious work of the association is the interest in foreign missions which it has aroused among young men. The student volunteer movement, which is an outgrowth of the student department, is the chief missionary agency in the colleges of this country. It annually secures a large number of students to volunteer for foreign missionary service. At one time as many as 4,000 students have been enrolled as volunteers in all colleges. In the men's colleges in 1917 the number was 1,237. More recently the effort has been broadened to include all religious callings, home as well as foreign. In 1917 there were reported 280 undergraduates as preparing for the secretaryship of the Y. M. C. A. and 3,066 for the ministry.

The latest period of association history has been marked by a great extension in the work for different classes of young men. In August 1895 the World's Student Christian Federation of under-graduates of all lands was established. This is now the largest organization among undergraduates in the world. In the United States and Canada the movement has been extended to professional schools, theological seminaries and other institutions of learning. There are now 791 college associations upon this continent, enrolling 51,117 student members. American student associations own buildings valued at \$1,581,000. There are now 137 student secretaries devoting their whole time to this work.

The work for railroad men has become one of the most remarkable features of Christian endeavor. Railroad corporations which control three-fourths of the railroad mileage on this continent contribute from the corporation funds large amounts toward the current expenses of the railroad associations. There are 122 buildings, valued at \$7,422,000, occupied by these associations, with a membership of 94,000 railroad men. There are 550 secretaries engaged in this department.

Since 1879 the International Committee has employed a secretary to develop the work among colored young men. The work among colored young men was greatly stimulated by the offer of Julius Rosenwald of Chicago, a wealthy business man of Jewish race, to give \$25,000 toward the erection of a building for a colored Young Men's Christian Association to any community which would raise \$75,000 additional. This offer was continued for a period of five years, during which some 12 colored association buildings were erected. There are now 150 associations of colored young men, with 17,600 members, with 77 employed officers, with property valued at \$1,716,000. The secretary of the International Committee for this department is Jesse E. Moorland. There are to-day 86 Indian associations, with 815 members, under the direction of a traveling secretary, who is a native American Indian.

Largely as an outgrowth of the work for students in other lands, the American International Committee was invited by missionaries in India to inaugurate a work among young men in non-Christian lands. This work has always been carried on in subordination to the church and as a supplementary work where missions have already been developed. There are now 118 secretaries of the American International Committee in India, Ceylon, Japan, China, Brazil, and other foreign lands.

The policy on the foreign field is to develop self-governing and self-supporting local associations and national committees. In countries outside of the United States, Canada and Europe there are 292 associations with 58,231 members, occupying property valued at \$700,000. In these associations there are 462 employed officers, four-fifths of whom are natives. In the promotion of this work in 1910 ex-President William Howard Taft invited a conference at the White House, attended by about 100 leading Christian laymen, which resulted in securing \$2,000,000 for the foreign work.

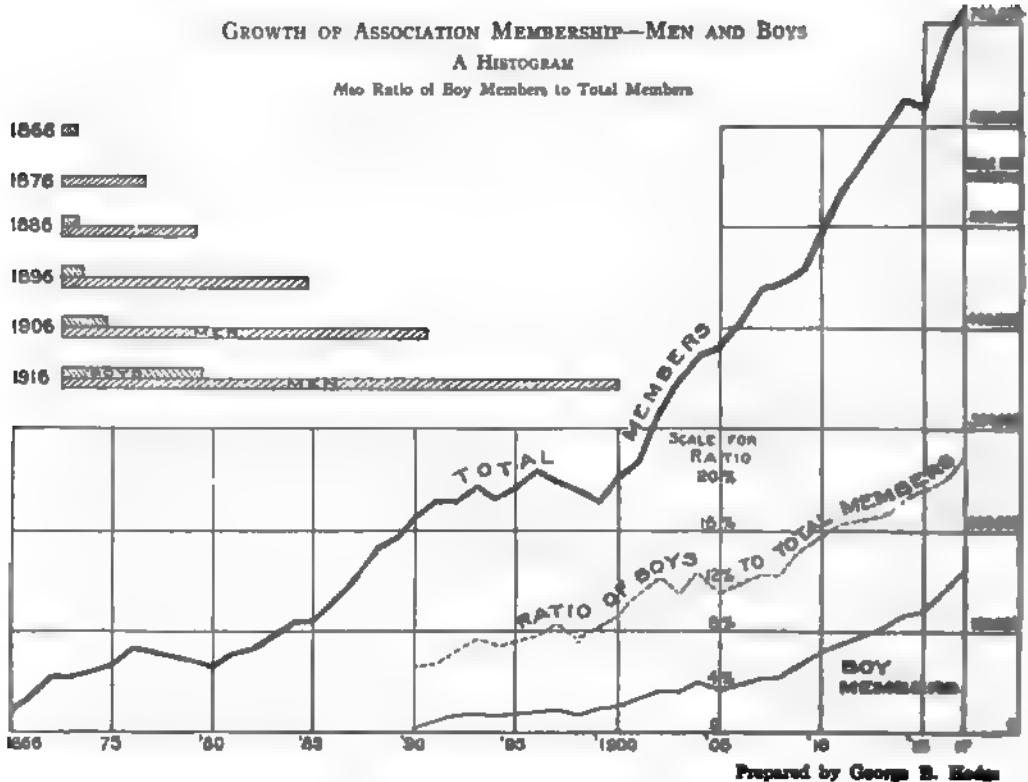

Even before the Spanish War began steps had been taken to inaugurate a work among the seamen of the navy, and after the war a building was equipped for seamen at the Brooklyn navy yard. This department has developed rapidly, and at the present time there is an organized movement among the seamen of the navy which is full of promise. Through the munificence of Mrs. Helen Gould Shepard and Mrs. Russell Sage, an attractively equipped building has been erected for the Naval Association, near the navy yard in Brooklyn, at a cost of \$1,100,000. Work is now being done at seven other home ports and also in the Philippine Islands. There were 77 secretaries in the army and navy associations of the United States at the outbreak of the war.

For many years the work of the associations

YOUNG MEN'S CHRISTIAN ASSOCIATION

was limited to young men between 16 to 17 years of age and upward. It is an interesting sociological development that, in the prosecuting of its work for young men, the association has been led to give its attention to work among boys. Careful study led to the conviction that effort ought to begin at the age when the boy is becoming a man—at the dawn of adolescence. There are almost as many boys in cities between the ages of 12 and 17 as there are young men. The first boys' department was organized at Salem in 1869, but it is only in recent years that a determined effort has been made to organize

commercial young men. Afterward associations were organized for students and later for railroad men. The city associations in recent years have been attracting large numbers of skilled mechanics to their membership, and to-day in Eastern associations 35 per cent of the members belong to this class. An industrial association existed in 1897 in connection with the Johnson Steel Plant at Lorain, Ohio, and an association building at a cost of \$25,000 was erected for the use of the workingmen. Similar associations were established at Proctor, Vt.; Wilmerding, Pa.; Stampo, Ark.; Douglas,

*Histogram in Detail*—The heavy full line (—) shows the total reported membership, the light line (—) shows the boy membership reported; and the broken line (-----) shows the ratio or per cent of the boy membership to the total membership. Thus, for any year, as 1893, we can find from this diagram that there was a total of 300,000 members, 17,000 of which were boy members, and the ratio of the boys to the total was 7 per cent.

a work among boys. In 1890 there were four secretaries giving their time to this department. This number had increased in 1903 to 107. It is now 545.

In 1903 there were 46,000 members in boys' departments. This number had increased by 1917 to 152,600. The work is carried on at 985 different points. The most unique feature of this department is what is known as the boys' camp, which was first developed by the Young Men's Christian Association, and is already a large factor in Christian work. In 1903 214 summer camps were conducted by the American associations.

One of the most important developments of recent years has been the extension of the association among men engaged in industrial pursuits. The associations were originally for

Alaska, and Cananea, Mexico. An extensive work was undertaken among the coal miners in Pennsylvania and the lumber men in a number of States. The Colorado Fuel and Iron Company and their employees combined to establish a series of associations among the workmen at the different plants of the company similar to the railroad Young Men's Christian Associations. It was the experience of the railroad and industrial associations which prepared the way for the unparalleled service rendered to the armies during the World War.

The distinctive industrial department is under the direction of Charles R. Towson of the International Committee, who has 11 associations. There are 117,000 industrial workers who are association members. In 70 cities special industrial secretaries are employed. There are

134 association buildings erected especially for men in industry at a cost of \$4,717,000. In 1917 the companies contributed \$417,000 toward current expenses and the employees paid an equal amount in membership fees.

The industrial revolution which attracted the young men to the city, and so created the basis for the Young Men's Christian Association, has to a large extent depleted the rural districts of young men. At the same time it still remains true that a majority of young men are found in the country. There are 8,000,000 young men in the country districts of the United States and Canada. For many years an effort was made to discover some method of carrying on association work among these men. What is known as county work has proved so successful that in 19 different States there are now county organizations, the most extensive work being carried on in Michigan, where 32 county secretaries are employed in 26 counties. The plan of work is a county committee, which employs a traveling secretary who will supervise and stimulate Christian work among the young men in the county, organizing Bible classes, men's meetings, in many cases establishing reading-rooms, social parlors, sometimes educational classes, and in some instances organizing clubs for athletics of various kinds. County conventions are held, deputation Sundays and a carefully systematized effort is made through the entire county. There are now 150 secretaries employed in county work.

Under Mr. Morse's leadership the staff of the International Committee had increased from two executive secretaries in 1869 to 93 on the home field and 175 on the foreign field in 1915. The budget of the committee had grown from \$2,345 in 1869 to \$354,000 for supervision of the home field and \$433,000 for the foreign field. The North American type of association work for the whole man had largely through the influence of the International Committee spread to Europe and widely through the colleges and cities of Asia, Africa and South America.

Membership fees range from \$2 to \$25 per year in addition to receipts from dormitories, restaurants, educational classes and many other features. The income of the North American associations for the year ending 30 April 1917, exclusive of receipts from contributions and endowments, was \$13,071,609—this amount was paid by the young men. The receipts from contributions were \$2,140,114 and from endowment \$325,561. The accompanying illustration gives an idea of the growth of the organization.

**Period IV, 1914 to 1919. The World War Period.**—The leading spirit during this period has been Dr. John R. Mott, who was transferred in 1915 from the secretaryship of the foreign department to the general secretaryship of the International Committee.

The important features of the past five years have been (1) the great activity of the home work in the rural field, in industry and among boys; (2) the rapid development in the foreign field; (3) the great work for the prisoners of war, both in allied countries and in the Central empires; and (4) and surpassing all these the transcendent work for the armies of America, France, Italy and Russia carried on by the American associations and for British and Canadian troops carried on by the British

and Canadian associations. The work for war prisoners was peculiarly the task of the American associations prior to the American declaration of war against Germany in April 1917. No other country was free to undertake this service. By May 1916 there were over 4,000,000 men in the prisoner-of-war camps of Europe (Report International Convention, 1916, page 91). These men were in enclosures containing from a few thousand to 40,000 persons, who were practically without occupation. Through the efforts of Dr. Mott and a number of American secretaries detailed from the foreign field, permission was secured from the various belligerent governments and a most beneficent service inaugurated for this vast body of prisoners. The policy was to erect in each camp an inexpensive hut or service building, organize a camp association, establish educational classes, athletics and games, furnish a reading room, supply writing material, inaugurate shows and entertainments and carry on religious meetings and Bible classes. In co-operation with the Red Cross, food kitchens were established and supplied, the sick men nursed and clothing and other necessities provided. During the first 17 months of the war \$300,000 was raised in the United States for this work and the following year \$1,167,322 were raised and expended for work in Europe among both prisoners and soldiers. This Christian service to the prisoners saved men from starving, restored morale, awakened new hope and often educated men for a new sphere in civil life.

On the Mexican border in the summer of 1916 there were a total of 150,000 American troops called into service under conditions, not only full of discomforts and hardships, but full of menace to moral character. The Army and Navy Department was quick to respond to this need. Thirty-eight temporary buildings were erected. Tents were used at six additional points and special motor equipments devised with moving picture machines, graphophones and other features. There were 350 secretaries, clergymen and business men employed in this service. Free stationery was provided for the writing of 5,000,000 letters home. Recreational and educational facilities were promoted by trained leaders. For this work during eight months \$308,000 was raised. At the entertainments there were present nearly 3,000,000 auditors; a well-planned religious program was carried out and over 13,000 soldiers decided to live the Christian life. The chairman of the Army and Navy Department of the International Committee was William Sloane of New York and the executive secretary John S. Tichenor. This work on the Mexican border prepared the way for the unsurpassed service among American troops during the World War—the climax of the work of the Young Men's Christian Associations. Upon the declaration of war in April 1917 the International Committee immediately offered the services of all the Young Men's Christian Associations of America to the government, and this offer was cordially accepted by President Wilson.

On 10 April Dr. Mott called a conference of association leaders to meet at Garden City, L. I. He outlined plans for the establishment of a National War Work Council of 100, which

should be appointed by the International Committee, carry on all work for the American soldiers and make reports to the International Committee. Dr. Mott asked that the associations raise \$3,000,000 to sustain this work until 31 Dec. 1917.

The conference enthusiastically endorsed the plan proposed and devised methods to cooperate in securing the fund needed in 30 days. Two days later a meeting was held of the International Committee; the proposition was approved, the National War Work Council appointed the first meeting called for 28 April. William Sloane became chairman, Cleveland H. Dodge, treasurer and Dr. John R. Mott, general secretary. George W. Perkins was made chairman of the finance committee; Lucien T. Warner, chairman of the committee on personnel and John Sherman Hoyt, chairman of the committee on activities.

It is well known how much vaster the American forces became by land, sea and air than was at first anticipated. The Young Men's Christian Association with heroic effort expanded its services to meet the crisis.

The advantages of this work to the comfort, the morals and the spirit of the troops was so great that requests came from the French government for a similar service to the French army. Later an urgent appeal was cheerfully responded to from both Russia and Italy. Under American leadership work for French troops was carried on at 1,350 *Foyers du soldat* and in Italy at 2,000 *case del soldato*. The British associations in the same manner did an extended work for the British soldiers in England and France. This effort was carried on under the leadership of the National Secretary, Sir Arthur Yapp, who was knighted by King George as a recognition of this service.

The Canadian associations under their own National Council ministered in an equally thorough manner to the Canadian army; about 700,000 Canadians were enlisted, of whom about 400,000 were sent overseas. This work overseas was in charge of Lieut.-Col. Gerald W. Birks of Montreal and in France under the direction of Maj. Ernest M. Best. This service began in Canada in August 1914 and was carried on during the entire war. The Young Men's Christian Association of Canada was made a part of the military establishment and the secretaries became officers in much the same manner as chaplains. The first secretary to give up his life was Capt. Harry Whiteman of Quebec, who died from overwork in northern France. The first secretary to receive the British Military Cross was Capt. Frank Guy Armitage.

The work for the American army was divided into two sections, (1) the home camps; and (2) the work overseas. Overseas, E. C. Carter, who had been national secretary of India, was placed in charge at Paris. The first problem of the War Work Council was to secure funds. To these appeals the citizens of America responded with great liberality. The first request for \$3,000,000 met with contributions amounting to \$5,000,000. So vast did the work become that this amount subscribed in May 1917 was exhausted by October and it became necessary to borrow large sums. A second campaign, of which A. H. Whitford, general secretary at Buffalo, was director, was

inaugurated in November 1917; an appeal was made for \$35,000,000 to carry on the war work at home and abroad for one year. This appeal met with a response of \$54,000,000. In the meantime other agencies beside the Young Men's Christian Association had become enlisted in a large way. As the association had been the pioneer since the Civil War in this form of effort it furnishes the standards and most of the methods undertaken by other agencies. In accordance with the desire of the government Commission on Soldier's Activities appointed by the War Department, the various agencies, exclusive of the Red Cross, which were engaged in promoting welfare work for the army and navy combined their budgets for a joint campaign for November 1918. The budgets were approved by the commission and a total of \$170,000,000 was asked for. Of this sum the allotment for the Red Triangle work was 58 per cent. Dr. John R. Mott was made director-general of this campaign and Mr. C. S. Ward, the originator of the short term campaign method for securing funds, was associated with him. In spite of the excitement incident to the signing of the armistice during the campaign the effort was successful, the subscriptions amounting to \$203,000,000—the largest voluntary offering for religious welfare work ever made.

It is impossible to portray here the enormous work done for the troops. Some facts about the activities carried on on the home side of the Atlantic for the year ending 30 April 1919 are as follows (Year Book 1919): Different men served, 4,000,000; number of employed officers, 4,600; funds expended, \$30,000,000; number of units, 1,171; attendance at entertainments, 27,000,000; participants in athletic sports, 2,500,000; lectures given, 39,044; attendance at educational classes, 5,404,000; at Bible classes, 2,085,000; at religious meetings, 14,181,000; decisions for the Christian life, 195,414. A most effective service was also rendered by the local associations throughout the country to soldiers on liberty leave, and a carefully organized work for the men in transit on the troop trains. The problem of personnel was most difficult; only men beyond military age could be used and the proportion of those interviewed who were qualified and were physically fit to stand the arduous work required was less than one in 10. Short term intensive courses of training covering one month were established at the Springfield and Chicago colleges in June 1917 and later at Silver Bay and Blue Ridge. In several of the large camps similar courses were conducted, the largest at San Antonio, Tex. Approximately 4,000 students received the training of the short-term courses. For the men who were to go overseas, an additional course of one week was conducted by the War Work Council at Columbia University.

The most remarkable work of all was for the Expeditionary Forces in France. Here over 3,000 miles from its base of supplies, the association undertook to serve 2,000,000 men scattered through France and later western Germany. How to interest the soldiers in their leisure time back of the front and how to serve them to the uttermost in the war area was the problem of the staff at headquarters. The association did not shrink from any task to which it was called, even when asked to carry

on the army store (canteen) in order to release effective men for fighting. When Mr. Carter reported to General Pershing that there were complaints about the canteen, General Pershing replied, "The Y. M. C. A. are not in this war to avoid criticism, but to render as much service as possible to the men, under the limitations under which we are all working in this war."

In the canteen alone the "Y" in France from June 1918 to April 1919 handled 2,000,000,000 cigarettes, 32,000,000 bars of chocolate, 18,000,000 cans of smoking tobacco, 50,000,000 cigars, 60,000,000 cans of jam, 20,000,000 packages of chewing gum and 10,000,000 packages of candy. These were only a few of the items handled. (Report on Activities by George W. Perkins). Because of the difficulty in buying supplies, the "Y" operated in France 20 biscuit factories, 13 chocolate factories, three candy factories and three jam factories. All of this canteen service was undertaken unexpectedly and carried on in addition to the regular work for the men—physical, social, intellectual and religious.

The "Y" was operating in March 1919 in France 587 buildings erected by the association, 596 leased buildings and 782 tents and army buildings. "These buildings were used as centres where the men could congregate, write letters, read magazines, books and papers, play games, visit and feel relieved of a certain amount of the restraint necessary to army life." (Perkins). In them were conducted concerts, moving picture shows, all sorts of entertainments and religious services. The buildings were open to all welfare organizations. Religious services were conducted by Protestants, Catholics, Jews and all other religious organizations, regardless of creeds.

A large number of well-trained athletes led in athletic games and in boxing and wrestling. Athletic supplies were given without charge to the soldiers. These included 575,000 baseballs, 140,000 bats, 65,000 fielders' gloves, 85,000 indoor baseballs and 75,000 footballs. This work was in charge of Dr. James H. McCurdy of Springfield. The entertainments of various kinds were multitudinous and often of the highest quality. A number of theatres were operated in different parts of France. In March 1919 there were 95 American troupes, playing in different parts of France, which gave 4,350 performances in a single month.

In one year 220 French entertainers and 702 American were employed. From August 1917 to April 1919 in France 90,000 "movie" shows were given to audiences aggregating 50,000,000 (Perkins).

Writing home was a great opportunity to the men; "400,000,000 sheets of writing paper with the necessary envelopes and 16,000,000 postal cards were distributed to the soldiers." At 25 leave areas holiday opportunities, including athletics and entertainments, and sight seeing were freely provided; also large hotels and recreation grounds at various centres in France, England, Italy and later in Germany.

An educational system was developed under the leadership of 600 college professors and school teachers. This was expanded rapidly after the fighting ceased. Up to April 1919, remittances from 323,432 soldiers were sent

home through the association, amounting to \$19,542,000.

Many prominent clergymen in addition to "Y" secretaries and business men led in the religious work. The religious program was carried on at all the centres. Instruction in sex-hygiene was given by a staff of 40 lecturers under the direction of Dr. Frank N. Seerley of Springfield, Mass. The general religious work was under the supervision of President Henry Churchill King of Oberlin.

A devoted body of workers enrolling a total 11,229 was sent overseas for this service. In April 1919 there were 5,693 men and 2,657 women on the association staff in France. A most self-sacrificing service was rendered by these workers, not only in the training areas but on every front in exposed positions in the face of danger and hardships. There were 215 casualties among association workers although they were non-combatants. Nine workers were killed by shell-fire while on duty, 29 were seriously gassed or wounded and 31 died in the service from exposure and over-work. (Mott, *Association Men*, January 1919).

Whether the Young Men's Christian Association has reached its final form no one would be bold enough to affirm. It is remarkable that it should have grouped together such a variety of agencies upon the simple platform of young men advancing the kingdom of Christ among young men. Through the four periods of its history the association has evolved into an institution with an enlarged ideal, closely akin to that of the Christian university. It is still animated by the evangelistic, spiritual purpose of the original band of young men who rallied around George Williams 75 years ago. But, while keeping uppermost this ideal, it has endeavored to do, in a popular way, for the multitudes of young men of our cities what the Christian university, in a more scholarly way, is doing for the young men who are to enter the professions. There is every evidence that the association has only begun its career of usefulness, and that in the future it will become a manifold more important factor than in the past.

*President International Young Men's Christian Association College, Springfield, Mass.*

**YOUNG PEOPLE'S CHRISTIAN ENDEAVOR UNION OF THE UNITED BROTHERS IN CHRIST**, founded 5 June 1890. It is a union of all forms of young people's societies within the church, uniting them for the purpose of denominational direction. It was originally named the Young People's Christian Union. Its official organ, *The Watchword*, was founded in 1893. With its junior societies the organization numbers over

2,000 societies and more than 85,000 members. It contributes about \$10,000 annually to missions.

**YOUNG PEOPLE'S SOCIETY OF CHRISTIAN ENDEAVOR.** See CHRISTIAN ENDEAVOR, YOUNG PEOPLE'S SOCIETY OF.

**YOUNG PRETENDER, The,** a title applied to Charles Edward Stuart, son of the Pretender. He was defeated by the Duke of Cumberland at Culloden, 16 April 1746.

**YOUNG'S TRAVELS.** In 1767 Arthur Young began that series of journeys, or farming tours, which were the basis for his graphic sketches of rural England, Ireland and France. His first trip included Southern England and Wales, and an account of his observations appeared in 1768 under the title 'A Six Weeks' Tour through the Southern Counties of England and Wales.' Following this first survey, he traveled through Northern and Eastern England from 1768-70; this resulted in 'A Six Months' Tour through the North of England' (4 vols., 1770), and 'The Farmer's Tour through the East of England' (2 vols., 1771). These books contain a wealth of information relative to the social, economic and political conditions in England during the latter half of the 18th century. Young was a most determined and indefatigable tourist. He visited practically every county in England, inspected farms, described farm methods and implements used. He met all classes of people, from peasantry to nobility. His information concerning rural conditions, such as rentals, produce, livestock, and means of transportation and communication in the kingdom, was founded on actual examination. Two features especially roused Young's indignation. In the first place, he saw on every side vast tracts of land uncultivated and in waste; even all the cultivated land, with rare exceptions, was placed under the same unvarying rotation. Everywhere there seemed to be inability to put the land to its best use. Then, too, Young had no patience with poor roads. In 1770, on the Preston-Wigan turnpike, he measured ruts "four feet deep and floating with mud, only from a wet summer"; and again he says, "I know not in the whole range of language terms sufficiently expressive to describe this infernal road. Let me most seriously caution all travelers who may accidentally propose to travel this terrible country, to avoid it as they would the devil; for a thousand to one, they break their necks or their limbs by overthrows or breakings down." His description of other highways is given in an equally lucid manner. Young's works on England were very favorably received, being translated into most of the European languages by 1792.

In 1776 he made a tour of Ireland, publishing his 'Tour in Ireland' in 1780. He remained in Ireland three years and during part of this time was occupied in managing an estate in County Cork. The result of his stay, nevertheless, was a survey of the country which, for accuracy, fullness of detail, and acuteness of observation, is invaluable to this day. He stated clearly and exposed unsparingly the causes which retarded the progress of Ireland. He strongly urged the repeal of the penal laws which oppressed the Catholics; he

condemned the restrictions imposed by Great Britain on the commerce of Ireland, and also the perpetual interference of the Irish Parliament with industry. The work abounds in elaborate statistics and tables of prices; as Marie Edgeworth well says, it is "the first faithful portrait of the inhabitants."

'Travels in France' (2 vols., 1792) is probably the best known of Young's writings. He made his first visit to France in 1787 largely as the result of an invitation from the French nobleman, the Duke of Lincourt. He traversed France in every direction just before and during the first movements of the French Revolution, and he paints not only a picture of French agriculture but describes institutional conditions in France at that critical period. This work, while of great intrinsic merit in itself, has been greatly enhanced and widely circulated because of the fact that it is one of the most valuable sources to which historians have turned for a comprehensive statement of the actual pre-revolutionary situation in France. He visited one out-of-the-way region after another, recording in diary fashion his impressions vividly and candidly. From the first page to the last he sets forth the abject wretchedness of the majority of the people and the stagnant conditions of trade and commerce caused by inefficient government. His earliest journey took him in a southwesterly direction through the Orleanais and the Berry, where for the first time he met with the *métayage*, which he described as "a miserable system that perpetuates poverty and excludes instruction"; and further, he describes the fields as "scenes of pitiable management; and the houses of misery." Throughout the entire work the *métayage*, or farming on half profits, is condemned in the strongest terms. Poitou is described as "an unimproved, poor and ugly country." Young said it seemed greatly in need of "communication, demand and activity of all kinds." Journeying on to Languedoc, he found the land in a high state of cultivation and the peasants happy; he concluded his journey by a visit to Landes on his way to Bordeaux. Young's second journey took him through Brittany and Anjou, which he described as a land "possessing nothing but privilege and poverty"—while Maine and Anjou—"have the appearances of deserts." His third tour of France covered a much greater area. He started with Champagne, traveled through Alsace-Lorraine, made his way through to Jura, Burgundy, the Bourbonnais, Auvergne; took a glimpse of the Rhone valley, visited Avignon and Comte de Nice. His impressions on this journey are not so full, and this fact is probably due to the extent of territory covered and the local disturbances. Young found that half, if not two-thirds, of the land was already in the hands of small proprietors. Peasants supplied the industry and carried out what improvements were made, thus illustrating his famous phrase, "The magic of property turns sand to gold." The great *seigneurs* did nothing; they received the quit rents and enforced *tailles* and *corvées* and all the other oppressive incidents of feudal tenure. He drew a severe indictment against the French nobility, and even approved of the forceful seizure of the waste land by the

French peasantry. He severely censured the higher classes for their neglect of the soil,—“Oh, if I were a Legislator of France for a day,” he exclaimed at the sight of estates left waste and only to be used for game purposes, “I would make such great lords skip again.” Young saw the commencement of violence in the rural districts and his sympathies were largely on the side of the classes suffering from excesses of the Revolution, although he was never a thorough political follower of the Revolutionists. Tocqueville recognized his work as a first-hand authority on the rural conditions of the country on the eve of the Revolution.

Young was a highly sensitive, enthusiastic, impulsive, affectionate man and a great lover of nature. His ‘Travels’ are deservedly famous and have earned a wide reputation and have been of great influence. No better summary of the chief characteristics of Young’s writings can be given than to quote the words of R. E. Prothero in ‘English Farming, Past and Present.’ “His careless ease of style, his racy, forcible English, his gift of happy phrases, his quick observation, his wealth of miscellaneous material, make him the first of English agricultural writers. . . . His tours, with their fresh word-pictures, their gossip, their personal incidents, and even their irrelevancies, have the charm of private diaries.” His varied agricultural writings, thus characterized above, were by far the most important agency in disseminating the information concerning those advanced methods introduced into England by Jethro Tull, Lord Townshend and Robert Bakewell and which constituted the agricultural revolution in 18th century England.

Consult the works mentioned. ‘Travels in France’ were translated in 1793-94 by Soules (new version by M. Lesage, with an introduction by M. De Lavergne, 1836). An interesting review of the latter publication, under the title of ‘Arthur Young et la France de 1789,’ will be found in M. Baudrillart’s ‘Publicistes modernes’ (2d ed., 1873). Consult also Bethan-Edwards, Matilda B., ‘Autobiography of Arthur Young’ (1898); Prothero, R. E., ‘English Farming, Past and Present’ (1912; pp. 154, 184, 195-206, 286, 313, 470).

HARRY JAMES CARMAN,

*Instructor in History, Columbia University.*

**YOUNG WOMEN'S CHRISTIAN ASSOCIATION.** The Young Women's Christian associations in the cities, the colleges and the rural communities of the United States are organized into a national association called the Young Women's Christian Association of the United States of America. The National Board is the executive body of this association, chosen to carry out the policies adopted by the voting delegates at the national conventions, which are the regular business meetings of the National Association. The 30 National Board members and the 15 auxiliary members are elected by the conventions; the 11 non-resident members are chosen each by her own field committee to represent that particular section of the country. The National Board appoints a committee of 40 or more members in each field to have the responsibility for organizing and aiding in the develop-

ment of the association in that field. Headquarters of these field committees are in Philadelphia, Richmond, Cincinnati, Chicago, Saint Louis, Dallas, Minneapolis, Denver, Seattle, San Francisco and New York City.

The name Young Women's Christian Association has been known in the United States since 1866. When the first organization bearing this title was formed in Boston, it had the same objective, the same evangelical church membership basis, the same combination of volunteers and employed working forces as obtain to-day. The first student association, Normal University, Illinois, dates from 1873. Without tracing history, in this connection it should be said that each united with other associations subsequently formed. The student and many city associations on the evangelical basis (according to which only associations in which the right to vote was held by members of evangelical churches were received into affiliation), united in electing the American Committee with headquarters in Chicago; the Women's and Young Women's Christian Association of many other large cities holding various forms of charter united in the International Board.

In December 1906, after 18 months of constructive negotiation, the present national movement was formed of all local, city and student associations affiliated with either body which wished to come in on their then existing basis, with the understanding that all associations in the future should have the evangelical church basis. Very few failed to avail themselves of this privilege. One hundred and thirty-two associations were represented by 392 delegates in that first convention, which voted policies for immediate action and elected the National Board. This board at once elected as president, Miss Grace H. Dodge, who had been chairman of the Joint Commission which had effected the union. Six years later, members of this board and a few other friends gave site and funds for the erection of the present headquarters building at Lexington avenue and 52d street, New York City.

The scheme of organization is as follows: The resident members of the National Board are assigned to committee work under eight departments—field work, department of method, foreign, secretarial, conventions and conferences, publication, finance and office. Each department has an employed executive and other staff secretaries. The office department applies scientific management to the work of all the other departments. The publication department edits and publishes *The Association Monthly*, technical leaflets, Bible study texts; handles printing of the other departments; fills orders for books. The finance department makes the budget and secures the money. In 1915 the conference department conducted 15 conferences with 4,592 delegates, two camp councils for high school girls and six for industrial members, attended by 1,358 girls. The secretarial department conducts a graduate training school in New York City; preparatory training centres in different parts of the country prior to this year's course; and a summer school with graduate courses for physical directors, house secretaries and lunch

room directors. The number enrolled in the whole training system for 1915-16 was 141. A bureau for placing association secretaries is also part of the work of this department. The foreign department co-operates with the World's Young Women's Christian Association in sending American secretaries, 38 in number, to India, China, Japan, South America and Turkey. The field work department correlates the work of the 11 field committees before mentioned with the work at headquarters.

If the field work department of the National Board can be called colloquially the clearing house, the *department of method* can be called the laboratory of the National Board. By visiting local associations, sharing in their work, studying other organizations of women and other Christian and social movements, a great body of information is gathered. This study and planning cover the needs and possibilities of all young women, their conditions and general environment in city, student, country and large town communities, with special emphasis at the present time upon the adolescent girls, the foreign-born young woman, the girls in business and professional life, the girls in industry, the girl at study, the girl in domestic service, the girl at home.

There are 994 associations with a total membership of 360,865, distributed as follows: (1) There are 255 city associations with a membership of 292,181. City associations are found in every State of the Union except Vermont, Wyoming and Nevada, and in Washington, D. C., and in Honolulu. There are a few unaffiliated city associations. In 1915, 137 associations received regular or transient guests; 90 associations have travelers' aid departments and are prepared to carry that responsibility until a national Travelers' Aid Society is formed. These associations (so far as reporting) have 193 gymnasiums where 65,693 members are enrolled; 18,341 students in domestic art and 8,623 in domestic science classes (1914); and 795 certificates of the National Board and American Red Cross were granted for first aid. Of the religious work and missionary department it can be said that it is to-day the most characteristic feature of the movement.

(2) There are 18 county associations in 13 States with a membership of 7,215. Supplementary to these organized associations in reaching country girls are the eight week clubs. From 101 different colleges last summer, specially prepared student members of the associations returned to their homes in villages and open country and organized 244 groups of 3,863 girls.

(3) There are 721 student associations with 61,569 members, of which 1,288 members are in Indian schools and 2,327 members are in colored schools. The National Board has four commissions at work—The Commission on Character Standards, on Social Morality, on Thrift and Efficiency and on Household Employment.

**YOUNGHUSBAND, Sir George John**, English soldier; b. 9 July 1859. He entered the army 1878, and was promoted successively lieutenant 1880, captain in 1889, major in 1896 and lieutenant-colonel in 1900. He served in

the Afghan War in 1878-80, in the Sudan in 1885, on the northwestern Indian frontier in 1886, and in the Burmese expedition of 1886-87. In 1895 he was a member of the Chitral relief force, and in 1898 was detailed to accompany the American forces in the Spanish-American War and the subsequent campaign against the Philippine insurgents. He fought in the second Boer War in South Africa (1899-1902), and was severely wounded. Subsequently he was assigned to the Indian staff corps, and was awarded a medal and clasp for his services with the Mohmand Expedition to the Northwestern frontier of India. He was knighted in 1913, and served in the European War in 1914-17, attaining rank as major-general. From 1917 he was Keeper of the Jewel House in the Tower of London. Author of 'Eighteen Hundred Miles in a Burmese Tat' (1888); 'The Queen's Commission' (1891); 'Relief of Chitral' (1895); 'The Story of the Guides' (1908); 'A Soldier's Memories' (1917); 'The Tower from Within' (1918), etc.

**YOUNGSTOWN, Ohio**, a modern industrial city of 140,000 population, centre of the second largest steel district in the United States, sixth city in population and fourth in financial and industrial importance in Ohio, county-seat of Mahoning County, on the direct line between Pittsburgh and Cleveland, 67 miles from each and five miles from the Pennsylvania line; covers a rectangle containing 25.15 square miles, divided diagonally by Mahoning River which flows southeasterly and joins the Ohio 35 miles away. The river divides the city into north and south sides, the latter first settled. A viaduct built in 1899 has given the "South Side" such impetus that it is now a thickly populated residence district. The main business street, Federal, parallels the river for three miles, crossing at the Public Square, Wick avenue which connects the north and south sides and southward is called Market street. The public square at Youngstown is 285 feet above Lake Erie, and 858 feet above sea-level.

**Municipal Service and Improvements.**—The city has 320 miles of streets of which 158 miles are paved. There are 180 miles of sewers, discharging into the Mahoning River. A disposal plant is now projected. In 1917 the city built an impounding reservoir of 1,700 acres on the river at Milton, 17 miles away. The capacity is 10,000,000,000 gallons; cost \$1,250,000. Beside producing an immediate expansion in the industries of the whole valley, the reservoir is becoming one of the most attractive play spots in the State. The domestic water supply is municipally owned and was established in 1872. A new pumping station, 1916, has 31,500,000 gallons daily capacity, the water from Mahoning River, passing through mechanical sand filter, with alum and lime, through 206 miles of cast-iron mains. There are 2,091 fire hydrants and three standpipes. The valuation of the water system is \$2,477,000 and the annual cost of the pumping plant \$56,460. The city as a whole is very healthy. The birth rate is 34.18 and the average death rate 14.51. In addition to the health officer, there is a secretary, chemist, bacteriologist, six sanitary inspectors, inspectors of plumbing and foods. The police department has 154 men, 12 mounted, with the three platoon system established in 1899; 80

YOUNGSTOWN

Battery of Blast Furnaces in 15-Mile Plant, Youngstown Sheet and Tube Company

**YOUNGSTOWN**

**1 Butler Art Institute**

**2 Mill Creek Park**

patrol boxes, 8 motor vehicles; expenditures \$158,732. The fire department was completely motorized in 1913 and now has three steam engines, five triple pumpers, nine hose wagons, 10 substations, 108 men, and expends \$151,859 annually. The service-at-cost, or "Tayler," system of street-car operation became effective by action of the council December 1918, and by this 59 miles of the track and property of the Mahoning and Shenango Railway Company is supervised by the city under a commissioner (\$6,000) appointed by the mayor for a four-year term. There are 119 miles of suburban street railways centering in Youngstown, besides a 23-mile line of the Youngstown and Southern, to Leetonia. The Mahoning River is spanned by seven bridges, of which the Market Street viaduct is 1,600 feet long. Division Street bridge is to be replaced by a high level bridge, 3,400 feet, crossing the river and 44 railroad tracks. There are two telephone companies—the automatic with 11,000 instruments, the Bell with 15,500 instruments. Electric lighting is general (14,000 meters) but natural gas from West Virginia is used for domestic fuel.

**Parks.**—Mill Creek Park, situated in the southwestern section of the city, consisting of 485 acres, is the largest and one of the most beautiful natural parks in the country, largely the result of the 30 years' labor of Volney Rogers, a local attorney. The park is three miles long, winding through a natural gorge. It has 14 miles of drives and seven miles of walks, three bathing beaches, two large artificial lakes, three water falls, an old mill and dancing pavilion. A canoe house at \$15,000 and bathing house at \$50,000 will be erected soon. This park is managed by a commission, consisting of three men appointed by the judge of the County Common Pleas Court, with power to levy a maintenance tax on the "township" of Youngstown. Up to the present time it has cost the taxpayers of the city \$700,000 and is valued at \$1,500,000. Other parks of the city are under the management of a commission appointed by the mayor. They receive their funds from the regular tax levy. Wick Park, northern part of the city, has 34 acres, one and one-half miles of paved drives; Lincoln Park, eastern part of city, 60 acres; Crandall Park, northern part of city, 50 acres; South Side Park, southern part of city, 22 acres; Pine Hollow Park, southeastern section of city, 22 acres. Most of these have playgrounds and bathing pools.

**Chief Buildings.**—The most notable building in Youngstown and one of the most beautiful in the country is the gallery of The Butler Art Institute, erected by Jos. G. Butler, Jr., at a cost of \$500,000 and opened in 1919. It is of marble, the simple, chaste design having been made by McKim, Mead and White. The Mahoning County Court House built in 1911, costing \$1,000,000, is a classic building containing excellent mural paintings by E. H. Blashfield and C. Y. Turner. In 1915 the city erected a handsome six-story municipal building at a cost of \$340,000. The Reuben McMillan Free Library building (named in honor of a former superintendent of schools) is a handsome Indiana Stone structure, planned with unusual success and built in 1911 at a cost of \$155,000, of which \$50,000 was contributed by Andrew Carnegie. The Y.M.C.A. building was opened

in 1915, having cost \$375,000. It has 137 dormitory rooms. The Y.W.C.A. building was opened in 1912, and an annex given by Robert Bentley in 1918, the total cost having been \$250,000. A post-office building, erected in 1898 (cost, \$75,000) and an addition in 1910 (cost, \$100,000) have for several years been totally inadequate so that temporary additions have been resorted to. Important business buildings include the Dollar Savings, Commercial National and Mahoning bank buildings, the Wick, Stambaugh and Home Savings and Loan buildings and others under construction. Three of the foregoing are 13 stories high. Rayen and South High schools offer interesting contrast, the first of Ionic style opened in 1866 built during the Civil War, but with two recent additions; the latter a buff brick building costing \$350,000 opened 1911. Other buildings of note are the Youngstown and Saint Elizabeth's hospitals, Masonic Temple, Saint Columbia's, Saint Edward's and Saint John's churches.

**Commerce.**—The Pennsylvania and Ohio Canal, built in 1839, stimulated mining of large deposits of Brier Hill block-coal, which long formed a principal part of Youngstown's commerce and warranted building a railroad to Cleveland, opened in 1856. There are now the Erie, Pittsburgh and Lake Erie, Pennsylvania, Baltimore and Ohio, New York Central, and Lake Erie and Eastern roads, four stations, and 57 passenger trains daily. Bonds for \$800,000 were issued by the city in 1915 to eliminate the Erie grade crossings and land has been condemned for a union passenger station costing \$5,000,000 to be erected by the Erie Railroad. One mile east of the city the railroads converge into what is reputed the heaviest traffic point in the United States. Of this tonnage the larger part is raw and finished products of the steel works which line the Mahoning River for 21 miles. Some relief is promised in the proposed Lake Erie and Ohio River barge canal, surveys for which have been completed.

**Steel Industries.**—The growth and importance of the city has been due to the iron and steel industry. As early as 1805 a blast furnace was built with a capacity of two tons of pig iron per day. The second blast furnace in the United States to use raw block coal, and a rolling mill for making bar iron were both built here in 1846. In 1856 shipments of Lake Superior ores brought much new smelting industry to Youngstown, and blast furnaces sprang up rapidly during the next generation, using lake ore and Pennsylvania coal and coke as the native supplies became exhausted. Rolling mills were built between 1880 and 1890 and the first general steel mill in the valley was erected in 1895 by the Ohio Steel Company, now the "Ohio Works" of the Carnegie Steel Company. The close proximity of limestone, one of the raw materials for steel making, has been a great aid in the industry. Four limestone quarries, nearby, have a combined output of 5,000,000 tons a year, employ over 2,000 people, and besides steel material supply the largest paving-brick plant in the world, as well as agricultural lime and other by-products.

During 1917 the American Iron and Steel Institute recognized the growing importance of Youngstown by creating the Youngstown District, which includes works in the Mahoning,

Shenango and Beaver valleys and adjacent territory, and produces one-sixth of the pig iron and one-eighth of all steel made in the United States. In 1918 there were in the district 51 blast furnaces producing 6,250,611 tons of pig iron, 47 steel works and rolling mills producing 2,843,455 tons of Bessemer, 4,462,061 of open hearth and 20,680 of other castings; wire rods, 225,306; plates and sheets, 1,133,712; merchant bars, 791,691; skelp, 701,376; other rolled products, 913,913 tons; a total of rolled products, 3,765,998. In addition there are coke-oven plants at three of the Youngstown works, with a total of 533 Koppers ovens. From the by-products large quantities of tar, benzol, ammonium sulphate, toluol, xylol and solvent naphthas are made locally, while other by-products are shipped for manufacture elsewhere.

**Subsidiary and Other Industries.**—Subsidiary to the steel industry are many manufactures which use steel or its by-products. Among these are steel furniture and structural parts; steel sash and pressed-steel buildings; waterproofing, asbestos, cement, shingles, blast furnace equipment, boilers, bridges, cars, cranes, engines, forgings, machine-shop products, stoves and washed metal. Independent of the steel industry are manufactories of automobile trucks, brass, cement, flour, gas mantles, mill work, electric bulbs, leather, powder, wagons and rubber.

**Finances and Banking.**—The assessed valuation of the city is \$215,260,960; tax rate, \$15; bonded debt, \$5,502,356. The State tax law makes bonding practically the only method for public improvements with the result that of a total city revenue of \$2,766,666, the annual interest on bonds and debts is \$1,778,882, while \$987,784 is spent on operating expenses. The school board levies its own tax, expending \$1,180,324 on public schools. The city owns property valued at \$17,717,110. Post-office receipts are \$457,190. The banking business is conducted by five banks and three building and loan associations, which have a combined capital of \$5,400,000 and total deposits of \$70,000,000. The savings deposits alone amount to \$41,428,036, an unusual average for the population. The First National (the third oldest national bank in the United States) and Dollar Bank has 61,000 depositors, and the largest retail foreign exchange department in the country, with 10,000 depositors and \$7,000,000 deposits. No bank failures have occurred in Youngstown.

**Churches.**—Of the 110 churches, chapels and missions 64 are English-speaking congregations; 74 are Protestant, with a membership of about 20,000 and Protestant constituency of approximately 50,000. These represent every major denomination. The Federated churches have a central office and a paid secretary to promote church activities. More than \$100,000 a year is contributed by these church members for missionary and benevolent enterprises. The contributions for local work total above \$200,000. There are five orthodox and one reformed Jewish Synagogues, with flourishing congregations, the Jewish population being approximately 10,000, who are active in the business, social and intellectual progress of the city. The Catholic church plays an important part in the life of the city. The estimated Catholic population is 65,000. There are 22 churches, six English, three Greek Catholic, two Polish, two Italian,

two Slovak, one each of German, Rumanian, Croatian, Magyar, Lithuanian and Syrian.

**Benevolent and Social Service.**—Youngstown has a complete and carefully developed plan for organized social service, centring in its Community Corporation (not for profit) organized in 1919, which annually raises in one campaign the funds necessary to maintain 26 affiliated organizations. Of the \$1,200,000 total budget \$400,000 is contributed annually by 15,000 citizens through the Community Corporation. Nursing service is furnished by City Hospital (250 beds), Saint Elizabeth Hospital (200 beds), Visiting Nurse Association, Anti-Tuberculosis League, Community Social Hygiene Clinic and Florence Crittenton Home Association. Bonds for \$500,000 have been issued by the city to erect a contagious hospital. Relief for needy families is given by the Community Service Society, Municipal Lodging House, Salvation Army, Rescue Mission, Saint Vincent de Paul Society and the United Jewish Charities. The welfare of children is promoted by the Baby Welfare Committee, Christ Mission Settlement, Day Nursery, Children's Service Bureau, Free Kindergarten Association, Fresh Air Camp and Joint Committee on Boys' and Girls' Work. Recreation, education, moral and civic training are afforded through activities of the Boy Scout Association (1,000 members), Y. M. C. A. (4,000 members), Y. W. C. A. (3,000 members), Playground Association, Nielson House, Colored Community Centre and the Booker T. Washington Settlement. Other organizations are the Youngstown Humane Society, Old Ladies' Home, Children's Home, Welfare Association for the Blind and Social Service Committee for the Blind, and the Mennonite Mission Settlement. Important industrial housing projects have been carried out, one company having erected 650 homes at an investment of \$2,750,000.

**Fraternal Orders.**—The fraternal orders in Youngstown include Masonic (three Blue Lodges), Odd Fellows, Elks, Knights of Columbus, Moose, etc. The Chamber of Commerce has 1,050 members, the Rotary Club 130 members.

**Education.**—Youngstown's schools stand high among those of the nation, due largely to the devotion and ability which has characterized superintendents and teachers since the beginning. Among these was Reuben McMillan (1820-98) who with two short intermissions was superintendent from 1853-86. There are now 49 public school buildings in the city, valued at \$2,820,000, on land valued at \$550,000, which with equipment represent a total value of \$3,482,000. There are two high schools, Rayen with a notable history dating back to the will of Judge William Rayen and opened in 1866, now with 38 teachers and 930 pupils; and South with 45 teachers and 1,208 pupils; 43 elementary schools, with 489 teachers and 18,273 pupils—a grand total of 565 teachers and 20,411 pupils. There are six kindergartens in addition to five others operated by the Kindergarten Association. The social centres regularly maintained at 12 schoolhouses and 13 public playgrounds on school property are effective and largely patronized. Schools are maintained also by the Catholic, Lutheran and other churches. The Catholic Church maintains 12 schools, with 80 teachers and 3,679 pupils. Yale School, estab-

lished in 1895, is a private school of 150 pupils. Large classes in varied subjects are conducted by the Y. M. C. A., Y. W. C. A., and other organizations. To supplement the schools the Public Library system is supported by taxation (\$31,000—including \$6,000 from School Board), and under direction of Reuben McMillan Free Library Association of open membership. It has collections totalling 85,000 volumes, a staff of 20 assistants and circulates 310,000 volumes per year from its central building and 45 distributing points, most of which are in schoolhouses.

**Newspapers.**—The city is fortunate in its high class newspapers—both evening—*Telegram* (Rep.) established in 1851, and *Vindicator* (Dem.) established in 1862, with Sunday edition. Weekly papers in Italian, Hungarian, Rumanian, Greek, Slovak are widely read among the adult foreigners in the Mahoning and Shenango valleys.

**Government.**—Every two years the people elect a mayor; president of council; one councilman from each of the seven wards and three councilmen-at-large; solicitor, auditor, treasurer. The city clerk is appointed by the council. A director of public service and director of public safety are appointed by the mayor for a term of two years, and they with the mayor form the Board of Control which awards contracts for public work. Under the department of public service are the city engineer and superintendent of waterworks. Under the public safety department are the chief of police, fire chief, building inspector, electrical inspector and charities agent. The chiefs of police and fire are appointed by the mayor. A judge of the civil and criminal branches of Municipal Court are elected by the voters for two and four years. The Sinking Fund Trustees have charge of and provide for the payment of all bonds issued, for interest maturing thereon and the payment of all judgments final against the corporation. The Sinking Fund is now \$509,745.54.

**Population.**—The population increased from 8,075 in 1870 to 44,885 in 1900, and 79,066 in 1910. It is now estimated at 140,000. The people of foreign birth or descent comprise the larger part of this number. According to the 1910 census there were 6,000 Germans, 5,500 Hungarians, 3,600 Italians and 1,700 Russians. The English, Irish, Welsh and Canadians totaled 5,600. Approximate estimates of foreign population now in Youngstown show Italians, 12,000; Slovaks, 12,000; Hungarians, 8,000; Croatians-Serbian, 5,000; Polish, 4,500; Rumanians, 4,000; Greeks, 3,000; Russians, 1,500; Spanish, 500; Syrians, Armenians, Turks, 250 each. Beside five newspapers these people have many social, educational and benefit organizations and take an increasingly valuable part in the city's progress.

**History.**—The township was named for John Young, one of the first settlers, who bought a tract from the Connecticut Land Company in 1796. David Tod, afterward "war governor," operated the first coal mines and led in establishing the canal and first railroad. Sturdy foreign elements attracted later by manual industries have combined with the descendants of early residents, largely from New England, and others, to form an enterprising, industrious, upright and patriotic com-

munity, which during 1917-18 sent 7,000 men (Mahoning County) to war, purchased over \$50,000,000 government bonds and gave more than \$3,000,000 to war work.

JOSEPH L. WHEELER,  
*Librarian, Youngstown Public Library.*

**YPRES**, *é'pr* (Flemish, *Yperen*), Belgium, a town in the province of West Flanders, in a plain, on both sides of the Yperle, 28 miles south-southwest of Bruges, 53 miles by rail. Ypres formerly was one of the most important manufacturing towns of Flanders, and in the 14th century had 200,000 inhabitants and employed 4,000 looms. Its manufacturing prosperity had long departed prior to the European War, 1914-18, but a striking monument remained in its cloth-hall (Les Halles), an immense building of the 13th and 14th centuries, in the form of an irregular trapezium, surmounted by a square tower or belfry. One of its wings was used as the town-house, and other parts were occupied by different public establishments and concert-rooms. The Gothic cathedral of Saint Martin, dating from the 13th century, was one of the most remarkable religious edifices in Belgium. The chief manufactures were cotton and lace. The population numbered 19,000. Ypres was made by Louis XIV in 1698 one of the strongest fortresses of the Low Countries, and in the great European wars seldom escaped a siege or bombardment. Jansen (q.v.) was bishop of Ypres, and was buried in the cathedral of Saint Martin. During the European War the town was reduced to ruins. Its location on the most hotly contested "debatable land" on the western front, made it the scene of many a grim struggle between the German and British forces, and three great pitched battles being fought over the vicinity. Here the British troops barred the way to the Channel ports. The first battle of Ypres began 14 Oct. 1914, the second on 9 Nov. 1915, and the third on 31 July 1916.

In March 1919 the Belgian government intimated their desire of making Canada a grant of land in the city of Ypres for the erection of a memorial museum and shrine to the brave Canadian soldiers who in the defense of liberty had made the supreme sacrifice on the battlefields of the famous Ypres salient. It was also suggested not to rebuild the city but to leave its ruins standing as a lasting monument to unjustifiable and ruthless German aggression. For an account of the Ypres battles see **WAR, EUROPEAN—MILITARY OPERATIONS ON THE WESTERN FRONT.**

**YPSILANTI**, *Ip-si-lán'ti*, a distinguished Fanariot family descended from the Comneni and of prominence as defenders of Greek liberties. Its most conspicuous members are: **ALEXANDER**: b. Constantinople 1725; d. 1805; hospodar of Wallachia 1774-82, and again in 1796-98, and of Moldavia 1784-92. He propounded a scheme for the fusion of the Greek and Turkish people, but having incurred the suspicion of the Porte, was executed. **CONSTANTINOS**, his son: b. Constantinople 1760; d. Kiev, Russia, 28 July 1816. He early planned the freedom of Greece, but his scheme was prematurely discovered, and he fled to Vienna. Pardonned by the sultan, he was hospodar of Moldavia 1799-1805. He then went to Russia, but returned to Bucharest with 20,000 men, in the hope of freeing Greece. The peace of Tilsit, interrupting his plans, he returned to Russia.

**ALEXANDER**, eldest son of the preceding: b. Constantinople, 12 Dec. 1792; d. Vienna, 31 Jan. 1828. He went with his father to Russia and, joining the Russian army, served with distinction in various campaigns. In 1820 he became head of the secret association known as *Hetæria*, whose aim was the independence of Greece, and in March 1821 entered Moldavia and raised the standard of revolt among the Rumanians. He was defeated by the Turks at Dragaschen, near Galatz, 19 June 1821, fled to Austria and was imprisoned six years at Munkacs, Hungary. **DIMITRIOS**, brother of the preceding: b. Constantinople, 25 Dec. 1793; d. Nauplia, 16 Aug. 1832. After serving in the Russian army, in 1821 he joined the Greek patriots in the Morea and played a brilliant part in the struggle. But though a brave and successful general, as his victory at Tripolitza and his defense of Argos show, his influence was constantly undermined by the "native" party, who never forgot that he was a Fanariot, and, therefore, a foreigner in part. In 1827, however, he was made commander-in-chief of the Greek army but the ungenerous course adopted toward him by the government of Capo d'Istria compelled him to resign 1 Jan. 1830, and he then withdrew from public affairs. **GREGORY**, brother of the preceding: d. 1835. He was the founder of a princely family now living near Brünn. **NICOLAS**, brother of the preceding: b. 1796. He wrote a volume of 'Mémoires,' which gives considerable information concerning events leading to the insurrection of 1820.

**YPSILANTI**, Mich., city in Washtenaw County, on the Huron River and on the Lake Shore and Michigan Southern and the Michigan Central railroads, 30 miles west of Detroit and eight miles southeast of Ann Arbor. It is on both sides of the river, which furnishes a large amount of water power. In 1807 there was an Indian trading post on the site of the present city. In 1824 it was laid out as a town, became a village in 1832 and was chartered as a city in 1858. It has considerable manufacturing interests. In 1900 (government census) the total capitalization of the manufacturing establishments in the city was \$1,200,000; the value of the annual products was \$1,318,793. The chief manufactures are flour, paper, dairy products, underwear, agricultural implements, iron castings, pressed steel, hosiery, automatic parts, sash, door and blinds, tags and labels, pumps, cement and foundry and machine-shop products. The city is the commercial centre of a rich surrounding country. It contains nine churches and the Michigan State Normal College, a high school established in 1849, a business college, public elementary schools, kindergartens and public and school libraries. The two banks have a combined capital of \$675,000, and, in 1919, had deposits amounting to \$2,500,000. The city owns and operates the electric-light plant, the waterworks and gas plant. The government is administered under a charter of 1898, and is vested in a mayor, who holds office one year, and a common council of 10 members. Pop. 7,500.

**YREKA**, wi-rē'ka, Cal., city, county-seat of Siskiyou County, on the Yreka Creek and on the Yreka Railroad, about 275 miles north of San Francisco. It is in an agricultural and

lumbering region, in which considerable attention is given to fruit cultivation and stock-raising. There are large stock yards, a lumber mill and fruit-packing houses. The city has three banks with a combined capital of \$210,000 and a county high school. Pop. about 1,390.

**YRIARTE**, ē-rē-ār'tā, **Charles Emile**, French journalist, artist and author: b. Paris, 5 Dec. 1832; d. there, 10 April 1898. He studied architecture as a pupil of Constant Dufeux became inspector of imperial asylums, and after this post was abolished, went on the Spanish expedition to Morocco in 1859 as correspondent and artist for the *Monde Illustré*, and in 1860 on Garibaldi's campaign in Sicily in the same capacity. From 1864 to 1870 he was editor-in-chief of the *Monde Illustré*. In 1881 he was made inspector of fine arts and in 1889 member of the superior council of fine arts. He wrote for the *Figaro* and for *La Vie Parisienne* over the pseudonym 'Marquis de Villemer.' Among his numerous volumes of various character are 'Portraits Parisiens' (1865); 'Gaya, sa vie et son œuvre' (1867); 'Les Tableaux de la Guerre' (1870); 'Le puritain' (1875); 'Venise' (1877); 'Autour du Concile' (1887); and several works on the Italian Renaissance, such as 'Florence' (1880); 'Francois de Rimini' (1882); 'Matteo Civitali, sa Vie et son Œuvre' (1885); 'Autour de Borgia' (1890) and 'Maso di Bartolommeo dit Masaccio' (1894).

**YRIARTE**, or **IRIARTE**, **Juan de**, Spanish linguist: b. Orotava, island of Teneriffe, 15 Dec. 1702; d. Madrid, 23 Aug. 1771. In 1714 he was sent to school at Paris and afterward he studied English in London and jurisprudence in Madrid, where he presently obtained a post in the royal library. In 1732 he became chief librarian and in 1742 translator for the ministry of foreign affairs. He published an important 'Codices græci manuscripti' (1769) and wrote many Latin and Spanish epigrams and proverbs. Latin poems, etc., included in his 'Obras Sueltas' (4 vols., 1774).

**YRIARTE**, or **IRIARTE**, **Tomas de**, Spanish dramatist: b. Orotava, island of Teneriffe, 18 Sept. 1750; d. Madrid, 17 Sept. 1791. He began to write in boyhood and in 1770 published his comedy, 'Hacer que hacemos,' under the pseudonym, 'Tirso Ymareta.' In 1870 he published a didactic poem, 'La musica,' and in 1782 'Fabulas literarias,' considered the best fables in the Spanish language. He also wrote the first regular comedies in Spanish, the best being 'The Spoiled Child' and 'The Ill-Bred Young Lady' (1788), and published Spanish translations of French plays. Horace's 'Ars Poetica' (1777), and four books of the *Æneid*. In 1771 he succeeded his uncle, Juan de Yriarte (q.v.), as royal librarian.

**YSAÏE**, ē-si-yē, **Eugene**, Belgian violinist: b. Liège, Belgium, 16 July 1858. He studied at the Liège Conservatory and subsequently with Wieniawski and Vieuxtemps at Brussels. He made many successful European concert tours and in 1886-98 he was professor in the Royal Conservatory of Brussels. He originated a new school of violin playing, embracing features of the German, the French and the Belgian schools. He is considered one of the leading violinists of the world and is gifted

with marvelous powers of interpretation. He visited London in 1889 and established there as well as in the principal cities of the Continent a high reputation as a conductor and soloist. He first visited the United States in 1894 and toured the country repeatedly thereafter, becoming in 1918 conductor of the Cincinnati Orchestra. His compositions include several violin concertos, a piano concerto, a program symphony and a 'Suite Wallonne.'

**YSLETA**, ē-slā'ta, Tex., city in El Paso County, on the Rio Grande and on the Texas and Pacific and the Southern Pacific railroads, 12 miles southeast of El Paso. It is in a fertile agricultural region, the productive Rio Grande Valley, in which fruit and grains grow in abundance. It was founded in 1682 after the uprising of 1680, its residents being the Tiguex Pueblo Indians of the village of the same name in New Mexico visited by Coronado in 1540. They were later settled here by Governor Otermin, retaining the name of their village in New Mexico. The city claims to be the oldest in the State. Several of the descendants of the Pueblos are residents of the city. Population is more than 2,000; about one-third are citizens of the United States and nearly all the others are Mexicans and Indians.

**YSSEL**, ȳ'sél, or **IJSSEL**, Netherlands, the name of several rivers, chief of which are: (1) the Nieuw Yssel, one of the principal arms of the Rhine, which leaves that river below Arnheim, flows northeast for 16 miles to Doesburg, where it receives the Oude Yssel from Westphalia, then northeast, north and northwest, through Gelderland and Overijssel, past Zutphen and Deventer, receiving the Borkel and Schip-Beek, emptying at Kampen by many arms into the Zuyder Zee about 40 miles northeast of Amsterdam, and forming a constantly widening delta. It is one of the five main arms of the Rhine, is 320 feet broad at Zutphen, 764 at Kampen, and 90 miles in length, all of which is navigable. (2) The Neder Yssel, an arm of the Leck, which leaves that stream at Vianen, flows west through Utrecht, at Oudewater enters southern Holland and flows southwest past Gouda to join the Maas above Rotterdam, forming at its mouth the island of Ysselmonde. Length, 30 miles.

**YTTERBIUM**, a rare chemical element belonging to the Yttrium group. Discovered by Marignac in 1878 in the mineral gadolinite, it was separated into two elements named neoytterbium and lutecium by G. Urbain in 1907, and the same result was announced in 1908 by E. A. von Welsbach, who named the elements didymium and cassiopeium. There was some discussion in regard to priority of discovery. Also found in other minerals occurring in Siberia, Scandinavia and Greenland. Symbol, Yb.; atomic weight, 173. Its oxide  $Yb_2O_3$  forms colorless salts with sulphuric acid, etc.

**YTTRIALITE**, a native silicate chiefly of thorium and the yttrium metals. It occurs in Llano County, Tex., in grayish-olive-green masses, associated with gadolinite and other minerals which have been mined as a source of the rare earths.

**YTTRIUM**, a rare chemical element discovered 1794 by Gadolin in the mineral gadolinite from Ytterby. It is always found in com-

bination, some of the minerals containing it being gadolinite, xenotime, euxenite, yttrantinite and polycrase. It is usually separated from the mineral by use of sulphuric acid or aqua regia. The element is obtained by heating the chloride with metallic potassium, by electrolysis of a molten mixture of the chloride and sodium chloride, or by heating the oxide with magnesium. It is a grayish-black, lustrous, metallic powder that burns in the air to the oxide  $Y_2O_3$ ; soluble in dilute acids; symbol Y; atomic weight 89; valence 3. It forms a great many compounds closely resembling aluminium, but unlike that element forms no alums.

**YUAN SHIH-KAI**, Chinese soldier and statesman: b. Hsiang Ching, province of Honan; d. Peking, 6 June 1916. Descended from a family long active in the service of the state, Yuan was destined from the beginning of his career to become a leader in military, foreign and domestic affairs. Yuan Chi-san, his grandfather, achieved distinction in suppressing the Taiping rebellion (q.v.) and died (1864) as imperial commissioner and provincial commander-in-chief. Yuan qualified for a bachelor's degree and immediately attached himself to the (then despised) military profession. At the age of 20 he was appointed aide-de-camp to General Wu Chang-ching, then commanding the Chinese forces in eastern Santung. When the rebellion broke out in Korea (July 1882) Li Hung Chang, then the helmsman of China's ship of state, sent an expeditionary force, to which Yuan was attached, to the assistance of the emperor and quelled the uprising. Yuan in 1884 was given command of the Chinese garrison in Korea and the following year was appointed Imperial Resident. For the next nine years he was the de facto ruler, ably assisted by Sir J. McLeavy Brown. Yuan soon demonstrated his uncompromising attitude and autocratic methods, which involved him in many difficulties with the Japanese at Seoul. The Tonghak Rebellion (1893), the well-organized movement of the Nationalist party, followed by the sinking of the *Kowshing*, first proved China's military weakness. Protected by British blue jackets Yuan escaped to the coast. After temporary peace Yuan was restored, Li Hung Chang sent 5,000 troops to Yuan and ordered them to be trained in the Western fashion. This marked the beginning of China's modern army. Yuan ruled this small force with a rod of iron, but the men were slow to accept subordination and Yuan could not instill the necessary spirit of devotion in his troops. After the *coup d'état* of 1898 and the subsequent resumption of power by the Empress Dowager, the military prowess and reputation of Yuan became an important factor. He always remained a close friend of the empress, who was able to maintain the ruling hand until her death, with the constant assistance of Yuan, by this time well versed in all important affairs of government. When at the death of the Empress Dowager Tzu Hsi (1908), Kuang Hsu came into power, he fulfilled an old grudge and caused Yuan's humiliating retirement, for it had been rumored that this close friend of the empress silently acquiesced in a plot to overthrow the state, in which Yuan's blood-brother, Jung Lu, was the dominating factor. During the Boxer uprising (1900) the military experience of Yuan

became necessary and he was reinstated. Assisting the different viceroys in keeping the trouble confined to the immediate vicinity of Tien-tsin, at the same time lending valuable aid to the allied forces then in China. As Viceroy of Ghihli, November 1901, he was welcomed by the natives and foreigners as the best guarantee of restoration of order, and in this office he at once instituted educational and administrative reforms. His statesmanship was of a high order; he could always be trusted, and so with his appointment as administrative head of the foreign office at Peking (September 1907) and member of the Grand Council, the foreign diplomats welcomed Yuan as a statesman well liked and respected. At this period China was in the throes of continual unrest, and lacking trained military leaders, was compelled to recall Yuan (October 1911); he was appointed president of the Council of Ministers on November 1, and Prime Minister two weeks later, with full power to meet conditions as he found them. His rise was rapid. The subjects in the south clamored for a republican form of government.

While the Manchu Tartar autocracy which had ruled the "Celestial Empire" since 1643, strove to withstand the inevitable, Yuan, ambitious to become the supreme ruler, wavered between the 'Old Buddha' of the Tartars and the reform movement; fully realizing his ability to continue the actual domination of China whether it were termed republic or monarchy, he consented to be proclaimed provisional President of the republic of China (15 Feb. 1912). He was finally elected President 6 Oct. 1913, and immediately announced that China undertook to observe all treaties and obligations incurred by the Manchu regimen. He immediately abolished the Democratic opposition party, deprived members of their seats and suspended Parliament, and appointed an Administration Council until it could be reconstituted. The provisional constitution was completed in the spring of 1914, giving Yuan extensive powers, thus smoothing the way for his complete direct control of the empire. In November 1915 most of the provinces having voted for a return to monarchy, Yuan refused to ascend the throne as emperor; then changed his views and fixed the coronation for 9 Feb. 1916, and again abandoned the proposed idea of a monarchy. The provinces in the south again revolted, declaring that Yuan had forfeited his right by acceptance of the throne and proclaimed the vice-president, General Li Yuan-hung, as President of the new republic, but he was not generally recognized. Upon the death of Yuan the appointment of General Li Yuan-hung became certain, and he stepped into office 7 June 1916.

**YUBA**, yoo'hā, a river in California formed by the junction of three rivers, North, Middle and South, which have their sources in the Sierra Nevada. The Yuba enters the Feather River just below Yuba City. In its upper course it has many picturesque gorges and several cascades.

**YUBA CITY**, Cal., town, county-seat of Sutter County, on the Feather River, near the mouth of the Yuba River, and on the Southern Pacific Railroad, about 40 miles north of Sacramento. It is in a fertile agricultural region, in which fruits are among the important pro-

ductions. The industries are chiefly connected with farm products. The town has one bank. Farmers' Co-operative Union of Sutter County, with a capital of \$50,000. Pop. 1,200.

**YUCATAN**, yoo'ka-tan, Mexico, the most southeasterly and in respect to its ancient history one of the most interesting states of the republic. It is situated between 17° 40' and 21° 35' north latitude, and between 8° 39' and 12° 12' east longitude, meridian of Mexico. Bounded on the north by the Gulf of Mexico; on the east by Quintana Roo; on the south by Quintana Roo and Campeche, and on the west by the state of Campeche. Area, 15,939 square miles. Principal cities and towns: Merida (the capital) (q.v.), Progreso, Peto, Ticul, Uxmal and Izamal. Principal products: aguardiente, henequen, corn, honey, woods not reported; fruits, the principal ones being oranges, aguacates, watermelons, bananas, limes and lemons. Henequen or sisal hemp has become the principal crop. It finds a ready market in the United States. In 1900 a portion of the state was formed into the territory of Quintana Roo. Pop. 347,781.

**YUCATAN**, a peninsula in the southeast extremity of Mexico, projecting north by east to within 120 miles of the western end of Cuba. The peninsula comprises the Mexican states of Campeche and Yucatan and the territory of Quintana Roo, British Honduras and a portion of the republic of Guatemala. The surface is largely a table-land. The climate is hot, with deficient rainfall, but is not unhealthful, except for periodical visits of yellow fever. The soil is calcareous and porous; and little is seen of the ancient fertility which must have characterized this region when it was the seat of a flourishing civilization, with populous cities of great size and splendor. Only a small portion of the country is under tillage, and the general appearance is that of a wilderness. Vastly different was the scene at the time of the Spanish conquest 1527-47, "as revealed by the innumerable remains of towns, cities, temples, palaces and other public buildings dotted over the plateau, especially round the now desolate north and northeast shore of the peninsula." The vast ruins are the mysterious monumental remains of the Maya nation, whom the Spaniards found here, and whose descendants constitute five-sixths of the present population. There is no evidence for the great antiquity formerly assigned to the ruined structures in Yucatan; yet they are considered to antedate the southward Toltec migration—some of the cities having been forgotten ruins at the time of the Spanish conquest. Pop. about 400,000.

**YUCATAN**, Antiquities of. See **MAYA**; **MAYAPÁN**.

**YUCCA**, the name of a genus of shrubs with clustered ensiform leaves, belonging to the *Liliaceae*, but also employed as a common name to designate the plants belonging to the entire botanical family of yuccas. This includes not only the genus *Yucca* but several other genera, as *Samuella*, *Clistoyucca*, *Hesperaloe*, etc. The species are chiefly found in the United States and Mexico, though some of them are distributed to many portions of the world. The best known species in the United States is *Yucca filamentosa*, or Adam's needle, which is

in cultivations as far north as New England, its clusters of large white, bell-shaped flowers making it a favorite in gardens. Until recently none of the species has been regarded valuable commercially, although the coarse *Y. filamentosa*, called bear-grass, has been used in a small way as tie material to the south. In Mexico, however, there are several species with larger leaves that have of late years been exploited for their fibre, which is being known as a rather coarse substitute for the better cordage fibres. *Yucca australis*, *Yucca eralæ funifera* and *Samuella carnerosana* are used in northern, eastern and central Mexico for fibre, which is derived from the central or central spike of unopened leaves, the leaves first being steamed, and the individual leaves scraped with a dull-edged iron tool, upon a block of wood, and the fibre extracted. This fibre is known as palma istle, pita syls, zamandoque, etc. Yucca fibre is stiff, and brittle, and as prepared is not always of good color, and therefore can never take the place of the better fibre known as hard cordage. (See FIBRE). *Yucca baccata* yields a very good fibre, and the parenchyma or pith of the root possess detergent qualities, from which the name soap-plant has been derived. The sun-cured, whitish yellow inner leaves of *Y. glauca* are used by the Arizona Indians for ornamental basketry, either entire or subdivided and several other species are also employed in the domestic economy of North American Indian tribes for rude cordage, bassandals, mats, etc.

Another very remarkable feature in the yucca is its attraction by the aid of any of several species of small whitish moths of the tineine *Pronuba*. The yucca flowers are so tender as to be impossible of fertilization, and other insects attach themselves to this plant. The yucca moth gathers a quantity of pollen in its mouth, then lays an egg in the pistil, and the hole in which it is laid with pollen, fertilizing the ovary. The caterpillar develops in the fruit-pod, but does not seriously injure the plant. This extraordinary case of entomology was disclosed by C. V. Riley in 1872, and may be found fully related by him in the 18th Annual Report of the State Entomologist of Missouri.

**YUCHEE**, a linguistic stock of North American Indians who once lived along the banks of the Savannah River. See UCHEAN.

**JEN**, or **YUAN**, a Mongolian dynasty which ruled in China in 1280-1367. The founder of the dynasty was Kublai Khan, who by 1280 had conquered China and established complete jurisdiction. But while he was wise in government, a patron of literature and art, and executed public works of great importance, the Chinese were less sensible of the benefits he conferred than of the fact that he was a barbarian and placed barbarians in power to the exclusion of Chinese. He was succeeded by his grandson, Timur, who reigned 1368-1397 as Yüen-chêng. A Mongol prince, Kublai, was the third of the dynasty; and in 1368, the Chinese became somewhat less rebellious to the alien dynasty through the efforts of Zhu Tsung, who paid honors to Confucius, retained the Chinese in many offices, and in various ways succeeded in gaining the favor of

his subjects. From his time the power of the dynasty declined rapidly in authority, and during the reign of the ninth ruler, Shun Ti, in whom were said to be all the faults and none of the virtues of his predecessors, revolts broke out all over China; the Chinese found a leader in Chu Yüen-chang, who forced Shun Ti to flee. He found refuge at Ying-chang Fu, and died there, the last of the dynasty.

**YUGA**, yoo'gä, or **YOOGA**, Sanskrit, *Yuga*, a period of time, one of the periods into which the past history of the globe is divided in the chronology of the Hindus. There are four yugas: The Satya Yuga, containing 1,728,000 years; the Treta Yuga, 1,296,000 years; the Dwapara Yuga, 864,000 years; and the Kali Yuga, now in progress, which began about 3094 a.c., and which will extend to 432,000 years. Horace Hayman Wilson points out that these numbers originate in the descending arithmetical progressions of 4, 3, 2, 1, according to the notions of diminishing virtue in several ages applied to a cycle of 12,000 divine years, each equal to 360 years of mortals; and  $12,000 \times 360 = 4,320,000$ , the periods of the four yugas added together. See INDIA.

**YUIT**, the Eskimos of extreme northeastern Asia, from East Cape to a little beyond Plover Bay. They migrated from America probably in recent times, and in appearance, customs and manners differ in no great degree from their Alaskan kinsmen. Their population is unknown.

**YUKIAN** (adjectival form of the Wintun *yuki*, "stranger," also "bad," "thieving"), a linguistic stock of North American Indians, consisting chiefly of the Ashochimi, Chumaya, Napa, Tatu and Yuki tribes, which formerly occupied Round Valley and the area extending therefrom to the California coast. The Round Valley reservation was subsequently established to receive these and other tribes, and most of their representatives now reside thereon. The entire group numbers only a few hundred at most. The original home of the Ashochimi was near the present Healdsburg; the Chumaya occupied middle Eel River; the Napa, upper Napa Valley; the Tatu, Potter Valley, and the Yuki, Round Valley.

**YUKON**, yoo'kôn, North America, a large river, mainly in the United States Territory of Alaska, which rises as the Lewes in British Columbia, about lat. 59°, and after a tortuous northwest by south, and northwest course of 2,300 miles, flows into Bering Sea, on the southern shore of Norton Sound, through a many-channeled delta from 80 to 90 miles wide. The northernmost channel of the delta, the Aphoon Mouth, is the only one navigable. It has a drainage area of 330,000 square miles. The main stream of the Yukon is formed at Fort Selkirk in 63°, by the junction of the Lewes and the Pelly, the former being constituted by the junction of the Big Salmon and Teslin flowing from Teslin Lake and draining a group of small lakes in the region around Mounts Landsdowne and Lorne. From Fort Selkirk, the Yukon flows northwest with many windings, passing through the Klondike goldfield, receiving from the right the Stewart River, and at Dawson the Klondike, and from the left

the White River, Sixty-Mile Creek and Forty-Mile Creek. It enters Alaska in about 65° N., and continues its northwestern course until the Arctic Circle is reached, when at the abandoned Fort Yukon it is joined on the right by the Porcupine River, bends suddenly, almost at right angles, and thenceforward has a general southwestern trend to its mouth.

The chief Alaskan tributaries of the Yukon are the Kozukuk on the right bank, and the Birch and Tanana on the left bank. Its whole course of 1,260 miles through Alaska is navigable by stern-wheel steamers, and beyond to Dawson in Canada; since the discovery of gold throughout the region in 1897 a regular summer service is maintained; the first impracticable obstruction to navigation is at the Grand Cañon, 1,866 miles from the mouth. In its lower course the Yukon is a broad, muddy stream flowing mostly through a marshy plain and for nearly nine months of the year, from October to June, frozen over; its upper course is through the grand scenery of narrow mountain valleys and rocky gorges. The Yukon is the largest American river flowing into the Pacific; it is the 17th river of the world as to length, the seventh of the Western hemisphere, the fifth of the North American continent and the third in the United States. This last assertion is based on its whole length of 2,300 miles, however, but taking only that portion which is in the United States, or Alaska, 1,260; it is the fifth river of our country, the Mississippi, Missouri, Arkansas and Ohio rivers being longer. There are but four rivers in the world with a greater capacity, the Amazon, the Mississippi, the Missouri and the Saint Lawrence.

**YUKON.** The Yukon territory is the most northwesterly of the political divisions of the Dominion of Canada. It embraces a large, roughly triangular area of country, measuring about 207,000 square miles, bounded on the south by British Columbia, on the west by Alaska, on the north by the Arctic Ocean and on the northeast by the series of mountain ranges separating the Yukon and Mackenzie basins. The population in 1911 was about 8,512, of which over 3,000 were Indians.

**Topography.**—The territory includes a mountainous belt on the northeast consisting of the Selwyn, Ogilvie and Peel River ranges of mountains, all of which are usually classed in the Rocky Mountain System, and the great Saint Elias range on the southwest. A number of peaks in the latter range, such as Mount Saint Elias and Mount Logan, exceed 18,000 feet in height. The central part of the territory is a broken upland known as the Yukon plateau, a great tract of rolling country deeply trenched in all directions by the wide valleys of the present and preglacial drainage system. Toward the Arctic Ocean the plateau is replaced by a plain sloping easily down to sea-level.

The greater part of the Yukon territory is drained by the Yukon River, with a total length of 2,300 miles, the fifth largest river on the North American continent and one of the great rivers of the world. The Yukon is formed by the junction of the Lewes and Pelly, the former drawing most of its waters from the Coast Range and the latter from the mountains of the Rocky Mountain System. Other large tributaries of the upper Yukon are White River, a

swift, turbid stream heading in the glaciers of the Saint Elias Range, and the Stewart and Porcupine rivers, both of which enter it from the east. River steamers navigate the Yukon River throughout its whole length and also ascend the Lewes up to Whitehorse rapids, a total distance from tide-water of about 2,000 miles. The Pelly, Stewart and other tributaries are also navigable for some hundreds of miles above their junctions with the main stream.

**Fauna and Flora.**—The valley flats and the lower slopes of the hills and ridges throughout the territory are more or less thickly forested, while the uplands are bare. In the southern part of the territory the forest ceases at an elevation of 4,000 feet above the sea. Going northward the tree line descends gradually, and at the Arctic circle has an elevation of less than 2,000 feet above the sea. The principal forest trees are the white and black spruces (*Picea alba* and *P. nigra*), the aspen (*Populus tremuloides*), the balsam poplar (*Populus balsamifera*), the balsam fir (*Abies subalpina*), the black pine (*Pinus Murrayana*), and the birch (*Betula papyrifera*).

The larger animals of the district include the black and brown bear, the woodland and barren land caribou, the moose, at least two species of mountain sheep, the mountain goat, the timber wolf, the red fox and the wolverine, lynx and martin.

**Climate.**—The climate is severe. The winter season lasts from about the first November until April. The rivers are usually frozen by the first of November and remain frozen until May, while the lakes are seldom free from ice before the first of June. During the winter season thaws are infrequent and the temperature usually ranges from zero to 40° F. below. Occasional dips to 60° F. below and one to 68.50° F. below have been recorded. The low temperatures are usually accompanied by a dry atmosphere and do not occasion much hardship. The summer season, lasting from the middle of May to the middle of September, is exceedingly pleasant, as the long clear days are never oppressively hot and the nights are always cool. The rainfall is light, the annual precipitation amounting to about 15 inches.

**History.**—The history of the Yukon territory dates back only to the year 1840. In that year Robert Campbell, a fur trader in the employ of the Hudson Bay Company, crossed from the Liard, a tributary of the Mackenzie, and discovered and named the Pelly, one of the main branches of the Yukon. In 1843 the same explorer descended the Pelly to its junction with the Lewes and was thus the first trader to reach the upper Yukon. In 1846 J. Bell, also in the employ of the Hudson Bay Company, descended the Porcupine to the Yukon, and in the following year Fort Yukon was built at the confluence of the two streams. In 1849 Fort Selkirk was established at the junction of the Lewes and the Pelly. It was raided and burnt by the Coast Indians in 1852 and was never rebuilt. Fort Yukon was occupied until 1869, when its site was proved to be in Alaskan territory and it was abandoned, and a new fort was built at the upper ramparts of the Porcupine. In 1858 Campbell descended the Yukon from Fort Selkirk to Fort Yukon and proved its identity with the Kwikhpak, the name by which the lower portion of the river was known to the Russians.

fur traders were followed, after an of some years, by the prospector. The d seeker entered the country by the pass, through the Coast Range, in n 1881, bar-mining began on the Big River, and discoveries of produc- of the Lewes, Pelly and Stewart soon

The first discovery of *coarse* gold e in 1886 on Forty-mile River and was by important finds on streams flow- ) Sixty-mile River. The Sixty-mile were actively worked until the an- ent, in 1896, of the discovery of aston- rich creeks in the Klondike district ost of the miners away. In 1897-98 a of 30,000 adventurers, including people ades and callings, poured into the coun- eading for the Klondike.

discovery of the Klondike gold fields ly changed conditions in the hitherto ized and almost unknown Yukon terri- he town of Dawson was built at the ce of the Yukon and Klondike rivers, n superseded Forty-mile as the chief ial centre. A local administration, with f justice and other organizations neces- government, was quickly established. and for better transportation was met nstruction of a railway from tide-water ead of Lynn Canal to the foot of the rse rapids on the Lewes River from oint communication with Dawson is ed by a large fleet of well-equipped amers. Telegraphic communication was ablished with the outside world and ere constructed up the valleys of most rducing creeks.

rnment.—The territory is governed, it, by a commissioner appointed by the government at Ottawa, assisted by an council of 10 members.

ries.—Placer Mining.—The devel- of the territory has depended so far ntirely on placer mining. The rich : creeks have been worked continuously 7, and have yielded gold to the value of 000 up to the end of 1917. The yearly on reached its maximum in 1900, when ted to \$22,275,000. Since that date on has been marked by a generally pro- decline; the yield of 1917 was \$3,672- e dwindling production marks the grad- ustion of the phenomenally rich claims various creeks, but does not mean a nding decline in the mining industry as nt of gravel handled has if anything l in recent years. The decreased re- : due to the lower grade of the gravels. In the early days of the camp most work was done with pick and shovel. onomic methods, such as dredging and ing, are now being introduced.

de the Klondike district, some placer : being done on the upper waters of the on the south branch of the Big Salmon he headwaters of the Alsek and White A certain proportion of the territory is respected.

Mining.—Ore mining follows placer t most mining camps, and such promises e case in the Yukon. Quartz veins free gold have been found at several the Klondike district. An important elt occurs west of Whitehorse. Some

development work has been done on a few of the claims and some rich ore, principally bornite, has been shipped to outside smelters. Native copper, sometimes in large masses, occurs loose in many of the creeks at the head of White River, but has not been traced to its source. Numerous discoveries of quartz veins carrying high grade silver minerals have recently been made in the vicinity of Windy Arm, Tagish Lake. Work is being actively prosecuted on some of these veins with very satisfactory results. Besides those mentioned, discoveries of ores of various kinds have been reported from nearly every section of the territory.

Coal Mining.—Seams of lignite coal of good quality occur at several points along the Yukon River, and a sufficient quantity is mined to supply the small local demand. Anthracite coal also occurs in the region southwest of Whitehorse but has not so far been worked.

Agriculture.—Experiments made during the past few years have shown that nearly all the common vegetables can be grown successfully in the Yukon valley, and there is every reason to believe that in the near future produce of this kind will be raised in sufficient quantity to supply the local market.

R. G. MCCONNELL,  
*Geological Survey of Canada.*

**YUKON GOLD FIELDS.** See ALASKA; CAPE NOME; KLONDIKE.

**YULAN,** a Chinese tree. See MAGNOLIA.

**YULE,** yool, Sir Henry, British geog- rapher and Orientalist: b. Inveresk, Midlothian, Scotland, 1 May 1820; d. London, 30 Dec. 1889. He was educated at Addiscombe and in 1840 was appointed to the Bengal Engineers, serving in both Sikh Wars. He retired from the army with rank of colonel in 1862 and in 1864 took up his residence at Palermo, Sicily, in order to continue and extend the researches which led to the publication of his great work, 'The Book of Ser Marco Polo, the Venetian' (1871-75), which gained him the founder's medal of the Royal Geological Society. In 1875 he returned to England, and from that year till 1889 was a member of the Indian Council. His other works include a treatise in 'Fortification,' which was used as a textbook; 'Narrative of a Mission to the Court of Ava in 1855' (1858); 'Cathay and the Way Thither' (1866); 'Notes on Hwen Tshang's Account of the Principalities of Tokharistan' (1872); 'Hobson-Jobson: a Glossary of Anglo-Indian Colloquial Words and Phrases, and of Kindred Terms, etc.' (1886), with A. C. Burnell; 'The Diary of William Hedges' (1887-89), edited for the Hakluyt Society, of which he was for many years president.

—**YULE,** the old English name for Christ- mas, still used provincially and in poetry or poetic phrases. See CHRISTMAS, and consult Pringle, Mary P., 'Yule-Tide in Many Lands' (1916).

**YULEE, David Levy,** American politician: b. West Indies, 1811; d. New York, 10 Oct. 1886. In boyhood he came with his father, whose name was Levy, to Richmond, Va., where he was educated. Sent to Florida in 1824, he there studied law, became a planter, and being elected to Congress, served from 1841 to 1845, chang- ing his name at this time from David Levy to David Yulee. He was United States senator from Florida 1845-51, taking a prominent part

in senatorial debates, and again 1855-61, when he resigned on account of the Civil War. He was then made a member of the Confederate Congress. After the war he became president of the Atlantic and Gulf Railroad, and was interested in the commercial development of Fernandina and Cedar Keys, Fla.

**YUMA**, yoo'ma, Ariz., city, county-seat of Yuma County, on the Colorado River, and on the Southern Pacific Railroad, 150 miles southwest of Phoenix. It is in a mining region in which there are considerable productive farm lands on which are raised grains and fruits. Its climate is remarkable for its dryness, its rainfall of 3.13 inches being the lowest recorded by the United States Weather Bureau Station. There are several churches, a high school, hospital and excellent county and Federal buildings and banking facilities. Pop. 2,914.

**YUMAN STOCK**, an important family or linguistic stock of North American Indians, the tribes composing it being scattered from the Colorado River region of Northern Arizona to the southern extremity of Lower California and even into the Mexican state of Sonora. The most important tribes of the stock are the Cochimi, Cocopa, Comeya, Cuchan, Diegueño, Havesupai, Maricopa, Mohave, Yavapai, Pericu, Seri, Tonto, Waikuru and Walapai. Of these, the Maricopa, or Cocco-Maricopa, formerly inhabited the region around the confluence of the Gila and Colorado rivers. Their descendants and the Pimas, with whom they subsequently confederated, are now to be found in the Gila River Reservation to the number of about 400. They were an agricultural people and raised large crops by irrigation. Under missionary influence they have been civilized and are now noted for their industry, their efforts at self-improvement, and their manufactures of cotton cloth, baskets and pottery.

The Seri Indians (Opata, "Spry") speak a distinct language and live on Tiburn Island, in the Gulf of California, and the adjacent mainland of Sonora, Mexico. Their houses are flimsy bowers of cactus and shrubbery, sometimes rudely shingled with turtle shells and sponges. They make graceful balsams of canes lashed together for use in navigating the strait between their island and the mainland. They also manufacture a very light pottery and some basketry. The modern Seris are loosely organized into a number of maternal groups or clans in which polygamy prevails. They manifest implacable hatred toward aliens whether Caucasian or Indian and regard the shedding of alien blood as a great virtue. The population of the tribe was formerly several thousands but by constant warfare this number has been greatly reduced.

The name Tonto (Spanish, "foolish") has been inappropriately applied by the Spanish colonists of Arizona in the 19th century to a number of Indian tribes, namely: (1) To the Tulkepaia, a tribe of the Yuman stock settled in 1875 on San Carlos reservation Arizona. (2) To the Eoyotero Apaches, an Athapascan tribe. (3) To the Pinal Apaches of the same stock. (4) To a mixture of Yavakai (Yuman) men and Pinal women who have intermarried. The name has been especially applied to the last-mentioned body, who formerly occupied Tonto Basin and the Pinal Mountains of central

Arizona, whence some 500 of them were removed to the Rio Verde reservation and later to the San Carlos reservation. They number about 700, and speak a mixed Yuman-Athapascan language.

The Mohave Indians reside in Arizona and California in the region of the Colorado River. There were in 1896 upward of 2,000 Mohaves remaining, 600 of whom live on the Colorado River Reservation in Arizona. They are an agricultural people, rank high physically and are expert makers of pottery and baskets. They practised tattooing and cremated their dead. The Yuma reside in the valley of the lower Colorado River in Arizona and California. Pop. about 655. The Cochimi were formerly the most populous of the tribes of Lower California but only a few are now extant. They live mainly about Loreto Mission. The Cocopa formerly occupied the valley of the Colorado River up to the Gila junction, but the remaining members now live mostly in Mexican territory. The Havesupai occupy the gorge of Cataract Creek, a branch of the Colorado River, in northwestern Arizona. The Mohave Yavapai left the main tribe in the Colorado valley and migrating to the Rio Santa Maria district, in 1873 were removed to the Camp Verde agency; but since 1875 they have been under the San Carlos agency. The Walapai originally occupied the territory above the Mohaves on the Colorado River. The total number, 20,000, who originally inhabited the United States, has been greatly depleted and at present there are not more than 6,000 living within the limits of the United States on reservations. But many members have become full-fledged citizens and no longer figure as wards of the United States. Of these no record is kept.

**YUNG-LO**, Chinese emperor, third of the Ming dynasty: b. 1360; d. 1424. He was the eldest son of Emperor Hung-wu, but was absent at the time of the emperor's death in 1398 and was superseded on the throne by a nephew, Kien-Wên. In 1403, however, Yung-lo reached Nanking with his forces, entered the city and assumed his place as emperor, compelling the flight of Kien-Wên. He conquered Cochin China and Tongking, and made successful war against Tartary. He was a famous patron of literature, particularly as sponsor of the 'Yung-lo Ta Tien'—'The Standard of Yung-lo,' a collection of all the literary work known to the Chinese down to that period. It was completed under the supervision of three scholars who were assisted by 2,166 literary workers, and when finished there were 22,877 books with a table of contents filling 60 books. The work was never printed, but three complete copies were made. Of these all have perished except about 11,000 books of one set.

**YUNG WING**, yoo'ng'wing', Chinese diplomatist and scholar: b. Nan Ping, province of Kwang Tung, 17 Nov. 1828; d. 21 April 1912. After graduation from Yale in 1854, he was in the silk and tea trade until 1864, and then entered the governmental service of China. The China Steam Navigation Company was established on his initiative, as was also the Chinese Educational Mission, for the education of Chinese in America. Yung Wing was made ch'ih commissioner of this enterprise, for which an appropriation of \$1,500,000 was made by the

Chinese government. He was granted the rank of mandarin of the second grade, and appointed intendant of Kiang-Su province; and was for four years associate resident minister to the United States, where he took up his residence in 1902. Author of 'My Life in China and America' (1909).

**YUNNAN**, yŭn-nān', China, the most southwesterly and second largest province of the empire, bordering on Tonkin and Burma; area, about 146,680 square miles. It is very mountainous in the north and west, and has a general slope toward the southeast. The central part is a plateau about 6,500 feet above sea-level, dotted with lakes and diversified by hills of red sandstone; but in the south the elevation of the land is much less. The province is traversed by several large rivers, principally the upper courses of the Yangtse-kiang (called Kin-cha-kiang), the Si-kiang, the Song-ka or Red River, the Mekong and the Salwin, but only the Song-ka can be regarded as of use for navigation within the province. The principal crops are rice, maize and wheat, but tea, indigo, sugar-cane, cotton, earth-nuts, and many vegetables also are cultivated. Opium was an important crop until 1907, when its cultivation was forbidden. Cattle, sheep, hogs and other animals are reared in considerable numbers, and silkworm-rearing is also extensively carried on. The chief wealth of the province, however, lies in its immense mineral resources, which include iron, coal, copper, gold, silver, lead, tin, zinc, cinnabar and precious stones. The manufacturing industries include the making of silk goods and other textiles, leather goods, etc. The climate varies from the rigor of the northern districts, where the mountains are snow-capped for the greater part of the year, to the comparatively tropical condition of the southeast. A large part of the population consists of Miao-tse and other non-Chinese elements, and Mohammedanism has many adherents. Yunnan, the capital, in the southeast, is a busy and prosperous town, with large copper factories, and manufactures of silks and carpets. (Pop. 150,000). Other towns are Chaotung, Tali-fu, Momein, Linganfu, Puerh, Tung-chwan, Mengtse and Ssumao, the last two being open to foreign trade since 1889 and 1897 respectively. The British have endeavored to establish a direct trade route between Yunnan and Burma, but from the physical features of the region this is not easy. The history of Yunnan can be traced back to the 3d century B.C. Owing to its distance from the seat of the central authority and its mountainous character this province long remained practically independent. It was conquered by Kublai Khan but was not incorporated in the empire until the 17th century. The most noteworthy event of its recent history is the great Panthay revolt of 1855, which was not suppressed by the Chinese authorities till 1873; and from the effects of which, owing to the merciless measures taken, the province has not yet wholly recovered. The first Protestant Christian mission work was begun in 1877. Pop. (estimated) 12,324,574.

**YUPANQUI PACHACUTI**, yoo-pān'kē pā-chā-koo'tē, or **PACHECUTEC YUPANQUI**, Peruvian inca: b. about 1380; d. about 1440. He was the ninth ruler of the Inca line

of sovereigns, and one of the greatest. He was the second son of the Inca Viracocha and after deposing or superseding his imbecile elder brother, Urco, he defeated the Chancas in a great battle, annexed their territory to his own and continued his successful career till the Inca kingdom included nearly all of what is now the republic of Peru. In order to relieve the congested condition of Peru he developed a system of colonies called mitimaes. Yupanqui figures largely in Quechua tradition and various national institutions have been traced to him. He was grandfather to Stahualpa, ruler of Peru at the time of its conquest by Pizarro.

**YUOK**. See **WEITSPEKAN INDIANS**.

**YURUARY**, yoo-roo-ā'rē, a river of Venezuela, rising to the east of the Caroni and flowing eastward to join the Cuyuni in about long. 61½° W., near the frontier of British Guiana. It gives its name to the Yuruary territory claimed by both Venezuela and Great Britain until 1899, when the award of an arbitration court gave most of it to Venezuela. There are several gold-fields here, including El Callao, etc.

**YURUCARES**, yoo-roo-kā-rās', or **YURUCARE**, Indians of Bolivia occupying the forest plains on the eastern slope of the Andes between the rivers Mamore and Beni. They include several tribes, are tall and shapely, and are almost white. They plant maize and manioc but are hunters and warriors for the most part. They are said to give complete liberty to their children, never punishing them but sometimes killing them in order to be rid of them. They dress in a bark cloth which they print with figures by means of engraved blocks; engage in duelling with bows and arrows; and make an intoxicating liquor from maize which is imbibed freely in their festivities. Their mythology is intricate and confused. Prior to the expulsion of the Jesuits, in 1767, numbers of them were attached to the Chiquito missions. Their number about 2,000.

**YUSUF**, yoo's'uf, or **YUSSUF**, Abu Amru, Arabic historian: b. Cordova, about 976; d. Xativa, 1070. He was profoundly versed in the traditions of the Oriental Mussulman countries and wrote 'Behedjet-Almodjalisyin,' a collection of tales relating to Mohammed, etc.; 'Tamhyd,' a commentary on one of the chief Mussulman works of religious and civil law; 'History of the Opinions and Doctrines of the Principal Mussulman Sects'; 'History of the Wars Against the Christians,' etc.

**YUSUF**, or **YUSSUF-BEN-TAXFYN**, Moorish prince: b. Velad, Sahara; d. 1106. He was the second prince of the Almoravide line and in 1086 aided the Emir of Seville, Al-Mo'tamid, to gain the victory over Alfonso VI at Zalaca near Badajoz. In 1090 he again invaded Spain, at the call of the emir of Seville, and taking advantage of Mohammedan dissensions, gradually acquired the sovereignty of the kingdoms of Malaga, Grenada, Murcia, Cordova, Seville, Almeria, Badajoz and Valencia, which he united to the kingdom of Morocco. Notwithstanding his power, Yusuf never assumed a higher title than that of emir, and in 1103 his son Ali was acknowledged heir of both

his Spanish and Moorish possessions. Consult Freeman, 'History and Conquests of the Saracens' (1856); Yonge, 'Story of the Christians and Moors in Spain' (1878); Coppée, 'History of the Conquest of Spain by the Arab-Moors' (1881).

**YÜTERBOG**, yu-tër bög, a town and district capital in Brandenburg, Prussia, about 26 miles south of Potsdam. Commercially and industrially it is of some local importance, possessing woolen mills, cigar factories and an export business in wines, wool, flax and constituting itself an excellent market centre for a considerable extent of country. It possesses a number of interesting old buildings, dating back to the 15th century. Pop. about 8,000.

**YVERDON**, ë-vër'dôn (German, *Ifferten*), Switzerland, a town in the canton of Vaud, at the southwestern extremity of Lake Neuchâtel and an outlet of the Orbe, 17 miles north of Lausanne. Its castle, built in 1135, was used by Pestalozzi (q.v.) as an educational establishment in 1805-25, and now contains a library and museum, devoted to Roman and Celtic antiquities. The town has also an excellent town-house, a hospital and a memorial of Pestalozzi. Among the manufactures are railway wagons and materials, beer, etc. The town has also an extensive system of wharves. Yverdon was the *Eburodunum* of the Romans, and there are remains of the ancient walls. Its residents are mostly French-speaking Protestants. Pop. about 8,600.

**YVES D'EVREUX**, ëv däv-re, Pierre, Franco-Brazilian historian: b. Evreux, Normandy, France, about 1577; d. after 1620. He became a member of the Capuchin order in 1595 and was sent in 1612 with four missionaries as their superior, to Maranhao, Brazil, where a French colony had been established. He returned in 1614 and wrote 'History of the

Most Memorable Things that Happened at Maranhao in the Years 1613 and 1614' (Paris, 1615; 2d ed. 1864), a continuation of the history of Claude d'Abbeville, a work of great historical value.

**YVETOT**, ëv-tö, France, a town in the department of Seine-Inférieure, on an elevated plain, 23 miles northwest of Rouen. It has manufactures of calico, hosiery, linen, leather and baskets. Antiquaries have been much puzzled by an ancient chronicle, and still earlier edict, which gave the title of king to the lords of Yvetot. This edict was formally abrogated in 1681. 'Le Roi d'Yvetot,' the well-known song by Béranger, translated by Thackeray, was a satire on Napoleon, which has immortalized the ancient dignity. It was the scene of the defeat of the troops of the League by Henry IV in 1592. Pop. about 7,133.

**YVON**, ë-vön, Adolphe, French historical painter: b. Eschwiller, Moselle, 1, Feb. 1817; d. Paris, 11 Sept. 1893. He studied under Paul Delaroche, traveled in Russia in 1843, and brought back with him a series of designs exhibited in Paris in 1847-48. He obtained the medal of honor at the Salon of 1857; 10 years later he became an officer of the Legion of Honor. In 1855 he was commissioned by the French government to accompany the army to the Crimea. Among his most important works are 'The Remorse of Judas' (1846); 'The Battle of Kolikova' (1850); 'The First Consul Descending the Alps' (1853); 'Marshal Ney Supporting the Rear Guard in Russia' (1855); 'The Seven Deadly Sins,' designed after Dante (1855); 'The Capture of the Malakoff' (1859); 'Battle of Solferino' (1861); and an allegorical picture of 'The United States of America' (1870), executed for A. T. Stewart. He was an artist of remarkable power and holds a prominent place among the historical and religious painters of France.

# Z

**Z** the twenty-sixth of the letters of the English alphabet, is a vocal or sonant consonant, as distinguished from *s*, which is the corresponding fricative sibilant. It was adopted into the Latin from the Greek alphabet in the time of Cicero: in the Latin alphabet, as in our own, it holds the last place; but in the Greek its place is sixth, and in the Phœnician, Hebrew and other Semitic alphabets seventh. Its earliest Phœnician and Greek form was *I*. The name of the Greek letter is Zeta, that of the Phœnician Zayin. The Greek name is either derived from that of the Phœnician letter Zade, or has been assimilated to Eta and Theta. In German and Italian it represents the sound of *ts*; in our language and in French it represents one simple sound. In Latin it was used only in words derived from the Greek. The exact value of zeta in Greek is not known with certainty; but beyond any question it stood for a double sound, not a simple sound like our *z*; this is conclusively inferred from Aristotle's remark that *xi* ( $\xi$ ), *psi* ( $\psi$ ), and *zeta* ( $\zeta$ ) are like in sound; and the inference is strengthened by the fact that in Greek prosody a vowel short by nature is made long by position when it occurs next before the zeta. The sound of the zeta, however, is in doubt — whether it was *dz* or *zd* or both. The name of Z in Great Britain is *zed*, in the United States *zee*. Z is often related to palatal sounds as *zealous*, *jealous*, etc. Though *z* is the alphabetic representative of the sonant sibilant, the special *z*-sound is in English and many other languages oftener represented by *s* than by *z*. In *azure* and some other words *z* is the sonant corresponding to *sh*. See ALPHABET.

**Z-BARS.** See RAILS AND STRUCTURAL SHAPES.

**ZABERN**, or **SAVERNE** (anc. *Tres Tabernæ*), Alsace, a town in lower Alsace, on the Rhine-Marne Canal, at the foot of a pass over the Vosges Mountains, 24 miles northwest of Strassburg, and on the railway to Avricourt. There is an episcopal palace, rebuilt in 1779, and under German rule used as a barracks; a church dating from the 15th century, and many ruined castles. The town was of importance in the time of the Romans, was destroyed by the Alemanni in 357, and was rebuilt by the Emperor Julian. It suffered greatly in the Thirty Years' War. It came prominently into public notice in 1913 through the "Zabern Incident." The 99th Infantry was garrisoned there and it was said that the soldiers were encouraged by their officers in maltreating the Alsatians. Affairs came to a climax when a young nobleman of the German army. Lieutenant von Forstner, offered 10 marks to any soldier who would bayonet an Alsatian, then

further compromised himself by striking with his sword a lame shoemaker. The incident aroused a furore of indignation, not only in the French press, but in Germany. In the Reichstag it reached such importance that a vote of no confidence was passed against the government, 293 to 54. This, however, had no result except as an expression of disapproval, the chancellor announcing that he held his office through imperial appointment and subject to no other control. von Forstner was upheld by his superior officers, and although subjected to the form of a court-martial was acquitted. The emperor's decision regarding the matter was that the honor of the army must be upheld with neither compromise nor apology. Pop. 8,643.

**ZABIANS**, a term not identical with Sabæans, but properly meaning certain non-Christian Gnostics, predecessors of the peculiar sect called Mandæans, still surviving in South Babylonia. The Cyrian Zabiens were the survivors of the ancient Syrian heathen who, being under Mohammedan rule, took the name of Zabiens in order to share the toleration which the followers of Mohammed extended to the real Zabiens. This sect became extinct about the 12th century. See MANDÆANS.

**ZACATECAS**, *tzā-kā-tā'kās*, a Mexican city and a state of the same name bounded by Coahuila, San Luis Potosi, Aguascalientes and Durango. The city of Zacatecas is 439 miles from Mexico City and 785 miles from El Paso, Tex., and is situated at an elevation of 8,044 feet above sea-level. It lies in a narrow and deep ravine, and is surrounded and closely abutted on three sides by mountains or high hills. It possesses a chain of mines many of which are among the oldest in the Republic and have produced enormous quantities of precious metals. Not all these are now worked, a number having seemingly become exhausted in so far as satisfactory returns are concerned. A public library containing some 20,000 volumes is maintained by the local government. The most notable buildings are the historic old Cathedral, with its front wall a mass of artistic carving, and the Theatre, a very imposing structure of modern design. In the heart of the city is the Market House, an iron building admirably adapted to its uses and of pleasing appearance. A few minutes' ride southward toward a broad valley is the little village of Guadalupe, where there was a Chapel of Gold, built by a devout woman and ornamented throughout in solid gold gilt at great cost, estimated at not less than \$1,000,000. Here, also, is located the State Industrial School for poor boys, in which shoe-making, tailoring, cabinet-making, and other trades are taught, together with the rudiments of a common school

education. There are The School of Arts, the Benito Juarez School and several other educational institutions of merit; the Civil Hospital and two theatres,—the González and the Calderón. Pop. about 60,000.

**ZACCHAEUS**, a New Testament character. He was a tax collector living near Jericho. Only one detail of his life is given,—he was short of stature. Jesus was accompanied by a crowd and in order to see the famous Rabbi, Zacchaeus climbed a tree. He was a Jew, but ostracised as an alien and outcast because of his business, so that Jesus by taking up his abode with him gave a blow at Jewish caste and at the same time laid himself liable to the criticism that arose, because he had accepted the hospitality of "a man that was a sinner." According to tradition Zacchaeus became the companion of Peter and finally Bishop of Caesarea in Palestine.

**ZACHARIA**, tsā-ha-rē'ā, **Heinrich Albert**, German publicist: b. Herbsleben, Saxe-Gotha, 20 Nov. 1806; d. Kanustadt, 29 April 1875. He was graduated from the University of Göttingen in 1829, was lecturer there in 1835-42, and in 1842 became professor of law. He took active part in the political movement of 1848 as a member of the National Parliament; in 1866 he opposed annexation to Prussia; and in 1867 took a leading part in the convention which framed the constitution of the North German Confederacy. He wrote 'German States' Rights and Federal Rights' (1841); 'Manual of German Criminal Procedure' (1860); 'German Constitutional Laws of the Present Time' (1855); 'The Question of the Competence of the Empire in View of the Dogma of Infallibility' (1871).

**ZACHARIA**, **Just Friedrich Wilhelm**, German poet: b. Frankenhausen, 1 May 1726; d. Brunswick, 30 Jan. 1777. After studying at Leipzig and Göttingen he became professor of belles-lettres in the Carolinum, Brunswick. He wrote: 'Der Rennomist' (The Brawler) (1744), the first burlesque heroic poem that had appeared in German; 'Fables and Tales' (1771), etc.; and translated into German hexameters Milton's 'Paradise Lost' (1760).

**ZACHARIA VON LINGENTHAL**, ling'-ēn-tāl, **Karl Eduard**, German writer on Jurisprudence, son of Karl Salomo Zacharia von Lingenthal (q.v.): b. Heidelberg, 21 Dec. 1812; d. Grosskmehlen, near Merseburg, 3 June 1894. He was educated at Leipzig, Berlin and Heidelberg, and traveled widely in Europe and in the East, making exhaustive researches in Roman and Byzantine law. He is regarded as the founder of the science of Græco-Roman jurisprudence. His works include 'Outline of a History of Græco-Roman Jurisprudence' (1839); 'History of Græco-Roman Private Right' (1844); 'Græco-Roman Laws' (1856-84); 'Paralipomena ad Basilica' (1893); and an edition of Justinian's 'Novellæ' (1881-91).

**ZACHARIA VON LINGENTHAL**, **Karl Salomo**, German jurist: b. Meissen, Saxony, 14 Sept. 1709; d. Heidelberg, 27 March 1843. He studied at Leipzig and Wittenberg, was professor of law at the latter university, 1797-1807, and filled the same position at Heidelberg, 1807-43. He was active politically in 1820-29. His writings covered practically every branch of

jurisprudence, dealing with Roman, Canon, German, English and French law, and paved the way for modern writing of the sort. He wrote 'The Unity of State and Church' (1797); 'Forty Books on the State' (2d ed. 7 vols. 1839-43); 'Hand-Book of French Civil Law' (8th ed. 1894-95), etc.

**ZACHARIAS**, zāk-a-rī'ās, father of Saint John the Baptist and husband of Saint Elizabeth. He was a priest of the temple of Jerusalem, and was stricken dumb on refusing to believe the announcement, made by the angel Gabriel, that a son should be born unto him; but recovered his speech at the birth of Saint John the Baptist. He is supposed to have been put to death by Herod (Luke i, 5-79).

**ZACHARIAS**, or **ZACHARY**, **Saint**, Pope of Greek birth; d. Rome, 14 March 752. He succeeded Saint Gregory III in the papal chair in 741 and at his death was followed by Stephen II. He exercised a powerful influence over several of the Lombard kings, obtaining the restoration of various cities and territories which had formerly been subject to the papacy, and gave his consent to the setting aside of the Merovingian Childeric III and the elevation of Pepin the Short to the French throne (1752). His day is commemorated 15 March.

**ZACHARIAS**. See ZACHARIAH.

**ZACHER**, tsāh'ēr, **Ernst Julius August**, German philologist: b. Obernigk, Silesia, 15 Feb. 1816; d. Halle, 23 March 1887. He was educated at Berlin and Breslau and was professor of German philology in Halle 1856-59, and 1863-87. His works, which are greatly prized by students, include 'German Proverbs' (1852); 'Ulfilas' Gothic Alphabet and the Runic Alphabet' (1855); 'History of the Palgravine Geneveva' (1860); 'Pseudo-Callisthenes' (1867), dealing with the Alexander myth, etc.

**ZACK**. See KEATS, GWENDOLINE.

**ZACYNTHUS** zā-kīn'thūs. See ZANTE.

**ZADKIEL**, zād'kī-ēl, (1) According to Jewish legend the angel of the planet Jupiter. (2) A pseudonym adopted by William Lilly (b. 1602; d. 1681), the astrologer. (3) The name assumed by Richard James Morrison (b. 1794; d. 5 Feb. 1874), compiler of an astrological almanac, begun by him in 1830, and which reached an annual sale of from 100,000 to 200,000 copies.

**ZADOK**, zā'dōk, (1) A high priest of Israel, contemporary with David. (See SARDUCEES). (2) A personage in Dryden's 'Absalom and Achitophel,' intended as a portrayal of Archbishop Sancroft.

**ZADOKITE FRAGMENTS**. The Zadokites are mentioned in the book of Ezekiel as the true upholders of the worship of Jehovah when Israel as a nation had deserted it. By some it is thought that their descendants settled in Damascus some time in the 1st century A.D. Some fragments discovered in the Cairo Geniza or Jewish Congregation, now in possession of Cambridge University Library, have been attributed to them with a date between 70 and 80 A.D. Considerable controversy arose concerning them among scholars in regard to their interpretation and implication. Rabbi Solomon Schechter published them under the title 'Documents of Jewish Sectaries' (2 vols., Cambridge 1910). The best account of the history of the

manuscripts and sect is in an article in *The Biblical World*, Dec. 1911, by James A. Montgomery entitled 'A Lost Jewish Sect.'

**ZAFFARIN ISLANDS**, a group of three islands lying off the coast of Morocco, near the Algerian frontier. They are at the mouth of the Muluya River and shelter its harbor. They have belonged to Spain since 1848. The central island is fortified.

**ZAFFRE**, or **ZAPPER**, in chemistry, an impure oxide of cobalt containing some arsenic and made by roasting speiss cobalt. The residuum consists of a grayish oxide of cobalt, usually mingled with sand and other impurities. It is used in the manufacture of smalt and in other ways, but its importance in furnishing "cobalt blue" has been lessened by the discovery of methods of making artificial blue.

**ZAGAZIG**, zā-gā-zēg', or **ZAKAZIK**, Egypt, the chief town of the province of Sharkieh, in the delta of the Nile, on the Muizz and Ismailia or Freshwater canals, connected by rail with Cairo, Alexandria, and Suez, 40 miles north-northwest of Cairo. The great number of factories, with their tall chimneys, and the structure of the houses, give the place a European appearance, and testify to the industrial activity which prevails. Nearly all of the cotton grown in the eastern Delta is sent here to be cleaned, sorted and partly spun before being put on the market. The town is also a centre of the grain trade, and has rapidly increased in prosperity and population since its connection with Suez by the Fresh-water Canal. Many European merchants maintain offices here. The excavated ruins of the ancient Bubastis are in the vicinity. Pop. about 34,900.

**ZAGOSKIN**, zā-gōs'kin, **Mikhail Nikolaievitch**, Russian author: b. government of Penza, 1789; d. Moscow, 5 July 1852. For some time he held a post in the department of mines at Saint Petersburg. His comedy, 'The Scapegrace,' was praised by Prince Tschaikovski, a dramatist of influence, and he wrote a number of others which had some success but were deficient in originality, although they gained for him the appointment as director of the Court Theatre at Moscow. His efforts in the domain of historical fiction, with Scott as a guide, were more worthy, the chief being 'Yuri Miloslavski' (1829) and he has been called the "Russian Walter Scott." There were half a score of others, their subjects derived from Russian history or legend. Their patriotic quality assured them an audience on their first appearance, and that they do not yet lack for readers is shown by the beginning of a complete edition of his works in 1898. There is a Russian biography by Aksakov in an edition of selected works published in 1858.

**ZAHM**, tsām, **John Augustine**, American author: b. New Lexington, Perry County, Ohio, 14 June 1851. He received his education at Notre Dame University, where he was graduated in 1871. He at once entered the order of the Holy Cross; and occupied the chair of physics at Notre Dame for 25 years, for the greater part of which time he was also head of the scientific department there. He was for many years president of the board of trustees of the university, provincial of his order in the United States and procurator-general of his

community in Rome, where he enjoyed the special favor of Leo XIII, who conferred on him the degree of Ph.D. in 1895. Dr. Zahm has lectured at the summer schools at Plattsburg, N. Y., and at Madison, Wis.; also at the New Orleans winter school and the Catholic University of America. In scientific circles, his position as an advanced evolutionist has brought him into prominence. He is a member of the Société Française de Physique; the Société Scientifique of Brussels; the Arcadia, Rome; and the Dante Society of Florence. His published works include 'Evolution and Dogma'; 'Bible Science and Faith'; 'Sound and Music'; 'Catholic Science and Catholic Scientists'; 'Scientific Theory and Catholic Doctrine'; 'Science and the Church'; 'Evolution and Teleology'; 'Souvenirs of Travel'; 'Alaska: The Country and the People'; 'Hawaii and the Hawaiians.' Dr. Zahm has devoted many years to the study of South America and on this subject has written, under the pseudonyms of H. J. Mozans and J. A. Manzo 'Following the Conquistadores by the Orinoco and Down the Magdalene'; 'Following the Conquistadores Along the Andes and Down the Amazon'; 'The Quest of El Dorado'; 'Woman in Science'; 'Following the Conquistadores Through South America's Southland, with an Account of the Roosevelt Expedition to South America.'

**ZAHN**, tsän, **Ernst**, Swiss novelist and writer of short stories: b. Zürich, 24 Jan. 1867. In 1873 his father, an innkeeper, bought a hotel at Siders in the canton of Wallis and here Ernst obtained his first instruction in the Protestant Elementary School. In 1875 he went to Zürich, where his grandparents took charge of him and sent him to the public schools, later (for three years) to the gymnasium. His father leased, in 1880, the restaurant in the railroad station at Göschenen, at the entrance to the Saint Gotthard Tunnel, and here Zahn worked as a waiter in 1883. For a year and a half he also attended the Breidenstein International Boys' School at Grenchen, canton of Solothurn. In all these various capacities, and in spite of a much interrupted education, he was energetically pursuing every opportunity that presented itself to him for increasing his knowledge. In the winter of 1885 he again worked as a waiter at Hotel Beaurivage, Geneva; in the winter of 1886 he was at Hastings, England, learning the language; in 1887 he was hotel clerk at the Hotel de la Ville, Genoa. He returned to his father's restaurant in 1888, becoming a partner in 1894 and taking sole charge in 1897. The town of Göschenen made him a town councillor, and one of his first acts in office was to cause the erection of a monument for the constructor of the Mount Saint Gotthard Tunnel and for the many laborers who met their death during its construction. In 1902 he became judge of the Uri Criminal Court, in 1904 a member of the Cantonal Council of Uri, in 1908 its president. He received the honorary degree of Ph.D. from the University of Geneva in 1909. He has written an unusual quantity of stories of Swiss local life, which are very attractive in form and correct in technique. Some of his short stories seem like faultless works of art, especially 'Stephan der Schmied' and 'Verena Stadler.' In his larger works, however, he has not devoted his atten-

tion chiefly to the difficult task of analyzing serious conflicts of character, but rather to more or less superficial problems, with the result that he is drifting more and more into the position of a writer interested only in success, which will therefore perhaps not be of very durable character. Consult 'Gesammelte Werke' (10 vols., Stuttgart 1910); 'Herzenskämpfe' (1893); 'Die Clari-Marie' (1904); 'Die Helden des Alltags' (1905; 20th ed., 1912), 'Firnwind' (1906); 'Der Apotheker von Klein Weltwil' (Stuttgart 1913). A translation of 'Stephan der Schmied' is given in 'German Classics' (Vol. XIX, New York 1914).

JACOB WITTMER HARTMANN.

**ZAHN, Johann Karl Wilhelm**, German architect, painter and art critic: b. Rodenberg, Schaumburg, 21 Aug. 1800; d. Berlin, 22 Aug. 1871. He became professor in the Academy of Arts, Berlin, 1829. He superintended excavations at Herculaneum and Pompeii; cast the finest bronzes and silver vases for the Museum Borbonico; and was architect of many fine houses and villas in Pompeiian style in England and America. Author of 'The Most Beautiful Ornaments and the Most Notable Pictures from Pompeii, Herculaneum and Stabia' (1828-30); 'Ornaments of All Classical Periods of Art' (1832-39).

**ZAHN, Theodor**, German theologian: b. Mörz, Prussia, 10 Oct. 1838. After studying at Basel, Erlangen and Berlin he became professor of theology in the University of Göttingen in 1871. He filled a similar chair at Kiel in 1877, at Erlangen in 1878, at Leipzig in 1888 and in 1892 returned to Erlangen. He became a foremost authority on the New Testament. Among his works may be named 'Marcellus of Ancyra' (1867); 'The Shepherd of Hermas' (1868); 'Ignatius of Antioch' (1873); 'The Acts of Saint John' (1880); 'Cyprian of Antioch and the German Story of Faust' (1882); 'Researches Into the History of the New Testament Canon' (1881-93); 'The Gospel of Peter' (1893); 'Introduction to the New Testament' (1897); 'Das Evangelium des Lucas' (1913), etc.

**ZÄHRINGEN**, tsä'ring-ën, the house from which the former grand-ducal family of Baden (q.v.), Germany, took its origin. The name is derived from the castle of Zähringen, now in ruins, in the village of that name, about two miles north of Freiburg in Baden. The founders of the family were from the 8th to the 10th century Counts of Breisgau, but the history of the house really began with Duke Bertold I, "the Bearded," d. 1078, who began to rule in the first third of the 11th century. Bertold II took the title of Duke of Zähringen in 1090. The main line of the family became extinct in 1218 and their territories, which included lands in Burgundy and Switzerland as well as Baden, were divided. A portion passed through a younger branch of the house to the Counts of Kyburg and thence to the Hapsburgs, to whom they are related. The remaining lands descended to the former reigning family of Baden.

**ZAIMIS, Alexander**, Greek statesman: b. Athens, 1855. He was educated at the universities of Athens, Leipzig, Berlin, Heidelberg and Paris. He was elected to the Chamber of

Deputies in 1885; served as Minister of Justice in 1890-92, and was president of the Chamber of Deputies in 1895-97. He was Premier in 1897-99, under King George, and again in 1901-02. He was High Commissioner of the Powers in Crete in 1906-11 and was successful in securing the annexation of that island to Greece. He was appointed Premier to succeed Venizelos in October 1915, but resigned a month later when his government failed to receive a vote of confidence. He was again appointed Premier in June 1916, but was succeeded by Lambros before the end of the year, only to succeed Lambros in May 1917. Upon the abdication of King Constantine, however, he was asked to resign, and was succeeded by Venizelos 25 June 1917. He was generally supposed to favor neutrality for Greece in the European War, but to be personally in favor of the Allies.

**ZAIRE**, zä-ë'rä, Africa (a Portuguese variant of the Bantu word, *nzari*), the name by which the Kongo River was known before the possession of the banks of its lower course by the Kongo tribe, and still much used until the last quarter of the 19th century.

**ZAKAZIK**, zä-kä-zëk', Egypt. See ZAGAZI.

**ZALESKI**, zä-lës'ki, Bohdan, Polish poet: b. Bohaterka, in the Ukraine, 14 Feb. 1802; d. Villepreux, near Paris, 31 March 1886. He studied at Warsaw and being obliged to leave his country after the revolution of 1830, he went to France. Many of his poems depict in the most vivid manner the scenery of Poland, as well as its history and legends, in which he was well-versed. His chief works are 'The Spirit of the Steppes' (1842); 'The Most Holy Family' (1851), and collections of shorter poems.

**ZALEUCUS**, zä-lü'kü's, the legendary law-giver to the Epizephyrian Locrians, the Greeks who colonized Magna Græcia, the southwest extremity of Italy. He is supposed to have flourished in the middle of the 7th century a.c. and his code is said to have comprised the first written laws of the Greeks. According to tradition his laws were exceedingly severe.

**ZALINSKI**, zä-lin'ski, Edmund, American soldier and inventor: b. Kurnich, Prussian Poland, 13 Dec. 1849; d. 10 March 1909. Coming to the United States in 1853 with his parents, who settled at Seneca Falls, N. Y., he was educated at the Syracuse High School, and entered the army in 1864 as volunteer aid on the staff of Gen. N. A. Miles. He was appointed second lieutenant Fifth United States Artillery in 1866, and captain in 1867. He was professor of military science at the Massachusetts Institute of Technology 1872-76, and was appointed second lieutenant Fifth United States Artillery School at Fort Monroe and the School of Submarine Mining at Willett's Point, N. Y. From 1883 to 1889 he devoted himself to the development and perfecting of a pneumatic dynamite torpedo gun. Among his inventions are an intrenching tool, a ramrod bayonet, a telescopic sight for artillery and a system of range and position finding for sea-coast and artillery firing. He retired from active service in 1894 and was promoted major in 1904. See ORDINANCE.

**ZALINSKI GUN.** See **ORDNANCE.**

**ZOKOSTAS, Georgios,** Greek poet: b. Ionia, Epirus, 17 April 1805; d. Athens, 3 1858. An ardent patriot, at 16 he fought in the insurrection at Missolonghi. Greek children taught his songs, and among his best-known poems are 'Missolonghi'; 'Armatoles Klepts'; 'The Entrance of Prevesa'; 'Hours of Leisure'; 'Marco Bozzaris,' etc. Several of his verses have been translated into English, Spanish, English, German, French and Italian. His 'Poetical Works' were published in Athens in 1860.

**ZALUSKI, Zdzisław,** Josef Andrezej, Polish poet and scholar: b. Poland, 1/02; d. 9 1874. After serving for three years at the court of the Pope Clement XII he became bishop of Kiev, but was banished to Siberia and imprisoned there in 1766-73 for his opposition to the Dissidents. He is chiefly remembered for the service he did in awakening Polish literature. He spent his fortune in collecting a great library, which he bequeathed to the city, but which was taken by Russia after the partition, and formed the nucleus of the Imperial Public Library. He was a great orator and while in prison wrote from memory a detailed account of the Polish histories in his own language. He was not a great writer but his works have a high historical and bibliographical value. Author of 'Biblioteka historyków' ; 'Specimen historiae Poloniae criticae

**ZAMBA, zā'mā,** North Africa, the name of several ancient cities about 30 miles apart, 100 miles west of Carthage, now represented by Sidi Amor-Djedidi. Both claim to be the scene of the victory of Scipio Africanus over Hannibal, which decided the fate of Carthage in 202 B.C. It led to an ignominious peace which closed the Second Punic War 201 B.C. The Romans lost about 2,000 killed and 10,000 captured, while the Carthaginians lost in killed prisoners over 40,000.

**ZAMACOIS, thā-mā-kō'ēs, Eduardo,** Spanish painter: b. Bilbao, Vizcaya, 1842; d. Madrid, 1871. He was a pupil in Madrid of the painter Federico de Madrazo, and the Académie des Beaux-Arts in Paris, of Meissonier and the Beaux-Arts and has been ranked as second to only Eugène Delacroix among Spanish genre-painters of the 19th century. His subjects were drawn largely from the 16th and 17th centuries, and were frequently treated in a satirical vein. His technical skill has been described as "almost as perfect as Meissonier's." Among his paintings are 'The Hunchback'; 'Spanish Recruits'; 'The Fighters'; 'Indirect Taxes'; 'A Court of the 16th Century'; 'The King's Favourite' (1867); 'Cervantes as a Recruit'; 'Rival Confessors' (1868); 'Return to the Motherland' (1869); 'The Education of a Soldier' (1870); 'The Puzzled Musician.' Several of his works are in private collections in the United States.

**ZAMBALAN, thām-bā'lās,** Philippines, a province of Luzon, in the southwestern part of Luzon; bounded on the west by the Philippine Sea; on the north by the province of Benguet; on the east by the provinces of Baguio, Tarlac, and Pampanga; and on the south by Bataan and Subig Bay; length, 80

miles; width, 28 miles in the southern part, 25 miles in the northern part, and 12 miles in the central part; area, about 1,650 square miles. The Zambales Mountain range near the eastern boundary parallels the coast, and has several points of high elevation, High Peak being 6,683 feet in height, Mount Pinalobo, 5,524 feet and Mount Guadrado 5,443 feet; there are also two groups of peaks but a few miles inland from the coast. There are numerous short rivers, and several thermal springs in the province. The chief industry of the province is agriculture; rice and wheat of superior quality are the special products; sugar, cotton, tobacco and coffee are also extensively cultivated. Next to agriculture in importance is the raising of cattle, horses, carabaos and hogs. The mechanical industries are very limited and primitive; copper and coal are mined; and there are indications of iron. The forest products are valuable, and amber is collected in considerable quantities on the coast. There are but few roads, and these are mostly impassable in the rainy season; a road and telegraph line parallel the coast for the greater part of the distance. Civil government was established in August 1901, and the provincial governor reported the province in a peaceful and prosperous condition in January 1902. The chief town and capital is Iba, a seaport (Pop. 4,482). Until 1904 the province extended north to Lingayen Gulf, but a re-division of territory then gave the territory north from Dasol Bay to the province of Pangasinan. Pop. 101,381.

**ZAMBESI, zām-bē'zē, or ZAMBEZI,** South Africa, a river rising in Portuguese West Africa, in lat. 11° 21' 3" S., and long. 24° 22' E., and reaching the Indian Ocean at Chinde and Conceifao in Portuguese East Africa, opposite Madagascar, after a total course of 2,200 miles, of which the middle part belongs wholly to Rhodesia. The Victoria Falls and the Kebrabasa Rapids, the former in the west of Rhodesia and the latter in Portuguese East Africa, above Tete, are regarded as dividing the river into three sections, the Upper, Middle and Lower Zambesi. The neighborhood of the source has an altitude of about 5,000 feet, and the river has its origin in a deep depression at the base of steep undulations, where the water oozes from a black marshy bog and quickly collects into a well-defined stream. Another head-stream of the Zambesi is the Kabompo, which rises in the northwest of Rhodesia, about lat. 11° 34' S., and long. 25° 17' E., also at an altitude of 5,000 feet, and in a region of open grassy downs. The former stream, at first known as Yambeshe and then as Liambai (Liambeshe), flows at first west with a southward trend, and then turns south-southeast. Ten miles of rapids precede the Sapuma cataracts (13° 7' S.), where the river flows "through a narrow rocky fissure into a pool of considerable extent." At about 14° S. it is joined by the Kabompo from the northeast, and the remaining course of the Upper Zambesi has a south and southeasterly direction through the low-lying, grassy Marotse country, and is marked by various cataracts and rapids. Sesheli is a place of some importance on the left bank, near where the river begins to be wholly in British territory; and a short distance farther down, opposite Kasungula, it receives

from the west the waters of the large tributary Kuanda. In about 18° S. there are the celebrated Victoria Falls (q.v.), discovered by Livingstone in 1855. Here the broad river suddenly plunges into a transverse chasm 400 feet deep amidst a scene of tremendous grandeur. The gorge just below (eight miles long) and in full view of the falls is spanned since 1904 by a lofty bridge on the Cape to Cairo Railway. The Middle Zambesi, whose direction is east, northeast and again east, receives the Guay-Shangani and Sanyati from the south; the Kafukwe and Loangwa from the north, the latter at Zumbo, where the river leaves British territory; and is interrupted by various rapids and rocks, especially at low water, the Kebrabasa Rapids being the first impassable obstacle to navigation from the mouth. The remaining course of the river (Lower Zambesi) has been described as, except for the Lupata Gorge, "merely a broad expanse of sand, three to five miles wide, with low, reed-fringed banks, and intersected by numerous shallow streams." It passes the town of Tete, below which it is joined on the right by the Mazoe, and after passing Sena it receives from the left the Shiré from Lake Nyassa, the waterway to British Central Africa. It enters the Indian Ocean by several mouths, of which the Chinde one is the most practicable. The delta covers an area of about 25,000 square miles, and begins about 90 miles from the coast, a little below the confluence of the main stream with the Shiré. The river drains an area estimated at 600,000 square miles. Its basin is separated from that of the Orange River on the southwest by a slight watershed, and from that of the Limpopo on the south by a mountain range. The valley of the Zambesi is capable of immense development in the way of trade. The Portuguese government has long exercised sway for 300 miles from the mouths of the river, and by the international arrangement of June 1891 the river from the coast to the confluence of the Loangwa is recognized as being in Portuguese territory. The Zambesi and its affluents are now free to the flags of all nations. The Upper Zambesi was first explored by Livingstone, who reached the Liambai in 1851. Consult Coillard, 'On the Threshold of Central Africa' (1897); Gibbons, 'Africa from South to North' (1904); Livingstone, 'Narrative of an Expedition to the Zambezi and its Tributaries' (1865).

**ZAMBESIA**, zām-bé'zhī-ā, one of the three districts of Portuguese East Africa, divided into the sub-districts Quilimane and Tete; also a name popularly applied to the regions in Rhodesia divided by the Zambesi, known respectively as North and South Zambesia, and sometimes called British Zambesia. See EAST AFRICA, PORTUGUESE; RHODESIA.

**ZAMBOANGA**, thām-hō-ān'gā, Philippines, (1) town, capital of the District of Zamboanga; on the southern coast, 17 miles across the strait from Isabela. It was founded in 1635 as a base of operations against Moro pirates; shortly before the American occupancy of the islands it was almost entirely destroyed by fire, partly by the Spaniards and partly by the Filipinos; since then it has been rebuilt. Many of the houses are of stone, and the town contains a fort, the

Castle of San Felipe, a cathedral, a public hospital, the provincial capitol, completed in 1908, and a customs house. Since the American occupation the streets have been improved, public parks established and docking facilities have been extended. It is connected with Manila by steamer, and is the chief market in the southern part of the archipelago for hemp, copra and gutta percha. Pop. 30,000. (2) A District of Moro province, forming the western peninsula of the island of Mindanao, bounded on the north by Dapitan and Misamis, on the south by the Celebes Sea and Basilan Strait, on the east by Lanao and on the west by the Sulu Sea; area, with dependent islands, 6,085 square miles. The district was increased in size by the act of the Philippine Commission 1 June 1903. The main mountain range extends west and then southwest from the northeastern boundary; another range traverses the Bañaganian or Flecha peninsula. The climate is the best in the Philippines, the temperature varying but a few degrees. Agriculture and stock raising are the more important industries; rice, hemp, cotton, coffee, sugar, coconuts are cultivated; and cloves and nutmegs and vegetables are also among the valuable products of this province. Cattle, horses and hogs are raised. There is an abundance of valuable woods, particularly teak and juniper; deposits of coal at the head of Sibuguey Bay and at other places, and gold also is found in the western portion. Pop. 98,078.

**ZAMBONI'S DRY PILE**, in electricity, a dry voltaic pile or battery invented by Zamboni. Paper silvered on one side is damped and coated on the other with manganese dioxide; half a dozen of these sheets being superimposed to save time, discs are punched out, and 1,000 to 2,000 single sheets are compressed in a glass tube with metal caps and knobs at the ends. Such a pile will charge a Leyden jar, though it will not give shocks or sparks.

**ZAMIA**, a genus of plants of the family *Cycadaceæ*. (See CYCADALES). In aspect the species partly resemble palms, and partly tree ferns; in affinity they are nearer the latter than the former, but rise considerably above them in organization. They are natives of tropical America, tropical Asia, the Cape of Good Hope, and Australia. The stems of *Z. tenuis* and *Z. furfuracea*, and the seeds of *Z. pumila*, in the West Indies, yield arrowroot. The Florida Indians call the last "coontie," and manufacture flour from the rhizomes. It grows in the everglades of Florida, and has large tubers of the shape and size of parsnips, which are rough and gray on the outside, but are white internally. The tubers are pounded to a pulp, in a log mortar, and washed in a straining cloth, the abundant starch of the coontie passing through and settling in a deerhide. This process rid the plant of an acrid poisonous principle which is carried away by the water. The Federal armies lost a number of men during the Civil War, who ate the root in its crude poisonous state. The sediment, or starch left in the deer-skin after straining, is fermented and dried, and becomes a yellowish-white flour ready for use, which has long been a staple food of the Seminoles. The coontie starch, when extracted in proper mills, is finer and whiter than the

Indian product, and is called Florida arrow-root. It is nutritious, and makes excellent puddings, and the like.

**ZAMOJSKI**, ză-moi'skē, **ZAMOYSKI**, or **ZAMOSC**, an ancient family of Poland, whose most distinguished members have been **JAN ZAMOJSKI**, statesman and general: b. Skokow, palatinate of Chelm, 1 April 1541; d. near Skokow, 3 July 1605. He was educated at Paris, Strassburg and Padua, and in 1564 was elected rector of the university at Padua. In 1565 he returned to Poland, and upon the death of King Sigismund Augustus in 1572, succeeded in so organizing the equestrian order, that in the diet of 1573, held at Warsaw, Henry of Anjou (afterward Henry III of France) was chosen king of Poland. Upon the abandonment of Poland by Henry, a party of nobles elected Maximilian II of Austria, and he was proclaimed king by the primate; but the party hostile to the house of Austria, led by Zamojski, chose Stephen Bathory (q.v.), who marched rapidly to Cracow, and was there crowned. Zamojski was made grand chancellor of the kingdom and became a power in Polish affairs. He was afterward married to Griselda, a niece of the king. In 1580, during the war with Russia, Báthori appointed him commander of the principal army, with the title of hetman; and in 1582 he negotiated the peace by which Livonia, Esthonia and Novgorod were ceded to Poland. After the death of Báthori in 1586, he might have secured the crown for himself; but he used his influence in favor of Sigismund III, son of the king of Sweden, defeated the army of the opposing claimant, the Archduke Maximilian, at Cracow, pursued him into Silesia, and took him and his forces prisoners. From 1590 to 1597 he was engaged in a constant series of wars; and while often at variance with Sigismund, with whom he was no favorite, he remained a dominant figure in the state, fighting successfully against the Turks, Tartars and Cossacks, and oftentimes supporting the army from his private fortune. Zamojski was not only a great statesman and general, but a munificent patron of literature and the sciences. He founded New Zamosc, which came to be regarded as one of the strongest fortresses of Poland, and established there a university and a famous printing press. He wrote 'Testamentum Joannis Zamori' (1606), and many letters of his are to be found in Lunig's 'Literæ Procerum Europæ.' **JAN ZAMOJSKI**, general, grandson of the preceding: b. 1626; d. Warsaw, 2 April 1665. He participated in the campaign of 1651 against the Cossacks, was made palatine of Sandomir, and was conspicuous in the wars that followed. In 1659 he was at the head of the army which acted in the Ukraine against the tsar of Russia. **ANDRZEJ ZAMOJSKI**, statesman: b. Bie-zun, 1716; d. Zamosc, 10 Feb. 1792. He entered the military service of Saxony, returned to Poland in 1754 and was made marshal of the palatinate of Smolensk. In 1760 he emancipated his serfs, and on the accession of Stanislas, Augustus was appointed grand chancellor in 1764, an office he resigned rather than sign the partition treaty. In 1776, at the request of the diet, he drew up a code of laws, which was printed under the title of 'Zbiór praw sadowych' (1778). The liberal character of the code, especially its provision for a general

measure of emancipation, aroused against it so great a hostility, that in the diet of 1780 it was not permitted to be read, but it was adopted in 1791. **ANDRZEJ ZAMOJSKI**, statesman, grandson of the preceding: b. 2 April 1800; d. Cracow, 29 Oct. 1874. He studied at Geneva and Edinburgh, entered the Polish civil service in 1823 and was Minister of the Interior of the revolutionary government in 1831. He later introduced steam navigation on the Vistula, but as the head of an important agricultural association incurred the suspicion of the Russian government. The association was suppressed in 1862. At the request of the viceroy, Grand Duke Constantine, Zamojski drew up a statement of the claims of Poland, a document which displeased the Russian government and caused Zamojski's banishment.

**ZAMORA**, thă-mō'ră, **Antonio de**, Spanish dramatist: b. Madrid, about 1660; d. there, before 1744. He was a court officer during the reign of Philip V and also held a secretaryship in the department of Indian affairs. He wrote many dramas which were highly esteemed by his contemporaries, some 40 of which are extant. He imitated the style of Calderon, but rarely attained the poetic beauty of that author. To modern taste his plays are slow and over-loaded with stage directions which were probably necessary in their day, and they lack the brilliant invention of the dramas of Calderon and Lope de Vega. Yet they are the best of their age. The best of his dramas, however, show skilful development of character. Among the most noteworthy are 'Mazariegos y Monsalves'; 'Cada uno es Linaje Aparte'; 'El hechizado por fuerza,' a comedy produced in Spain in modern times; and 'El Convidado de Piedra,' on which is based the libretto of the opera of 'Don Juan.'

**ZAMORA**, Spain, a city and capital of a province of the same name, 140 miles northwest of Madrid, on a rocky hill on the right bank of the Douro which is here crossed by a fine bridge. It has interesting mediæval buildings, and is the see of a bishop; the cathedral is a Gothic structure, completed about 1174, but partially modernized in the Corinthian and Doric styles. Zamora as a fortified town played an important part in early Spanish history, and it is renowned for the successful defense which it made against the Moors in 939 A.D. Pop. 20,000. The province of Zamora is divided into eight departments and has a population of about 280,000.

**ZAMORA**, Venezuela, an interior north-western state bounded by Lara, Miranda, Bolivar and Los Andes. It has not been very much developed and possesses many natural resources. The capital is Barinas. Pop. 36,000. Area of province, 25,212 square miles. Pop. 246,676.

**ZAMORA Y CORONADO**, ē kō-rō-nă'thō, **José Mariá**, Central American jurist: b. Cartago, Costa Rica, 1785; d. Cuba, after 1846. He was educated in Spain and on his return from there held important judicial and civil posts in both Porto Rico and Cuba. He published 'Registro de la legislación ultramarina' (6 vols., 1844-48), a work of much historical value on account of its being a collection of laws and regulations pertaining to the Spanish-American colonies. For this reason it has been

largely consulted by students of Latin American law and institutions.

**ZAMOSC**, ză'mösch (Zamostye, in Russian) Russian Poland, a fortified town in the province of Lublin, on the Wieprz, 50 miles southeast of the town of Lublin. It was laid out in 1588 in the Italian style by Jan Zamojski, and all its houses have arcades. Its fine castle, the four churches, the arsenal, and the town-house are the chief buildings. The manufacture of furniture is the principal industry. Pop. 16,000.

**ZAMOUSE**, ză-moos', the West African short-horned buffalo (q.v.).

**ZAMPA**, zän-pä, *Ou la Fiancée de Marbre*, an opera comique by the French composer, Louis Joseph Ferdinand Hérold (q.v.), first produced in 1831.

**ZAMPIERI**, dzäm-pë-ä'rë, **Domenico**. See DOMENICHINO.

**ZANARDELLI**, dzä-när-dë'l'lë, **Giuseppe**, Italian statesman: b. Brescia, 29 Oct. 1826; d. Modena, 20 Dec. 1903. After study at Pavia, he was a volunteer in the war of 1848, then was for a time in journalism and gave lectures on law, but was forced by the Austrian officials to discontinue them. Elected deputy in 1859, he held various administrative posts, in 1876 became Minister of Public Works, and in 1878 of the Interior. From 1881 to 1883 he was Minister of Justice, and from 1887 to 1891 again held that portfolio. During the latter period of service he issued the penal code and began a reform in the magistracy. He was president of the Chamber of Deputies in 1894, in 1896 was again chosen, in December 1897 accepted the portfolio of justice for a third time, but withdrew in May 1898, once more to become president of the Chamber. This post, too, he relinquished, to identify himself with the opposition, and at the fall of the Saracco Cabinet in February 1901 was able to form an administration with the aid of the extreme left. He was an orator of high rank, a steadfast Liberal, and the recognized leader of the constitutional left. Failing health prompted his resignation 2 Nov. 1903, shortly before his death.

**ZANDEH**, zän'dä. See NYAM-NYAM.

**ZANE**, zän, **Ebenezer**, American pioneer: b. Berkeley County, Va., 7 Oct. 1747; d. Wheeling, W. Va., 1811. Of Danish descent he made the first permanent settlement on the Ohio River in 1770, on the site of the present city of Wheeling, building there a block house called Fort Henry, whence he repelled several Indian assaults during the Revolutionary War. He was a disbursing officer under Lord Dunmore; held several military and civil offices, and attained the rank of colonel. The land where the city of Zanesville, Ohio, now stands, formed a portion of his property, and he assisted his brother Jonathan and John McIntire in laying out that town in 1799. The locality was called by them Westbourn, and the present name was not adopted till 1802.

**ZANELLA**, dzä-në'l'lä, **Giacomo**, Italian poet: b. Chiampo (Vicenza) 9 Sept. 1820; d. Vicenza, 17 May 1888. After studying for the priesthood at the Vicenza Seminary, he became professor there of philosophy and Italian literature. Having held posts in lyceums at Venice,

Vicenza and Padua, he was made professor of Italian literature in the University of Padua in 1866, and in 1871-72 was rector of the university. His work is noted for beauty of style and mastery of form; his most popular poem being 'La Conchiglia Fossile' (The Fossil Shell). His first volume of poems, 'Verses,' appeared in 1868, and was followed by several others. Among his poetic tales are 'The Little Calabrese' (1870), and 'Robin Redbreast' (1881). He published also some volumes of prose, including 'On Italian Literature in the Last Century' (1885).

**ZANESVILLE**, Ohio, city and county-seat of Muskingum County, at the confluence of the Muskingum and Licking Rivers, 60 miles east of Columbus, on the Baltimore and Ohio, the Pennsylvania, the Zanesville and Western, the Wheeling and Lake Erie, the Ohio River and Western, and several electric railroads. The town was founded by Ebenezer and Jonathan Zane and John McIntire in 1799; it was capital of the State in 1810-12; was incorporated as a town in 1814; and received its city charter in 1850. There are seven bridges crossing the Muskingum and two across the Licking River, the town being built on the banks of the two rivers. The Muskingum is made navigable for small vessels by means of a series of locks and dams, and the city thus has water communication with Columbus; and with Cleveland by means of the Ohio Canal. The city is situated in a fertile agricultural region which has also deposits of coal, clay and limestone. Manufactures were early attracted by the abundant water power supplied by the two rivers and by cheap fuel; they consist of important tile works, potteries, brickyards, tanneries, machine shops, foundries, bent-wood works, tube works, flour and woolen mills, and glass, coffin and mining-tool factories. The chief buildings include the Soldiers' and Sailors' Monumental Building, the County Courthouse, the City Market House, and excellent banking and fraternity buildings. There is a well-organized city school system, both Roman Catholic and Lutheran parochial schools, a business college, high school and Roman Catholic Academy. The McIntire Children's Home was endowed by the estate of John McIntire, and the John McIntire Public Library received a \$50,000 Carnegie endowment. The city owns its waterworks, and has a municipal hospital. The commission form of government is in force. Pop. (est.) 33,000.

**ZANGWILL**, Israel, British author: b. London, 14 Feb. 1864. He was educated at the Jews' Free School, 'Spitalfields,' and the University of London, published in 1888 'The Premier and the Painter,' a fantastic romance, in 1890 established *Ariel*, or *the London Puck*, a brilliant but short-lived periodical, and soon made his reputation by his essays, works in fiction, and plays. His department of literary caustic, 'Without Prejudice,' in the *Pall Mall Magazine*, became well known in Great Britain for its able critiques. Some of these essays were gathered into a volume of that title in 1896. Some of Zangwill's best fiction deals with Jewish types and subjects, as in 'Dreamers of the Ghetto' (1898), with its semi-historical pictures of Heine, Spinoza, Uriel (Gabriel) Acosta and others. He lectured in Great Britain, Ireland,

Palestine, Holland and the United States, and, as a prominent Zionist, gave addresses in connection with that movement and the application to it of the Baron de Hirsch millions; and is president of the Jewish International Territorial Association. His literary work is in a style of much distinction, with frequent touches of irony. Besides the works already mentioned he is author of 'Children of the Ghetto' (1892); 'Ghetto Tragedies' (1893); 'They That Walk in Darkness' (1899); 'The Mantle of Elijah' (1900); 'The Grey Wig' (1903); 'The Celibates' Club' (1904); 'Blind Children,' verses (1903); 'Ghetto Comedies' (1907); 'Italian Fantasies' (1910); 'The War for the World' (1916); 'The Principle of Nationalities' (1917); 'Chosen Peoples' (1918), etc. The play which he constructed (under the same title) from his 'Merely Mary Ann' (1893), was more successful (1904) than the dramatization (1899) of 'Children of the Ghetto' or the one-act 'The Moment of Death' (1900). 'Six Persons' (1892) was well received in England and later plays include 'The War God' (1911); 'Plaster Saints' (1914); 'Too Much Money' (1918), etc.

**ZANGWILL, Louis**, English author, brother of I. Zangwill (q.v.): b. Bristol, 25 July 1869. At first a journalist he later took up literature as a profession, using for a while the pseudonym "ZZ." He has published 'A Drama in Dutch' (1894); 'The World and a Man' (1896); 'The Beautiful Miss Brooke' (1897); 'A 19th Century Miracle' (1897); 'One's Womanhood' (1902); 'An Engagement of Convenience' (1908), etc.

**ZANKOFF, zän'köf, Dragan**, Bulgarian politician: b. Sistova, 1827; d. Sofia, 24 March 1911. He studied at the universities of Odessa, Kiev and Vienna, and entering the service of Turkey, became secretary to the Pasha of Rustchuk, Bulgaria. In 1880 he was made Premier of Bulgaria and Minister of Foreign Affairs by Prince Alexander, and again held the post of Premier 1883-84. Later he became the enemy of Alexander and the head of the pro-Russian party. On the night of 20 Aug. 1886 Zankoff with a party of fellow-revolutionists broke in Prince Alexander's palace and forced him to resign. Zankoff then became a member of the provisional government. Upon the restoration of the prince he was banished, but was subsequently permitted to return. He again became the leader of the Russophile party and in 1902-03 he was president of the Sobranje.

**ZANOTTI, dzä-nöt'té, or CAVAZZONI ZANOTTI, Giovanni Pietro**, jō-vän'nē pē-ä'trō. Italian artist: b. Paris, 1674; d. Cortona, 1765. He was a pupil of Lorenzo Pasinelli at Bologna, and became a good designer and colorist, and an adept in chiaroscuro. For churches at Bologna he executed several altarpieces, among the chief that of 'The Incredulity of Saint Thomas' in the church of that saint. There is also in the Palazzo Pubblico a large picture by him of 'The Ambassadors of Rome Swearing Fidelity to the Bolognese.' At Cortona, where he long resided, he distinguished himself by such pictures for churches as 'Christ Appearing to Mary Magdalene' and 'Christ Carrying His Cross.' He was a careful writer on art, the most important of his works being

the 'Storia dell' Accademia Clementina di Bologna' (2 vols., 1739).

**ZANTE, zän'té**, Greece (anc. *Zacynthus*), one of the Ionian Islands, in the Mediterranean, between eight and 10 miles south of Cephalonia and 15 miles from the nearest point of Greece. It is about 24 miles long, 12 miles broad, and 60 miles in circuit; area, 277 square miles. It has the form of an irregular oblong, indented with a deep bay at its southeast extremity. The western half is hilly, rising to 2,500 feet, and the west coast exhibits limestone cliffs. The east coast has a harbor, within which is situated the town of Zante (pop. about 13,501), a thriving and well-built place, the see of a Greek protopapas, and of a Roman Catholic bishop. Part of the island consists of an extensive fertile plain, having the appearance of one continuous vineyard, with a few parcels under cereals or pasture. The prevailing rocks are calcareous; gypsum appears in various parts, and its pitch-wells are famous. Earthquakes frequently occur. The staple export of Zante is the dried "currant" of commerce, the fruit of a dwarf grape. The other chief exports are oil, soap and a little wine; pomegranates, melons, peaches, oranges, citrons and other fruits are also grown, but the corn raised scarcely supplies three months' consumption. Goats are the only livestock. The island forms a monarchy of the kingdom of Greece since 1864; it is mentioned by Homer, and was formerly an independent state which successively came under Macedonian, Roman, and finally Greek rule. Pop. 42,502.

**ZANTHOXYLUM**, a genus of the family *Rutaceæ*, composed of erect or climbing shrubs or trees, often with prickly branches. The leaves are compound, pinnate, sometimes reduced to three, or rarely, to one, leaflet, usually pellucid-dotted. The flowers are small, in axillary or terminal panicles, and are from three- to five-parted. The fruits split in two, with one or two shining black seeds. *Zanthoxylum* is a large genus, found in both the Eastern and Western hemispheres, especially in their warmer parts. The species are so aromatic and pungent that in the countries where they exist they are popularly called peppers, specially *Z. piperitum*, called Japan pepper, which is regarded as an antidote for poison. *Z. rhetsa*, an Indian species, has small yellow flowers and small round berries, which, when unripe, taste like the skin of a fresh orange. Its fruit, and the seeds and bark of *Z. alatum*, which grows near the base of the Himalayas, and those of *Z. budrunge*, also Indian, are given as aromatic tonics in fever, diarrhoea, dysentery and cholera. They are used as a condiment in India and as a fish-poison. The small branches are employed to make walking-sticks, and the twigs as toothbrushes. The seeds of the latter are as fragrant as lemon peel. *Z. clava-herculis* and *Z. americanum* applied externally to the gums or taken internally, are powerful sudorifics and diaphoretics used in toothache, paralysis of the muscles of the mouth and rheumatism. The root of *Z. nitidum* is sudorific, emmenagogue, etc. The powdered bark of *Z. hiemale* is given in Brazil in earache; and the capsules and seeds of *Z. hostile* are employed in northern India to intoxicate fish. The West Indian species of

*Zanthoxylum* is called yellow-wood, *Z. caribæum* being differentiated as the prickly yellow-wood. It is a tree, 20 to 50 feet high, whose prickly young stems are made into walking-sticks. The wood is used for inlaying and for furniture. *Z. cribratum* is the satin-wood of the West Indies, which when first cut has the odor of the veritable satin-wood. *Z. fagara* is a small tree common in the same region, and tropical America, producing a hard, heavy, reddish-brown wood known as savin or iron-wood or as the wild-lime. Still another species is *Z. emarginatum*, a shrub with coriaceous foliage, exported under the name of rose-wood, but called licca-tree or lignumvorum at home. The commonest species of the northern United States and the hardiest is *Z. americanum*, a shrub or small tree, with odd-pinnate leaves, and twigs which are generally prickly. The cymose flowers are axillary and sessile, without calyx, and they are greenish-white. The capsules are black and ellipsoidal. It is called prickly-ash or toothache-tree, because both Indians and country people used the hot, acrid bark of both this species and *Z. clavaherculis*, which when chewed produces a stinging sensation, for aching teeth. The bark of both these species, and the capsules of the latter, are a powerful stimulant and tonic drug. The southern prickly ash, *Z. clava-herculis*, the sea-ash, or pepper-wood, has its flowers in large terminal compound cymes, and its prickles are supported on corky cushions.

#### ZANZALIANS. See JACOBITES.

**ZANZIBAR**, zän-zī-bār', East Africa, (1) A sultanate comprising the whole coast between Magdishu (Magadoxo), about lat. 2° N., and Cape Delgado, lat. 10° 42' S., with the four islands of Zanzibar, Pemba, Lamu and Mafia. The continental part of the sultanate in 1890 was divided between British East Africa and German East Africa; while the island and town of Zanzibar, and the island of Pemba became a British protectorate; in the course of the European War the German territory was taken by the Allies late in 1917. Joint area, 1,020 square miles; pop. est. 250,000. (2) The island of Zanzibar, with an area of 640 square miles, is 47 miles long and 20 miles wide. It is partly of coralline formation. Its forests have disappeared but its flora is abundant and of great variety. Its fauna is chiefly continental. The island is very fertile and well cultivated, being especially suited for the cultivation of cloves, sugar, coffee, cocoa and various spices, of which there is a considerable export. There are more than 60,000 acres planted to cloves, and there are extensive plantations of rubber and chile. Copra also is an important export. Roads are excellent and an American railway traverses the island. The abolition of slavery was accomplished gradually, beginning in 1897, when it was decreed that no child could be born a slave, and provision for slaves obtaining freedom was made. The process was completed in 1908 and was notably successful in its avoidance of upsetting economic conditions or offending the Moslems. The heterogeneous population estimated at 176,000 includes Europeans, Arabs, half-caste Portuguese from the Malabar Coast of India, and the Suahilis from the mainland. (3) Zanzibar, the chief town (pop. 55,750) on the west side

of the island, is the centre of trade for the eastern seaboard of Africa, and of missionary and exploring work for the interior. The city is connected with all parts of the world by cables and is a regular port of call for steamships plying between India and Europe. Direct steamship communication was established with London in 1910. The commerce of the islands is largely in the hands of East Indians, of whom there are about 10,000; while the Arabs also numbering about 10,000, are the principal landlords. European residents number less than 300. Both its exports and imports amount to more than £1,000,000 annually. The government is practically British.

**ZAPATA**, Emiliano, Mexican agitator and revolutionary leader: b. state of Morelos, about 1869. He became known as a political agitator during the Diaz régime and was banished to Quintana Roo, but he later returned to his native state. In 1910, at the time of the Madero insurrection, Zapata fought independently against Diaz, in the hope of personally setting up a government. He formulated a scheme for an agrarian reform known as the Plan of Ayala, and when it was refused by the new leaders in Mexico he fought in turn against Madero, Huerta and Carranza. He was in possession of the capital for short periods in March and April 1915, and subsequently, in command of an army of about 10,000 men, he conducted a harrying warfare in the neighborhood with the purpose of establishing a government of which he would be the head.

**ZAPOLYA**, zä'pöl'yö, John, king of Hungary: b. about 1487; d. 1540. After the death of Louis II at Mohács (1526) he was elected king of Hungary by the National party, having previously been voivode, or prince, of Transylvania. The crown was contested by Ferdinand of Austria, who was at first so successful as to compel Zapolya to flee to Poland. But the latter, with Turkish assistance, by 1529 had subdued a great part of Hungary, together with the capital city of Buda, as well as Transylvania. The kingdom was divided between Zapolya and Ferdinand in 1538 by the treaty of Grosswardein.

**ZAPPI**, Giovanni Bastista Felice, jö-vän'nē hä-tēs'tä fä-lē'chä zäp'pē, Italian poet: b. Imola, 18 March 1667; d. Rome, 30 Aug. 1719. after a legal training at Bologna, he went to Rome, where he gained a brilliant reputation as jurisconsult and poet. He assisted in establishing the Academy of Arcadians, in which he held the name Tirsi Leucasio. His verse abounds in fantastic adornments. A collection of it appeared in 1776, and it has been otherwise published, both separately and in association with that of his Arcadian colleagues. He received the patronage of Pope Clement XI.

**ZARA**, zä'rä (Ital. *dsä rä*), Austria, a seaport town, capital of Dalmatia, on a promontory, which was converted into an island by cutting through the narrow isthmus which formerly connected it with the mainland, 70 miles northwest of Spalatro. It was a fortress till 1871 and still has four gates and mediæval ramparts, the latter now converted into a public promenade. It has steep and narrow streets; several squares; a fine Roman triumphal arch; an

interesting cathedral, in the Lombard style, dating from the 13th century; several other churches; a town-house; a lyceum, gymnasium, archiepiscopal seminary, normal and other schools; a civil and a military hospital; and a capacious but somewhat shallow harbor, admitting warships of medium size. It has manufactures of rosoglio, maraschino, and glass, and a considerable coasting trade. Zara has stood many sieges, particularly one in 1202, when it was taken by the Venetian doge Dandolo, with the assistance of the French crusaders; and another in 1346, when it was taken by Marino Faliero in the face of a large Hungarian army. It was under Venetian control from 1409 and passed into Austrian possession in 1797. It was under French rule in 1805-13. Pop. 36,600.

**ZARATE**, thär-ä'tä, **Antonio Gil y**, Spanish dramatic poet: b. San Lorenzo de l'Escorial, Spain, 1795; d. 1860. He was educated in Paris; and on his return to Spain became professor of physics in Granda. He afterward wrote dramas notable for striking situations, lively dialogue and elegant versification; among them are 'Blanca de Bourbon' (1835); 'Guzmán il Bravo'; 'El Czar Demetrius.' He also published a history of Spanish literature and other prose and poetic work including good literary criticism.

**ZARATE**, **Augustin de**, Spanish historian: b. about 1492; d. Madrid, about 1560. After holding for 15 years the office of comptroller of Castile he accompanied Nuñez Vela, viceroy of Peru, to South America in 1543, and while there was not only an eyewitness of many historical events of importance, but made a close study of Peru and its annals. On the fall of Gonzalo Pizarro he returned to Spain and in 1555 published 'Historia del descubrimiento y conquista de la provincia del Perú' (History of the Discovery and Conquest of the Province of Peru). There have been many later editions of this most valuable work, and it has been translated into French, English, German, Portuguese and Italian.

**ZARATHUSHTRA**, zä-rä-thoosh'trä, the name by which Zoroaster is known in the 'Avesta.' See ZOROASTER.

**ZARATITE**, an emerald-green incrustation usually on chromite. It is a hydrous basic carbonate of nickel. Its best known locality is at Texas, Pa. It is often called "emerald nickel."

**ZAREEBA**, the general name of all the African striped species of the horse family. See ZERIBA.

**ZARITZIN**, Russia. See TSARITSYN.

**ZARLINO**, tzär-lé'nō, **Giuseppe**, Italian composer: b. Chioggia, near Venice, 1517; d. Venice, 14 Feb. 1590. He became a Franciscan in 1537 and in 1541 went to Venice to study music with Willaert. In 1565 he was appointed choir master of Saint Mark's, Venice, and continued in that position till his death. He was especially famous for the music he composed to be performed on the occasion of the victory of Lepanto. He determined the relations of the tones and semitones more precisely than had previously been done, and on this subject wrote 'Istituzioni

armoniche' (1562-73). Other works of his are 'Dimostrazioni harmoniche (1571); 'Supplementi musicali' (1588). Among his musical compositions may be named 'Modulationes' (1566); 'Lectones pro Mortuis' (1563).

**ZARNCKE**, tsärn'kē, **Friedrich**, German scholar: b. Zahrenstorf, near Brüel, Mecklenburg-Schwerin, 7 July 1825; d. Leipzig, 15 Oct. 1891. After study at Rostock, Leipzig and Berlin, he founded the *Litterarisches Zentralblatt für Deutschland* at Leipzig in 1850, and in 1858 became professor at the university there. His work in connection with mediæval literature was of particular importance, and his chief publications were his edition of Brant's 'Narrenschiff' (1854), and joint-edition of Benecke's 'Middle High German Lexicon' (1863). His valuable library was acquired by Cornell University. Among his further writings were a study of Christian Reuter (1884) and 'Kurzgefasstes Verzeichniss der Originalaufnahmen von Goethes Bildniss' (1888).

**ZARSKOJE-SELO**, zär-skō'j-sä'lō, Russia. See TSARSKOYE-SELO.

**ZASULITCH**, **Viera Ivanovna**, Russian revolutionist: b. 1851. She was arrested for connection with a revolutionary plot in 1869, imprisoned for two years and was later under police surveillance in Eastern Russia, but was freed in 1876. On 5 Feb. 1878 she shot, but did not kill, General Trepov, head of the secret police, because of his ordering the flogging of a student who had failed to salute him. She was acquitted by the jury at her trial and the verdict was favorably received. General Trepov, in deference to public opinion, was transferred to the cavalry. Later, her acquittal was annulled by the Supreme Court of Appeals, and Mme. Zaslulich fled to Switzerland, remaining there until the Tsar's amnesty of 1905 permitted her return to Russia. Her works were published (2 vols., 1906).

**ZAUBERFLÖTE**, tsow'bē-flē'tē, **Die** ('The Magic Flute'), an opera by Mozart, first produced at Vienna in September 1791, under the direction of the composer. A French version of the opera bears the title 'Les Mystères d'Isis.'

**ZAVALA**, thä-vä'lä, **Joaquin**, Nicaraguan politician: b. Nicaragua, about 1839. He entered the army, became prominent in political affairs and was president of Nicaragua 1879-83. He was afterward Minister to the United States and in 1893 headed the insurrection which secured the deposition of President Sacaza in May 1893. On 17 July of that year he was declared provisional president, but only to lose his position through another revolt a fortnight later.

**ZBYLITOWSKI**, zbī-lī-tow'skē, **Andre**, Polish writer, philosopher and poet: b. Galicia, 1732; d. 1813. He was doctor of philosophy for a time at Cracow and later made extensive travels through South America and Europe. Author of 'Rhythms in Polish Verse' (1763); 'The Marshal'; 'A Beard,' etc.

**ZBYLITOWSKI**, **Pierre**, Polish writer and poet: b. in the palatine of Lublin 1684; d. Warsaw 1757. He was educated at the Uni-

versity of Warsaw and after leaving there traveled extensively through Europe and North America. He has published 'Porydia' (1734); 'Epigrams' (1735); 'Lucie,' a poem (1739), etc.

**ZEA**, thā'a, **Francisco Antonio**, Colombian naturalist and statesman: b. Medellin, New Granada (Colombia), 21 Oct. 1772; d. Bath, England, 28 Nov. 1822. After study at the College of Popayan, he was connected with the botanical expeditions of Mutis, in 1795 was sent to Spain under arrest on the charge of circulating republican literature, and though acquitted in 1799 was forbidden to return to New Granada. He carried on botanical researches in Europe, but in 1815 joined Bolivar at Jamaica. In 1819 he was chosen vice-president of Colombia by the congress of Angostura, and in 1820 went to Europe as envoy of the Colombian republic to France and England. He has sometimes been styled the "Franklin of Colombia." Among his published works are 'Memoria sobre la Quina según los Principios de Mutis' (1800), and a 'Historia de Colombia' (1821).

**ZEA**, zē'a. See CEOS.

**ZEALAND**, zē'land, or **SJELLAND**, Denmark, the largest island of the kingdom, between the Cattegat and the Baltic, separated from Sweden by the Sound and from Funen by the Great Belt; it is 82 miles long by 68 miles wide and very irregular, its area being 2,636 square miles, including the two islands Møen and Samsøe, 2,793 square miles; it is three miles from Sweden and 11 miles from Funen. It has no mountains; but the surface is finely variegated, having small hills and fields of a fertile soil, intersected by canals. It produces large crops of corn, and has excellent pasture. Besides several other towns of considerable importance, it contains the fortress of Elsinore or Helsingør, and the capital and royal residence, Copenhagen. Pop. about 1,096,897.

**ZEALAND**, or **ZEELAND**, Netherlands, a province bounded south by Belgium, west by the North Sea, east by North Brabant and northeast by South Holland; area, 690 square miles. The capital is Middleburg, in the island of Walcheren; principal seaport town, Flushing. The province consists of a low-lying tract of land on the frontiers of Belgium and on the southern shore of the estuary of the Schelde, and of the islands of Walcheren, North and South Beveland, Schouwen, Tholen, etc., separated from each other and from the mainland by arms of the Schelde, from which and from the North Sea it is protected by dikes. As a whole the province is flat and fertile, producing excellent crops of the ordinary cereals, a considerable quantity of clover, rape and madder, and a superabundance of excellent fruit. The grass lands also are rich and extensive. The climate is rather moist, but comparatively healthful. Large tracts partially covered by the sea have in recent times been successfully reclaimed. Pop. 236,149.

**ZEALOTS** (Greek, *zelotes*, enthusiasts, followers and strong supporters), a sect of the Jews, composed of the more fanatical elements opposed to Roman rule. They led a revolt

against the Romans in 6 A.D., and after that frequently robbed and murdered those whom they knew to be supporters of or sympathizers with the Romans. Felix tried to suppress them by crucifying all of the sect whom he could capture, but this only caused an increase in the number of their acts of violence. They continually stirred up the Jews against the Romans, and were largely influential in bringing on the Jewish War of 66-70, which resulted in the overthrow of Jerusalem.

**ZEBALLOS**, thā-bāl'yōs, or **CEBALLOS**, Pedro (**ZEBALLOS CORTES Y CALDERON**), Spanish general: b. Cadiz, 29 June 1715; d. Cordova, 26 Dec. 1778. Entering the army as a cavalry captain in 1738, he became a lieutenant-general in 1755 and was dispatched to Buenos Aires a governor the next year. On the outbreak of the war with Portugal and England in 1762, Zeballos besieged the Portuguese port of Colonia de Sacramento, near the entrance of the Uruguay River, forcing its surrender 2 Nov. 1762, and capturing 26 English ships in its harbor. He returned to Spain in 1767 and in 1771 was made viceroy of the newly established viceroyalty of La Plata. On his way thither he wrested Santa Catharina from the Portuguese and retaking Colonia de Sacramento, which had reverted to Portugal since its former capture, destroyed it. He was relieved of his duties in 1778 and returned to Spain where he died shortly after his arrival.

**ZEBID**, zē-bēd', Arabia, a town in Yemen, on the inland route from Hodeida to Mokha, 60 miles north of the latter. It was formerly the seat of a long line of princes, and was famous for its commerce and learning. In the neighborhood are ruins of ancient cities. The population has dwindled to 9,000 inhabitants.

**ZEBRA**, the name of several animals, natives of Africa, belonging to the family of the horses. The zebra belongs to the same general type as the ass, distinguished from *Equus* (the horse) proper by smaller size and by having the body more or less banded black upon yellowish. The forelegs only possess the "warts" seen in both fore- and hind-legs in the horses; and the tail is "tufted." The typical or mountain zebra (*Equus zebra*) inhabits South Africa, but it is now almost extinct. A few specimens, however, are strictly preserved in the mountainous districts of eastern Cape Colony, where, until about 1875, they abounded in herds on the plains. The body is cream-colored, its characteristic bands being deep black. The stripes are drawn at right angles to the axis of the body. The legs are striped right down to the hoof, but the under part of the body has no stripes. The neck bears a faint development of skin or dew-lap, and the mane is very short. The animal was long considered untamable, but experiments made since 1872 have shown that with proper treatment it can be made to work well in harness. Any general utilization and improvement of it, however, seems impracticable. The dauw, or Burchell's zebra (*Equus burchelli*), is higher and more graceful than the true zebra and is the one commonly seen in menageries. Its stripes are narrower and somewhat differently disposed from those of the true zebra, and extend under the belly, but are absent from the lower part of the legs. It has been

driven northward, and is now rare even in the Transvaal. Chapmann's zebra (*E. chapmanni*) is another variety, found from Bechuanaland north to the Sudan. Grévy's zebra (*E. grevyi*) is restricted to Abyssinia and Somaliland. The quagga (q.v.) is a near ally of the zebras. Consult Lydekker, 'Royal Natural History' (Vol. II, London 1895); Tegetmeier and Sutherland, 'Horses, Zebras, Mules and Mule-breeding' (London 1895).

**ZEBRA PARRAKEET**, an Australian or East Indian parrot. See BUDGERIGAR.

**ZEBRA-SHARK**. See TIGER-SHARKS.

**ZEBRA WOLF**, an early colonial name for the wolf-like, striped, predatory marsupial of Tasmania. See DASVURE.

**ZEBRA WOOD**, in botany and commerce: (1) A kind of wood imported from South America, and used by cabinet makers, produced by *Conarus guianensis* (*Omphalobium lamberti*), a large tree belonging to the natural order *Connaceae*, and growing in Guiana. Its colors consist of brown on a white ground, clouded with black, and each strongly contrasted, thus somewhat resembling the skin of a zebra. It is also called pigeon wood, and is used for furniture. (2) The wood of *Eugenia fragrans*, variety *cuneata*. It is a shrub about eight feet high, growing in Jamaica. (3) The wood of *Guettarda speciosa*, an evergreen tree 25 feet high, with scarlet-colored flowers, growing in the East Indies.

**ZEBU**, zē-boo' or thā-boo', Philippines. See CEBU.

**ZEBU**. See INDIAN HUMPED CATTLE.

**ZEBULUN**, zēb'ū-lūn, or **ZEBULON**, the 10th of Jacob's 12 sons, and the sixth and last by his wife Leah (Gen. xxx, 19-20). Of his individual history nothing is related in the Scriptures, but his name was given to one of the 12 tribes of Israel, and to a region of Palestine. At the time of the exodus from Egypt the tribe of Zebulun moved in the van, following the tribes of Judah and Issacher. The territory of the tribe lay in the fertile hilly country to the north of the plain of Jezreel, and included Nazareth. The tribe of Zebulun was inferior in importance to several of the other tribes and its tribal existence closed when Tiglath-Pileser carried its principal members, with the northern tribes, into captivity (2 Kings xv, 29).

**ZECH**, Frederick, American pianist and composer: b. Philadelphia, Pa., 10 May 1858. Taken to San Francisco when very young, he began to study music there and afterward studied in Berlin, 1877-82. Since the year last named he has resided in San Francisco, where he has been conductor of the symphony orchestra and has given many piano recitals. Among his many compositions are four symphonies, four concertos for piano and orchestra, a concerto for violin, one for 'cello; two string quartettes; three sonatas for violin and piano; two for clarinet and piano, one sonata for 'cello and piano, one for flute and piano; several symphonic poems: 'The Eve of Saint Agnes,' 'The Raven'; 'Lamia' after Keats, and 'The Wreck of the Hesperus' after Longfellow; operas 'The

Cruise of the Excelsior' and 'Wakinyon,' a North American Indian Opera, sonatas and songs.

**ZECHARIAH**, zēk-ā-rī'ā, the 11th in order of the Hebrew writers known as minor prophets. Little is known of his personal history, but he first publicly discharged his office as priest in the second year of Darius 519 B.C. He is called in his prophecy the son of Berechiah and the grandson of Iddo, but in the Book of Ezra (v, 1; vi, 14) he is termed "the son of Iddo." He was priest as well as prophet and is associated with the prophet Haggai. Tradition states that Zechariah had much to do in furnishing the liturgical services of the temple, and in the Septuagint and Vulgate versions several psalms are attributed to him. He deals in his prophecy with the same objects as occupied the mind of the prophet Haggai. His style is characterized by symbolic vision and dramatic action. It is distinctly Apocalyptic. This form of prophecy never predominated until after the Exile and seems to have constituted an element in the last and most powerful appeal made by the mouthpieces of Jehovah to the heart and conscience of His people.

*Contents of the Prophecy.*—The great portion of the Book consists of a series of visions intended to represent grounds for national confidence and to encourage national effort. The prophecy opens with an exhortation to repentance and a warning against neglect of the prophet's word. The remainder of the book consists of two sections. The first section runs from chapters i to vi.

Ch. i, 15, contains nine symbols, mostly visions, accompanied by their interpretations.

Ch. i, 8-17, a vision of the horses of Jehovah, which, as His messengers, report to Him; along with His reply.

Ch. i, 18-21, four horns, representing the opponents of Israel, are broken.

Ch. ii, a man with a measuring-line lays out the restored Jerusalem.

Ch. iii, Joshua, the high priest, is accused by Satan, and acquitted, and is honored with commissions and revelations from Jehovah.

Ch. iv, the beautiful symbol of the golden candlestick and two olive trees, with the practical application of encouragement to Zerubabel.

Ch. v, 1-4, a flying roll recording a curse upon immoral actions.

Ch. v, 5-11, an ephah measure containing a woman is seen carried away to Babylon.

Ch. vi, 1-8, four chariots, each having horses of a particular color, are the four heavenly spirits charged to carry out God's purposes in the earth.

Ch. vi, 9-15, the symbolical action of crowns of silver and gold being made and placed upon the head of Joshua the high-priest, who thus represents the Messiah-priest upon His throne.

The second section runs from chapters vii to xiv. In ch. vii the prophet, in answer to a question as to observance of a certain fast, replies that the true fast is justice, mercy and piety, which had been so much neglected in earlier generations. This suggests, in ch. viii, the coming Messianic time, when the city shall be populous and happy under the renewed protection of Jehovah, and the fasts shall be joyful

feasts, attended by multitude of strangers seeking His favor.

There is so much that is matter of dispute in ch. ix-xiv, as regards their date and immediate application, that we shall have to content ourselves with a summary and a few general remarks. The contents are largely symbolical and figurative. Ch. ix-xi, form a division by themselves, perhaps written by the Zechariah of Isa. viii, 2. It has an entirely different historical setting from that of ch. i, 8. Here we are transported back to the 8th century B.C. Ch. ix, 1-8, refers to conquests made by Tiglath-pileser III (745-727 B.C.). Northern Israel is still in existence, and Assyria is still in its "pride" (x, 10ff). These allusions form part of the very texture of the prophecy, and are assumed by some to be old fragments embedded in a post-Exilic work.

Ch. ix, 1-8, Syria, Phœnicia and Philistia are to be brought low. Yet a remnant of the Philistines shall be united with Judah, and both shall be under the protection of Jehovah. Ch. ix, 9-17, the Messiah shall come as the Prince of Peace to restore the dispersed of Israel, and save them from their enemies. Ch. x, the people are entreated to turn to Jehovah in their troubles, and not to diviners and images. Jehovah will be the defender alike of Judah and Israel, restoring and strengthening them and bringing low their oppressors. Ch. xi announces the shock of war which appals the rulers of Judah (ver. 1-3). The rest of the chapter is allegorical. It represents Jehovah as rejected by His people, their being in turn rejected by Him, their true Shepherd. By an expressive figure, the brotherhood of Judah and Israel is declared to be broken. Ch. xii, 1 to xiii, 6, the nations come against Jerusalem; but Jehovah defends and saves it. The conflict is shown to be spiritual, for a spirit of grace and supplication is to be poured upon Judah and Jerusalem. Also a fountain is to be opened for the cleansing of guilt, and the idols and false prophets are to be banished. Ch. xiv—Again Jerusalem is besieged, and this time it is taken, half the people going into exile; but the residue are saved. After various figurative illustrations of the processes and results of the Messianic reign, it is declared that the survivors among the nations shall go up to worship in Jerusalem, which shall be wholly consecrated to Jehovah.

**ZECHARIAH, Book of.** One of the generally accepted results of Biblical criticism is the conclusion that Zechariah i-viii are the work of the prophet whose name they bear, but that the remainder of the book, chapters ix-xiv, was written by another author or authors. The reasons for this conclusion will be given later. The first part, chapters i-viii, will be discussed by themselves, followed by a consideration of the remaining chapters.

Zechariah the prophet is doubtless to be identified with Zechariah the priest of Nehemiah xii, 16, see also xii, 4. He was probably the son rather than the grandson of Iddo, see Ezra v, 1, vi, 14, the phrase "the son of Berechiah" in Zechariah i, 1 being a later addition, resulting from a confusion with Zechariah the son of Jeherechiah mentioned in Isaiah viii, 2. The evident interest of Zechariah

in the temple is in accord with his priestly descent. But his general outlook is more prophetic than priestly, as in the case of the other priest-prophets, Jeremiah and Ezekiel. Zechariah doubtless returned from the exile in the company of Zerubbabel along with his father, Iddo, Nehemiah xii, 1-4.

These chapters are given precise dates, in the years 520-518 B.C. The historical circumstances of that time are well known. The return from the Babylonian exile under Zerubbabel had taken place some 16 years before. A beginning of the rebuilding of the temple had been made at that time, if the data are historical, but it is evident that little progress had been made. The people became discouraged, they were few in numbers, surrounded by enemies, with precarious conditions of existence. The attempt to rebuild the temple was soon given up, and the people resigned themselves to a discouraged selfish life. Haggai began his prophetic ministry in 520, endeavoring to encourage the people to rebuild the temple. His message centred about this thought, accompanied by denunciation of the people for their sins and indifference. About two months later came the first message of Zechariah. Both prophets speak as if there had been no return from the exile in any true sense. The return announced in prediction, especially by Deutero-Isaiah, was to be a glorious return, accompanied by signal manifestations of the power of Yahweh. Such a return had not taken place. Zechariah speaks of the people, therefore, as still in captivity, and the return as yet of the future. Zechariah continues and amplifies the work of Haggai. His specific object is the rebuilding of the temple, but he seeks the attainment of this end by a presentation of the glorious future in store for the nation.

There are probably no important later additions in these chapters. iv, 6b-10a is probably by Zechariah, but does not belong in its present position where it interrupts the connection. The meaning in vi, 11-13 has been obscured by textual corruption, which will be considered later.

Chap. i, 1-6 is a hortatory introduction, dated in 520. The main part of the collection consists of i, 7-vi, 15, bearing the date of 514. This is made up of eight visions and their interpretations, with an appendix. The interpreter is an angel, a feature original with Zechariah. The first three visions, i, 7-ii, 13, present various features in the coming return from the captivity; iii-iv, except iv, 6b-10a, deal with the two leaders of the people, Joshua the priest and Zerubbabel the Davidic prince, teaching the removal of the guilt of Joshua and of the nation and the divine favor which will attend both these leaders; v, 1-vi, 8 contain three visions, dealing with the purification from sin of the restored people. vi, 9-15 contains a historical appendix to the visions. This predicts, in accord with Haggai, that Zerubbabel is to be manifested as the Messiah, rebuilding the temple and bringing deliverance to the people, while Joshua is to be closely associated with him. The principal place, however, is occupied by Zerubbabel. Verse 11 doubtless originally mentioned only one crown, for Zerubbabel, this being required by the con-

text. How the verse originally read is a question; perhaps the latter part should be omitted. In verse 13 the phrase "and he shall be a priest upon his throne" should be read "and there shall be a priest upon his right hand," with the Septuagint. The changes in the text as it now is were doubtless intentional, introduced later when it was seen that Zerubbabel was not the Messiah. For the interpretation here given compare verse 13 with iv, 8. Chaps. vii-viii give an account of the visit of men of Bethel to the prophet with inquiries concerning fasting, with special reference to the fast commemorating the destruction of Jerusalem. The prophet answers that the future will be a time of joy and rejoicing rather than of fasting and sadness.

The thought of Zechariah shows much similarity to that of the earlier prophets, with which he is evidently familiar, and his phraseology also shows the impress of their influence. He demands faithfulness to Yahweh and the observance of ethical standards, in accord with the highest teaching of the pre-exilic prophets.

The activity of angels is specially prominent in these messages of Zechariah. The superhuman adversary, Satan, also appears here for the first time, iii, 1-2.

There are practically no resemblances between chapters ix-xiv and i-viii, while there are many differences. The first chapters, those of Zechariah, are precisely dated, the second part has no dates; the first part has visions, the second not; the first part makes the temple especially prominent, it is hardly alluded to in the second part; the first part reflects the Persian period, the second part has no certain references to it; and the peaceful outlook of the first part has become warlike in the second part, and is characterized, in certain portions, by a bitterness of feeling toward other nations hardly paralleled elsewhere, see ix, 1ff, 13ff, xii, 1ff, etc. The nations mentioned are not those of the Persian period, Hadrach and Damascus, ix, 1, Hamath, ix, 2, Greece, if the text is correct, ix, 13, and Assyria and Egypt, x, 10. The Messianic picture of the second part, ix, 9-10, is the ordinary one of a Messianic king of the future, his reign in this case to be preceded by the destruction of enemy nations, in contrast with Zechariah's conception of Zerubbabel, the prince already present, as the Messianic king, himself bringing deliverance.

The question to what period chapters ix-xiv belong has been much disputed, which is also true of the further question whether they are the work of one author, or of more than one.

The following features are claimed to be references to a pre-exilic situation. The northern kingdom, it is said, is still in existence, ix, 10, 13; xi, 14; Egypt and Assyria are contemporary nations of the writer, x, 10f; idolatrous conditions, 10, 1f, are thought to indicate this period; and the nations mentioned with threats, ix, 1-7, are said to be those of this time, see Amos i, 3-10. The pre-exilic date usually assigned is about the time of Amos.

There is a growing tendency, however, to assign these chapters to the time after the exile, and usually to the Greek period. Little dependence can be placed on the mention of the Greeks as a present power, ix, 13, for there

is considerable reason to think that these words may be an addition. The nations which are here denounced were prominent during the time of conflict between the Seleucidæ of Syria and the Ptolemies of Egypt. Egypt and Assyria, on this view, designate the Ptolemies and the Seleucidæ; such a usage probably has parallels elsewhere, as in Micah v, 5f, which at least uses the term Assyria after Assyria had passed away. These chapters contain evident allusions to the captivity, ix, 11f, x, 6-9. There is no reference to a Davidic king as reigning in Jerusalem, the Davidic family being like the other noble families, xii, 7, 12ff. The general character of the message is not like that of pre-exilic prophecy, it has characteristics which are usually called apocalyptic, found in Ezekiel xxxviii-xxxix, Joel iii, Isaiah xxiv-xxvii, etc. These characteristics are partly vagueness and obscurity; in part the form of presentation of the future, the nations are to attack Israel and Yahweh is to destroy them; and especially the great extravagance of representation, found particularly in chapter xiv. The priestly tone, manifesting itself in the great emphasis upon the externals of worship and upon holiness, is also a mark of the later time.

The inconclusiveness of some of the arguments given above for a pre-exilic date has already been noted. Further, the mention of the northern kingdom is not out of harmony with the postexilic period, for a return of Ephraim along with Judah was a part of the prophetic expectation, see Ezekiel xxxvii, 16ff. Idolatry is not unknown after the exile, contrary to the view often maintained, see Malachi iii, 5.

The indications which have been mentioned point to the Greek period for chapters ix-xiv. There are many obscurities in these chapters, so that the interpretation is not always certain. But there are variations in the representation which make it probable that these chapters are not entirely the work of one author, or of entirely the same period. Especially to be noted is the optimistic tone in ix, 11-xi, 3, in which the restoration of the people from captivity under favorable national conditions is indicated. In xi, 4-17, xiii, 7-9, however, the tone is one of pessimism. Here severe oppression by their captors has aroused intense bitterness toward them. Such oppression seems to have characterized the reign of Ptolemy Philopator, 222-205 B.C., after the battle of Raphia, 217 B.C. These portions, therefore, seem to have been written after 217 B.C., while the more optimistic portions are somewhat earlier under more favorable conditions. It may be that the earlier portion includes all of ix, 1-xi, 3, and the later xi, 4-xiv, 21. But it is also quite possible that there are more than two authors.

In the whole of chapters ix-xiv the principal thought is the future expectation of the nation. In the first part it is a message of hope and national restoration, accompanied by punishment of the enemies. In the second part there is a note of discouragement, finding expression in bitterness against the oppressors. The destruction of these oppressors is portrayed with expressions of hate in chapter xiv. The ethical teaching concerning the present-day conditions, so characteristic of the earlier prophets and of Zechariah himself, is not found here. The hope for the future of

the nation is principally in Yahweh's manifestation of his power against the nations, rather than in the co-operation of the nation with God.

GEORGE RICKER BERRY,

*Professor of Old Testament Interpretation and Semitic Languages, Colgate University.*

**ZEDEKIAH**, zēd-ē-kī'a, the last king of Judah of the line of David. He was the third son of Josiah and Hamutal and his name was originally Mattaniah. At 21 he was appointed by Nebuchadnezzar to succeed his nephew Jehoiachim (whom he had carried to Babylon) as king of Judah about 579 B.C., and changed his name to Zedekiah. He reigned in Jerusalem 11 years. He took an oath of allegiance to Nebuchadnezzar, which he afterward broke, and entered into a league with Egypt against him. His action in so doing was denounced by the prophet, Jeremiah, who, as well as Ezekiel, then in Chaldæa, predicted the approaching fall of Jerusalem. Jerusalem was besieged by Nebuchadnezzar and taken in 588 B.C., after a siege of a year and a half, the temple and city destroyed, and the leaders of the Jews carried captive. Zedekiah, whose sons were killed in his presence, had his eyes put out, and was carried in fetters of brass to Babylon, where he died, but the time of his death is unknown. His history is recorded in the books of Kings and Chronicles, and more fully in Jeremiah.

**ZEDLITZ**, tsēd'lits, Josef Christian, BARON VON, Austrian poet: b. Johannisberg, Austria Silesia, 28 Feb. 1790; d. Vienna, 16 March 1862. He served in the Austrian army at the battles of Regensburg, Aspern and Wagram, and afterward entered the service of the Austrian foreign-office. His dramas, 'Der Stern von Sevilla' (1830); 'Kerker und Krone' (1834), etc., were long popular, but he is best known by his pleasing lyrics and ballads, 'Totenkränz,' a collection of elegies (1827); 'Gedichte' (1832); 'Soldatenbüchlein' (1848). He translated into German Byron's 'Childe Harold' (1836).

**ZEDLITZ**, Karl Abraham, BARON VON, Prussian statesman: b. Landshut, Silesia, 4 Jan. 1731; d. Kapsdorf, Silesia, 18 March 1793. He was appointed Minister of Justice in 1770, and was placed at the head of the department of ecclesiastical affairs and public instruction in the next year. He did much to uphold the liberty of the press and was a leader in the matter of prison reform. He resigned office in 1789.

**ZEDOARY**, certain species of *Curcuma*, natives of India, China, etc., whose rootstocks are aromatic, bitter, pungent and tonic, and are used for similar purposes with ginger, although less effective. The round zedoary is the product of *C. zedoaria*, having palmate rootstocks, straw-colored within, which are used like turmeric for dyeing. Long zedoary, produced by the same species, has long palmate rootstocks, yellow within. Zedoary is a powerful sudorific

and is employed in the Orient in alterative medicines and for incense.

**ZEEHAN**, zē'hān, Tasmania, a mining township on the west coast near the base of Mount Zeehan, from which it takes its name, and 29 miles from the port of Strahan on Macquarie Harbor. The township owes its existence to the discovery in 1884 of rich silver-lead ore in great abundance, extending over an area of more than 160 square miles. Pop. 5,014.

**ZEELAND**, zē'lānt, Netherlands. See ZELAND.

**ZEEMAN**, Pieter, Dutch physicist: b. Zonnemaire, Zeeland, 1865. He was educated at the University of Leyden, and was later assistant and lecturer there. From 1900 he was professor of physics at the University of Amsterdam. He discovered in 1896 the phenomenon in light now known as the Zeeman Effect, for which achievement he was awarded the Baumgartner prize at Vienna; the Wilde prize at Paris, and one-half of the Nobel prize in physics in 1902. He wrote 'Messungen über das kerrische Magneto-optische Phänomen' (1893); 'Experimentalluntersuchungen über Teile die kleiner als Atome Sind' (1900); 'Researches in Magneto Optics' (1913), etc.

**ZEEMAN**, Remigius, Dutch marine painter: b. Amsterdam, about 1609; d. there, after 1673. His real name was Nooms, but he received the name of Zeeman from painting marine subjects. There are a number of his works in the royal palaces at Berlin, where he resided for a number of years and was painter to the Elector Frederick William. He also produced several etchings of more than ordinary merit, among them three of naval battles between the English, French and Dutch, which occurred in 1673. Among his paintings are 'Sea-fight near Leghorn, 14 March 1653' (Amsterdam Museum); 'Seashore with Boats' (Berlin Museum), the very fine 'View of the Old Louvre from the South Bank of the Seine' (Louvre), etc.

**ZEEMAN EFFECT**, a phenomenon highly important in connection with theoretical physics, discovered in 1897 by Dr. Pieter Zeeman, of the University of Amsterdam. It consists in the doubling (or further multiplication) of the lines of the spectrum of a substance, when the source of the light under examination is placed in a powerful magnetic field. (See SPECTROSCOPY.) The results that are obtained under varying conditions are too complicated to admit of full discussion in the present place. In general, however, it may be said that when the ray of light under examination travels in a direction parallel to the lines of force in the magnetic field, each line of its spectrum is separated into two lines, which are collectively known as a "magnetic doublet." The two components of such a magnetic doublet have (in general) the same intensity, and they are circularly polarized in opposite directions. Previous to Dr. Zeeman's discovery, no source of light was known, the rays from which were completely polarized, either circularly or otherwise. In order to observe the Zeeman effect properly, it is essential for the magnetic field to be both intense and uniform, and for the spectroscope to have a high resolving power. An idea of the order of magnitude of the phenomenon may be had

the following fact: In a magnetic field intensity is 10,000 C. G. S. units, each of so well-known D lines of sodium is re-intensified to a doublet, and the separation of the components of either of these doublets is approximately equal to one-twelfth of the distance in the original D lines.

When a ray of light originating in a magnetic field leaves that field in a direction perpendicular to the lines of magnetic force, the phenomena that are observed are much more complicated. The lines of the spectrum are observed to be triple, and not infrequently quadrupled, or even more complex. In these cases, however, each constituent of the modification is completely polarized, but the polarization is instead of being circular as before, is linear. The several constituents into which the primitive line is resolved may, in fact, be divided into two groups, one of which is polarized in a plane parallel to the lines of magnetic force while the other is polarized in a plane perpendicular to those lines.

It will be observed that the Zeeman effect is apparently, to the influence of the magnetic field upon the ultimate molecular mechanism which is concerned in the very genesis of light-ray; and herein lies its great theoretical importance. The ordinary theories of light of the propagation of luminous waves through the ether and through matter, after waves have left their source; and little is known of the way in which a light-wave originates at the atom which presumably gives it.

The phenomenon discovered by Dr. Zeeman enables us to trace the consequences of the Zeeman effect, by direct experimental means, under the conditions that prevail at the very source of the light; and for this reason it is of the highest importance. It leads to results of the highest importance with respect to the structure of matter and its motions. At the present day, physicists believe that the atoms constitute matter are themselves composed of far smaller particles called "electrons," the electron, or ultimate unit in the structure of matter, being of the nature of a disembodied charge of electricity. Light is believed to be due to the motions of these electrons within the atoms; and the Zeeman effect is believed to be due to the influence of the magnetic field upon the motion of the electrons. **LIGHT; ETHER; ELECTRON THEORY; SPECTROSCOPY** For a good account of the main facts consult Cotton, 'Le phénomène de Zeeman' (Paris 1900). Consult also Lewis, E. P., 'The Zeeman Effect in a Magnetic Field on Radiation' Scientific Memoir Series, Vol. VIII, New York (1903); Zeeman, Pieter, 'Researches in Zeeman's optics' (London 1913). Reference may also be made to current scientific periodicals, because the subject is being intensely studied, and data in connection with it are being rapidly accumulated.

#### ALLAN D. RISTEN

**ZEGEDIN, Stephen de**, Hungarian Protestant theologian: b. Zegedin, 1505; d. Revin, Hungary, 2 May 1572. He studied under Luther at Wittenberg, and taught there afterward throughout the cities of Hungary; was taken prisoner by the Turks, who treated him with severe cruelty, and his works were 'Speculum Rosticum

Pontificum Historicum' (1602); 'Assertio de Trinitate' (1573); 'Tabula Analytica in Prophetas, Psalmos, et Novum Testamentum' (1592).

**ZEGEDIN, SZEGEDIN, or SZEGED**, Hungary, city in Csongrad, near confluence of the rivers Maros and Theisse, 100 miles southeast of Budapest and an important railroad junction. It is the second largest town in Hungary and has been practically rebuilt since the inundation caused by the rising of the Theiss nearly destroyed it 11 March 1879. It has fine buildings and handsome squares and boulevards. A dam protects the town from the river. It manufactures paprika, soap, woolens, leather and toys. Being located adjacent to two navigable rivers, it controls the commerce of a large surrounding district. It has been an imperial city since the 15th century and was held by the Turks in 1541-1686. Pop. 118,000.

**ZEGERS, zî'gers, or SEGHERS, Hercules**, Dutch landscape painter: b. about 1580; d. about 1645. He was an artist and engraver of great merit, but notwithstanding the general excellence of his works he found great difficulty in disposing of them, and, becoming discouraged, fell into habits of intemperance. After his death his works sold for very high prices.

**ZEGERS, Tacite Nicolas**, Flemish theologian: b. Brussels, in the latter part of the 15th century; d. there, 1559. He entered the Franciscan order and in 1536-48 he was professor of theology at Louvain. His works are of high value and he was considered one of the greatest critics of his time. He prepared many volumes of criticisms on the New Testament besides a Latin edition 'Testamentum juxta veterem ecclesiam editionem' (1559).

**ZEILA, zî'la, ZAYLAH, or SELA**, Northeast Africa, a seaport of the British Small Coast Protectorate, on the Gulf of Aden, 25 miles southeast of Jibuti, the port of French Somaliland. Its former commercial importance as the terminus of caravan routes from Harar and Shoa in Abyssinia has diminished since the construction of a railroad from Jibuti to Harar. Pop. 15,000.

**ZEILER, tsî'ler, or ZEILLER, Martin**, German geographer: b. Styria 1589; d. 6 Oct. 1661. He was one of the foremost authorities of his time, and a voluminous writer on various subjects. He wrote the text for many of the long series of works entitled 'Topographia' published by Matthew Merian, who himself engraved the copper plates.

**ZEISBERGER, tsîs'bêrg-er, David**, American Moravian missionary among the Indians: b. Zauchenthal, Moravia, 11 April 1721; d. Goshen, Ohio, 17 Nov. 1808. Educated in Saxony, he emigrated to Georgia in 1738 and in 1740 went to Pennsylvania, where he was one of the founders of the towns of Bethlehem and Nazareth. In 1743 he became a missionary to the Indians, and labored until the breaking out of the Indian war in 1755 among the Delaware at Shamokin (Sunbury, Pa.), and the Iroquois at Onondaga. In the time of the Pontiac conspiracy, he assisted in ministering to the Christian Indians for whom the governor of Pennsylvania had provided a refuge at the barracks at Philadelphia. Peace having been concluded, he led the remnant of these Indians

to Wyalusing, on the Susquehanna, in Bradford County, Pa. In 1767 he penetrated through the wilderness to Goshgoshunk, on the Allegheny, in Venango County, and established a church among the Monseys. He removed with his flock in 1770 to the Beaver Creek, and began another station, called Friedenstadt, in what is now Lawrence County; two years later he explored the Muskingum region, in the present State of Ohio, and laid out an Indian town, Schoenbrunn, on the Tuscarawas. After a time he was joined by all the Moravian Indians of Pennsylvania, whom the march of civilization drove westward. Two more towns were built, a number of other missionaries entered the field, and many new converts were added. In 1782 the Wyandots fell upon the settlement of the Christian Indians at Gnadenhütten and massacred many of them. This was a death blow to the Moravian mission among the Indians. With a small remnant Zeisberger built an Indian town, in what is now the State of Michigan, but in 1786, at the head of a small band of followers, he returned to Ohio, and in the following year commenced a new settlement, which he called New Salem, in Huron County. In 1791 the hostility of other Indians obliged them to emigrate to Canada, where they founded Fairfield, on the river Thames. In 1798 the United States Congress having granted to the Moravian Indians the tract of land in Ohio upon which they had formerly been settled, Zeisberger returned to that country with some of his converts, and near the ruins of their once flourishing towns established a new station, to which he gave the name of Goshen. There he preached the remaining 10 years of his life. His published works are a 'Delaware and English Spelling Book' (1776); 'A Collection of Hymns in Delaware' (1803); 'Sermons to Children,' in Delaware (1803). In recent years have appeared his 'Dictionary in German and Delaware' (1887); 'Diary of David Zeisberger 1781-98' (1888); and 'Essay toward an Onondaga Grammar' (1888). Consult Schweinitz, 'Life and Times of David Zeisberger' (1870).

**ZEISE**, tsí'sě, Heinrich, German poet: b. Altona, Schleswig-Holstein, 19 April 1822. He was an apothecary successively in Altona and Copenhagen, and from 1863 to his retirement in 1875 was proprietor of a chemical manufactory at Altona. He finally settled in Grosslöbbeck, near Altona. During an extended journey through Norway, Sweden and Denmark, he familiarized himself with Scandinavian literature, and subsequently he translated the writings of Oehlenschläger, Andersen, Holst, Jørgen, Moe and others, and works of natural history by Schouw and Oersted. Zeise's original verse is often careless in diction, but has generally a pleasing quality, and reaches a stirring note in his patriotic songs, many of which are among the more valuable in his collection of 'Deutsche Kriegs- und Siegeslieder' (1864). Among his volumes are 'Reiseblätter aus dem Norden' (1848); 'Gedichte' (2d ed. 1852); 'Neuere Gedichte' (1850); 'Kampf- und Schwertlieder' (1849); 'Kleine Lieder' (1871); 'Aus dem Leben und den Erinnerungen eines Nord-Deutschen Poeten' (1888); and 'Natur- und Lebensbilder' (1892).

**ZEISING**, tsí'sing, Adolf, German writer on aesthetics: b. Ballenstedt (Anhalt), 24 Sept.

1810; d. Munich, 27 April 1876. He wrote 'Neue Lehre von den Proportionen des menschlichen Körpers' (1854); 'Ästhetische Forschungen' (1855); 'Religion und Wissenschaft' (1873); and several works of fiction. For a time he held a professorship in the Bernburg (Anhalt) gymnasium, but after 1853 devoted himself to letters, residing generally in Munich.

**ZEISLER**, Fannie Bloomfield, American pianist: b. Bielitz, Austria, 1865. When she was two years of age, her family emigrated to the United States and settled at Chicago, where she showed an early aptitude for the piano. Her first teacher was Bernard Ziehn of Chicago, and she studied later under Carl Wolfsohn in this country. In 1878, she went to Vienna where she studied for five years under Leschetizky, and also made her début in 1883. In 1885 she married Sigmund Zeisler, a Chicago lawyer. Until 1893 she played in concerts in the United States; then toured Germany (1893-95), England in 1898, and returned to America for an extended tour in that year. In 1902, she was again in Europe, touring Germany, Austria and France. Since 1903 she has been in the United States, with the exception of one concert tour in Europe in 1912. She is also a prominent member of literary and musical clubs in Chicago. Mrs. Zeisler's playing has met with the greatest praise. Her technique is brilliant and her interpretation is of much intellectual and emotional depth.

**ZEITUN**, zā-toon', or **ZEITAN**, Asiatic Turkey, a town in the province of Aleppo, 25 miles northwest of Marash, in an iron-mining district, inhabited chiefly by Armenian Christians. The district is fertile but mountainous. The people, distinguished by their martial spirit and their immunity from crimes of violence, are descendants of the Armenian kingdom which existed in Cilicia from the 11th to the 14th century. A sanguinary conflict with Turkish troops soon after the Crimean War drew European attention to the community, and it was stopped by the intervention of the British and French consuls. In 1878, 1890 and 1895 they defended themselves successfully from Turkish oppression, securing favorable conditions of peace. The population suffered greatly from massacres during the European War. Pop. about 20,000.

**ZEITZ**, tsits, Germany, a town in the province of Saxony, Prussia, on the Weisse Elster. 23 miles by rail southwest of Leipzig. A gymnasium, and a library in a former Franciscan monastery are among its educational institutions. It is a busy industrial centre with manufactures of woollens, cottons, calicoes, leather, hosiery, mineral oil, sugar, pianofortes, cycles, etc. Pop. 37,000.

**ZELA**, zé'la, an ancient town of Asia Minor, in the Pontus, where Julius Caesar defeated Pharnaces, king of Pontus and son of Mithridates, and announced his victory to the Roman Senate, in the famous brief dispatch, *I'm, vidi, vici* — 'I came, I saw, I conquered.' This battle ended the war; Pharnaces escaped into Bosphorus, where he was slain by his lieutenant Asander; Pontus was made a Roman province, and Bosphorus was given to Mithridates of Pergamus, 47 a.c.

**ZELAYA, zā-lā'yā, José Santos,** Nicaraguan statesman: b. Managua, Nicaragua, 1853. Educated in England, he entered Nicaraguan army and was made a general in 1875. He became the leader of the Liberal and united with Joaquin Zavala in the revolt of April-June 1893, which resulted in the overthrow of President Sacaza. When Zavala made provisional President Zelaya rebelled, Zavala was obliged to resign. A new constitution was then proclaimed, under which Zelaya was elected President 17 Sept. 1893 and held the office until 1911. In the next year he led the Mosquito territory and in May 1895 English force held the port of Corinto for a time until Nicaragua agreed to pay indemnity for the murder of an English subject.

**ZELAYA,** Mexico, a town of Guanajuato, on Rio Grande de Santiago, 120 miles north of Mexico City. It is a cotton, soap and manufacturing centre. The chief building is a large and elegant cathedral and seminaries. Pop. 32,000.

**ZELNY, John,** American physicist: b. Erie, Wis., 26 March 1872. He was graduated at the University of Minnesota in 1892 and took his Ph.D. there in 1906, meantime having studied at the University of Berlin and Cambridge University. He was professor of physics at the University of Minnesota 1892-1915, and has held that position at Sheffield Scientific School, Yale University, 1915. He is author of various papers on electricity, particularly on the conduction of electricity through gases and on kindred subjects.

**ZELKONA TREE,** a large elm-like tree (*oiva crenata*), native to the Orient. The wood is much prized, the heartwood when dry being exceedingly hard, capable of a fine polish and an excellent furniture wood.

**ZELL, tsël, Karl,** German philologist and linguist: b. Mannheim, Baden, 8 April 1817. He studied in Heidelberg, Göttingen and Bonn, and was made professor of philology at Bonn in 1821, and, as representative of the city in the first Baden chamber in 1831-35, directed a reorganization of the system of higher education in the grand duchy. He was made a member of the council for higher studies, with the rank of ministerial councillor. From 1846, on his retirement in 1855, he was professor of philology at Heidelberg. His scholarship is fully shown by his studies of Aristotle and Aristotelian philosophy. He served in the Chamber of the Diet of Baden in 1848-51 and was noted for his defense of the Roman Catholic Church against its enemies in that year. He was president of the assemblies of the Catholic Union in 1852 and 1853. Among his writings are 'Observationes Criticæ de tele' (1817); 'Ethica Nicomachea' (1821); a translation (1834) of the 'Organon'; 'Der aus der Gegenwart' (1855); and some *ita academica*.

**ZELLER, tsël'lër, Eduard,** German theologian and historian of Greek philosophy: b. Stuttgart, Württemberg, 22 Jan. 1814; d. Stuttgart, 19 March 1908. He studied at Göttingen and Berlin, and was made privat-docent at Tübingen in 1840. Though bitterly opposed by the more orthodox, he became pro-

cessor of theology at Bern in 1847, and at Marburg in 1849. Appointed to the chair of philosophy at Heidelberg in 1862, he went to Berlin in 1872 and retired in 1895. He early forsook theology and his Hegelianism for historical work which reveals the most impartial and eclectic spirit. Among his writings the following are the most important: 'Platonische Studien' (1839); 'Die Philosophie der Griechen,' his greatest work (1844-52; last personally revised ed. 1904); 'Das Theologische System Zwinglis' (1853); 'Die Apostelgeschichte kritisch untersucht' (1854; English trans. 1875-76); 'Vorträge und Abhandlungen' (1865; 2d ed. 1875-77-84); 'Staat und Kirche' (1873); 'David Friedrich Strauss' (1874); 'Geschichte der deutschen Philosophie seit Leibnitz' (1872); 'Friedrich der Grosse als Philosoph' (1886). His work on Greek philosophy has been translated into English under the titles 'Socrates and the Socratic Schools' (1868); 'Stoics, Epicureans, and Sceptics' (1870); 'Plato and the Older Academy' (1876); 'The Pre-Socratic Philosophy' (1881); 'The Eclectics' (1883); 'Aristotle' (1897).

**ZELLER, zël-lär, Jules Sylvain,** French historian: b. Paris, 23 April 1820; d. there, 25 July 1900. He studied in Paris and in Germany and afterward held the chair of history successively in the lycées of Rennes, Bordeaux and Strassburg, in the faculty of Aix and in the Paris Normal School. In 1863 he was made professor of history in the Ecole Polytechnique, in 1874 member of the Academy of Moral and Political Sciences and in 1876-88 was inspector-general of higher education. His works include 'Les Empereurs Romains' (1863); 'Entretiens sur l'Histoire' (1865); 'Pie IX et Victor Emanuel' (1879); 'Histoire de l'Allemagne' (1872-91); and 'Histoire Resumée de l'Allemagne' (1888).

**ZEMSTVO, or ZEMSKIYA UCHREJDERIYA** (district institutions), a Russian political body, originally designating the country people, but later used for the governments and their representative bodies, comparing with our State legislatures. The Zemstvo was first mentioned by Alexander II in the imperial edict of 1859, and after years of labor in perfecting it, in January 1864, was officially recognized by him as an institution. Its original intent was the greatest possible development of local home rule, the members of the district assemblies or zemstvos being elected by three different electoral classes—the landowners, the city people and the country inhabitants—thereby introducing for trial a sort of constitutional representation. Before long, however, dissensions arose, the central government accusing the zemstvos of assuming too much authority, of becoming too liberal and by several edicts the orderly development of these districts was checked. Finally by the edict of June 1890 the zemstvo representation was limited to two classes of citizens—the hereditary and personal nobility and the burghers of the cities—thus depriving the peasants entirely of their elective franchise, their representatives afterward being selected by the governors and by members of the volost assemblies.

**ZENANA MISSION,** a mission founded in 1852 under the auspices of the Protestant missionary societies in India, with the object

(1) of sending the Gospel to the women of India in their own homes by means of female missionaries; (2) of alleviating their sufferings in sickness and ministering to their spiritual need; and (3) of promoting education, based on Holy Scripture, especially among women of the higher classes. See INDIA.

**ZEND**, more correctly **AVESTAN**, an ancient Iranian language, in which the Zend-Avesta is composed. This language was first introduced to notice by Anquetil Duperron, and the accurate knowledge of it has been developed among others by Rask, Burnouf, Bopp and Haug. It is now recognized to be a coeval and cognate dialect with the Vedic Sanskrit. It embraces two dialects called Bactrian, in contradistinction to the ancient languages of Media and Persia, which are called the Western Iranian, while the Zend or Bactrian dialects are called the Eastern Iranian dialects. The two Zend dialects consist of an earlier and a later, analogous to the Vedic and classic Sanskrit or to the Homeric and classic Greek. The period of transition between them is perhaps from 100 to 200 years. The earlier dialect is called the Gâtha, from the Gâthas or sacred songs which form the only remains of it; the later is that in which the greater part of the Zend-Avesta or Zoroastrian sacred writings are found. They differ both in grammar and pronunciation, they are both highly cultivated languages and rich in inflections, but the earlier is richer in inflections and the later in compounds. The earlier is distinguished by long vowel terminations, probably produced by transcribing the singing pronunciation of the gâthas. The present alphabet is comparatively modern and is probably derived from the Syriac. There are 12 simple vowels, 14 diphthongs and 29 consonants, represented by separate characters. The roots are mostly monosyllabic, some consisting only of a single vowel, others of a vowel and consonant or a vowel between two consonants. These primitive roots are modified by articulate additions, which extend or limit their meaning after the manner of prefixes and suffixes, thus *dâ*, to make, with the addition of *th*, becomes *dath*, to place. Verbal roots undergo modifications producing three distinct forms, the causal, the desiderative and the intensive. Verbs have three voices, active, middle (reflective) and passive; and four moods, indicative, subjunctive, potential and imperative. Some of these moods are double. The tenses include one for the present, four for the past and two for the future. Nouns are formed from roots by means of suffixes. There are three genders, masculine, feminine and neuter. There are also three numbers, singular, dual and plural, with eight inflections in the first and last and five in the middle number. The forms of the declensions closely resemble those of Sanskrit; and there are many other analogies between the Gâtha dialect and the Vedic Sanskrit. See **AVESTA**; **SANSKRIT**; **SANSKRIT LITERATURE**.

**ZENGER**, John Peter, American publisher: b. Germany, about 1680; d. New York, 1746. He came to America about 1700 and became a printer's apprentice. He began the publication of the *New York Weekly Journal*, 5 Nov. 1733, an organ opposed to the governor and supported by Chief Justice Lewis Morris and other leading men. The paper was cred-

ited with greatly influencing public opinion against the government, and Zenger was arrested 17 Nov. 1734 on a charge of publishing seditious libels. He was imprisoned for some time before his trial, at which he was defended by Andrew Hamilton, and his acquittal by the jury was regarded as the first important victory for the freedom of the press. The verdict has been called "the morning star of the liberty which subsequently revolutionized America." Consult Rutherford, 'John Peter Zenger' (New York 1904).

**ZENITH**, the vertical point of the heavens at any place, that is, the point right above a spectator's head and from which a line drawn perpendicular to the plane of the horizon would, if produced, pass through the earth's centre, supposing the earth a perfect sphere. Each point on the surface of the earth has, therefore, its corresponding zenith. The zenith distance of a heavenly body is the arc intercepted between the body and the zenith, being the same as the coaltitude of the body.

**ZENITH SECTOR**, an astronomical instrument consisting of a telescope swinging upon pivots and having attached to it an arc graduated into degrees and minutes. It is used for the same purpose as the mural circle, namely, to ascertain the zenith distance of the several stars.

**ZENITH TELESCOPE**, an instrument used in field astronomy for the determination of latitudes, by the measurement of the difference of meridian-zenith distance of two

A Zenith Telescope.

stars, one culminating north of the zenith and the other at so nearly the same distance south that that difference can be measured by a fine micrometer in the field of the telescope when

ter is revolved 180° round a vertical between the two culminations.

e determination of latitude with this instrument is frequently referred to as the "Talcott method," because first practically used by Captain Talcott of the United States Engineers in 1845. It is also sometimes called the "Talcott method." Prior to this accurate latitudes were usually determined by the employment of the transit instrument mounted in the Prime Vertical, but this mode has been practically superseded by the present method, which is one of extreme accuracy and simplicity. It is employed for the determination of latitudes in the United States Coast and Geodetic Survey, in the fixed observatories, and, in fact, wherever accurate latitudes are desired. Its only drawback consists in the fact that it requires a special instrument, designed for the determination of latitudes alone, and not available for other kinds of astronomical observation.

**ZENITH TUBE**, an instrument designed for accurate determinations of latitude serving stars which transit the meridian to the observer's zenith, or (when the declination is known), for determining the declinations of such stars. It consists of a rigid, adjustable telescope tube so mounted as to always be to the zenith; the plane of the objective lens is thus horizontal. Within the tube at a distance below the lens of slightly more than one-half of the focal length, there is a lens of mercury; the rays from a zenith star after passing through the objective are reflected from the mercury surface and finally converge to a focus and form the image a short distance above the lens, a hole being drilled through the centre of this to allow of their escape. The micrometer wires are adjusted to the lens in this focal plane, both they and the image being reflected horizontally by a prism placed at this point into the eyepiece, of which there are two on the sides of the main tube, one to the east and one to the west of it.

A great advantage possessed by the instrument consists in the fact that the observer's declination (and, therefore, his zenith) is determined wholly by the surface of the mercury; there are no usual level tubes, which always present irregular and annoying anomalies when used for work of the highest accuracy, and which are wholly dispensed with. Only stars which pass within a few minutes of the zenith, however, can be observed with it.

A very large zenith tube (aperture eight inches), was installed in the Flower Observatory of the University of Pennsylvania at Philadelphia in the year 1904, for the purpose of finding whether certain sudden changes of the local magnetic field, amounting in some cases to several degrees, had a real existence, or whether they were due to undetected changes in the zenith declination (q.v.), with which the latitudes had previously been determined. The new instrument agreed with the other in indicating local sudden changes in latitude, but their cause has not yet been discovered.

**ZINJAN**, zĕn-jŭn', or **ZINJAN**, Persia, capital of the province of Khamseh, 100 miles northwest of Teheran, on the high-

way to Tabriz. It has postal and telegraph service and is important commercially to the surrounding district. Its elevation is 5,180 feet. It has manufactures of carpets, woolen cloths and arms. Pop 24,000.

**ZENKER**, Friedrich Albert von, German physician: b. Dresden, 13 March 1825; d. Reppentin, Mecklenburg, 13 June 1898. He was educated at the universities of Leipzig and Heidelberg. From 1851 he was connected with the city hospital of Dresden and in 1855-62 he was also professor of pathological anatomy and general pathology at the Surgico-Medical Academy at Dresden. He was appointed professor of pathological anatomy and pharmacology at Erlangen in 1862, and in 1865 he became joint editor of the *Deutschen Archiv für klinische Medizin*. He is famous for his discovery of trichinae in 1860, concerning which he published 'Ueber die Trichinenkrankheit des Menschen' (in Virchow's 'Archiv,' Vol. XVIII, 1860).

**ZENKOJI**, zĕn-kō'jĕ, Japan. See NAGANO.

**ZENO**, zĕ-nō, Emperor of the East (Byzantine empire) from 474 to 491 A.D. An Isaurian by birth and named Trascalisseus he changed his name to Zeno upon his marriage to the daughter of Leo I. He commanded the imperial guards and armies, and was elevated to the consulship in 469; procured the assassination of Aspar, the minister of Leo, in 471, and usurped the crown on the death of Leo in 474. He was driven out of his capital by Basiliscus, who was proclaimed emperor in 475, but regained Constantinople in 477 by buying over Harmatius, the nephew and general of Basiliscus, who was deposed and died shortly afterward. In 478 a Gothic invasion was bought off; in 479 a revolt in Constantinople was put down by corrupting the troops engaged; a second Gothic invasion was bought off, and a third was repelled by purchasing the aid of an opposing party among the Goths, one of whose chieftains, afterward Theodoric the Great, was made consul in 484. Having quarreled with Theodoric, Zeno in 487, anxious to save himself and his capital, proposed to him to invade Italy, and expel Odoacer and the Heruli. Among the more important events of his reign was the publication of the so-called 'Henoticon' (482), or 'Decree of Union,' intended to adjust the controversy between the Monophysites (q.v.) and the Orthodox Church.

**ZENO**, dzĕ-nō, Apostolo, Italian dramatist and literary historian: b. Venice, 11 Dec. 1668; d. there, 11 Nov. 1750. He was a founder (1710) of the critical periodical *Giornale de' Letterati d'Italia*, in 1718-29 was at Vienna as court-poet, and made his reputation in Italian literature by libretti for the musical drama, which in his work attained real literary rank. For many years he was the chief dramatic poet of Italy. He was also a scholar, antiquary and well-known numismatist. His collected dramas appeared in 1744. Among his further writings is the 'Dissertazioni Istorico-Critiche e Letterarie' (1752-53). Consult the 'Life' by Negri (1816); Fehr, M., 'Apostolo Zeno und seine Reform des Operntextes' (1912).

**ZENO**, Nicolò and Antonio, Venetian navigators of the late 14th and early 15th centuries. Antonio about 1390 fitted a ship with which he sailed northward on the Atlantic. He was

wrecked on one of the Faroë islands. Here he would have been killed by the Scandinavian natives had he not been opportunely rescued by Earl Sinclair, whom Haakon VI of Norway had invested with the Orkneys and Caithness. He was made commander of the earl's small fleet, and in 1393 or 1394 sailed with three ships to Greenland, where he spent some time. He died in the Faroës about 1395. Antonio went out to the Faroës in 1391, and was in Sinclair's service for 14 years, dying at Venice in 1406. After Nicolò's death he was commander of the fleet; and on one occasion, to verify fishermen's reports of land some 1,000 miles westward, he undertook a voyage of discovery in the Atlantic. He described his adventures in a letter, and on this letter and some others and a sailing-chart, probably made by Antonio, is based a work containing matter of some interest in connection with pre-Columbian discovery in the New World. The letters were worked into a narrative, and, with a copy of the map, appeared in book-form in 1558. The narrative says that a fisherman, returning to the Faroës after a 26 years' absence, told of a land called Estotiland, where there was much gold and forest. The people built small boats and traded with Greenland. The description of Estotiland is vague, and contains little to suggest North America. But a voyage was undertaken from Estotiland to a region southward, called Drogio. There, said the fishermen, the people were cannibals. "They have no kind of metal. They live by hunting, and carry lances of wood, sharpened at the point." Farther south, "they have cities and temples," as well as "some knowledge and use of gold and silver." The honesty of the Zeno narrative has been sufficiently well established; but whether or not the fisherman had the experiences he narrated in Drogio, and whether that may be identified with North America, are questions that have been much debated. The map, drawn from hearsay, and necessarily of the vaguest character, was accepted as authentic and caused trouble for mariners and geographers for more than a century. Consult Major, 'The Voyages of Nicolò and Antonio Zeno' (Hakluyt Society, 1873), with a translation of the narrative and a copy of the map; and Fiske, 'The Discovery of America' (Vol. I, 1892).

**ZENO** (zē'nō) (Gk. Ζήνων) **OF CITIUM**, ancient Greek philosopher: b. Citiium, island of Cyprus. He flourished in the late 4th and early 3d century B.C., and was the founder of the Stoic school of philosophy (see STOICISM). The circumstances of his life are not well known. Tradition says that after suffering shipwreck near the Peiræus, and according to one account losing his all, while by another his wealth amounted to 1,000 talents, he settled at Athens. There he early made himself remarked for the virtues of moderation and contentment, and during his long life he so acquired the esteem of the citizens that they voted him a crown of gold and a public burial in the Ceramicus. He is said to have declined the citizenship of Athens from fidelity to his native country. He first resorted to the teaching of the Cynic Crater, and by this school his own views, especially in the earlier period of his career, were much influenced. It may seem surprising

that Zeno, who rejected both the contempt for established usages and for general knowledge which distinguished the Cynics, should have attached himself to that school, but the central point of every true system of philosophy is its ethics, and he was attracted to the Cynics by their doctrines of moral obligation, which he made the foundation of his own system. Contrary to the advice of Crater he afterward studied under Stilpo the Megarian. Among his subsequent advisers or teachers are enumerated the Megarians, Cronus and Philon, and the Academics, Xenocrates and Polemon. Of the last two he is said to have been a pupil. He maintained a friendship with Antogonus Gonatas, king of Macedonia, of whom his disciples Persæus and Philonides were companions. About 310 B.C. he opened his school in the Πικτή Στωά (Stoa), or "Painted Porch." This place, which was adorned with paintings by Polygnotus, had formerly been the resort of a school of poets, who were from this circumstance called Stoics, and the name was now transferred from them to the disciples of Zeno, who at first had been called Zenonians. All the works of Zeno are lost. They were numerous, and include treatises 'On the State' (early and of cynical tendencies); 'On the Ethics of Crater'; 'On Life According to Nature'; 'On Impulse'; 'On the Nature of Man'; 'On the Affections'; 'On the Becoming' (or Fitting); 'On Law,' and 'On Grecian Education'; various treatises on physics, logic and poetry, and a work on the Pythagorean doctrine. Concerning the doctrines of Zeno, which employed very largely the ethics of the Cynic school, as well as the physics of Heraclitus and Pythagoras, see STOICISM; and consult also Zeller, 'Stoics, Epicureans, and Sceptics' (1870); Ueberweg, 'History of Philosophy' (Eng. trans., 1887); and Ritter and Preller, 'Historia Philosophiæ Græcæ' (8th ed., 1898).

**ZENO OF ELEA**, ancient Greek philosopher: b. Ele (Velia), Lucania, southern Italy, about 488 B.C. He was the favorite disciple of Parmenides, whose opinions he defended, and whose ethico-political schemes he shared. He appears to have lived for a considerable time in Athens, where he taught for remunerations, and had distinguished pupils, as Pericles and Callias. He is said, on unsatisfactory evidence, to have engaged in an enterprise on behalf of his native land against the tyrant Nearchus. Whether he perished in this attempt or survived is not known. None of his writings are extant, but his opinions are referred to by Aristotle, who attempted to confute some of them, and who had distinguished him as the inventor of dialectic. As a defender of the Eleatic doctrine of the unity of the existent, he was the first to lay down the problems of skepticism in regard to the real existence of the phenomenal world, and has thus exercised an important influence on philosophy. He is said to have directed four arguments against the reality of motion. These all are very similar to one another; the two most famous are those of the flying arrow and of Achilles and the tortoise. The first finds a contradiction in the properties of the arrow, which cannot be where it is not, but is at rest if it remain where it is. That is, al-

a body in motion is in motion throughout its course, if any instant of the existence of the body be considered in itself, there is no indivisible property of the body which can lead to motion. Bergson considers that the paradox, which was stated by Zeno in order to give the specious character of motion and rest, is insoluble on any view which analyzes motion into a series of states. An answer to the paradox which is more in favor among scientists follows outlines that had already been given by Aristotle, and depends upon the fact that the velocity or measure of motion of a body is a limit—the limit of the ratio of the distance traversed by a body, divided by the time which it takes the body to traverse the distance, as this time grows smaller and smaller. The distinction between a property of a body at an instant, and the limit of a property of a body in the neighborhood of that instant, is all-essential for the explanation of the paradox. This distinction was only rendered clear in the last century by the development of the theories of assemblages and of the calculus of a real variable, which made clear the nature of continua and of continuous functions. It will be seen, then, how incorrect is the often-repeated statement that the paradox of Zeno were dialectical puerilities which were completely refuted by Aristotle.

One other famous paradox of Zeno is that of Achilles and the tortoise. Achilles, the swiftest of mortals, can never catch up with the tortoise, because when he reaches the tortoise's former position, the animal is no longer there, so that he has to traverse an infinite series of distances to overtake it. This argument is completely dependent on a clear distinction between the measure of an interval and the number of points it contains—a distinction whose true import has only been understood within the past 50 years. Zeno, in his arguments against motion, exhibits a truer application of the nature of this process than is afforded by many moderns in their support of it. Another argument, designed to establish the illogical nature of sense-perception, Zeno based on his knowledge of the existence of semilimita (see WEBER'S LAW). He points out the difficulty of understanding how, if the fall of one grain of wheat makes no audible sound, the fall of a bushel can be heard. See SPACE; ASSEMBLAGES, GENERAL THEORY OF REAL VARIABLE, THEORY OF FUNCTIONS OF

Bibliography.—Bergson, H., 'Time and Will' (tr., London 1910); Burnet, J., 'Greek Philosophy' (part i, London 1914); H., 'Die Fragmente der Vorsokratiker' (in 1906-07); Russell, B. A. W., 'Principles of Mathematics' (Cambridge 1903).

**ZENO OF SIDON**, Epicurean philosopher, about 150 B.C.; d. about 80 B.C. He was a contemporary and instructor of Cicero, and refers to him in 'De Natura Deorum', as an accurate and highly cultivated orator, but one who was scornful of other orators. His works are not in existence, but a treatise by Posidonius gives a summary of his beliefs and teachings.

**ZENOBIA**, zē-nō'hī-ā, queen of Palmyra. Her native name was Septimia Batha, and she was instructed in the sciences

by the celebrated Longinus, and made such progress that besides her native tongue she spoke the Latin, Greek, Coptic and Syrian languages. She also patronized learned men, and herself formed an epitome of Egyptian history. She was married to Odenathus, king of Palmyra, accompanied him both in the war and the chase, and the success of his military expedition against the Persians is, in a great degree, attributed to her prudence and courage. Gallienus, in return for services which tended to preserve the East to the Romans after the capture of Valerian by Sapor, king of Persia, acknowledged Odenathus as emperor, and on his death, 267 A.D., Zenobia assumed the sovereignty, under the title of Queen of the East. She preserved the provinces which had been ruled by Odenathus, and was preparing to make other conquests, when the succession of Aurelian to the purple led to a remarkable change of fortune. That martial prince, disgusted at the usurpation of the richest provinces of the East by a female, determined to make war upon her; and having gained two battles, Antioch and Emesa, besieged her in Palmyra, where she defended herself with great bravery. At length, finding that the city would be obliged to surrender, she quitted it privately; but the emperor, having notice of her escape, caused her to be pursued with such diligence that she was overtaken just as she got into a boat to cross the Euphrates, in 272. Aurelian spared her life, but made her serve to grace his triumph. The Roman soldiers demanded her life, and according to Zosimus she purchased her safety by sacrificing her ministers, among whom was the distinguished scholar, Longinus. She was allowed to pass the remainder of her life as a Roman matron, and her daughters were married by Aurelian into families of distinction. Her only surviving son retired into Armenia, where the emperor bestowed on him a small principality. Consult Gibbon, 'Decline and Fall' (ed. Bury, 1896-1900); 'Life of Aurelian' by Vopiscus in 'Augustæ Historiæ Scriptores' (Eng. trans., Bernard 1740); Ware, 'Zenobia, or The Fall of Palmyra' (1837).

**ZENOBIA, or THE FALL OF PALMYRA**, a noted historical novel, by William Ware, first issued in 1837 in the *Knickerbocker Magazine*, and then entitled 'Letters from Palmyra.' It was shortly afterward published in book form, and later editions were issued from time to time for more than 50 years.

**ZENOS**, zē'nōs, Andrew Constantiniades, American educator: b. of Greek parentage, Constantinople, Turkey, 13 Aug. 1855. He was graduated at Robert College, Constantinople, in 1872, studied theology at Princeton Seminary and was pastor of a Presbyterian church in Brandt, Pa., 1881-83. From 1883 to 1888 he was professor of Greek in Lake Forest University and of New Testament exegesis at Hartford Theological Seminary 1888-91. In 1891 he was made professor of church history in McCormick Theological Seminary in Chicago, and in 1894 was transferred to the chair of biblical theology in that institution, a position he still (1919) holds. He wrote 'Elements of Higher Criticism'; 'Compendium of Church History' (1896); 'The Teachings of Jesus Concerning Christian Conduct' (1905); 'The Son of Man'

(1914), etc.; edited Xenophon's 'Anabasis' (with F. W. Kelsey (1888)), and was co-editor of 'The Standard Bible Dictionary' (1909).

**ZENTA**, zén'tō, Hungary, a town in the county of Bács-Bodrog, on the Theiss, 120 miles southeast of Budapest. Here, 11 Sept. 1697, the Germans under Prince Eugene of Savoy, defeated the Turks, a victory which led to the Peace of Carlowitz, ratified January 1699. Pop. about 30,000.

**ZEOLITE**, a name given to a group of hydrated silicate minerals commonly found in cavities in igneous rocks, from which they are derived through secondary alteration. They include thompsonite, natrolite, scolecite, analcite, chabazite, gmelinite, phillipsite, harmotome, stillite and heulandite. The name is derived from the boiling reaction before the blowpipe.

**ZEPHANIAH**, zéf-ā-nī'ā, the ninth in order of the Scriptural writers known as the minor prophets. His pedigree is traced back for four generations. He is the son of Cushi, the son of Gedaliah, the son of Amariah, the son of Hezekiah and he is supposed to have been of noble, if not of royal, ancestry. His brief but pregnant prophecy was delivered just after the time of the first appearance of Jeremiah (626 B.C.)—that is, in the first half of the reign of Josiah. The next preceding prophet was Micah, who died in the early part of the reign of Manasseh. But the condition of the whole of western Asia, including Palestine, portended a speedy upheaval. Above all, Nineveh was beginning its memorable decline after the death of its king, Assur-banipal (668-626 B.C.). Morally and religiously the Jewish nation had improved but little since the degeneracy that had followed the death of Hezekiah, and Josiah's reform (621 B.C.) had not yet begun, if we may judge the invectives of the prophet against idolatrous practices. Zephaniah was apparently a descendant of King Hezekiah.

**The Prophet's Message.**—Zephaniah spoke and wrote primarily for the correction and warning of Judah and Jerusalem, though he draws illustrations from the sins and fates of other peoples. The culmination of these is found in the iniquities, the pride and the speedy fall of Nineveh. His prophecy extends to three chapters in the Bible. A division into four parts is as follows:

The threatening: ch. i (1), the whole world—that is, the Semitic world—is to undergo exemplary punishment, particularly Jerusalem and its apostates from Jehovah (ver. 1-6). (2) The classes of people who are to be thus visited—the royal house, the nobles, the wealthy traders, the careless and defiant generally—are characterized, and their chastisement set forth in language largely figurative (ver. 7-18).

The lessons from the nations: ch. ii. God's own people are warned to repent in time (ver. 1-3), and so avoid the doom that is about to fall upon the Philistines (ver. 4-7), Moab (ver. 8-11), Egypt, under the name of Ethiopia (ver. 12), and finally Assyria and Nineveh (ver. 13-15).

The remonstrance: ch. iii, 1-7. Rebellious and obstinate Jerusalem is urged to repent by the righteous and reasonable God, in view of coming woes; for the lesson of the fate of other nations has so far been unheeded.

The promised redemption: ch. iii, 8-20. (1) The faithful remnant is bidden to wait and trust. It shall survive the ruin of the nations be joined by exiled brethren from far and near, and rest in quiet content (ver. 8-13). (2) Joyous thanksgiving is now in place, for Jehovah is in the midst of Jerusalem, to comfort and bless his people. Their reproach is taken away, dispersion and captivity are at an end.

**ZEPHANIAH, Book of.** The title of the book of Zephaniah says that the prophetic message was given in the days of Josiah, king of Judah, 639-608 B.C. Since that time is appropriate for the book, the title is usually considered to rest upon an historical basis, although other suitable times for these utterances might be found. In the title Zephaniah is said to have been the great-great-grandson of Hezekiah, by whom the king of that name is doubtless meant. This also is generally accepted, since the book contains nothing out of harmony with the royal descent.

It is evident that the message of Zephaniah must have preceded the introduction of the Deuteronomic law in 621. This is because the conditions here reflected are such as doubtless belonged to the early part of the reign of Josiah, but were somewhat changed, perhaps only temporarily, by the Deuteronomic reform. The characteristic features are religious syncretism, astral worship, imitation of foreign customs, and scepticism, i, 4-6, 8, 9, 12. Since the book shows no clear influence of Jeremiah it is probably to be dated not later than the beginning of his work. That indicates a date of about 627 B.C.

The background of the book is some great invasion affecting many lands. At the time mentioned that must have been the Scythian invasion, alluded to in Jeremiah i, as a danger from the north. The invasion cannot have come from Egypt or Assyria, since both are mentioned as affected by it, ii, 12. This Scythian invasion, it is known, affected Assyria and extended to the borders of Egypt, overrunning also several of the intermediate countries. It lasted for a considerable number of years, and while its limits cannot be determined with entire certainty, the year mentioned, 627, was quite evidently near the beginning of its course.

The theme of the book is the coming of the day of Yahweh. This is probably not to be regarded as identified with the Scythian invasion, but the latter is an introductory movement indicating that it is at hand. The day of Yahweh is first mentioned by Amos, and then as a familiar idea. As here presented the destruction of that day is to engulf Judah, Philistia, Moab, Ammon, Ethiopia (Egypt) and Assyria; but the mention of Moab and Ammon is often considered a later addition. That day, while regularly a day of world-judgment in some real sense, is here presented in unusually vivid terms as a day of universal judgment and destruction. The judgment upon Judah has an ethical basis, a point which does not appear in the condemnation of the other nations.

Zephaniah, like Amos whom he resembles is distinctly a prophet of judgment. Most of the book gives little suggestion of mercy. At the end, however, are several verses of a different tenor which, as in the parallel case of Amos, are to be regarded as a later addition.

applies most clearly to iii, 14-20. Here message of restoration of the people now led among the nations. This belongs to exile or, more probably, after the exile. 10 is probably also a later addition because its attitude toward the nations is out of sympathy with most of the book. Other passages sometimes considered to be later are less certain; most prominent among these is ii, 8-11 which has suggestions of the exile.

Zephaniah adds nothing of fundamental importance to the messages of the line of prophets who have preceded him, yet his message is characterized by a zeal for righteousness and a vigor of presentation not untypical of that goodly fellowship. Historically, testimony to the conditions in the time before the reform of Josiah is of much

GEORGE RICKER BERRY,  
Professor of Old Testament Interpretation and  
Semitic Languages, Colgate University.

**ZEPHYR**, a soft, cool, agreeable wind; in the west, or rather west-southwest wind, and in Greek mythology by the god of the wind Zephyrus (q.v.). The Greek name, owing to the etymology, signifies life-bringer because at the time when this wind begins to blow, the plants are restored to life by the spring air.

**ZEPHYRANTHES**, a genus of *Liliaceae*, known in the warmer regions of America, most commonly represented by the atamasco. The species are bulbous, and are not found in the Northern States, but make charming summer-blooming window and greenhouse plants, resting in the winter. The foliage is green, springing from the bulb, and a scape, arising at the same time, is crowned by a large, three-parted corolla which is nearly erect, from one to three inches across, and yellow or white. *Z. candida* is one of the most delicate species, and is also one of the most delicate and thricest. It is a lovely, lily-like plant, with pure-white blossoms, growing out flat in the sunshine, and evergreen in the south.

**ZEPHYRUS**, zēf'i-rūs, in Greek mythology, god of the west-wind, a son of Æolus, or of the god of the east wind, and of the goddess of Aurora. He was married to Iris, goddess of fruits and flowers, their son being Carpus, god of fruit. By the harpy Calypso he was the sire of the swift horses Pegasus, Xanthos and Balius. His love being repulsed by Hyacinthus, he was the cause of his death by blowing Apollo's quail against his feet. Some make him the husband of one of the Graces. Flowers and fruits are under his dominion. He is represented as a gentle beauty, with a wreath on his head or a winged helmet in the fold of his mantle. According to some he was brother to Boreas, with whom he lived in a palace in Thrace. The Romans called him Favonius, and his wife, Chloris, or Zephyra.

**ZEPPELIN**, tsép'pé-lin, Ferdinand, Count von, German airship builder: b. Constance, Baden, 8 July 1838; d. Charlottenburg, Prussia, 8 March 1917. His father was Count Friedrich von Zeppelin, a Württemberg court official. After studies at the Stuttgart Polytechnicum, the Ludwigsburg Military Academy and the University of Tübingen, he entered on a military career and as a lieutenant was one of the German military observers in 1863 attached to the Army of the Potomac during the Civil War in the United States. His first ascent in a balloon made at Saint Paul, Minn., during this visit, is said to have been the incentive of his later experiments in aeronautics. He took part in the Seven Weeks' War of 1866, fighting for Württemberg against Prussia, and was an officer of cavalry in the Franco-German War 1871-72. He rose to the rank of lieutenant-general in the German army and in 1891 at the age of 53 retired and devoted his time and wealth to experiments in connection with dirigible balloons. While increasing proofs of success encouraged him to continue his efforts, a record of failures which reduced him to poverty marked his experiments for several years. Imperial patronage and public subscriptions, however, enabled him at last to conquer all difficulties, and in 1908-09 dirigibles of the type constructed with his name were making successful journeys ranging from 350 to 1,000 miles. Thirteen Zeppelins, however, had been destroyed and numerous lives sacrificed during the experiments up to 1914. During the European War, Zeppelins were used mostly for raids over Belgium and England, and over 40 were reported as destroyed. Their failure as warships is said to have been a great disappointment to Count Zeppelin. (See AERONAUTICS; DIRIGIBLE). Consult Hearne, R. P., 'Zeppelins and Super-Zeppelins' (New York 1916).

**ZERAFSHAN**, zēr-āf-shān', Asiatic Russia, a river rising in a valley at the junction of the Hissar and Turkestan Mountain chains, and after a westerly by north course of about 400 miles, passing the towns of Penjakent, Samarkand, Katakurgan, Kerminch and Bokhara, dispersing itself in the desert sands, between Karakul and the Oxus River. A railway line traverses the valley from Karakul to near Penjakent.

**ZERAH**, (Heb. *Zarach*), king of Ethiopia, known to the Egyptians as Azekh Amen, who flourished in southern Egypt about 900 a.c. He conquered Egypt and invaded Palestine, where he was defeated by Asa, king of Judah. Zerah then abandoned not only Palestine, but also Egypt (2 Chron. xiv).

**ZERBI**, or DE ZARBIS, Gabriel, Italian physician and anatomist: b. Verona in the 15th century; d. there, 1505. He lectured for some time at Rome, and became professor of medicine at Padua in 1495. His chief work is 'Anatomy of the Human Body' ('*Liber Anatomiae Corporis humani*'), published about 1490, a work remarkable for its keen insight and deductions confirmed by later discoveries in anatomy.

**ZERBONI DI SPOSETTI**, Joseph, German philosopher: b. Breslau, 1760; d. 1831. In 1796 he wrote to the governor of Silesia a letter in which he set forth the absurdity of granting to the nobility exalted privileges through

right of birth. Knowledge of the letter reaching Frederick William III, he was imprisoned for three years on a charge of high treason. When his case was brought to trial he was freed, with no political disability, and later received various official appointments.

**ZERBST**, tsërpst, Germany, a town in the duchy of Anhalt, on the Nuthe, a small tributary of the Elbe, 70 miles southwest of Berlin, and 27 miles southeast of Magdeburg, on the Dessau-Leipzig Railway. The chief buildings are the great Schloss in a fine park; the 15th century Nikolaikirche, and the stately 15th century Rathaus on the market place where are the Roland column (1445) and the Butterjungfer, a slender column bearing a female figure. The chief educational institution is the Francisceum, a gymnasium of high repute. The town has manufactures of noted bitter beer, of silks, plush, cloth, leather, machinery, musical instruments, etc. Zerbst was founded in 1007. From 1603 to 1793 it was the capital of a principality of the same name, which in 1797 was absorbed in Anhalt-Dessau. Pop. of commune about 19,210.

**ZERFFI, George Gustavus**, English author; b. Hungary, 1821; d. Chiswick, England, 28 Jan. 1892. He edited a newspaper at Budapest, and in 1848 served as a captain in the revolutionary army. He also acted for a time as Kossuth's private secretary. On the failure of the revolution in 1849 he went to England and was naturalized, and some years later was engaged as a lecturer in the department of art at South Kensington. Throughout his career Zerffi gave much attention to the subjects of decoration and history, and wrote many works treating these themes in a comprehensive manner. He asserted that history should be studied as a whole on philosophical principles. He planned a general work on these lines entitled 'Studies in the Science of General History,' of which two volumes were issued, dealing with ancient and mediæval history respectively. Among his other publications are 'A Manual of the Historical Development of Art, with Special Reference to Architecture, Sculpture, Painting and Ornament' (1876); an English version of Goethe's 'Faust' with critical and explanatory notes (1859); he also published a number of his lectures.

**ZERIBA, or ZAREEBA**, a temporary military enclosure, the sides of which are formed of prickly brush wood, sheltered by which a force may camp comparatively safe from sudden surprise. The term came into prominent use during the Anglo-Egyptian campaign of 1884. The protection is also used against wild animals.

**ZERMATT**, tsër-mät', or zër-mät' (formerly called **PRABORGNE**), Switzerland, a mountain village and tourist-resort in the canton of Valais, at the foot of the Matterhorn and near the head of the Visp Valley, 22½ miles by rail southwest of Visp. It stands 5,315 feet above sea-level, having to the south the great Théodule glacier, above which tower the Breithorn on the east, and beyond the Monte Rosa group, and on the west the rocky cone of the Matterhorn. An electric mountain railway connects with the Riffelberg and the sum-

mit of the Gornergrat (10,290 feet). The Théodule Pass or Matterjoch (10,899 feet) leads to Aosta in Italy. Its scenery compares in grandeur with that of Grindelwald and Chamoni. In the village churchyard are the graves of many victims of mountaineering. Pop. about 750.

**ZERO**, in *mathematics*, the absence of magnitude; the remainder that is obtained when any quantity is subtracted from itself; nothing, considered as a quantity; that which separates real positive quantities from real negative quantities. Zero is denoted by the symbol 0 ("cipher"), and this symbol itself is often called "zero." In the theory of functions, any value of a variable which reduces a given function of that variable to zero is called a "zero" of the given function. In infinitesimal analysis, infinitesimal quantities are sometimes called zeros. This usage is incorrect, and it leads to confusion of thought. An "infinitesimal" has an actual magnitude, and although that magnitude is smaller than any quantity that can be definitely stated or assigned, the fact that it exists distinguishes the infinitesimal from zero, properly so-called.

In physical measurement, the "zero" of any scale is the starting point from which measurements on that scale are reckoned. In thermometry (q.v.) it is customary to distinguish three different kinds of zeros. These are, respectively, (1) the arbitrary zero, (2) the "natural" zero and (3) the "absolute" zero. The arbitrary zero on such a scale is a zero that is selected arbitrarily, as a convenient point of reference; the selection being governed by practical considerations of convenience, or by the facility with which the point can be experimentally determined. (See THERMOMETER). The "natural" zero is employed chiefly in connection with the gas thermometer. In a gas thermometer in which the temperature is indicated by the expansion of a given volume of gas at constant pressure, the "natural" zero is the temperature at which the volume of the gas would just vanish, if the contraction of the gas were to follow, at very low temperatures, the law of variation with temperature that prevails between the freezing and boiling points of water. Similarly, in a gas thermometer in which temperature is measured by the change in pressure of a mass of gas that is confined at constant volume, the "natural" zero is the temperature at which the pressure of the gas would just vanish, if the law of variation of pressure were the same, at very low temperatures, as it is between the freezing and boiling points of water. The "natural" zeros of the various gas thermometers that are in actual use are not identical, but their positions differ only by a few degrees, at the most.

The "absolute" zero of temperature is the temperature that a body would have, if it were absolutely deprived of heat; and this "absolute" zero is identically the same for all substances. It happens that the "absolute" zero has nearly the same position on the thermometer scale as the "natural" zeros of the various gas thermometers that are in use, and this fact has led to a great deal of confusion in popular and scientific writings upon the subject of temperature, the "natural" and "absolute" zeros being

commonly confounded with one another. "absolute" zero is slightly lower than the "real" zero of any gas thermometer that we know of, with the possible exception of the "real" zero of the hydrogen thermometer. There is some reason for believing that the "real" zero of the normal hydrogen thermometer (whether at constant volume or at constant pressure) is a few hundredths of a degree lower than the true "absolute" zero. If further research bears out this opinion, then it is plain that the "natural" zero of the hydrogen thermometer can never be attained; for the "absolute" zero, being the temperature corresponding to absolute cold, is the lowest temperature that can possibly have any existence. On the absolute centigrade scale, the temperature of the "absolute" zero is approximately  $273.10^{\circ}$  below the freezing point of water. This estimate is probably in error by a few hundredths of a degree. There is no theoretical reason why the position of the "absolute" zero cannot be determined to the thousandth of a degree; but the experimental data required for such a determination are not yet available. See THERMODYNAMICS.

**ZERRAHN**, Carl, American musical conductor; b. Malchow, Mecklenburg, 28 July 1826; d. Boston, Mass., 29 Dec. 1909. In 1848 he came to America as flute-player with the German Orchestra, and six years later became conductor of the Handel and Haydn Society of Boston, a position he held for 42 years. He was conductor of the Harvard Symphony from 1861-82, and for several years was a successful director of famous musical festivals throughout New England, among them being at Worcester, Mass., which he conducted from 1866-97. He retired in 1898.

**ZERUBBABEL**, zĕ-rŭb'ă-bĕl, leader of the first and second of Israelitish exiles returning from Babylon. His name in the Captivity was Bazzar. He was the recognized prince of the Jews, son of Shealtiel, governor of Judah (Ezra i, 12, 14), and on arrival at Jerusalem, Jeshua, the high-priest, directed the rebuilding of the temple, and the celebration of public daily worship and of festival days. He died in the second month of the second year of the return, the reconstruction of the temple being completed in the seventh month. This last work was stopped by their enemies, and revived only after 16 years, when it was again undertaken and finally completed by Zerubbabel and Jeshua.

**ZETA**, zĕ'tă, (1) the Greek equivalent of the English letter Z, and sixth in the Greek alphabet. (2) a small closet or chamber; apply to some authorities to the room over the entrance of a Christian church, where were kept the vestments of the church and also contained the quarters of the sexton.

**ZETLAND ISLANDS**. See SHETLAND.

**ZEUGLON**, zŭ'glŏ-dŏn, a gigantic fossil cetacean mammal, found in the Eocene and Miocene strata of the southern United States and Europe, so named by Owen from the yoke-character displayed by a section of the lower jaw. Its remains were first discovered in 1841 in the Tertiary of Louisiana, and were first shown to belong to some reptile, to which Owen gave the name of *Basilosaurus*; but later research showed that it was a mammal, and belonged among cetaceans. A few years later a

German collector named Koch collected great quantities of the bones and stringing them together in some semblance of a natural skeleton, constructed a "sea-serpent," mostly neck and tail, no less than 114 feet long, which was exhibited widely in America and Europe, and required the exertions of eminent men (for example, Wyman, 'Proc. Boston Soc. Nat. Hist.', November 1845) to expose as a humbug. The form was probably cetacean, though slender, elongated and more snake-like, with small anterior limbs in the shape of paddles, and no hind limbs; the length about 70 feet; the skin was supplied with an armor consisting of small irregular bony plates more or less fused together. The skull in some specimens was nearly a yard in length. It is well constructed, the blow-hole in the middle of the face, and the brain-cavity. The teeth are limited in number and disposed in three series as incisors, canines and molars; the molars are double-rooted, and have serrated crowns. Much discussion has occurred as to the affinities of this great sea-beast, whose characters are so generalized, and period of existence so early that it is now agreed to be a representative of the most primitive *Cetacea*, and is set apart as a family, *Zeuglodontida* constituting a primitive order *Archæoceti*. Consult Woodward, 'Vertebrate Palæontology' (New York 1898); Zittel-Eastman, 'Text-Book of Palæontology' (Part III); Lucas, F. A., 'Animals in the Past' (1901), and 'The Pelvic Girdle of the Zeuglodon' (1901).

**ZEUGMA**, zŭg'mă, the connection of one word with two words or with two clauses, to both of which it does not equally apply; so that, for one of them, another word (to be gathered from the sense of the passage) must be mentally supplied. Zeugma is, therefore, a species of ellipsis; both abbreviate discourse. Where the word to be supplied is a form of another in the sentence, as 'I love you, and you [love] me,' the construction is elliptical; where the sense requires a different word, as 'The sun shall not smite thee by day, nor the moon [injure thee] by night' (Ps. cxxi, 6) (Prayer Book), it is zeugma.

**ZEUNERITE**, a hydrous copper-uranium arsenate,  $\text{Cu}(\text{UO}_2)_2\text{As}_2\text{O}_7 \cdot \text{H}_2\text{O}$ . Minute yellowish-green crystals with barite in ores of the Tintic district, Utah. A possible source of uranium.

**ZEUS**, zŭs (Greek Ζεύς), in Greek mythology, the chief of the gods. He was the son of Cronus and Rhæa. According to the myth Cronus was in the habit of swallowing his children immediately after their birth. When Zeus was about to be born Rhæa consulted Uranus and Gæa as to how he might be saved, and they sent her to Crete (the Trojan Ida and other places are mentioned in other accounts) to be delivered. She concealed Zeus in a cave in Mount Ida, and gave Cronus a stone wrapped up in a cloth to swallow. The infant Zeus was tended by the nymphs Ida and Adrastea. He was supplied with milk by the goat Amalthea, and the bees gathered honey for him. When he had reached manhood, by the aid of Gæa or Metis he persuaded his father to restore to the light the children he had swallowed. Zeus now united with his brothers to dethrone his father. This led to a war with the Titans, a struggle

not terminated until Zeus delivered the Cyclopes, sons of Uranus and Gæa, who had been bound by Cronus, and who in return provided him with thunder and lightning, and also liberated the hundred-handed beings Briareus, Cottus and Gyes, who likewise lent him their aid. Having vanquished the Titans, the other children of Uranus and Gæa, he shut them up in Tartarus. Tartarus and Gæa now begot another monster, Typhœus, who engaged in a fearful struggle with Zeus, but was finally vanquished by a thunderbolt. Zeus now obtained the dominion of the world, which he divided by lot with his brothers Poseidon (Neptune), who obtained the sea, and Hades (Pluto), who received the lower world. Zeus retained for himself the heavens and the upper regions, while the earth was held as common property. Another dreadful war was now waged against the Olympian gods by the giants sprung from the blood of Uranus. In this struggle the gods were assisted by Athene, Apollo, Heracles and other children of Zeus, and the giants were completely vanquished. Zeus had three sisters and three brothers, Hestia (Vesta), Demeter (Ceres) and Hera (Juno). He first married Metis, a daughter of Oceanus and Tethys; but as Fate had prophesied that she should bear a son who should rule the world, Zeus swallowed her when she was with child, and Athene subsequently sprang from his head. As his second wife he took, for a time, Themis, daughter of Uranus and Gæa, but his final and best-beloved consort was his sister Hera, by whom he had Hebe, Ares and Hephæstus. Zeus was regarded at the height of the organization of the Roman pantheon, as the founder of law, order and authority, the avenger of wrongs, the punisher of crime, the rewarder of good actions, the source of prophetic power, the author of all good things and the omnipotent, all-wise and benevolent ruler of the universe. He was especially looked upon as the controller of all the phenomena of the heavens, and was constantly spoken of as the "Cloud-gatherer" or the "Thunderer." Notwithstanding his general character of wisdom and benevolence, his conduct was anything but immaculate. The incongruity struck some of the ancients themselves, and led to protest against such stories being believed. There appear to have been various local gods of the same name, with various attributes and legendary histories, who were finally merged in the national Hellenic Zeus. Traces of the original traditions, however, remained in the local rites of particular places. An Arcadian and a Cretan Zeus are particularly distinguished. The former had a temple at Mount Lycæus, so sacred that if any one entered it he died within 12 months, while intentional trespassers were stoned to death. In Crete there were many places sacred to Zeus, who had passed his early life there, particularly Mount Ida and the district around it. Zeus, according to tradition, also landed on the island at Gortyn in the shape of a bull, when he carried off Europa, and was worshipped there by the surname of Hecatombæus. The national god was worshipped by sacrifices of bulls, cows and goats. Two of the principal localities where his worship was carried on in Greece were Athens and Olympia. At the latter place the Olympic games, the most splendid

festival in Greece, were held in his honor (See OLYMPIC GAMES). Here there was a magnificent temple and a gold and ivory statue of the god, the work of Phidias, and reckoned one of the seven wonders of the world. In representations of Zeus his attributes are the eagle, the sceptre and the thunderbolt. See ROMAN RELIGION. Consult Preller-Robert, 'Griechische Mythologie' (1887).

**ZEUSS**, tsois, Johann Kaspar, German philologist and historical scholar: b. Vogtendorf, near Kronach, in Upper Franconia, 22 July 1806; d. there, 10 Nov. 1856. He was educated in Munich, and became professor of history in the lycée at Bamberg, Upper Franconia. He wrote several valuable books—'Die Deutschen und die Nachbarstämme' (1837); 'Die Herkunft der Bayern von den Markomannen' (1839); 'Traditiones Possessionesque Witzenburgenses' (1842); 'Die Freie Reichstadt Speier vor ihrer Zerstörung' (1843). But his greatest work was 'Grammatica Celtica' (1853; 2d ed., by Ebel, 1868-71), a pattern of scholarship and thorough method, in which he really founded the science of Celtic philology. Consult Kuhn, E., 'Johann Kaspar Zeuss' (1906).

**ZEUXIPPUS**, zük-síp'üs, one of the eight successors of Ænesidemus (q.v.) in the last school of Greek skeptics. Of him, as of all the others with the exception of Sextus Empiricus (q.v.), nothing further is known. Consult Zeller, E., 'Outlines of the History of Greek Philosophy' (trans. Alleyne and Abbott, 1886).

**ZEUXIS**, zük'sis (Greek Ζεύξιος), ancient Greek painter. He was a native of Heraclea, but which town of that name was his birthplace is not certain. He was born about the middle of the 5th century before Christ, and flourished about the end of the 4th century ac. He is said by some authorities to have studied under Demophilus of Himera, by others under Neseas of Thasos. He also studied at Ephesus, where he eventually settled, although he worked at times at Athens and other cities. Aristotle says that an elevated conception of character was wanting in his work, while Cicero praises him along with Polygnotus and Timanthes for *forma et lineamenta*. He learned from Apollodorus the treatment of light and shade, which he greatly developed, and from Phidias to take Homer's descriptions of his heroes as ideal models and to paint them with limbs larger than the ordinary human proportion. One of his most famous works was a picture of Helen for the temple of Hera at Croton. The rivalry of Zeuxis and Parrhasius is represented in a well-known story about a contest in which Zeuxis painted grapes at which the birds pecked, and Parrhasius a curtain which Zeuxis wished to have raised in order to see the picture. Some of his later works he gave away as being valuable beyond any fixed price. As far as may be judged from extant accounts, he painted small works on panels in contrast to the large mural paintings of Polygnotus. It is, of course, now impossible to form a correct idea of his art, though more anecdotes are told of him than of any other painter of antiquity. These are to be found in Lucian, Cicero, and especially the 'Historia Naturalis' of Pliny. Among his other works were 'Zeus on His Throne Sur-

led by Deities'; 'Eros Crowned with Centaur Family'; 'The Infant Her-Strangling the Serpent'; 'Penelope'; 'Claus Weeping'; 'Boy with Grapes.'

**ZEVECOT**, zāv-kō, **Jacques** (ZEVECOTIUS), poet: b. Ghent, 14 Jan. 1596; d. Harderwijk 17 March 1642. For a time he was a friar, but subsequently he became a friar of the order of Saint Augustine, and wrote Latin which made him widely and favorably known. He visited Rome in 1624 and declined offers of preferment from Pope Urban VIII. In 1625 he made open profession of Protestantism, and later was appointed professor of history and eloquence in the University of Harderwijk (Gelderland). Certainly in the Netherlands, if not beyond, he was considered the best Latin poet of his time. The edition of his verse is 'Jacobi Zevecotii Opera Editio Ultima' (1740).

**ZYER**, tsi'ér, **Jules**, Czech author: b. Prague, 26 April 1841; d. 29 Jan. 1901. After studying in France, Germany, Italy, Greece and Austria, he became an instructor in the last, and published a number of volumes highly valued in literature. In prose these include 'The Life of Xavier' and 'Andrew Cernysev,' the latter of which is that of Catharine II; in verse 'Vysehrad,' a series of epic poems, the majority of which are derived from the early history of Bohemia.

**ZSCHWITZ**, tsëtsh'vish, **Gerhard von**, Lutheran theologian: b. Bautzen, Saxony, 2 July 1825; d. Erlangen, 20 July 1886. He studied in the University of Leipzig, he became pastor at Grosszschocher, near Leipzig, and subsequently passed from a lectureship in the University to an extraordinary professorship here. Still later he held chairs in Giessen, 1865, and in Erlangen from 1866. He has been an authority in the department of practical theology. A full list of his volumes cannot be given here; but they number such solid contributions as 'System der Christlichen Katechetik' (1863-72; 2d ed. of II, 1872-74); 'System der Praktischen Theologie' (1876-78), and 'Die Christenlehre im Zusammenhang' (2d ed., 1883-86). 'Con-Zur Erinnerung an Gerhard von Zeschwitz' (1886).

**ZITLOVOSKY**, Chaim, Jewish writer and Communist: b. Vitebsk, Russia, 1865. He is well known as a writer in Yiddish before he came to New York in 1907, and in 1909 he published there the *Das Neue Leben*. He was one of the early advocates of Jewish nationalism and was one of the founders of the Jewish Socialist Labor Party. His books include 'The Rights on the Historical Fate of Judaism'; 'Socialism and Nationalism' (1907); 'The Philosophy of What It Is and How It Develops' (1910), etc. A collected edition of his works was published (4 vols., 1912).

**ZHOB**, zhōb, Northwest India, a river of the British Baluchistan, which joins the northwest of the Suliman Mountains, into which it flows into the Indus near Dera Iskan. The Gomul and the Zhob valleys, the latter of which was first known to Europeans about 1884, and with Gomul Pass was annexed by Great Britain in 1889 — are passes of Baluchistan of strategical value, as they

form the most direct route between the northwest frontier province and Quetta, and cut off the Pathan tribes of Baluchistan from Afghanistan.

**ZHUKOVSKIĪ**, zhoo-kōf'skī-i, **Vasilii Andreevich**, Russian poet: b. near Byelev, government of Tula, Russia, 29 Jan. 1783; d. 12 April 1852. He served in the campaign of 1812 against Napoleon, later settled in Dorpat, in 1816 obtained an imperial pension and in 1826 became tutor to the tsarevitch, later Alexander II. His most important service to Russian literature is to be found in his translations of the poems of Byron, Gray, Moore, Scott, Goethe, Schiller, Rucker and others; 'Don Quixote'; the 'Odyssey' and various further foreign classics. Among his original verses, 'Liudmilla,' an imitation of Bürger's 'Lenore,' and 'The Minstrel in the Russian Camp' were the most successful. Examples of them were turned into English verse in Bowring's 'Specimens of the Russian Poets' (1821-23).

**ZICHY**, Géza, **COUNT VON Vásonykeő**, Hungarian pianist and composer: b. Sztára, 23 July 1849. He lost his right arm at the age of 16, but under the tutelage of Liszt gained a mastery of the piano which created a sensation when he made his début in 1878, his work comparing favorably with that of other artists despite his single hand. His public appearances have been made solely for charity, for which he has raised huge sums. Since the European War he has added to his activities by giving recitals for the maimed in order to prove what can be accomplished by them. He is president of the Hungarian National Conservatory and since 1891 has been intendant of the Royal Opera House and the National Theatre of Budapest. He has written several choral works, piano pieces for the left hand, songs and the operas 'Alár' (1896); 'Meister Roland' (1897).

**ZIEGENBALG**, tsé'gën-bäl-g, **Bartholomäus**, German missionary: b. Pulsnitz (Saxony), 24 June 1683; d. Tranquebar (Coromandel Coast), 6 March 1719. He obtained a university training at Halle and in 1705 sailed from Copenhagen for Tranquebar in response to the call of Frederick IV of Denmark for missionaries to the Danish possessions in India. He compiled a grammar of Tamil and two lexicons and translated the New Testament and the Pentateuch. His labors were effective despite much opposition. He was the first Protestant missionary to India. Consult Germann, 'Ziegenbald und Plutzschau' (1868); and Plitt, 'Kurze Geschichte der Lutherischen Mission' (1871).

**ZIEGLER**, tség'lér, **Friedrich Wilhelm**, German actor and dramatist: b. Brunswick, 1750; d. Pressburg, 21 or 24 Sept. 1827. He first appeared in 1784 at Vienna, and from that time until his retirement in 1822 he was connected with the Court Theatre there, becoming one of the foremost actors of his day. Of his many dramatic works, the comedy 'Die Temperamente' and the drama 'Parteiwuth' were among those of less ephemeral value.

**ZIEGLER**, Karl, Austrian poet: b. Saint Martin, Upper Austria, 12 April 1812; d. Vienna, 20 May 1877. He studied at the University of Vienna, was in the government service

from 1835 until his retirement in 1857 and subsequently devoted himself to literature. He contributed largely to the literary periodicals and "annuals" of the time, and under his pseudonym of "Carlopagio" published a collection of 'Gedichte' in 1843. His other volumes were 'Himmel und Erde' (1856); 'Oden' (1866) and 'Vom Kothurn der Lyrik' (1869). His verse is simple and original in quality and was once extremely popular, especially in literary circles.

**ZIEGLER, Theobald**, German philosopher: b. Göppingen, Württemberg, 9 Feb. 1846. He studied at Tübingen, from 1871 was an instructor in various gymnasia, in 1884 was appointed lecturer on philosophy and pedagogy in the University of Strassburg and in 1886 professor there. He retired in 1911. His 'Sittliches Sein und Sittliches Werden' (2d ed., 1890; English, 1892) was a substantial enrichment of the literature of moral philosophy, and the 'Geschichte der Ethik' (2d ed., 1892) is also a work of importance. His further volumes include 'Religion und Religionen' (1893); and 'Fr. Th. Vischer' (1893); 'David Friedrich Strauss' (2 vols., 1908); 'Menschen und Probleme' (1914); 'Der Krieg als Erzieher' (1914); 'Das öffentliche Leben' (1914), etc.

**ZIEGLER, William**, American capitalist: b. Beaver County, Pa., 1 Sept. 1843; d. Stamford, Conn., 24 May 1905. He at first entered the printers' trade and in 1868 the bakers' and confectioners' supplies business. In 1870 he organized the Royal Chemical Company, which he developed into the Royal Baking Powder Company, retiring from active business in 1886. He also operated largely in real estate. He fitted out the Ziegler expedition to explore the Arctic by way of Franz Josef Land, and, if possible, reach the North Pole. The expedition, Commander Fiala, left Vardö, Norway, 10 July 1903, and was not heard from thereafter.

**ZIEGLER UND KLIPPHAUSEN**, oont klip'howzèn, **Heinrich Anselm von**, German poet: b. Radmeritz, Upper Lusatia, 6 Jan. 1663; d. Liebertwolkwitz, near Leipzig, 8 Sept. 1696. He was educated at Frankfort-on-the-Oder and lived as a landed proprietor. His chief work is 'Asiatische Banise, oder Blutiges doch Mutiges Pegu' (1688), which continued to appear in successive editions as late as 1764. It was reprinted, under Felix Bober-tag's supervision, from the third edition (1707), in Vol. XXXVII of Kürschner's 'Deutsche Nationalliteratur.' The work is done in a turgid style, but met in its day a great success and had in Germany considerable literary influence. Its author's further writings are of less significance.

**ZIEM, zēm, Félix**, French artist: b. Beaune (Côte d'Or), 25 Feb. 1821; d. Paris, 10 Nov. 1911. He studied in the art school of Dijon, traveled in southern France, Italy and the Orient, obtained a third-class medal at the Salon of 1851, a first-class in 1852 and became well known for his landscapes, particularly for scenes of Venice. Among his many canvases are 'View of Venice' (1852; Luxembourg); 'The Bank of the Amstel' (Bordeaux Museum); 'Quai Saint-Jean at Marseilles' (Marseilles Museum); 'The Doge's Palace' (Ravené Gallery, Berlin) and several in private collections in the United States.

**ZIERIKSEE, zé'rik-zá**, Netherlands, a town in the province of Zeeland, on the south side and the chief town of the island of Schouwen, three miles from the Ooster Schelde, with which it is connected by two canal harbors, and 38 miles northwest of Antwerp. It has six churches, a fine townhouse dating from the 15th century and a gymnasium; manufactures madder, carries on brewing and oyster fishing and has considerable trade and shipping. It is the oldest town of Zeeland and was formerly an important Hanse town. Its demolished walls are now replaced by promenades. Pop. 6,813.

**ZIETHEN, tsé'tèn, or ZIETEN, Hans Joachim von**, German general: b. Wustrau, near Neu-Ruppin, Brandenburg, 14 May 1699; d. Berlin, 26 Jan. 1786. He entered the Prussian army in 1714, distinguished himself as a colonel in the Silesian campaign of 1742, as a major-general in that of 1745, and in May 1745 made his celebrated march through the enemy's country in Upper Silesia, in order to communicate with the Margrave Karl at Jägerndorf. In 1756 he was made lieutenant-general. He obtained his chief renown in the Seven Years' War, winning the victories of Reichenberg, Prague and Leuthen, and deciding the day at Torgau by storming the heights of Süptitz. He was promoted general of cavalry and was the most famous of the commanders of Frederick the Great. To the development of the light cavalry service he made important contributions. Consult the biographies by Com: zur Lippe-Weissenfeld (2d ed., 1885) and by Winter (1886).

**ZIF, ZIV, ZIPH, IYAR, or IYYAR**, is the Hebrew calendar, the second month of the year, always of 29 days. It falls between 10 April and 8 June.

**ZIHLMAN, Frederick Nicholas**, American legislator, son of Nicholas Zihlman, a Swiss glassworker who came to the United States in 1870: b. Carnegie, Pa., 2 Oct. 1879. The family removed to Cumberland, Md. three years later. Mr. Zihlman was educated in the public schools. At the age of 11 years he began working in a glass factory and subsequently became a journeyman; he was president of local Flint Glass Workers 1904-09; national delegate 1904-08; member of the National Executive Board 1905-06; and president of the Allegany Trades Council 1904-09; and president of the Maryland State Federation of Labor 1906-07. He continued working at the glass trade until 1912, when he entered the real estate firm of Cowden and Zihlman, in which business he is still engaged. He was elected State senator for Allegany County, Md., in 1909, and was re-elected in 1913, serving until 1917, when he resigned to take his seat in the Sixty-fifth Congress. He was minority leader in the Maryland State senate in 1914-16. He was re-elected member of the Sixty-sixth Congress. Mr. Zihlman is the author of the first compulsory Workman's Compensation Law in operation in the United States. In 1907 he married Margaret Clara, daughter of Charles J. Dahl of Cumberland, Md.

**ZILLEH, zél-lé', or ZILE (anc. Zris)**, Asiatic Turkey, a town in the vilayet of Siraz 25 miles south of Amasia. It is built on a hill, the mound of Semiramis mentioned by Strabo: a modern castle occupies the site of an old

Byzantine fortress. Ancient Zela was a theocracy ruled by the priests of the temple of Anaitis. Here Mithridates won a victory over the Romans 67 B.C., and it was also the scene of Cæsar's victory over Pharnaces, 47 B.C., concerning which Cæsar wrote "*Veni, vidi, vici.*" Pop. 20,000.

**ZILLER**, tsil'lër, **Tuisken**, German educator: b. Wasungen, Saxe-Meiningen, 22 Dec. 1817; d. Leipzig, 20 April 1882. He was educated at Leipzig, where he was at first a lecturer in jurisprudence, but in 1854 became professor of philosophy and pedagogy. At his initiative the Verein für Wissenschaftliche Pädagogik was founded. Among his books are 'Einleitung in die Allgemeine Pädagogik' (1856; 2d ed., 1901) and 'Allgemeine Philosophische Ethik' (1880; 2d ed., 1886).

**ZILLERTHAL**, tsil'lër-täl, Austria, a valley of the Tyrol in the eastern Alps, about 25 miles below Innsbruck, famous for its scenic beauties. It is traversed by the Ziller, which joins the Inn River at the mouth of the valley. It is much frequented by tourists, a railway line connecting with Mairhofen in the valley.

**ZIMBABWE**, zëm-bäb'wä, or **ZIMBABYE** (Bantu for "here is a great kraal"), a name applied to numerous interesting South African ruins in Rhodesia and the Transvaal. They were discovered by Adam Benders in 1868. The best known and most important is the Great Zimbabwe, near the Sabi River, about 17 miles from Victoria in southern Rhodesia. There are two principal structures at Great Zimbabwe, one on the crest of a granite hill breaking down precipitously to the south, and the other on the level ground about a third of a mile to the south. The lower one is roughly circular or elliptical, enclosed by a wall of 30 or 40 feet high, 14 feet thick at the base, and from six to nine feet thick at the summit. The wall is composed of well-trimmed blocks of granite fitted together without mortar in regular courses and occasionally set angularly for ornamental purposes. An inner wall runs close to the outer for a considerable distance, forming a passage which leads to a sacred enclosure containing two conical solid towers, the larger of which is some 40 feet high. The rest of the enclosure is divided into irregular unroofed chambers. The building on the hill is very strongly built for defense and also contains a sacred enclosure. Emblems, believed by some to be phallic, many curious objects in soapstone, and undoubted remains of gold-working utensils have been found in the Zimbabwe. The nearest gold deposits and ancient gold workings are, however, some miles distant. Some theorists would locate here the Ophir of Solomon. It is also suggested that the lower building was a kind of town occupied by pre-Mohammedan Arabs who came here in search of gold, and that the ruin on the hill was a stronghold for defense. The signs of orientation reported by earlier visitors were disproved by scientific investigators who explored the ruins in 1905. The theories of Bent are now definitely discarded. Consult Randall-MacIver, D., 'Mediæval Rhodesia' (1906); for illustrations Bent, J. T., 'The Ruined Cities of Mashonaland' (1892); and Hall and Neal, 'The Ancient Ruins of Rhodesia' (1902).

**ZIMMERMAN**, Eugene ("Zim"), American caricaturist and illustrator: b. Basel, Switzerland, 25 May 1862. After a public school education in Paterson, N. J., and some time in various employments, he turned his attention to comic art, was on the staff of *Puck* illustrators in 1882-85, and in 1885 became connected with *Judge*. He also did illustrations for some of the works of J. W. Riley ("Bill Nye") and others. He conducted *Zim's* Correspondence School of Cartooning, Comic Art and Caricature. Author of 'This and That About Caricature' (1892-93).

**ZIMMERMAN**, Jeremiah, American clergyman, author, educator and numismatist: b. Snydersburg, Md., 26 April 1848. Graduated from Pennsylvania College, Gettysburg, in 1873, and the theological seminary there in 1876, he was pastor of the Lutheran Church at Valatie, N. Y., in 1877-78, and in 1879 organized at Syracuse, N. Y., the First English Lutheran Church, of which he was pastor until 1904. He then resigned to engage in foreign travel and literature, specializing on the Far East, archæology and history. He is also regarded as an authority on the historical branch of numismatics, and has been professor of numismatics at Syracuse University since 1912. Author of 'Spain and her People' (1902); 'The Religious Character of Ancient Coins'; 'The God Jugger-naut and Hinduism in India' (1914), etc.

**ZIMMERMANN**, tsim'mër-män, **Albert**, German painter: b. Zittau, Saxony, 20 Sept. 1809; d. Munich, 18 Oct. 1888. He studied in Dresden and Munich and was made professor in the Milan Academy in 1857 and at the Vienna Academy in 1859. His works display admirable characterizations of mountainous scenery and excellent light-effects, and are represented in the museums at Leipzig, Munich, Stuttgart, Hanover, Dresden, Frankfurt and in the R. L. Stuart Collection (New York Public Library). Among them are 'Rocky Landscape with Centaurs and Leopards'; 'Chiem Lake in Storm'; 'The High Göll'; 'Sunset on Hintersee'; and 'Lake Como.'

**ZIMMERMANN**, Johann Georg, **RITTER** von, Swiss philosopher and writer: b. at Brugg, canton of Aargau (then in Bern), 8 Dec. 1728; d. Hanover, 7 Oct. 1795. He studied medicine under Haller at Göttingen, and in 1754 was appointed public physician to his native town. He employed his leisure in the publication of pieces in prose and verse, including the first sketch of his popular work 'Ueber die Einsamkeit' (On Solitude, 1756; completely rewritten 1784-85). This was followed by his essay 'Vom Nationalstolz' (On National Pride 1758). In 1763 he composed his work 'Von der Erfahrung in der Arzneykunst' (1764), which he followed up by several other professional treatises; in consequence of which he received an offer of the post of physician to the king of England for Hanover, which he accepted, and removed in 1768 to that capital. In 1786 he attended Frederick the Great in his last illness, which afforded little room for medical skill, but enabled him to publish an account of his conversations with that celebrated sovereign, 'Ueber Friedrich den Grossen und meine Unterredung mit ihm' (1788), and 'Fragmente über Friedrich den Grossen' (1789), works of little value. His 'Solitude' was at one time very popular, and

was translated into almost every language of Europe. Consult the studies by Bodemann (1878) and Ischer (1893).

**ZIMMERMANN, Wilhelm**, German poet and historian: b. Stuttgart, 2 Jan. 1807; d. Mergentheim, Württemberg, 22 Sept. 1878. After study at Tübingen, he was connected with various journals at Stuttgart, from 1847 to 1850 was professor of history and of German language and literature in the Polytechnic Institute there, but lost the post through his liberal attitude as a member of the German National Assembly (1848) and the Württemberg Parliament. Subsequently he was pastor of Evangelical churches at Leonbronn, Schnaitheim and Owen. He is best known for his 'Gedichte' (1832; 2d ed., 1839; 3d ed., 1854), which reveal the influence of Schiller and Uhland, but are never merely imitative. Others of his publications are 'Befreiungskämpfe der Deutschen gegen Napoleon' (1836; 3d ed., 1859); 'Geschichte des Grossen Bauernkriegs' (3 vols., 1841-43; 3d ed., 1891), etc.

**ZIMMERN, Helen**, English author: b. Hamburg, Germany, 25 March 1846. She was taken to England when an infant and was naturalized as a British subject upon coming of age. After a secondary education at Bayswater, she became a contributor to *Once a Week*, *Old Merry's Monthly*, the *Press*, the *Examiner* and other periodicals, and in 1876 achieved a success with 'Schopenhauer, his Life and Philosophy.' From 1887 she has resided at Florence, Italy, where she corresponds for Italian, English and American periodicals. She has also lectured in Italy, England and Germany on Italian art. Among her further publications are 'Gotthold Ephraim Lessing, his Life and his Works' (1878); 'The Epic of Kings' (1882), a paraphrase from Firdusi; a 'Life of Maria Edgeworth' (1883); 'The Hansa Towns' (1889); 'Italy of the Italians' (1906); 'Tripoli and Young Italy' (1912); 'Italian Leaders of Today' (1915); 'New Italy' (1918), etc. She also translated from Nietzsche, and Lessing's prose; edited the comedies of Goldoni (1892); was joint translator of Ferrero's essays as 'Europe's Fateful Hour' (1918), and translated Enrico Cattsellani's 'Italy and Austria at War' (1918).

**ZIMRI**, zim'ri, in the satire 'Absalom and Achitophel' (pt. i, 1681; pt. ii, 1682) by John Dryden (q.v.), a character representing Villiers, Duke of Buckingham:

Some of the chiefs were princes in the land:  
In the front rank of these did Imri stand, etc.  
(Pt. i, 545 et seq.)

Buckingham was depicted as a factional leader, like Zimri who conspired against Asa, king of Judah (1 Kings xvi, 9).

**ZINC**. Zinc cast into slabs as it comes from the furnace is commercially known as spelter, but zinc recast into forms such as are used in galvanic batteries is known as battery zinc, and zinc rolled into sheets is known as sheet zinc. There is a growing movement, fostered by the American Zinc Institute, to avoid confusion by abandoning the use of the word spelter.

**Properties**. Zinc is a bluish-white metal with a bright metallic lustre, an atomic weight of 65.37, a density of about seven, and a hard-

ness, when cast, of 38 in the Brinell scale, as compared to a hardness of 40 for copper and 28 for silver. Both density and hardness are slightly increased by rolling. It is so hard that it can be filed with difficulty, and in a large mass it can be broken only with considerable force. Its texture as shown on a broken surface is prismatic crystalline, the crystals being six-sided and belonging to the hexagonal system. At different temperatures zinc has different properties. At ordinary temperatures it is fairly brittle, but at 100°-150°C. it can be rolled out into sheets or drawn into wire, though above 200° C. it becomes brittle again. It melts at 419.4° C. and boils at 920° C., the vapor burning in air with a characteristic brilliant bluish-green flame to zinc oxide, formerly known as "philosopher's wool" or "flowers of zinc." Zinc is not affected by dry air or by oxygen at ordinary temperatures, but under moist atmospheric conditions the surface becomes covered with a coating of grayish-white basic carbonate of zinc, which protects the metal from further corrosion. The industrial value of zinc for use as a protective coating for iron and steel and for use in exposed positions is due largely to this property.

**Uses**.—Zinc is used in metallic form in galvanizing iron and steel, in making sheet zinc, and in making brass and some other alloys. Iron and steel may be galvanized in several ways—by dipping the articles in a bath of molten zinc; by heating them to 425°-450° C. in a drum filled with zinc dust, a process known as "sherardizing," in which they are coated with zinc by the zinc vapor given off from the zinc dust; and by electroplating them with zinc. As only the last method employs the galvanic current, the others are mis-called "galvanizing," and an article protected by a coat of zinc would better be called "zinc-coated." In normal times about 60 per cent of the zinc output of the country is used in zinc-coating iron and steel. Metallic zinc may be rolled in plates an inch or so thick—"boiler plates," which, suspended in boilers, preserve them from the corrosion of sea water—or in thinner sheets for roofing, shingles, gutters, spouts, household utensils, zincographer's plates, dry batteries, buttons, shoe-lace tips, etc. Much sheet zinc was used during the European War to line packing cases filled with munitions and machined parts which needed protection from the sea air. Metallic zinc is alloyed with copper to form brass, some "bronzes" and other alloys. In normal times only about 20 per cent of the total consumption is used in making brass, but during the European War the greater part of the metallic zinc produced in the country was used for that purpose. A considerable quantity of metallic zinc is used annually in desilverizing lead by the Parkes process.

Zinc oxide is made under the French process by burning metallic zinc in an oxidizing atmosphere, and under the American process by burning oxidized or desulphurized zinc ores mixed with ground coal in an oxidizing atmosphere. The purity of the product depends on the purity of the metal and the ore. Chemically pure zinc oxide is used in pharmaceutical preparations. Zinc oxide of good grades free from lead is also used largely in making rubber, to increase its tensile strength, toughness &

and increase its wear-resisting properties. Zinc oxide of both good and common grades is used as a pigment in making paints. American process oxide, in which there is a considerable percentage of lead, i.e., leaded zinc oxide, is also used for pigment, as a combination of lead and zinc is held to be desirable in a paint.

Zinc dust, which consists of minute droplets of metallic zinc coated with a film of zinc oxide, is formed in the distillation of zinc, or is specially prepared. It is a very active chemical agent and is used to discharge the color of the pattern in calico printing. It is also used to precipitate gold in the cyanide process of gold recovery and to precipitate other metals and purify the solution in making lithopone and in the electrolytic deposition of zinc. Another use is in sherardizing as mentioned above. Lithopone, a chemical combination of zinc sulphide and barium sulphate, is a white pigment used for interior paints and forms the base of most white enamels. Several salts of zinc are employed in medicine and the arts. Zinc acetate and zinc sulphate are used in medicine as an emetic, astringent and antiseptic. They are used as a mordant in dyeing, and are also useful in wood preservation, but the chloride is generally employed for that purpose, as in the Burnett process. Zinc chloride is used as a caustic agent in the treatment of certain diseases, as a general disinfectant and preservative, and as a flux in soldering. Zinc sulphate is used in bleaching paper and as a dryer in varnishes and in fireproofing paints.

**Sources.**—The chief zinc minerals are zinc sulphide, sphalerite (zinc blende or "black jack"); zinc carbonates, smithsonite (calamine in Europe) and hydrozincite; zinc silicates, calamine (smithsonite in Europe) and willemitte; zinc oxide, zincite ("red zinc ore"); and zinc-iron-manganese oxide, franklinite. The three minerals last named form the ore at Franklin Furnace mines, in New Jersey, where they occur more plentifully than anywhere else in the world. Zinc blende is the most common ore of zinc. It usually occurs as a complex ore in association with galena and with pyrite and other metallic sulphides, but in the Mascot mines of eastern Tennessee it is unassociated with either lead or iron. The upper parts of sulphide deposits containing zinc have usually been altered by oxidation, and the zinc minerals changed to the silicate and carbonate. The principal zinc-producing region in the United States is the Joplin district, comprising southwestern Missouri, southeastern Kansas and northeastern Oklahoma, which in 1917 produced ores containing 238,676 short tons of recoverable zinc, about 34 per cent of the total production of the country. The Franklin Furnace mines produced 119,736 tons of recoverable zinc, or 17 per cent of the total, the Butte district of Montana produced 90,145 tons, or 13 per cent, and the upper Mississippi Valley district of Wisconsin, Illinois and Iowa produced 64,027 tons, or 9 per cent. Other important zinc districts are the Cœur d'Alene district of Idaho, the Leadville district of Colorado, the east Tennessee district and the Yellow Pine district of Nevada. The total recoverable zinc content of zinc ores mined in the country in 1917 was 710,972 short tons, a large increase in response to the demands of the

war, from an average of 400,000 tons in the years immediately before the war.

Canada and Mexico are well supplied with reserves of zinc ores and have exported large quantities into the United States in past years. During the early years of the European War large imports of zinc concentrates were brought to the United States from Australia, where the extensive deposits of lead-zinc ores of the Broken Hill lode of New South Wales have been for years the main foreign dependence of the zinc smelters of Belgium, Germany and France. The zinc deposits of Rhodesia Broken Hill in Africa are extensive, and there are many deposits in Algeria and Tunis. The Bawdwin deposits of India are reckoned among the largest in the world, as are also those of the Ridder and adjoining concessions in the Irtysh region of southwestern Siberia. The chief zinc-producing regions of Europe are the Upper Silesia district, formerly a part of Prussia; the Rhine district of Germany; the island of Sardinia in Italy, and the Santander and Cartagena districts of Spain.

Before the complex ores, sulphides of zinc, lead, copper and other metals—the refractory ores of the metallurgist—are treated in the usual practice by smelting in the blast furnace, the zinc minerals must be separated from the others because zinc interferes so greatly with the reduction of the other minerals that a "fine" or "penalty" is placed by the smelter on ores containing zinc above a fixed limit, depending on circumstances. Moreover, the zinc is lost. Hence practically all zinc-bearing ores are subjected to milling, in which the zinc minerals are separated from the others and all are concentrated to workable richness. In the Joplin region ore of lower metallic content than anywhere else in the world is profitably mined. In one type of deposits, the "sheet ground," the ore mined in 1916-17 averaged 1.3 per cent of zinc and .03 per cent of lead, as shown by the metal content of the concentrates. The zinc concentrates average from 58 to 59 per cent of zinc. In the Broken Hill district of New South Wales in early years the zinc was separated as middlings and accumulated in huge stacks. By the flotation process, perfected in that region since 1903, the sulphide minerals are floated off in a froth while the gangue minerals sink to the bottom. The stocks of zincky middlings thus became available and have furnished the bulk of Broken Hill's large annual output of zinc concentrates in recent years. The flotation process has likewise made available large reserves of lead-zinc ores previously unworkable in various parts of the world.

**Zinc Smelting.**—The origin of the art of smelting is lost in the mists of antiquity. Brass was an article of commerce with the Orient from the earliest days of which there is record, but brass can be made by the "cementation" process in which granulated copper is melted with granulated "calamine" (oxidized zinc ore), and hence the existence of brass is not proof of the production of metallic zinc. However, metallic zinc was certainly known in India in the 14th century. Zinc ore may be reduced by burning off the zinc as oxide, and the oxide may be utilized as such or may be dissolved and the zinc content deposited

electrolytically; or the desulphurized ore may be leached with sulphuric or other acid and the zinc obtained by electrolysis. Both these methods are in commercial use, and other electrochemical processes are in a fair way to be established. Electrothermic reduction of zinc ores is practised in Sweden, but has not yet proved commercially feasible in the United States. The low volatilization point of zinc led to distillation as the first method for the reduction of zinc ores, and it is yet the chief

In 1913 the United States ranked first in production, with 31.7 per cent, and first in consumption, with 27.7 per cent. The other large consumers were Germany, 22.9 per cent; Great Britain, 19.2 per cent; France, 8.1 per cent, and Belgium, 7.5 per cent.

The production and consumption of metallic zinc in the United States during the European War as compared to the average of the four years immediately preceding the war is here shown, in short tons.

	1910-1913 (average)	1914	1915	1916	1917	1918
<b>Production of primary zinc:*</b>						
From domestic ore.....	296,315	343,418	458,135	563,451	584,597	692,085
From foreign ore.....	13,983	9,631	31,384	104,005	84,976	25,522
	310,298	353,049	489,519	667,456	669,573	517,927
<b>Production of secondary zinc:*</b>						
Re-distilled.....	19,721	20,545	29,764	29,663	16,835	9,911
Remelted.....	26,302	22,424	23,136	21,037	14,565	17,190
	356,321	396,018	542,419	718,156	700,973	545,015
<b>Apparent consumption of primary zinc</b>	290,413	299,125	364,632	458,428	413,643	423,356

\* "Primary zinc," which is produced from ore, is distinguished from "secondary zinc," which is obtained by refining zinc ashes, skimmings, drosses, and old metals and which has already been statistically counted as metal.

method. The native Chinese method of making zinc, though primitive, nevertheless, involves all the essential principles of modern zinc distillation. Clay pots or crucibles are set in the flat top of the furnace so that the lower half is exposed to the heat of the furnace. The zinc ore and carbon are put into the pot, a sloping partition with a perforation at the upper edge is luted (sealed with clay) into position at the middle of the pot, and the cover is luted on. The zinc vapor comes up through the perforation, condenses in the cooler upper chamber and collects as liquid zinc on the lower portion of the sloping partition, whence it may be dipped and cast into cakes. In the modern retort furnace there may be 300 to 450 clay retorts set in three to five horizontal rows, each retort about 10 inches in diameter and about five feet long. Two such furnaces are joined back to back in a block. Only the mouth of the retort projects from the furnace, and to this is luted the condenser, a conical clay cylinder closed at the slightly lower front end, except for a small aperture, by a clay plug. The zinc vapor distils over and is liquefied in the condenser, from which it is "drawn" and cast into slabs four times during the "campaign," which lasts 24 hours, the retorts being cleaned out and the charges renewed each morning.

**Production.**—World's production of metallic zinc in 1913, in short tons was as follows:

Australia.....	4,105
Austria.....	23,928
Belgium.....	217,928
France.....	71,672
Germany.....	
Silesia.....	124,552
Rhine district.....	187,522
Great Britain.....	65,197
Holland.....	26,811
Norway.....	10,237
Russia.....	8,389
Spain.....	6,617
United States.....	346,676
<b>Total.....</b>	<b>1,093,634</b>

The first zinc was made in the United States in 1835 by Dr. F. R. Hassler, superintendent of the United States Coast Survey. Finding it impossible to obtain abroad brass or zinc of the requisite purity for the standard sets of weights and measures he set up a small zinc-distillation plant in the arsenal at Washington. The ore used was a mixture of blende from Perkiomen, Pa., and red zinc ore from Franklin Furnace, New Jersey. The first zinc smelting on a commercial scale was at the Lehigh works at South Bethlehem, Pa., in 1860. In the same year the Matthiessen and Hegeler works were opened at La Salle, Ill. These were the main eastern and western centres of zinc smelting until 1892, when smelters in the coal fields of Kansas assumed equal importance with Illinois plants. This importance was increased about 1896, when natural gas began to be used for smelting, and by 1899 Kansas had become the largest producer among the States. The waning of the gas fields caused Kansas to fall behind Illinois in 1913, but for the last two years the natural-gas smelters of Oklahoma, which first smelted zinc in 1907, have held that State in the front rank. **ZINC WHITE.** See **WHITE COLORS.**

**ZINCITE, or KINKITE,** a deep blood-red to orange-red mineral found quite abundantly in Sussex County, N. J. It is

y in granular or foliated masses, associated with franklinite, willemite, tephroite and . It rarely occurs in hexagonal, hemimorphic crystals, with perfect basal cleavage. Its specific gravity is 4 to 4.5 and specific gravity about that of an oxide of zinc, ZnO, and is valuable ore of that metal. It is often called "red of zinc" and "red zinc ore."

**ZINCOGRAPHY.** See **LITHOGRAPHY.**

**NGARELLI, dzên-gâ-rêl'kê, Nicolo Antonio.** Italian composer: b. Naples, 4 April 1733; d. Forre del Greco, 5 May 1837. He studied at the Conservatorio di Loreto and also at the Abbate Speranza, and on leaving the conservatory received the place of master of chapel at Torre dell' Annunziata. In 1781 he was imposed for the Theatre San Carlos, in Naples, his opera 'Montezuma,' and in 1785 he sent forward his 'Alzinda' in La Scala, Milan, with great success. In this work he adopted a more simple and easy style. His operas are 'Pirro,' 'Artaserse' and 'Rosina' (Giulietta.) In 1789 he brought out his 'L'incoronazione di Poppea,' from Marmontel in Paris; but public events then occurring absorbed the attention of the public, and he soon returned to Naples, where he became director of the Viceroyal chapel in 1804. He refused to conduct the chapel services rejoicing over the birth of Napoleon's son as the "King of Rome," and by order of Napoleon was arrested and taken to Paris. Napoleon, however, pardoned him because of his fondness for the composer's music. In 1803 he was appointed director of the music academy of San Sebastiano, and in 1816 became master in Saint Peter's, Naples, holding various positions while he lived. Zingarelli composed much church music, including more than 100 masses, and numerous cantatas and oratorios. His works are highly esteemed for their expression. From 1781 he wrote about 40 operas, many melodies from which have continued to be interpolated in modern Italian productions.

**NGERLE (VON SOMMERSBERG), Ignaz Vincenz,** Austrian Teutonic scholar: b. Meran, 6 June 1825; d. Innsbruck, 10 March 1892. He was a nephew of Pius Zingarelli (q.v.). He studied at Innsbruck, Trent, and Fribourg, and was for a time an inmate of a Benedictine monastery at Marienberg, but abandoned theology. From 1859 until his death in 1890 was the professor of German language and literature at Innsbruck. Among his works are 'Sagen aus Tirol' (1850; 2d ed., 1891); 'Sitten, Bräuche, und Meinungen des Volkes' (2d ed., 1871); 'Schildereien aus Tirol' (1877-88); his tales include 'Von dem Bauer von Longviall' (1850); 'Der Bauer von Longviall', etc.

**NGERLE, Pius,** Austrian Orientalist and Catholic theologian: b. Meran, 17 March 1811; d. Marienberg cloister, 10 Jan. 1881. He studied at Innsbruck, became in 1862 professor of Oriental languages in the Sapienza at Rome, and from 1867-71 was director of the gymnasium at Meran. Among his works are 'Ausgewählte Stellen des Heiligen Kirchenvaters Ephraem' (1837; 2d ed., 1845-46); 'Akten der Heiligen Synode des Morgenlandes' (1836); 'Chrestomathia Syriaca' (1871), and 'Lexicon Syriaco-

**ZINJAN, zin-jân', Persia.** See **ZENJUN.**

**ZINNIA,** a genus of annual and perennial herbs and sub-shrubby plants of the family *Asteraceae*. The species, of which about 20 are known, are indigenous from southern Colorado to Chile, but are chiefly distributed in Mexico and Central America. They have opposite, generally entire leaves and terminal heads of very variously tinted flowers, for which some of the species have become popular in gardens. The best-known species is the garden zinnia or youth-and-old-age (*Z. elegans*), an erect annual usually about 18 inches tall and originally bearing yellow or orange flowers, but now exhibiting nearly every tint except blue and green in both single and double forms, which often exceed three inches in diameter. *Z. haageana* was introduced into cultivation in 1861, but being less showy and smaller than the former is of secondary importance. A hybrid race developed from these two species, and known as *Z. darwinii*, has been evolved, but has not become widely popular in America. The plants are rather stiff, formal and coarse in habit, and their colors, although brilliant and metallic, lack the delicacy of the dahlia and the china aster, to which they are not distantly related. They are, however, among the most useful garden annuals, because they will thrive upon almost any kind of soil and yield a profusion of bloom from midsummer until frost.

**ZINZENDORF, tsin'tsên-dôrf, Nicholas Ludwig, Count von,** German religious leader, founder of the Society of United Brethren: b. Dresden, Saxony, 26 May 1700; d. Herrnhut, Upper Lusatia, 9 May 1760. From 1716 to 1719 he studied at the orthodox University of Wittenberg, and subsequently traveled in Holland and France, describing his journey in 'The Pilgrimage of Atticus through the World.' In 1721 he received an appointment to the council of state from the Saxon government, which he held till 1727. He then completely withdrew from public affairs. He received at his estate in Upper Lusatia in 1722 the persecuted Moravian Brethren. This settlement received in 1724 the name of Herrnhut. With a view to founding the body called the United Brethren (q.v.), he published various projects, not in harmony with each other, which excited opposition, but he persevered in his plan and finally succeeded in establishing a religious order based on family instead of monastic conditions. In 1734 he passed a theological examination under an assumed name, and was ordained a clergyman of the Lutheran Church. After two years spent in traveling on behalf of his society, he was banished in 1736 from Saxony. The order of his banishment was repealed in 1747. In the meantime he had been consecrated bishop of the Moravian Church in Berlin, founded Moravian colonies in Holland, Esthonia and Livonia, and visited England. In 1739 he wrote a catechism which he styled the 'Good Word of the Lord,' and the same year visited the missions of the Brethren in the West Indies. In 1741 he visited the United States and founded the well-known Moravian colony at Bethlehem, Pa., and before returning to Germany in 1743 assisted in establishing missions among the Indian tribes. After returning to Europe he made a journey to Livonia, whence the Russian

government sent him back under a military escort to the frontier. He afterward visited Holland, spent several years in England, and obtained an act of Parliament for the protection of his followers in the British dominions. He wrote more than 100 works in prose and verse. A collection of his hymns, edited by Knapp, appeared in 1845. His 'Diary' was published (1907). Consult the 'Lives' by Spangenberg, A. G. (1772-75); Eng. trans., abridged, London 1838) and Römer, H. (Gnadau 1900); also, Plitt, H., 'Zinzendorf's Theologie' (3 vols., Gotha, 1869-74), and Becker, B., 'Zinzendorf und sein Christentum im Verhältnis zum kirchlichen und religiösen Leben seiner Zeit' (1886; 2d ed., Leipzig 1900). Williston, W., 'Great Men of the Christian Church' (Chicago 1908).

**ZION**, or **SION**, the loftiest mount of Jerusalem, and often used in biblical and other literature to designate the whole city, and metaphorically the kingdom of God on earth and in heaven. Zion rises about 2,500 feet above the Mediterranean, and from 200 to 300 feet above the valleys at its base. It was separated from Akra on the north and Moriah on the northwest by the Valley Tyropœon, and had the valley of Gibbon on the west, that of Hinnom on the south and that of the Kidron on the southeast. It was a fortified town of the Jebusites till subdued by David, and thenceforward was called the "City of David" (2 Sam. 6-7). A mosque near its southern brow now covers the "tomb of David" so-called. This mount, together with Moriah and Ophel, was enclosed by the first wall, and fortified by citadels. On it were erected the palaces of Solomon, and long afterward those of Herod. At the present day a considerable portion of it lies outside of the modern wall on the south.

**ZION CITY**, Ill., city in Lake County, 40 miles north of Chicago, on the Chicago and Northwestern Railroad. Manufactures include lace, bricks and candy, and office, milling, baking and electrical supplies. Pop. 4,789.

**ZION NATIONAL MONUMENT**. A government reservation in the southwestern part of Utah. Its area is 76,800 acres. It comprises the upper part of the valley of the Virgin River which here flows for eight miles in a narrow canyon with walls in places 2,500 feet high, of brilliant colors and with great variety of gorgeous cliffs, towers and pinnacles. Notable among these are two great pinnacles known as the Temples of the Virgin and also as the Gates of Zion; they rise 4,000 feet above the valley and consist of sandstone, red in large part, capped by gleaming white. They were discovered by J. W. Powell in 1864. While the reservation is a long distance from the railroad, being 90 miles from Lund, the nearest point on the Salt Lake Line, it is accessible by good auto roads and a camp for tourists is maintained by the Wylie Company.

**ZIONISM**. See **JEW** AND **JUDAISM** — **ZIONISM**.

**ZIPAQUIRA**, sê-pâ-kê-râ', Colombia, town, department of Cundinamarca, 25 miles north of Bogotá. It is built on the site of an old Chibcha Indian town, which was the residence of the chiefs of Zipas. It is especially noted for its valuable salt bed which is owned

and operated by the government, and supplies the greater part of the salt used in the republic. Coal, lead, copper and iron are also found in the vicinity, and the town carries on an active trade with the surrounding district. Pop. (district) 12,000.

**ZIPH**. See **ZIF**.

**ZIRCON**, the native zirconium silicate, ZrSiO<sub>4</sub>. Its crystals are tetragonal and isomorphous with thorite, xenotime, cassiterite and rutile. Though its crystal forms are very varied, they are usually prisms terminated by pyramids, the base being rare. Small crystals frequently show a wealth of faces, among which the "zirconoids; or ditetragonal pyramids are prominent. It is a heavy mineral, its specific gravity averaging about 4.7, and it has a characteristic greasy-adamantine lustre. Though often nearly or quite opaque, transparent crystals are not uncommon, and owing to its hardness, 7.5, strong double refraction and the variety of rich colors in which it is found, zircon has long been prized as a gem. Its dispersive power is excelled only by the diamond. "Hyacinth" or "jacinth" includes reddish, orange or brownish gem stones, while "jargon" embraces the colorless, yellowish, grayish or smoky varieties. It is often an important accessory constituent of gneiss, syenite and many crystalline rocks. Because of its resistance to weathering and abrasion it frequently occurs in fine little crystals in alluvial sands as in Ceylon, Brazil and the monazite region of North Carolina. The finest zircon gems come from Ceylon and New South Wales, while France yields very small stones of remarkably fine red color. Excellent translucent to opaque crystals occur in Norway, the Ural Mountains, Canada (up to 15 pounds), in New York, New Jersey, Colorado and North Carolina. By far the most important locality is in Henderson County, N. C., where many tons of crystals occur loose in the soil. Zirconia, derived from this source, was used in the "Welsbach" or "Auer" mantles, but its incandescence had not sufficient permanency and its use has been superseded by thoria. Zirconia is still useful as a refractory material in furnace and crucible linings, and because of its incandescence in the "zircon light," which is an improvement on the ordinary lime light.

**ZIRCONIUM**, a chemical element named after the mineral zircon in which Klaproth discovered the oxide zirconia (1789), and obtained by Berzelius in 1824 as an iron-gray powder. Afterward found in many other minerals, some of the most important being eudialyte, hyacinth, polymignite, etc. It has many physical and chemical properties resembling the element silicon. Like silicon and carbon it exists free in three allotropic forms; the amorphous, as a black powder by heating sodium chloride with metallic sodium or potassium; the crystalline, as foliated leaves from sodium zirconium fluoride with meta-zirconium; and the graphitoidal, obtained as a steel gray color by action of iron on zirconium. Symbol Zr; atomic weight 91.224; specific gravity 4.15. The element is insoluble in hydrochloric or sulphuric acid, but readily so in aqua regia or hydrofluoric acid. When heated highly in the air it

$ZrO_2$ . This oxide, commonly known as zirconia, is prepared by fusing the mineral zircon ( $ZrSiO_4$ ) with a mixture of sodium hydrate and sodium carbonate, treating with hydrochloric acid and heating to separate the silica, precipitating the solution so obtained with ammonia and heating this white precipitate. Another method is now used by which the chloride is obtained by treating crushed zircon with hydrochloric acid, separating the silicon chloride by heat, precipitating the solution of zirconium chloride with ammonia, and heating the precipitate. Zirconia

forms a white powder or amorphous mass. It has both basic and acid properties. It dissolves slowly in hydrofluoric or sulphuric acid, the fluoride ( $ZrF_6$ ) uniting with fluorides of other metals forming complex salts called zirconates, for example  $K_2ZrF_6$ , potassium zirconate. With strong alkalis zirconia forms silicates, for example,  $K_2ZrO_4$ , potassium zirconate. Zirconium forms a long series of salts, the most important of which it acts as a basic element.

**Uses.**—Zirconia possesses the power of becoming extremely refractory toward heat, not being softened even by that of the oxy-hydrogen blow-lamp. It also has great radiating power. The use of this it is used in the "zirconia light," which is used considerably in lighthouses. A lamp of zirconia is played upon by the very same flame of the oxy-hydrogen blowpipe so that it glows with a very intense white light. While this is the principal use of compounds of zirconium, certain minerals containing it are found as beautiful stones and are used as gems.

**ZIRKNITZ**, tsirk'nits, or **ZIRKNITZER SEE**, or **CZIRKNITZER SEE**, Austria, a mineral periodical lake in Carniola, 30 miles northeast of Trieste, in a deep valley surrounded by mountains, the principal of which are Avornik, Succhi, Slivinza and Sternitz. The lake takes its name from Zirknitz, situated at an elevation of 3,500 feet, and one of the villages in the neighborhood. Receiving the waters of six streams, and surrounded by mountains with no outlet, the characteristic feature of the lake is its internal drainage. The bottom of the lake partakes of the same formation of the district, which is raised as readily, and has numerous subterranean caves and channels. Some of these are of great depth, and in the dry season absorb the waters of the lake, leaving it sometimes completely dry, with only a few pools, in which the fish take refuge. Luxuriant natural vegetation covers the shores of the deserted lake, and when the height is protracted grass, millet, or buckwheat is sown on it and the harvest reaped before the return of the water. In June the lake is frequented by wild ducks, which afford a great sport, and when the water is deepening fish are caught in great numbers. The lake is from six to seven miles long, with three broad and of an average depth of 10 feet, but there is no stated limit to its depth.

It receives the drainage of a considerable country, and even when no rain falls in the immediate neighborhood its reservoirs are filled from the rainfall of more distant hills. In dry seasons the lake takes about 30 days to empty. When rain has been abundant and all the subterranean sources are in simultaneous activity it reaches the average height in 72

hours, and when the rain has extended to all the tributary region it reaches its extreme level, which is about two feet above the average, in 196 hours. The natural outlets then no longer suffice to carry away the water, and it overflows the country, damaging or destroying the surrounding villages. The emptying and flooding of the lake depends upon the drought or moisture of the season, and is not strictly periodic. It has been known to empty and fill three times in one year. From 1707-14 it was only once dry, and from January 1834 to February 1835, it remained entirely without water, the longest drought on record. This lake was known to the ancients for the same phenomena, the Romans calling it *Lacus Lugens* or *Lugea Palus*; and it has been picturesquely described by Tasso in his 'Sette Giornate del Mondo.'

**ZISKA**, zis'ka (properly **ŽIŽKA**, zhizh'ka), John, Bohemian Hussite leader: b. Trocznov, near Budweis, about 1360 (by some authorities as late as 1380); d. Přebyslav 11 Oct. 1424. He was educated at the court of King Wenceslas at Prague, entered the profession of arms, joined the contingent that went from Bohemia and Hungary in 1410 to the assistance of the Teutonic Knights against the Poles and Lithuanians, and fought with great prowess in the fiercely contested battle of Tannenberg, 15 July 1410. Then he served in Hungary against the Turks, and with the English at Agincourt, 25 Oct. 1415. Soon after the execution of Huss (q.v.), he returned to Bohemia and became a leader of the Hussites. In 1419, when the Hussites broke into rebellion against the Emperor Sigismund, Ziska organized their military forces into a well-disciplined army of infantry, supplying the want of cavalry by means of the Waggenburgen, or "car-forts," constructed of the baggage-wagons. He took up his headquarters at a stronghold on the heights of Austic, in southern Bohemia, the fortress being known as Tabor (with reference, perhaps, both to *tabor*, Bohemian for "encampment," and to Mount Tabor in Palestine), and the extreme Hussites as "Taborites." Sigismund sent an army of 30,000 men into the country, but Ziska, with a hasty levy of about 4,000, took up his position on Mount Vitkov, near Prague, and on 14 July 1420 defeated the enemy with great slaughter. The eminence has since been known as the Hill of Ziska. On 1 Nov. 1420, at Pankratz, he was again victorious over Sigismund, and on 2 November captured the fortress of Vyšehrad, near Prague. He won a second great battle against Sigismund 8 Jan. 1422 at Deutschbrod, and penetrated into Moravia and Austria. He had long had but one eye, and lost the other by an arrow-wound at the siege of Raby castle in 1421. Notwithstanding his blindness he continued to direct his troops with great efficiency and almost unvarying success. Prague refused to recognize his authority, and he thoroughly subdued it in 1424. In that year, it is said, Sigismund, realizing the impossibility of conquering Bohemia, began negotiations toward a treaty, by the terms of which the Hussites were to have full religious liberty and Ziska was to be governor of Bohemia. Such negotiations, if undertaken, were interrupted by Ziska's death at the siege of Přebyslav.

Zizka became the hero of the Bohemian revolutionary party and for this character he was well fitted by his zeal and military ability. He was frequently cruel in his method of warfare and conquest. Much fiction has been mingled with the facts of his career. Alfred Meissner's epic 'Zizka,' based on the leader's history, reached a 12th edition in 1884. Consult the German translation (1882) of Tomek's 'Life.'

**ZITHER**, or **CITHERN**, a modern development of the musical instrument known to the Greeks as cithara. In the early part of the 19th century it became a favorite with the peasantry of the Styrian and Bavarian Alps, and was introduced into England about 1850. The zither consists of a resonance box, with a large circular sound hole near the middle; the strings, 32 in number, in some cases increased to 40 and even 46, being made of steel, brass, catgut and silk covered with fine silver or copper wire, and tuned by pegs at one end. Five of the strings are stretched over a fretted keyboard, and are used to play the melody, the fingers of the left hand stopping the strings on the frets, the right-hand thumb, armed with a metal ring, striking the strings, which are tuned in fifths, and have a chromatic range from C in the second space of the bass staff to D in the sixth ledger line above the treble. The remainder, called the accompaniment strings, are struck by the first three fingers of the right hand. The viola zither, in which the resonance box is heart-shaped, is tuned like the violin, and is played with a bow.

**ZITTAU**, tsit'tow, Germany, a town of Saxony, on the Mandau, near the Austrian frontier, 49 miles by rail east-southeast of Dresden. The town was practically destroyed in the Seven Years' War, since which time most of its buildings have been erected. The chief public buildings are a splendid town-house, the churches of Saint Peter, Saint Paul, Saint John and Mary, hospitals, custom-house, gymnasium, a municipal museum, and a valuable library. Its principal manufactures are cotton-spinning, dress goods, iron-founding machinery, stained glass, cycles, ropes, paper, brewing and brick-making; and there is a trade in cotton and linen goods, chemicals, etc. There are a number of lignite mines in the neighborhood. Pop. 34,719.

**ZITTEL**, tsit'tel, Karl Alfred von, German paleontologist and geologist: b. Bahlingen, Baden, 25 Sept. 1839; d. Munich, Bavaria, 6 Jan. 1904. After study at Heidelberg and Paris, he entered the geological survey at Vienna, in 1863 became a lecturer in the university there, and later in the same year was appointed professor of mineralogy at Karlsruhe. In 1866 he was made professor of paleontology and geology at Munich; and from 1899 he was president of the Bavarian Academy of Sciences and curator-general of the scientific collections of Bavaria. The Rohlfs expedition, which he accompanied to Egypt and the Libyan desert in 1873-74, derived much of its value from his important labors. Among his publications are the 'Paläontologische Studien über die Grenzschichten der Jura- und Kreideformation' (1868-83); 'Aus

der Urzeit' (1872; 2d ed., 1875); 'Handbuch der Paläontologie' (5 vols; 5th vol. with Schimper and Schenk, 1876-93), the most complete and authoritative work in that field; and 'Geschichte der Geologie und Paläontologie bis Ende des Neunzehnten Jahrhunderts' (1899). He edited the periodical *Paläontographica* from 1869.

**ZIWET**, Alexander, American mathematician: b. Breslau, Germany, 8 Feb. 1853. Graduated from the Polytechnical School of Karlsruhe in 1880, he came in that year to the United States, and for some time was connected with the United States lake survey (Detroit) and the coast and geodetic survey (Washington). Subsequently he became successively instructor in, and junior professor of, mathematics in the University of Michigan, where he has been professor since 1905. In 1892 he was made co-editor of the *Bulletin of the American Mathematical Society*. He published an 'Elementary Treatise on Theoretical Mechanics' in three parts, as follows: Pt. I, 'Kinematics' (1893); Pt. II, 'Introduction to Dynamics, Statics' (1893); Pt. III, 'Kinetics' (1894; revised ed., 1904).

**ZIZANIA**, a genus of grasses (q.v.) including the wild rice.

**ZIZYPHUS**, a genus of the family *Rhamnaceæ*, shrubs or small trees, with spiny stipules, alternate three-nerved leaves, a spreading five-cleft calyx, five hood-like petals, five stamens, a five-angled disc, adhering to the tube of the calyx, and having enclosed within it the two- or three-celled ovary. Fruit a drupe, which is sometimes edible and has a large stone or kernel containing from one to several flattened seeds. *Zizyphus* is widely distributed, but is chiefly indigenous to tropical Asia and America. The fruits of the cultivated *Z. jujuba*, and of *Z. sativa*, are of the size and shape of a small, oval plum. They ripen in September when they are gathered and stored in a dry place, the pulp becoming sweeter by the process. They have a dark-red skin, but are yellow within. If carefully dried, these fruits, called jujubes, will keep for a long time, and retain their acid flavor, which has made them a refreshing dessert fruit in the Mediterranean countries and in China. They are nutritive and demulcent, a cough medicine having been prepared from them, and formerly the sweet-meat known as jujube paste was made from the evaporated juice of jujube, and of gum-arabic; but now the jujube is displaced by the gum and by gelatine. *Z. sativa* is a handsome arborescent shrub, with small, varnished, oval leaves and greenish inconspicuous flowers, succeeded by the bright drupes. It is sometimes cultivated in the United States, being hardy as far north as Washington. The bark, in its native countries, was used medicinally, for fever and for sores; and it is also employed for tanning and for a dye-stuff like that of *Z. xylopyra* which yields a black dye. Various parts of other species yield medicines, and the edible fruits of *Z. bailei* of Africa are used for a pleasant drink and are also made into bread. *Z. lotus* is by some believed to be the lotus-trees the fruit of which produced such intolerance in those who ate them. It grows in Barbary.

where it is called *sadr*. *Z. spinachristi* is a small, prickly tree, which is reputed to have composed Christ's crown of thorns. Like other spiny species of *Zizyphus*, this is a good hedge plant. *Z. nummularia* of Persia and India is one of the camel's thorns, whose foliage forms a fodder, and which has edible fruits. The cog-wood of Jamaica, an important timber tree, is *Z. chloroxylon*.

**ZLATOUST**, zlä-tō-oost', Russia, a town in the province of Ufa, on the Ai, an affluent of the Ufa, near the Ural Mountains, 150 miles direct and 199 miles by railway northeast of Ufa. It has a cathedral and a meteorological and magnetical observatory. In the vicinity are rich iron and gold mines, and in the town are government works, manufacturing sword-blades, steel instruments and ammunition. Pop. about 34,245.

**ZNAIM**, tsnim (formerly **ZNOIMO** or **ZNOJMO**), Austria, a town of Moravia, on the Thaya, 50 miles northwest of Vienna. The chief buildings are a Rathaus (1446), a circular church, said to have been a heathen temple, and the Gothic church of Saint Nicholas, dating from 1348. The old ducal castle crowns a neighboring height. The trade is largely agricultural. Mustard, wine and cucumbers are exported. Fine majolica, leather and chocolate are manufactured. New water-works were opened in 1877. As Znoimo, it was the capital of Moravia, destroyed in 1145 by the Bohemian Prince Vladislav, and rebuilt in 1226. On 11 July 1809, the French under Massena and Marmont defeated the Austrians here, resulting in the armistice between Napoleon and Archduke Charles; it was captured by the Prussians 13 July 1866 and was occupied by them until 3 Sept. 1866. Pop. about 18,828.

**ZOANTHARIA**, an order of *Actinozoa* (q.v.) characterized by the fact that the tentacles are simple and unbranched, that there are usually incomplete as well as complete mesenteries, and that the tentacles usually alternate in several circles. The mesenteries and tentacles are often arranged in multiples of the number six, but this is variable, and in some forms the number of mesenteries increases during the growth of the animal. The animal develops as a gastrula, the blastopore of which remains as the mouth. The larva is usually ciliated and free-swimming. The Zoantharia include the sea-anemones and corals (qq.v.); these do not represent natural divisions of the class, but merely modes of life of its members. A colonial Zoantharian with a calcareous exoskeleton is a coral; an isolated Zoantharian without an exoskeleton is a sea-anemone.

**ZOAR**, Palestine, an ancient city mentioned in the Bible, but whose exact location is unknown, although it probably stood at the southern end of the Dead Sea. It is spoken of as visible from Pisgah (Deut. xxxiv, 3). The Arabic historian Abulfeda speaks of a Zoara near the Dead Sea, and the Roman garrison, Zoara, mentioned by Jerome and Eusebius, is probably the same place. Mention of it occurs in Genesis xiv and xix; in Isaiah, xv, and in Jeremiah xlvi. Consult Smith, G. A., 'His-

torical Geography of the Holy Land' (16th ed., London 1910).

**ZOAR**, zō'ar, Separatists Society of. The Separatists Society of Zoar was a communistic religious organization located at Zoar, on the Tuscarawas River, Tuscarawas County, Ohio. They were German Protestant peasants, 225 in number, who emigrated from Württemberg in April 1817. Their chosen leader was Joseph Baumler, whose name was later changed, for the sake of euphony, to Bimeler. Bimeler was of humble origin, but a man of unusual ability and independence, well educated, a natural leader, and a fluent speaker; he purchased in his own name, in the locality named above, 5,000 acres of farm land, at an average value of \$3 per acre, giving a mortgage at long time for the entire amount. This Separatist emigration had been primarily for the purpose of securing religious liberty; and for better opportunities in obtaining a livelihood. It was expected that each family would, by its industrious labor, secure separate ownership in a portion of the land held by Bimeler, but the colonists being diverse in age, strength, experience, education and enterprize, they soon realized that their personal inequality stood in the way of the collective success of the colony, and early in 1819 they decided to organize into a community of property and effort. Articles of agreement were signed by 159 adults—53 males and 104 females. The articles created a community of interest, present and prospective, whereby all the property, movable and immovable, of the individual members, and their future earnings should become the common stock of the association, to be held and managed by chosen directors. Death of a member passed no property interest to his heirs, and withdrawal from the society, voluntary or compulsory, carried with it no claim upon a divided or undivided right in the association. Bimeler was to retain the realty in trust until the society by its earnings could pay the mortgage and assume title.

In 1832 the society reached its highest membership of 500, and was incorporated under the then existing laws of Ohio by the name of "The Society of Separatists of Zoar." This conferred upon the society the ordinary powers of a corporation, with perpetual succession, power to hold property, purchase and sell, pass by-laws, etc. Under this reorganization the members were divided into two classes, known as the novitiates and the full associates; the novitiates were obliged to serve at least one year before admission to the second class, and this applied to the children of the members if, on becoming of age, they wished to join the society; the full associates must be of legal age—the males 21 and the females 18; all officers were elected by the whole society, the women voting as well as the men, all elections being by ballot and a majority vote; the government of the community vested solely in a board of three trustees (or directors) to serve three years each, one to be elected annually; these trustees had unlimited power over the custody and management of the property and all the temporalities of the society, but were bound to provide clothing, board and dwelling for each member "without respect to person," and use all means

committed to their charge for the best interests of the society; they directed the industries and detail of affairs of the society; assigned each member his especial work, and the portion of necessities each should receive. Beside the board of trustees there was a standing committee, or council, of five, one member being elected each year. This council was the supreme judiciary, or board of arbitration, of the society, in cases of disagreement, dissension or complaint; it had power to excommunicate members or deprive them of participation in the affairs of the society. They also elected once in four years a cashier or treasurer who had custody of all moneys, kept the books, and had immediate oversight over the finances of the society. In addition there was an official known as the "agent general," who acted as the trader to buy and sell for the society in its dealings with the outside world, make and enforce contracts, etc. The office of agent general was regarded as the position of honor and influence, and to it Joseph Bimeler was elected for life; after his death the office remained vacant, its duties being performed by the cashier or the trustees.

The society, from its organization as a commune, steadily prospered, and in time built up a large number of enterprising and successful industries, having in the period of its height two large flour mills, saw mill, planing mill, machine shop, tannery, dyehouse, stove foundry, cooper shop, woolen mill, brewery, slaughter-house, blacksmith shop, tile works, pottery, etc. In all these concerns a high grade of goods was produced which found a ready market with foreign customers. The value of the Zoar property increased until about 1875, when their land, industrial plants and money accumulation were estimated at \$1,500,000. From that time the enterprise began to decline. Bimeler died in 1853, and there was no leader or director his equal in sagacity or personality. The environment of the society slowly changed from that of a western pioneer frontier to a prosperous, cultivated section of country, and rival neighboring industries made inroads into the export business of Zoar; the Zoarites were not progressive and did not keep pace in their manufactures with modern methods and improvements, and in time found that they could purchase products for use and wear cheaper than they could make them; there were few accessions to the society; the original members became too old and feeble to conduct its affairs; outside laborers had to be employed; the younger members were inclined to leave and seek their fortunes where they could acquire independent property and freedom of action. This decline continued until in 1897, when, by a common consent, the organization decided to disband and place the property in the hands of a commission for equal division. The appraisal and distribution was completed in the fall of 1898. There were at this time 222 people, adults and children, in the society, of whom 136 were entitled to one equal share. They each received a few hundred dollars in cash and a portion of the farm land or village property.

The religious tenets of the Zoarites were few and simple. They confessed the doctrine of the Trinity; the fall of man, the return

through Christ, the Holy Scriptures as the guide of their lives, all ceremonies were declared useless and injurious, marriages were contracted by mutual consent and before witnesses, they recognized no ordained minister, and engaged in no public prayer. Bimeler was their only preacher and teacher, he spoke each Sunday to the society, and after his death his published discourses were read in the public meetings by various members. The society did not seek additions and made no attempt to propagate its principles, either economic or religious. The life of the Zoarites was one of utmost simplicity, serenity and morality. There never was a divorce in the community and no member was ever charged with a crime or felony. Consult Nordhoff 'Communitistic Societies in United States' (1875); and Randall 'History Zoar Society' (1904).

**ZOBELR, or ZUBAIR, IBN al Awam,** a relative of Mohammed, and one of the earliest converts to Islam: d. 656. He was one of the 10 predicted by Mohammed as certain to enter the Garden of Allah. Before his death, Omar, successor of Mohammed, appointed Zobelr one of a council of six who were to choose from their own number a new caliph. Zobelr opposed the election of Othman and was thereafter his enemy; he also opposed his successor, Ali, with whom he had been friendly before Ali's accession. Later Zobelr succeeded in raising a rebellion against Ali, and he was slain at the battle of the Camel, at Basra. For his son see **ABD ALLAH IBN ZUBAIR**. Consult Huart, C. I., 'Histoire des Arabes' (Paris 1912).

**ZOBELR, Rahama,** Egyptian pasha and Sudanese governor: b. 1830. He came of a family claiming descent from an uncle of Mohammed. By 1860 he had established his leadership among the Arab ivory and slave traders on the White Nile and in the Bahr-el-Ghazal, and although nominally an Egyptian subject he maintained a great army of blacks and was the real ruler of the surrounding country. He defeated an expedition sent from Khartoum to Bahr-el-Ghazal in 1869, but pleaded innocence in the matter, was pardoned and appointed governor of the district. In 1874 he conquered Darfur, and was made governor-general of the new province, but when he went to Cairo in 1876 the authorities prevented his return. His son assumed his place in Bahr-el-Ghazal, and under the instruction of Zobelr defied the forces of General Gordon, and in 1878 was subdued. In 1884, however, General Gordon, apprehensive of the Mahdist movement, vainly asked that Zobelr be permitted to return in order to check it. Zobelr was interned at Gibraltar in 1885-87, returned to Cairo in 1889, and after 1899 lived on his estates in his native country.

**ZÖCKLER, tsék'lér, Otto,** German Lutheran theologian: b. Grünberg, Hesse, 27 May 1833; d. Greifswald, 9 Feb. 1906. He was educated in the universities of Giessen, Erlangen, Halle, Göttingen and Berlin, became a lecturer at the first-named in 1857, and in 1863 professor of theology. In 1866 he was appointed professor at Greifswald, and in 1885 consistorial councillor. He was one of the leaders of the movement toward the establishment of a state church in Prussia. In 1882 he became editor of the

*relische Kirchenseitung.* For the 'Kurztrent und zu den Apokryphen' (1886 et which he edited with Strack, he prepared mmentaries on the Old Testament apocrybooks, the Acts, and the epistles to the alonians and Galatians. Among his works Hieronymus, sein Leben und Wirken' ); commentaries to Chronicles, Job, Prov-Ecclesiastes, Canticles and Daniel, in 's 'Bibelwerk' (1866-72; Eng. trans. 1870 1.); 'Das Kreuz Christi' (1875; Eng. 1877); 'Gottes Zeugen im Reich der ' (1881; 4th ed., 1906; Eng. trans. 1886); sehe und Kirchen-historische Studien' ); 'Die Tugendlehre des Christentums' ); 'Geschichte der Apologie des Christen-' (edited by H. J. and E. Schlapp, 1907),

**ZODIAC.** The zodiac is a belt of the celesthe, extending 8° on each side of the c, or the path of the sun among the

"The name is derived from ζῳον a livreature, because the constellations in it pt Libra) are all figures of animals. It aken of that particular width by the an- simply because the moon and the then 1 planets never go farther than 8° from lptic" (Young's 'Astronomy'). The belt ided into 12 parts, of 30° each, to which ven the following names: Aries, Taurus, ii, Cancer, Leo, Virgo, Libra, Scorpio, arius, Capricornus, Aquarius, Pisces. division into 12 parts was suggested by 2 reappearances of the moon in a year. dea seems to have originated with the an astronomers, about 2100 B.C.

ving to the fact that the earth is not a t sphere, the pole of the earth's equator bes a circle around the pole of the ecliphich causes a constant retrograde motion ator with the point of intersection of the of the zodiac. The rate of this motion in 70 years, and has amounted to 30°, : entire sign, up to the present time. "The of Aries, therefore, is now in the position e constellation Pisces; each sign having 1 so to speak into the constellation west

' The constellations themselves bear no blance to the signs designated by them. ring the Middle Ages the signs of the

were supposed to influence human life, ence were distributed to different parts : human body. Disease was supposed to ed by the aid of the zodiacal power pre- over that part of the body. The rem- of this superstition is still seen in some acs.

e Egyptians are supposed to have adopted 2-fold division of the Zodiac from the s, but they changed the symbols of living res to others of their own. The Chinese d the course of the sun into 12 parts, they designated as the rat, the ox, the hare, dragon, serpent, horse, sheep, mon- ien, dog and pig. This division is still in some parts of Central Asia and Japan. : also been found among the remains of ttec race in America. The original zodi- onstellations occupied unequal spaces in avens. Hipparchus was the first to divide diac into equal spaces of 30° each, and

give to them the names of the older constella- tions. His method of reckoning positions in the ecliptic was used until this century. Astron- omers have now abandoned it for the more accu- rate measurement of degrees, beginning at the vernal equinox.

The origin of the names of the animals as- signed to the zodiac by the ancients is unknown. Some have supposed that the spring signs: Aries, the Ram, Taurus, the Bull, and Gemini, the Twins, mark the time of the bringing forth of young by flocks and herds. Cancer, the Crab, marks the time when the sun appears to move backward. Leo, the Lion, symbolizes the fierce heat of summer, and Virgo, the Virgin, glean- ing corn, symbolizes the harvest. In Libra, the Balance, the day and night balance each other. Scorpio is supposed to have marked the pres- ence of venomous reptiles in October; while Sagittarius symbolizes the season of hunting. Capricornus marks the beginning of the return of the sun to the north, Aquarius symbolizes the winter rains, and Pisces the season of fishes. These are but fanciful representations, and have no foundation in fact.

**ZODIACAL LIGHT.** "The zodiacal light is a faint column of light rising from the west- ern horizon after twilight in winter or spring evenings; and before daybreak in summer or autumn. It extends out on each side of the sun, and lies nearly in the plane of the ecliptic. Near the equator it can be seen all the year, and has been traced all the way across the heavens from east to west, forming a complete ring." In our latitudes it can seldom be traced more than 90° from the sun. Parts of the column near the sun are somewhat bright, but distant portions are extremely faint, and can only be seen on the very clearest nights; though the cause of the zodiacal light cannot be said to have been definitely proved, it is very probable that it is sunlight reflected by myriads of small meteoric bodies revolving around the sun, nearly in the plane of the ecliptic. This theory requires a thin flat ring of these meteors to extending beyond the orbit of the earth. The name zodiacal light was given to this phenome- non by Cassini in 1653, who described it as a flat luminous ring encircling the sun nearly in the plane of the ecliptic. Kepler supposed it to be the atmosphere of the sun; but Laplace showed that the atmosphere of the sun could not extend to anything like the distance from the sun which is reached by the zodiacal light. In 1853 an extended series of observations was made by Jones from different parts of the Pacific Ocean. From these observations he deduced the theory that the zodiacal light was caused by a ring of matter surrounding the earth, and not the sun.

Professor Wright, of Yale University, has determined that the spectrum of the light is continuous, and therefore is essentially reflected sunlight. He has also determined that the light is partially polarized in a plane passing through the sun, and that the amount of the polarization is between 15 and 20 per cent. The origin of the minute particles which reflect the light has been accounted for in many ways. By some they are believed to have been thrown out from the corona of the sun; by others to be com- posed of dust thrown out from the equatorial

regions of the sun; but by most they are believed to be an immense cloud of meteoroids filling the space between the earth and the sun. The meteoric theory of the sun's heat presupposes a multitude of these meteoric bodies constantly falling into the sun to supply the loss by radiation, as well as multitudes of others which never reach the surface. It is not probable, however, that these meteors if they exist play any part in the phenomena of the zodiacal light.

A most valuable and important contribution to our knowledge of the zodiacal light is due to a recent research of Seeliger. It has long been known that the slow, secular changes of some of the elements of the orbits of the planets of the solar system, when these are derived from observation, are not in exact agreement when these same changes are determined from a computation based upon the law of universal gravitation. In particular, it is found that the computed motions of the perihelia of the orbits of Mercury and Mars and of the node of Venus differ from the motions derived from observation by amounts far in excess of the uncertainties inherent in the observations themselves. Many attempts to account for the first discrepancy have been made. Thus, Leverrier assumed that it arose from the disturbing pull of a small planet near the sun, which for many years found its place in our astronomical books under the name of Vulcan. Other astronomers have supposed that the disturbance might be due to the pull of a ring of particles about the sun, to an unequal distribution of the material within the body of the sun itself, or even to an inexactness in the accepted statement of the law of gravity. Analysis shows, however, that none of these explanations are admissible, for all of them lead to disturbances in other directions, either of the planets or of the moon, which are in discordance with observation. But Seeliger has shown that if there be ascribed to the zodiacal light an even almost inconceivable tenuity, its gravitational pull will exactly account for the discrepancies observed, without at the same time introducing any new discrepancies. The densities to be assumed for the inner and outer portions of the zodiacal light in order that its attraction may be sufficient to balance the former discrepancies are as follows:

Average density of the inner portion, extending from the sun to  $0.24X$ , the distance of the earth  $= 2.52 \times 10^{-11} X$ , the sun's density;

Average density of the outer portion, extending from the sun to  $1.20X$ , the distance of the earth  $= 2.52 \times 10^{-11} X$ , the sun's density. Average density of the outer portion, extending from the sun to  $1.20X$ , the distance of the earth  $= 0.0026 \times 10^{-11} X$ , the sun's density.

**ZOE**, *zōē* (Gr. *Zōē*), empress of the East: b. about 978; d. 1050. She was the daughter of Constantine VIII, and became the wife of Romanus III in 1028. In 1034 Romanus was put to death by Zoe and Michael the Paphlagonian, whom she married and raised to the throne as Michael IV. The latter dying, was succeeded by his nephew, Michael V, who was deposed by the people in 1042. Zoe and her sister Theodora were then proclaimed joint sovereigns. She displayed great ability and firmness in the government, and in 1042 married Constantine IX,

Monomachus, who supplanted Theodora. She reigned till her death.

**ZOETROPE**, an optical instrument used as a mechanical top, depending, for its interest, on the constancy of visual impressions. It consists of a rotating drum, open at the top, in which around its inner periphery are placed strips of paper, having figures of men, animals, etc., in varying positions. By turning the cylinder the images are seen through slots in its upper side, giving the effect of action to the figures.

**ZOFFANY**, *tsōf'fā-nī* (properly **ZAU-FELBY**), Johann, British painter: b. Ratisbon, 1733; d. London, 11 Nov. 1810. He was a pupil of Speer at Ratisbon, but at 13 ran away to Italy, where he studied for 12 years. In 1758 he went to England, where he first attracted attention by a portrait of Garrick, and soon won considerable reputation, becoming one of the original members of the Royal Academy on its foundation in 1769. He was sent by George III to Italy, where he remained in 1772-79, and among other paintings executed 'The Tribune of Florence,' one of his most celebrated works. In 1783-90 he engaged in painting in India; and the last 20 years of his life he spent in England. Among his further paintings are 'Earl of Barrymore'; 'Foote'; 'Weston'; 'Members of the Royal Academy'; 'Tiger Hunt'; and 'Embassy of Hyder Beg.'

**ZOGBAUM**, Rufus Fairchild, American artist: b. Charleston, S. C., 28 Aug. 1849. He studied at the Art Students' League 1878-79 and in Paris with Léon Bonnat in 1880-82, made extensive study of European armies in field and garrison, and later became known as a leading delineator of military and naval subjects, which he renders with scrupulous fidelity to the various points of detail. His publications, written and illustrated by himself, are 'Horse, Foot and Dragoons' (1887); 'All Hands' (1897); 'Ships and Sailors' and 'The Junior Officer of the Watch' (1908).

**ZOHAR**, *zōhār*, the Bible of the Kabbalists, long revered by Jewish mystics and regarded by some as higher than the Bible and the Talmud, but proved a clever forgery. The secret science of the Kabbala received a marked development at the beginning of the 13th century, when a mystic, Ezra or Azriel (b. 1160; d. 1238), compiled a work called 'Brilliance' ('*Bahir*'). In an atmosphere of reputed miracles and a new Messiah, there appeared some years later the most famous Kabbalistic book of the time—the 'Zohar,' or 'Splendor.' It was offered as the work of Simon ben Jochai, a sage of the 2d century, of whom many legends are told. He is said to have spent years in solitude, a hermit receiving special revelations. It was claimed that for over a thousand years the 'Zohar' had been concealed in a cave in Galilee and had been at last brought to light. The literary forger who 'discovered' the 'Zohar' was Moses of Leon (b. Leon, about 1250; d. Arvalo, 1305), who employed an Aramaic idiom to give the book an air of antiquity, and with such skill that Jew and Christian alike were deceived and some even to-day attribute to it hoary age. Yet his widow declared that it was a forgery.

The character of the 'Zohar' can hardly

missed as unique in literature, with its tastic, imaginative and emotional elements. A medley of spirituality and coarseness, a combination of intellectuality and grossness whose influence has been far-reaching whose adherents have numbered hundreds of thousands. It is a work without method, a profusion of impressionist commentary on the Pentateuch, half homily, half meditation, dwelling on the "higher" sense of Scripture and using every opportunity for vague and mysterious interpretation. Hence the moral perversion that abound, the blasphemy and absurdities, the pre-existence of the soul is assumed, paradise and hell are alike depicted, the degrees of sin described with painful minute-Messianic speculations indulged in, and the doctrine favorable to the dogma of the Trinity degraded, while communion with departed spiritual hosts and angels completes the picture of nonsensical speculation. Such a situation is rare in the history of Judaism as has been productive of much harm. Its grossness has nourished gross superstitions and strengthened the belief in ghosts and evil spirits; its mode of interpretation has degraded the study of the Bible and spread the wildest superstitions. At one time it was high in favor with the rabbis, when the Talmud was condemned in the flames, but it was later included in the Index Expurgatorius. Its occasional Christian elements were not overlooked by Christian scholars. Giovanni di Mirandola (1463-94) and Reuchlin (1522) both made the 'Zohar' the basis of their vindication of Jewish literature. Its mystical influence, however, was not long retained. It developed a few "saints" and "miraculous" spurious Messiahs and the like, but has had no successor. In absorbing the ideas of the earlier Kabbalistic literature, it has given birth to germs for further development. (See ZOHAR AND JUDAISM). Consult Graetz's 'History of the Jews' (Vols. III and IV); Abrahams' 'Jewish Literature' (pp. 172-175).

**ZOÏLUS**, zōi-lūs (Gr. Ζωίλος): b. about 320 B.C.; d. about 320 B.C. Thracian rhetorician, remembered for the asperity of his criticisms on the poems of Homer. An account of his career is given by Vitruvius, which is self-consistent, and states that he lived about 47 B.C. He is said to have been a pupil of Isocrates, to have been eminent before the time of Socrates, and to have continued to write during the reign of Alexander. Vitruvius reproaches him as seeking the patronage of Ptolemy I Soter. Heracleides says he was originally a Thracian slave. He is reported by Vitruvius to have died a violent death. The nature of his attacks on Homer procured him the title of *Homeromastix* ("The Scourge of Homer"). He also attacked Plato and Isocrates. He is said to have censored Homer principally for mixing fabulous and incredible stories into his poems. He has the reputation of a captious and unjust critic, so that his name became a synonym for such, but Dionysius of Halicarnassus places him in the highest rank. Consult Herodotus, 'De Zoïlo' (1888-89).

**ZOISITE**, a mineral closely related to epidote, named by Werner in 1805 in honor of Johann von Zois who discovered it. It is a ortho-silicate of calcium and aluminum,  $\text{Ca}_2\text{Al}_2\text{Si}_2\text{O}_{10}$ .

The aluminum is sometimes partly replaced by iron, the mineral thus approaching epidote in composition. Though its crystals are orthorhombic, their form is very similar to the monoclinic epidote. Its hardness is 6 to 6.5 and specific gravity about 3.3. Its color is usually dull gray or brown, but in the variety "thulite," found in Norway, it is a beautiful rose pink. It is found in many European localities, also abundantly in the New England States, Pennsylvania, and North Carolina, and in exceptionally good crystals at Ducktown, Tenn.

**ZOLA**, zō'la (Fr. zō-lā), **Émile Edouard Charles Antoine**, French novelist; b. Paris, 2 April 1840; d. there, 29 Sept. 1902. He was educated at the College of Aix, from which he went to the Lycée Saint Louis at Paris with a scholarship in 1858. His career there was undistinguished, and he left in 1860 after failing to take his degree owing to insufficiency in literature. After a brief experience as a clerk in a business house he was for more than a year compelled to sound the lowest depths of poverty in Paris, but in 1861 he obtained employment as a shopman with MM. Hachette, the publishers, at a salary of about five dollars a week. He devoted his spare time to literary work, contributing short stories to the *Petit Journal* and *La Vie Parisienne* and critical articles to the *Salut Public* of Lyons and afterward to Villemessant's journals, *L'Événement* and the *Figaro*. Several of his stories were published separately in the volumes 'Contes à Ninon' (1864), which contain some of his best and purest work, and which were followed in 1874 by 'Nouveaux Contes à Ninon.' Some of his critical articles were collected under the title 'Mes Haines' (1866). In 'La Confession de Claude' (1865), a novel in which he utilized his early struggles, we find him already in full progress toward the characteristic work of his maturity, and this tendency became still more marked in the immediately succeeding novels: 'Le Vœu d'une Morte' (1866); 'Les Mystères de Marseille' (1867); 'Thérèse Raquin' (1867), a powerful study of the effects of remorse following on adultery and murder; and 'Madeleine Férat' (1868). Having by this time gained a secure footing in the world of letters, he conceived the plan of the series of novels known as 'Les Rougon-Macquart' (1871-93), which includes his best-known work and occupied him for nearly a quarter of a century. It is described as an 'histoire naturelle et sociale d'une famille sous le second empire,' and consists of 20 works dealing with different phases of modern life, not always strictly that of the Second Empire, but rather that of the Third Republic. The particular departments of life treated in the volumes were studied by Zola in the spirit of a scientific observer, but of one with a decided bias toward the portrayal of moral filth and disease; and the bond of connection which constitutes them a series is the persistence under various forms in all the members of the Rougon family of a moral taint which is transmitted in accordance with Zola's views of heredity. The series consists of the following works: 'La Fortune des Rougon' (1871); 'La Curée' (1874); 'La Conquête de Passans' (1874); 'Le Ventre de Paris' (1874), treating of the Paris markets;

'La Faute de l'Abbé Mouret' (1875), whose subject is clerical celibacy; 'Son Excellence Eugène Rougon' (1876); 'L'Assommoir' (1877), a powerful but revolting study of the effects of drunkenness and idleness, the first great success of the series; 'Une page d'amour' (1878); 'Nana' (1880), a coarse picture of courtesan life; 'Pot-Bouille' (1882); 'Au Bonheur des Dames' (1883), dealing with the great shops of Paris; 'La Joie de Vivre' (1883); 'Germinal' (1885), treating of the life of French miners; 'L'Œuvre' (1886), in which he dissects literary and artistic decadents; 'La Terre' (1888), a study of the French peasantry in which prurient naturalism reaches the zenith of repulsiveness; 'Le Rêve' (1888); 'La Bête Humaine' (1890), treating of railways; 'L'Argent' (1891), dealing with stockbrokers and company promoters; 'La Débâcle' (1892), a powerfully realistic picture of military life in connection with the Franco-German war and the break-up of the Second Empire; and 'Le Docteur Pascal' (1893), in which the whole is brought to a conclusion. Immediately after completing this huge undertaking he started the 'Trois Villes' series, consisting of 'Lourdes' (1894), 'Rome' (1896), and 'Paris' (1898), in which he portrays the spiritual development of a priest, Pierre Froment, out of miraculous Christianity through a sort of social Catholicism into a creed of justice and labor. In the incomplete tetralogy entitled 'Les Quatres Evangiles' ('The Four Gospels') he proposed to formulate his social gospel. The first volume is 'Fécondité' (1900), whose hero, Mathieu, is the son of the hero of the preceding series. The second volume, 'Travail' ('Labor,' 1901), has a hero named Luc; and of the remaining two, 'Vérité (Truth) and 'Justice,' whose heroes were to be named after the other two evangelists, the former was appearing at the time of his death. In the eyes of English readers Zola appears best in his short stories, of which, in addition to those already mentioned, collections entitled 'Le Capitaine Burle' (1882), and 'Nais Micoulin' (1883) have been published. His famous story of 'L'Attaque du Moulin' forms part of the volume of 'Soirées de Médan' (1880), to which Maupassant and other friends also contributed. He defended his view of the nature and function of literary art and collected many critical articles in several works. Several of his novels were dramatized by himself and others, and he also wrote for the stage 'Les Héritiers Raibourdin' (1874), and 'Le Bouton de Rose' (1878), but none of them, except 'L'Assommoir' (1881), known in Charles Reade's English version as 'Drink' (1879), were at all successful. On 13 Jan. 1898, Zola, convinced of the innocence of Captain Dreyfus, (q.v.) went chivalrously to the defense of that officer in a letter 'l'Accuse' published in *L'Aurore*. In it he arraigned the government for the irregularities of Dreyfus's trial, making charges that practically forced the government to prosecute him, an expedient that achieved its purpose in reopening the Dreyfus case and led to the complete vindication of that officer. Zola was tried in February 1898 and a verdict imposing imprisonment and fine was brought against him. He appealed the case and the verdict was quashed by the Cour de Cassation, 2 April 1898. A second trial was called and Zola, his purpose

accomplished, decided not to appear, but went to England where he remained until the amnesty for offenders connected with the Dreyfus case, 24 Dec. 1900, permitted his return to France. His account of his connection with the case is given in 'L'affaire Dreyfus. La vérité en marche' (1901). He was created a knight of the Legion of Honor in 1888 and an officer in 1893, but after his condemnation in 1898 his name was removed from the roll. He was president of the Société des Gens de Lettres in 1891-94, but he was repeatedly refused admission to the Academy. Zola was the recognized head of the naturalistic school in fiction, but his followers were latterly few in number. His novels belong rather to the domain of science than to that of art. They are studies, in the main faithful enough though not free from distortion and exaggeration, in moral and social pathology; but they are not true to life and nature in the fullest sense, in the only sense which would entitle them to rank as artistic creations. Translations of the most important have appeared, chiefly by Vizetelly. Consult Brunetière, 'Le Roman Naturaliste' (1883); R. H. Sherard's highly eulogistic biographical and critical study (1893); 'La Procès Zola' (2 vols., 1898; Eng. trans. 1898); Vizetelly, E. A., 'Emile Zola, Novelist and Reformer' (1904); and his 'Letters' (1908).

**ZOLLARS, Ely Vaughan**, American educator: b. near Lower Salem, Washington County, Ohio, 19 Sept. 1847; d. Warren, Ohio, 10 Feb. 1916. Graduated from Bethany College, West Virginia, in 1875, he was pastor of the church of the Disciples of Christ at Springfield, Ill., in 1885-88, and in 1888-1902 was president of Hiram College (Ohio). He was president of the Texas Christian Union in 1902-06; and from 1906 was president of Phillips University. His writings include 'Holy Book and Sacred Day' (1893); 'Bible Geography' (1894); 'Great Salvation' (1895); 'Hebrew Prophecy'; 'The King of Kings'; 'Word of Truth'; 'The Commission Executed'; 'Sermons,' etc.

**ZOLLICOFFER, zöl'f-köf-ér, Felix Kirk**, American soldier: b. Maury County, Tenn., 19 May 1812; d. near Mill Springs, Ky., 19 Jan. 1862. He entered the printer's trade, published a weekly newspaper at Paris, Tenn., for about a year, and afterward was editor of the *Observer* at Columbia, Tenn., his duties being temporarily interrupted by his service in the Seminole war, in which he rose to be a commissioned officer. At Columbia he also published and edited an agricultural weekly. He became editor of the Nashville *Banner*, the leading Whig organ of Tennessee, in 1841; in 1844-49 was State comptroller; and in 1853-59 was a representative in Congress. In 1861 he entered the Confederate army with brigadier's rank. He was in immediate command at the battle of Mill Springs, on the Cumberland, when Thomas drove the Confederates from the field, and achieved the first real victory for the National cause. Zollcoffer was killed within the Union lines, whether he had passed by mistake while on a tour of reconnaissance.

**ZÖLLNER, tsél'nér, Johann Karl Friedrich**, German physicist and astronomer: b. Berlin, 8 Nov. 1834; d. Leipzig, 25 April 1882. Educated at Berlin and Basel, he became a

lecturer in the University of Leipzig in 1865, in 1866 professor extraordinary of physical astronomy, and in 1872 professor ordinary. He made numerous contributions to astronomical science. These included the determination of the reflective capacity (albedo) of many planets and a study of their thermal conditions; photometric investigations of the Mercurian phases; and a study, through observation, of the intensity of solar radiations at their source, of the solar temperature. His 'Grundzüge einer allgemeinen Photometrie des Himmels' (1861) contained the description of a new instrument, the astrophotometer, for the measurement of the light and color of stars. To the publications of the Royal Saxon Scientific Society he furnished many papers on the physical constitution of the sun and stars; and he constructed spectroscopic instruments. 'Ueber die Natur der Kometen' (1872; 3d ed. 1883) expounded the theory that the brightness of comets is due not to the fact that they are incandescent through heat but that they are glowing with electricity. Zöllner was latterly interested in spiritualism. Among his further volumes are 'Photometrische Untersuchungen' (1865), and 'Ueber die universelle Bedeutung der mechanischen Principien' (1867). 'Wissenschaftliche Abhandlungen' (4 vols., 1878-82). Consult the study by F. Körber (Berlin 1899), and Clerke, A. M., *History of Astronomy in the 19th Century* (London 1908).

**ZOLLVEREIN**, tsöl'fër-in ('customs-union'). The feeble German Confederation formed in 1815 failed in many respects to meet the desire for union among the German people, or even to satisfy their practical requirements. The trade of Germany in particular suffered much from the obstructions caused by the different customs systems of so many petty states. In 1818 Prussia took the initiative of abolishing internal customs, but this policy excited much opposition among the other German states, and even on the part of the Bund itself, which was indeed to some extent justified by the coercive measures used by Prussia to enforce the adoption of its policy on the smaller German states within its bounds. Prussia offered to admit the other German states within its union, but many of them preferred to set up rival and antagonistic associations. Thus Bavaria and Würtemberg formed a customs league in 1827, and Hohenzollern joined these states in 1828. In the same year was formed the Middle German Union, including Saxony, Hanover, Hesse, Brunswick, Nassau, Oldenburg, Bremen, Frankfort-on-the-Main, etc., and in 1834 another union (Steuerverein) between Hanover, Brunswick, Schaumburg-Lippe, and which was joined by Oldenburg in 1836. But these hostile unions were not sufficiently extensive to have any great vitality, and they were gradually disintegrated by the desertion of their individual members to join the Prussian union. Electoral Hesse joined in 1831; Bavaria, Würtemberg, Saxony, and other states in 1833; Hesse-Homburg, Baden, and Nassau in 1835; Frankfort in 1836; Luxemburg in 1842; Hanover, Oldenburg, etc., in 1851. During the treaty period of 1854-65 nearly all Germany, with the exception of Austria, the two Mecklenburgs and the Hansetowns, was included in the union. A difference of views between the various parties to the union began at this time

to develop, which caused much tedious negotiation. In general the north of Germany was in favor of imposing import duties on foreign trade for purposes of revenue only, while the south favored protective duties. As each member of the Zollverein had an equal voice in the direction of a common policy it was impossible to adjust these differences so as to satisfy the more powerful states, particularly Prussia. Austria also wished either to be included in the union or to break it up. Matters continued substantially in the same state after the renewal of the treaty from 1 Jan. 1866 to 31 Dec. 1867; but the war of 1866 put an end to this agreement and new arrangements were entered into according to the political combinations then formed, Prussia obtaining a preponderating influence in the union of 1867, which included the North German Bund, Bavaria, Würtemberg, Baden, Hesse (south of the Main) and Luxemburg. It was directed by a Zollbundesrath and a Zoll Parliament. The total number of votes in the Zollbundesrath was 58, of which Prussia had 17. This arrangement, formed for 12 years, was also brought to an end prematurely by the formation of the German Empire. By article 33 of the constitution of the empire the territory included in the Zollverein is to coincide with the territories of the empire, with a few exceptions noticed below. The powers of the Zollbundesrath and Zoll Parliament are transferred to the legislative bodies of the empire, and the affairs of the central bureau of the Zollverein are transferred to committees formed by the Federal Council of the empire. The territories of the free ports of Hamburg and Bremen were for some time excluded from the Zollverein and some communes of the grand duchy of Baden and a fragment of Hamburg were still excluded from it; while Luxemburg and the Austrian commune of Jungholz were included in it up to the fall of the empire in November 1918. Consult Ashley, W. L., *Modern Tariff History: Germany, United States, France* (2d ed., London 1910); *Cambridge Modern History* (Vols. X, XI, New York 1909); Dittmar, *Der deutsche Zollverein* (Leipzig 1867); Worms, *L'Allemagne économique au histoire du Zollverein allemand* (Paris 1874). See **GERMANY**; **WAR**, **EUROPEAN**.

**ZOLNAY**, George Julian, American sculptor: b. Pecs, Hungary, 4 July 1863. Although educated for the diplomatic service, he eventually entered the Royal Art Academy of Bucharest and later the Imperial Academy of Fine Arts of Vienna, graduating with highest honors from both institutions. In 1894, after his work at the Columbian Exposition of Chicago, he settled in New York City where he won national reputation through his *Tympanum* and *Poe* bust for the University of Virginia; the *Winnie Davis Memorial* (Richmond, Va.); decorative figures for the *Nashville Centennial*; the monuments to *General Bartow* and *McLaws* (Savannah, Ga.); the *Soldier Monument* for *Owensboro, Ky.*; the *Duncan Jacob Memorial* for *Louisville, Ky.*, and a large number of portrait busts.

In 1903 he was appointed director of the sculpture exhibit at the *World's Fair* in *Saint Louis* and professor of sculpture and perspective at *Washington University*. He resigned in 1909 to become director of the new *University City*

Art Academy. There he produced the heroic size granite group for the United States Custom House in San Francisco; the Sam Davis and Soldier Monument for Nashville, Tenn.; the Hayes Memorial for Richmond, Va.; two colossal lions for University City; the Laclède Monument for Saint Louis; portrait busts of Emperor Francis Joseph, Victor Hugo, Gen. Stonewall Jackson, Major Rollins, Clara Hoffman, Walter Sheldon and others. In 1913 he transferred his studio to Washington, D. C., where he has since produced the Saint Louis Confederate Monument; the great Industrial Monument for New Bedford, Mass.; a large educational frieze for the National Capitol's new high school; the Hoxie Memorial for Arlington cemetery; a number of portrait busts, and the Dr. Still Monument for Kirksville, Mo. He was president of the Saint Louis Artist's Guild, Vice-president Society of Washington Artists, Union Internationale des Arts et Sciences of Paris. He has won four bronze, one silver and three gold medals and was decorated by the king of Rumania with the Order Pour le Merit of the first class.

**ZOMBOR**, zöm'bör, or **SOMBOR**, Hungary, a town of the comitat of Bács-Bodrog, on the Baczer or Franzens Canal, which unites the Theiss with the Danube, 65 miles southwest of Szegedin. It has two Greek churches, a magnificent town-house, and a public library, and carries on manufactures of silk. There is a large trade in cattle and corn. Pop. 30,552.

**ZONA LIBRE**, só'nä lě'brä, formerly the designation of a strip of country extending along the whole northern frontier of Mexico, 20 kilometres wide, where imported goods were admitted at 10 per cent of the ordinary duties for use within the zone. This zone was first established on the frontier of the state of Tamaulipas alone, in 1858, and was not extended across the whole frontier until 1885. At one time after the Civil War, the United States authorities claimed that the privileges permitted within the zone encouraged smuggling; the Mexican government claimed that the conditions of retail trade made the zone a necessity; opposition to the zone, however, continued among competing manufacturers in the interior of Mexico and the zone privileges were at length eliminated.

**ZONARAS**, Joannes, Byzantine historian of the first half of the 12th century A.D. He filled some distinguished offices about the imperial court, but gave himself up to a religious life as a monk of Saint Basil, employing his leisure hours in the compilation of a 'History of the World from the Earliest Periods to the Year 1118.' In this work (of which an edition appeared at Paris in 1686) he follows principally the narrative of Dio Cassius, of whose first 20 books nothing is extant save Zonaras' abstract; but as he approaches his own times he becomes more entitled to attention, as his mistakes arise evidently more from ignorance than design. There is also extant a commentary on the apostolic canons by him. There is an edition of the 'History' by Pinder (1841-44), with a third volume by Büttner-Wobst (1897). His 'Chronicon' was edited by Dindorf (Leipzig 1868-75). Consult Krumbacher, Karl,

'Geschichte der byzantinischen Litterature' (2d ed., Munich 1897).

**ZONE**, the term applied to any portion of the earth's surface bounded by two parallels of latitude, but more particularly applied to five such zones, the position of which is marked by natural boundaries. These five zones are called the torrid, northern and southern temperate, and northern and southern frigid zones. The torrid zone extends  $23\frac{1}{2}^{\circ}$  north and south of the equator; and twice a year the sun shines vertically on its inhabitants. This zone is bounded, on both sides of the equator, by the two tropics; that is, the circles in which the sun reaches its greatest distance from the equator. As the rays of the sun here are nearly vertical a perpetual summer reigns, and day and night under the equator are always equal; and even at the tropics the difference is scarcely an hour. Owing to the nature and situation, however, of the countries in this zone the heat is not everywhere the same. The warmest portions are the sandy deserts of Africa; in the regions nearer the equator where vegetation prevails the heat is less excessive; in the islands of the South Seas a milder climate prevails, and the highest mountains of Peru and equatorial Africa are covered with perpetual snow. The two temperate zones extend from the tropics to the polar circles. They contain the most populous countries, and the climate is various. As the distance from the tropics increases the heat under similar conditions diminishes, the difference of the seasons becomes greater, the days and nights become more unequal until we arrive at a point where once a year the sun does not appear above the horizon during the 24 hours, and once a year does not set for the same time. The circles passing through these points, parallel to the equator and the tropics, form the limits of the temperate zones, and are called the arctic and antarctic circles. The distance from the tropics to the polar circles, or the breadth of the temperate zones, both in the northern and southern hemispheres, is  $43^{\circ}$ . All beyond the polar circles to the poles is called the frigid zones. The distance from the polar circles to the poles is  $23\frac{1}{2}^{\circ}$ . The characteristic of the frigid zones is, that day and night are more and more unequal the nearer you approach the poles, and for days, weeks and even months the sun is either constantly above or constantly below the horizon. At the poles the year consists of one day and one night each six months long.

**ZONE OF FLOWAGE.** See ROCK-FLOWAGE.

**ZONE OF FRACTURE.** See ROCK-FLOWAGE.

**ZOOGEOGRAPHY**, the science of mapping out the surface of the earth with reference to its faunæ; the study of the distribution of animal life. It has always been obvious to travelers, and even the most superficial students of nature, that the various regions of the earth's surface were characterized, among other differences, by local peculiarities in animals and plants. It is a commonplace of knowledge that the animal life of the tropics is different from that of the arctic regions; that the birds and mammals and small creatures of Africa differ

almost altogether from those of South America or Australia. Closer examination shows that such differences exist in a greater or less degree between lesser regions, as the east and west sides of a continent, groups of islands separated by a sea-space, and so forth. On the other hand, there may be found striking resemblances in the faunæ of certain separate regions, or a sameness over an extensive area, as Europe and Asia.

The importance and significance of these facts impressed themselves upon scientific men only within recent times. As long as it was held that each species must have been created, as a general rule within the geographical area which it now occupies, the most curious facts of distribution could be regarded only with "sterile wonder." But when the idea came to be entertained that allied species have had a common origin, it was obviously implied that they or their ancestors must have had a common birthplace, and consequently, when we find members of a group severed from their nearest kindred, we feel bound to inquire how this came about. Thus, we have to explain how the tapirs are confined to the Malayan region and South America; the camels to the deserts of Asia and the Andes; marsupials to the Australian region and America; how the birds, mammals and reptiles of North America resemble those of Europe more than those of South America and so on.

**Means of Dispersal.**—Accepting as a starting point the proposition that the various forms of life originated in some parent-stock or stocks at a particular place or places, the present distribution of their descendants as we know them, must depend mainly upon the powers of dispersion which each possessed, and the character of the physical influences and obstructions which acted as controlling factors or barriers in guiding their dispersal along certain lines and altogether prevented it elsewhere. Theoretically a new stock would spread equally in all directions from its point of origin; actually a very irregular and complicated kind of distribution has ensued in most or all cases. Hence an inquiry as to the means and limitations of dispersion possessed by animals and plants is of first importance.

It is scarcely necessary to draw attention to the facilities for diffusion possessed by animals endowed with great locomotive powers, and especially among land animals, by those having the power of flight (q.v.); but it is important to note that some animals, which in the adult state have only feeble powers of locomotion, are better endowed in this respect when young. Such, for example, is the case with echinoderms, marine mollusks and similar lowly aquatic forms, all of which develop from free-swimming and often far-drifting larvæ. (See DEEP-SEA LIFE). But accidental modes of dispersal must also be taken into account. The carrying power of winds is known to be sufficient to bear along in the air fine dust across seas many hundreds of miles in width, and we have in that agency alone an adequate means of accounting for the dispersion of all plants propagated by minute spores. For that reason the distribution of most cryptogamic plants hardly enters into the problem, since these mosses, fungi, seaweeds and the like are almost

universal. What part winds may have played in carrying the seeds of flowering plants is more doubtful; but observations show that even for such seeds, especially when provided with some kind of feathery appendage, winds may occasionally serve as a means of transport for very long distances. See PLANT GEOGRAPHY; PLANTS, MIGRATION OF.

But in the case of animals also, winds are a more important means of transport than one might at first suppose. Birds and insects are often blown immense distances out of their course; and to this cause, for instance, is due the arrival every year of American birds on the coasts of Great Britain and France, while European birds almost never reach America—a fact plainly due to the prevalent easterly direction of the winds, and especially the gales in spring and autumn, when birds are migrating. Insects have been caught on ships more than 300 miles from land. Further, there are well-authenticated cases of even crabs, frogs and fishes being carried long distances by storms, and in this way it is possible to account for the transference of fish, etc., from one river system to another. Still more frequently, in all probability, are the eggs of such creatures transported by this means.

Next, marine currents also form, beyond doubt, a highly important means of dispersal both for plants and animals, and that in various ways. First, seeds may float on the surface of the ocean, and be carried by currents hundreds of miles, and become stranded on a distant shore still in a condition fit for germination. The experiments of Darwin to determine the vitality of seeds in sea-water first enabled us to appreciate the importance of this factor. Further, marine currents often carry on their surface various kinds of natural rafts, which may transport both plants and animals. In the polar regions icebergs and icefloes may serve this purpose; and elsewhere trunks of trees, and even fragments torn from the land. Such fragments, forming small islands with erect trees upon them, have been seen at a distance of 100 miles from the mouth of the Ganges and other rivers. Wallace points out that ocean waifs of one kind or another are almost the only means we can imagine by which land-shells can have acquired the wide distribution for which they are remarkable. Again, locomotive animals are very frequently the means of dispersing both plants and other animals. Seeds may be attached to the fleece or fur of mammals or the plumage of birds, or may be enclosed in clumps of earth clinging to the feet or some other part of bird or beast, even of insects. It seems probable that aquatic birds and water-beetles have been the means of distributing aquatic plants and freshwater mollusks, which are remarkable for their wide diffusion; and the spawn of amphibians and freshwater fishes may be conveyed from one body of fresh water to another by the same means.

Lastly, man is often unintentionally the means of conveying both plants and animals from one region to another. The foreign plants found growing on ballast heaps near every civilized port are instances of this, and so, also, are the plants which have sprung from seeds introduced with imported grain and

merchandise. The whole costal region of North America is overrun with European weeds. Wherever European ships have gone the rats and other vermin of the Old World have accompanied them, and hundreds of species of exotic injurious insects are known in all agricultural districts.

**Obstacles to Diffusion of Animals.**—For all land plants and land animals the most obvious and effective barrier is a wide expanse of ocean; and where the expanse is very wide it is seldom passable except with the aid of man. For land mammals the ocean is an absolutely impassable barrier, and hence native mammals are always absent from oceanic islands (that is, islands that have never been connected with the mainland); and this barrier is almost equally effective for serpents and amphibians, which also are nearly always wanting where there are no native mammals. Lizards are more frequently found indigenous on oceanic islands, though their means of transit from the mainland is unknown. Arms of the sea and broad rivers are likewise generally impassable for the creatures mentioned, though some of them have greater powers of swimming than is generally supposed. The tiger, the jaguar, the bear and the bison are capable of swimming the widest rivers; pigs have been known to swim ashore when carried out to sea to a distance of several miles; and even a boa constrictor, it is said, has swum to the island of Saint Vincent from the South American coast—a distance of 200 miles.

Mountains, and especially high mountains, are also frequently effective barriers to the migration of land plants and animals; but in some cases they enable plants and animals of a cold climate to spread along their summits into latitudes where, in the plains, the climate is too hot for them. Again, deserts act as a barrier to the majority of plants and animals; forests are a barrier to the camel, hare, zebra, giraffe, etc.; treeless regions to apes, lemurs and many monkeys; plains to wild goats and sheep. Broad rivers also act occasionally as barriers to distribution, and that, strange to say, even in the case of some species of birds.

Another important barrier is that of climate; but climate merely limits the range of a species or group within a continuous area, for example, through limiting the food supply by restricting vegetation. The range of insects is peculiarly liable to be limited in this way, certain insects being attached to particular species of plants, or at least to genera or families; and for this reason insects, in spite of the exceptional facilities for dispersal which many of them enjoy, are remarkable, as a rule, rather for the restriction of their areas of distribution than for their wide diffusion. Various other minor factors might be mentioned.

But a more generally operative organic barrier consists in the fact of a region being already fully occupied by a native flora and fauna, so that there is no room for newcomers. Hence it happens that seeds may be wafted in plenty from one country to another without a single plant growing from these seeds being able to establish itself; and there may even be, as in South America, a free communication with another region while the fauna remains strikingly distinct, simply because that

portion of the American continent is already completely stocked with a fauna perfectly adapted to the physical conditions there prevailing.

The barriers to the spread of marine creatures are not so numerous as in the case of terrestrial forms. The freedom of communication between one part of the ocean and another makes it impossible to mark out any marine zoogeographical regions, though many seas and coasts are distinguished by characteristic fishes and other marine creatures. There is also in the ocean a vertical distribution, the limits of which are determined by depth and its conditions. The principal barriers for fish are temperature and the intervention of land. Thus, the Isthmus of Panama is at present a complete barrier for fishes requiring warm seas.

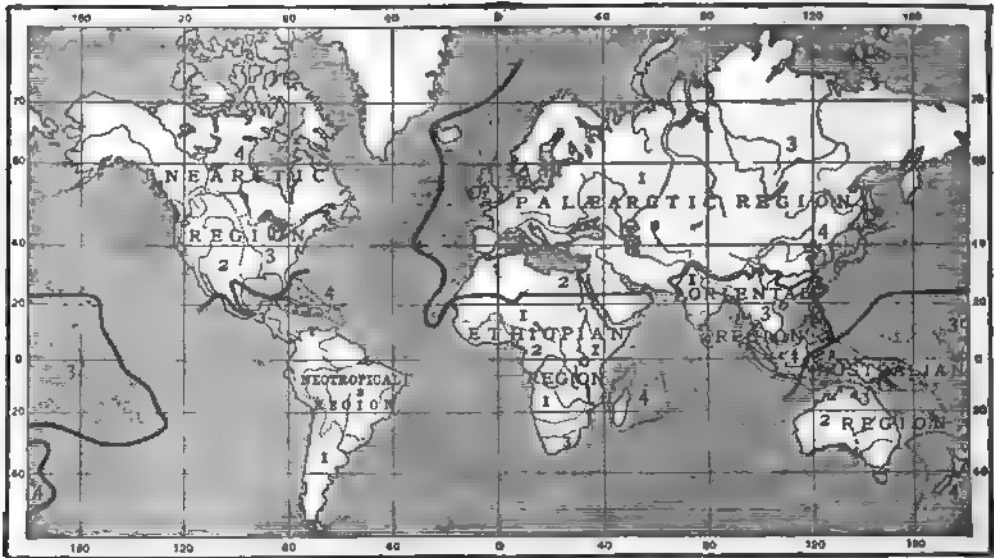

**Geological Evidence.**—If all the barriers to migration had existed in all past time as they are now, it would be quite impossible to explain the present distribution of plants and animals on the supposition that kindred groups have had a common birthplace. But the solution of the problems of distribution is to be found in the fact that all the barriers are liable to change. Of changes of sea and land geology supplies us with abundant evidence. Portions of the mainland now continuous were at one time severed by arms of the sea; and islands have been formed by the severance of portions of land that once belonged to the mainland. Such islands are known as continental islands, and the study of their fauna and floras is one of peculiar interest in connection with geographical distribution. These fauna and floras show, as might be expected, a greater or less degree of correspondence with those of the mainland from which the islands have been cut off; and the resemblance is the closer the more recently the land connection has been destroyed. The relative date of the disunion is usually approximately indicated by the depth of the sea which now separates island and mainland, shallow seas dividing portions of land that have only recently been disconnected, and deeper seas separating those which have been longer apart.

The most remarkable case of isolation is presented by the Australian region, the fauna and flora of which are the most peculiar in the world. In the widest sense, this region includes not only the vast island of Australia itself, but also New Guinea and all the Malayan and Pacific islands to the east of a deep channel between the islands of Bali and Lombok—a channel the significance of which, as a boundary line for plants and animals, was first pointed out by A. R. Wallace, the great authority on animal distribution, and hence known as Wallace's Line. The great feature of this region (so far as animal distribution is concerned) is "the almost total absence of all the forms of mammalia which abound in the rest of the world, their place being taken by a great variety of marsupials." This presents one of the best examples of what are known as discontinuous areas of distribution, and offers an illustration of the mode in which such discontinuity is usually brought about. The early severance of the Australian region from the Asiatic continent (in the Mesozoic

Age) saved the Australian marsupials from the competition which almost extinguished the group elsewhere.

Changes in the climatic barrier have also had an important influence on geographical distribution; and it is by such changes, combined with changes in the continuity of land in the north polar regions, that the affinities between the floras of Japan and eastern North America must be explained. (See LAND-BRIDGES). When these affinities were first pointed out by Asa Gray, that distinguished botanist divined the true explanation—namely, that in former geological epochs, a genial climate must

various barriers to migration, and of the changes in these barriers, we have the present distribution of plants and animals, which is such as to enable us to divide the terrestrial surface of the globe into more or less well-marked regions. For mammals, the regions adopted by Wallace are nearly the same as those first suggested by Scater as applicable to the distribution of birds; for, in spite of the exceptional facility which birds have for crossing barriers impassable by mammals, Wallace finds that the distribution of mammals (which afford the best means of marking off zoogeographical regions) corresponds with that of birds to an extent that

The Zoogeographical Regions according to Scater and Wallace:

Sub-regions of Palearctic Region —	Sub-regions of Oriental Region —	Sub-regions of Neotropical Region —
1. European.	1. Indian.	1. Chilean.
2. Mediterranean.	2. Ceylonese.	2. Brazilian.
3. Siberian.	3. Indo-Chinese.	3. Mexican.
4. Manchurian.	4. Indo-Malayan.	4. Antillean.
Sub-regions of Ethiopian Region —	Sub-regions of Australian Region —	Sub-regions of Nearctic Region —
1. East African.	1. Austro-Malayan.	1. Californian.
2. West African.	2. Australian.	2. Rocky Mountain.
3. South African.	3. Polynesian.	3. Alleghanian.
4. Malagasy.	4. New Zealand.	4. Canadian.

have prevailed even within the polar circle, so as to allow of the existence of a remarkably uniform flora, suitable to such a climate, all round the pole in very high latitudes; and that as the climate became colder in the North this flora was driven southward, and became differentiated according to the differences of climate in the more southerly latitudes to which it advanced. Hence the eastern parts of America and Asia, as they correspond pretty much in climate, came to correspond also more closely than other tracts in the same latitude in the character of their floras. The soundness of this surmise was afterward confirmed by the discovery of abundant plant remains of the Miocene Age, indicating a warm climate in Greenland, Spitzbergen, and elsewhere. The effects on distribution of the changes of climate belonging to the Glacial Period or Ice Age may only be alluded to here.

**Zoogeographical Regions.**—As the result of all the processes of dispersal across the

one would not perhaps have previously anticipated. But with regard to these regions it must be remembered (1) that it is impossible in most cases to draw any very clearly marked boundary line between one region and another; (2) that the degree of divergence between different regions is different in different cases; and (3) that, when any two regions are compared, we have not the same degree of divergence between different groups of the animal kingdom, or between animals and plants belonging to the two regions. Obviously, the degree of correspondence depends largely on the facilities for dispersal, and largely also on the geological age of different groups; and both of these are varying factors. These considerations being premised, we may now state briefly the limits of the six zoological regions adopted by Wallace, as given in his 'Island Life.' In the space to which the present article is necessarily restricted it is impossible to give even the most fragmentary sketch of the

characteristic life of the different regions, for which the reader must be referred to the works cited at the end of the article.

(1) Palaearctic Region, including Europe and north temperate Asia and Africa to the northern borders of the Sahara.

(2) Ethiopian or Palæotropical Region, consisting of all tropical and South Africa, together with Madagascar and the Mascarene Islands.

(3) Oriental Region, comprising all Asia south of the Palaearctic limits, and the Malay Islands as far as the Philippines, Borneo and Java.

(4) Australian Region, the Papuan Islands, Australia, New Zealand, and the islands of Oceania. Celebes might be referred almost with equal right to this or the previous region. New Zealand is treated by Wallace as a highly peculiar sub-region of this great region.

(5) Nearctic Region, comprising all temperate and arctic North America, including Greenland, and extending on the south to an irregular line running from the Rio Grande del Norte on the east to a point nearly opposite Cape Saint Lucas on the west.

(6) Neotropical Region, the American continent south of this line, together with the West Indian Islands, sometimes called Neogæa.

Heilprin and others advocate the union of the Nearctic and Palaartic regions under the name of Holarctic, and introduce three transitional tracts (the Mediterranean, embracing southern Europe, northern Africa and western Asia, south of the Caspian and west of India, but exclusive of the southern half of Arabia; the Sonoran tract, embracing the northwest of Mexico; and the Austro-Malaysian tract, embracing Celebes and the smaller islands lying between it and New Guinea and Australia). Otherwise his major faunal divisions of the globe are similar to those of Wallace.

On plant distribution the most important recent works are those of Engler and Drude. Engler attempts to trace the history of the vegetable kingdom since the Tertiary period, and comes to the conclusion that already in the Tertiary period four "floral elements" (*Florenlemente*) could be distinguished, namely:

(1) The Arcto-tertiary element, characterized by an abundance of conifers and numerous genera of trees and shrubs now prevalent in North America, or in extratropical eastern Asia and in Europe.

(2) The Palæotropical element, characterized by the presence of the families and sub-families dominant in the tropics of the Old World; and still more by the absence of certain families, groups and genera found in the territory of the Arcto-tertiary element.

(3) The Neotropical or South American element, which, according to Engler, must have had in Tertiary times much the same character as that now possessed by tropical Brazil and the West Indies.

(4) The old Oceanic element, consisting of forms which possessed the power of traversing considerable stretches of ocean and developing further on islands.

The modern provinces of the vegetable kingdom are subordinated by Engler to these great divisions. Drude, in the first place, distin-

guishes the oceanic (marine) flora from the terrestrial forms, and the latter he divides into three great groups, and these again into 14 floral domains. See PLANT GEOGRAPHY.

**ZOOLOGY**, the worship of animals. This seems to have passed through three stages: (1) The animal was revered and propitiated as possessing a power greater than that of man. (2) It was regarded as an incarnation of some deity or spirit. (3) It was raised to the position of a tribal ancestor. Zoölatry had its origin in the belief of primitive man that all nature was endowed with life and that many beings were possessed of great and magical powers. Animals were believed to be especially endowed with such powers. They were also thought to have their chiefs and tribal organizations just as man had, and their great magicians who were powerful enough to bring confusion upon their enemies. Hence primitive man attempted to conciliate all the mysterious forces and powers of nature, among them, those of the animal kingdom. Out of this, through successive stages, grew animal worship, with all its attendant ceremonies, forms and incantations. In the early history of the human race zoölatry of some kind was very prevalent. Traces of it appear in the Bible, as in the story of the Golden Calf made by the Israelites (Ex. xxxii). Zoölatry took deep root in the religious life of the ancient Egyptians, and all three forms flourished among that people. Juvenal opens his 15th satire with a scathing invective of Egyptian zoölatry, and detailed accounts of it occur in Herodotus, Plutarch, Strabo and Cicero. In the present day zoölatry survives chiefly in India and among the snake-worshippers of the west coast of Africa. See NATURE WORSHIP.

**ZOOLOGICAL GARDENS**, or **PARKS**, places for the keeping and attractive display of living animals, where they may live, as far as possible, in the open air and under natural conditions; a zoological garden thus differs from a menagerie, as that term is now understood, in that in the latter the animals are confined in narrow prison-cages, under cover, and are usually borne from place to place to be displayed for a fee. Collections of captive animals have always been kept by royal and eminent persons, and formed a large element in the sights and amusements of the populace in ancient and mediæval cities. The present conception of zoological collection, as a place where animals shall be maintained in the greatest practicable freedom for the sake of exhibiting their traits to the student, and shall be regarded only secondarily as objects of curiosity, is a modern idea, and one that has been

ped to its highest degree in the United

Many large cities of the Old World "zoos," as they are popularly called, not London, Dublin, Berlin, Paris, Vienna, Amsterdam, Rotterdam, Antwerp, Hamburg, Hagen, Hanover, Cologne, Bombay, Calcutta, Tokio, Melbourne and several South American cities, especially Rio de Janeiro and Buenos Aires. All of these are the property of society or private ownership of some sort: the garden in Berlin, and that attached to the Museum of Natural History at the Jardin des Plantes, in Paris and that in Vienna. They are maintained, therefore, partly by membership contributions and partly by gate-receipts, but in all of them give free days. The sale of animals born and reared within their premises is a source of revenue with some, as, for example, the Dublin garden which has supplied a proportion of all the lions now held in captivity by circus and traveling menageries. The Berlin "zoo" stands third in the number of animals and general excellence of arrangements; that of London, founded in 1828, is only to the New York Zoological Park, the splendid series of volumes constituting the 'Proceedings' and 'Transactions' of the Zoological Society of London attest the adequate use which has been made of the collection by naturalists.

Zoological gardens have long existed in the United States, among the oldest being those at Philadelphia and Philadelphia, both privately supported and each highly creditable. To these are added collections of living animals in the city of various cities, maintained by municipal provision, among which those in Bronx Park, New York; Highland Park, Pittsburgh; Lincoln Park, Chicago; Belle Isle, Detroit, and Golden Gate Park, San Francisco, are important.

The National Zoological Park at Washington is established in 1889, in a large tract of wooded and forested land along Rock Creek in the District of Washington. Its prime purpose is to gather a representative collection of wild animals and possibly preserve from extinction species threatened with racial destruction. It has extensive and highly picturesque grounds, and its collection of animals in remarkably favorable surroundings and in an admirable condition. The support of the free park, one-half of which comes from the District and one-half from the District of Columbia, has not been sufficiently liberal to its development as rapid as its friends

the latest and foremost American zoologists. The park is that in the northern part of the city of New York, which is under the control of the New York Zoological Society, to which the donated 264 acres of land in Bronx Park, protection and various aids and immunities. It is largely financed out of municipal funds and is free to the public five days a week.

A large herd of American bison is a feature of this park. This is the largest enclosed suitable space devoted to the care and protection of animals anywhere in the world, since its opening in 1897 it has developed into the most prominent and useful position among the world's institutions of this kind. The society has about 2,000 members, and is-

issues a series of important periodical publications. This park has been developed and remains under the care of William T. Hornaday. Consult 'Annual Reports' of the Smithsonian Institution (Washington, D. C.); 'Bulletins of the Zoological Society of New York' (containing many photographs and plans of buildings and enclosures); Flower, S. S., 'Notes on Zoological Collections visited in Europe in 1907' (Public Works Department, Cairo, Egypt); 'Reference List of the Zoological Gardens of the World' (1910); Loisel, G., 'Rapport sur une mission scientifique dans les jardins et établissements zoologiques publics et privés du Royaume-Uni, de la Belgique et des Pays-Bas, et des États-Unis et du Canada, et conclusions générales' (Paris 1908); Peel, C. V. A., 'The Zoological Gardens of Europe' (London 1903).

**ZOOLOGY**, that branch of biology, or the science of living things, which treats of animals. The scope of the science may be gathered from the following enumeration of its main branches: (1) *Morphology*, which treats of the outer form and internal structure of animals, their anatomy, histology, physiology, etc.; (2) *Embryology*, or ontogeny, treating of the development of individual animals from their earliest discernible stage; (3) *Thremmatology*, treating of "breeding or propagating animals and plants under domestication, of their congenital variations under these circumstances, and of the perpetuation of such variations"; (4) *Palæozoology*, or animal palæontology, treating of fossil animals. (5) *Phylogeny*, which seeks to investigate the evolution of the various groups or types of animals; (6) *Taxonomy*, or *Systematic Zoology*, treating of the classification of animals,—their arrangement in groups determined by genetic relationships; (7) *Bionomics*, or *Ecology*, which investigates the conditions of life as a whole, habits, instincts, etc.; (8) *Zoogeography*, dealing with the distribution of animals on the surface of the earth. So comprehensive a view of zoology is a modern conception and has resulted from the conviction of the unity of organic nature and the kinship of descent which pervades the whole realm of beings, past and present. In the earlier days of the study of nature each group of animals was considered by itself, and to each such study was naturally given a name, many of which survive as convenient terms in descriptive zoology. Such are *Conchology*, the study of shells (of mollusks), and hence the study of the *Mollusca*; *Entomology*, the study of insects; *Herpetology*, the study of reptiles (popularly including amphibians); *Ornithology*, the study of birds, and so on. For detailed information upon animals and the various aspects of their instigation consult articles under their names, as birds, horse, pompano, etc.; under the technical names of groups, as Carnivora, Camelidæ, and under such terms as Ichthyology, Herpetology and the like. See also ANATOMY; ANIMAL HEAT; BIOLOGY; BIONOMICS; BREEDING; CELL; COLORATION, PROTECTIVE; DARWINIAN THEORY; EMBRYOLOGY; EVOLUTION; GROWTH; HEREDITY; HYBRIDITY; INSTINCT; LAMARCKISM; LIFE; MIGRATION; NATURAL SELECTION; ORGAN; PALÆONTOLOGY; WEISMANNISM; ZOOGEOGRAPHY and related topics.

**ZOOLOGY, History of**, the record of discovery in the science of zoology. We have no

evidence that the study of zoology was prosecuted to any considerable extent before the time of Aristotle. In his hands it became at once a science, and the foundations of a system of classification were laid. No artificial system of classification has ever been proposed in zoology, like the sexual system of Linnæus in botany; but from the very first to the present day, a natural grouping of animals has always been attempted. To this the widely-marked distinctions between the principal groups almost unavoidably led. Aristotle brought to bear on the subject the highest powers both of observation and of generalization, and some of the groups established by him retain their place in the most modern systems.

Aelian and Pliny show no capacity for the scientific treatment of the subject, and in their writings facts are largely mingled with fables. During the Middle Ages the greatest name in connection with the history of the science is that of Albertus Magnus; much of whose knowledge, however, was derived from Aristotle and other ancient authors. From his time, in the first half of the 13th century, to the beginning of the 16th, zoology made little advances; but the new activity of mind which then displayed itself soon sought this as well as other directions, and an especial impulse was given to zoology by the progress of geographical discovery. The names of Belon and Rondelet are the two greatest in this department at this period, and by them zoology was enriched with many new facts, while attempts were made at a more perfect classification. Aldrovandi and Gesner soon followed, besides others who began to direct their attention more specially to particular branches of zoology; but it was not till after the middle of the 17th century that any real progress was made in classification founded on a philosophical study and comparison of animals. The works of Ray are described by Cuvier as "the foundation of modern zoology." The materials, however, were in great part prepared, and the first outline of a system sketched by Willughby. From the days of Aristotle, zoology had never been prosecuted with such acuteness of observation, accuracy of description and breadth of philosophical generalization as it was by Willughby and Ray. The progress of the science now became very rapid. Buffon won for it, by his interesting descriptions and brilliant style, the general attention of the educated portion of society in his own and in other countries. He was almost immediately followed by Linnæus, who, extending his studies from botany to zoology, not only enlarged the science by his own observations and discoveries, but rendered it far greater service by gathering together the facts ascertained by others, and by the improvement which he effected in classification. Some of the larger groups established by Linnæus have been retained by all subsequent naturalists without essential modification of their characters, and even his smallest groups—genera—have been very generally retained, though now regarded as constituting tribes or families. According to the Linnæan system, the animal kingdom is divided into six great classes, further brought together in groups of two each. His classes are: I. *Mammalia*, with the orders Primates, Bruta, Feræ, Gliræ, Pecora, Belluæ

and Lete; II. *Aves*, with the orders Accipitres, Picæ, Anseres, Grallæ, Gallinæ and Passeres; III. *Amphibia*, with the orders Reptilia, Serpentes and Nantes; IV. *Pisces*, with the orders Apodes, Jugulares, Thoracici and Abdominales; V. *Insecta*, with the orders Colcoptera, Hemiptera, Lepidoptera, Neuroptera, Hymenoptera, Diptera and Aptera; VI. *Vermes*, with the orders Intestina, Mollusca, Testacea, Lithophyta and Zoophyta. It was, however, in constituting and defining the genera that Linnæus showed in the highest degree his powers both of observation and of arrangement. The names of Pallas, Hunter and Blumenbach particularly are worthy of notice, but more than any other the name of Cuvier, who, like Linnæus, took a comprehensive view of the whole subject of zoology and carried forward the work of minute observation as well as of generalization. His system of classification is so vast an improvement on that of Linnæus as to be almost fundamentally new, and has formed a new starting point for all further progress.

He rejected the view, held by Lamarck, that a linear classification of the animal kingdom is possible, and in his great work, 'Le Règne Animal' (1817), he grouped his classes in four embranchements, representing four fundamentally distinct types of structure. These branches, with their contained classes, are as follows: *Vertebrata*, including *Mammalia*, Birds, Reptiles, Fishes; *Mollusca*, including Cephalopoda, Pteropoda, Gasteropoda, Acephala, Brachiopoda, Cirrhopoda; *Articulata*, including Annelides, Crustacea, Arachnides, Insects; and *Radiata*, including Echinoderms, Intestinal Worms, Acalephæ, Polyphi, Infusoria. He raised comparative anatomy to the dignity of a true science, and he carried out researches of the utmost value in palæontology. In the restoration of extinct animals from remains of parts he used his law of the correlation of parts according to which animals are so constituted that single organs or parts can serve as an index to all other parts and to the general structure. The system of Cuvier has been extensively modified by many subsequent anatomists; notably Lamarck, De Blainville, Ehrenberg, Owen, Milne-Edwards, Von Siebold, Stannius, Leuckart, Agassiz, Huxley, Haeckel and others. The present state of classification must not be regarded as authoritative or final, since the rapid progress of knowledge is introducing incessant change in our conceptions of the relations of the greater groups. The reverse error must, however, be guarded against—that of supposing one classification as good as another, for each really marks a stage of progress.

Darwin and After.—The theory of the fixity of species was challenged at various times by different zoologists, notably by Lamarck, but it was not till the publication of 'The Origin of Species' (1859) by Charles Robert Darwin (1809-82) that the old view became generally abandoned and the evolution or development theory took its place. This has completely transformed the whole outlook of the zoologist and has brought new branches of the science into being, notably thremmatology. It makes the tree-like classification to which systematists have steadily advanced a truly genealogical tree, and it has contributed enormously to the progress of what may be called philosophical zool-

ogy. The natural-selection principle was independently discovered at practically the same time by Alfred R. Wallace (1823-1913), the eminent naturalist-traveler. Herbert Spencer had also formulated an evolution theory, extending to the whole of nature and life. Thomas Henry Huxley (1825-95), master of an admirably lucid and attractive method of exposition, and Ernst Hæckel (1834-), have done admirable work in embryology and other branches of zoology, and have contributed much to developing and popularizing the Darwinian views. August Weismann (1834-1914) is best known by his valuable contributions to the doctrine of heredity. The number of other zoologists who have done good work during the Darwinian period and under the influence of the Darwinian conceptions is so great that no attempt will be made to enumerate them.

**Bibliography.**—Lamarck, 'Philosophie Zoologique' (Paris 1809); Carus, 'Geschichte der Zoologie' (Leipzig 1872); Spencer, 'Principles of Biology' (London and New York 1898); Osborn, 'From the Greeks to Darwin' (New York 1894); Miall, 'Early Naturalists' (London 1912); 'Cambridge Natural History' (10 vols., New York 1895-1909); Lankester, E. R., 'Zoology' (ib. 1906); Parker and Haswell, 'Zoology' (2 vols., ib. 1910); *Zoological Record* (London, annually).

**ZÖOMORPHIC**, a word meaning, pertaining to or exhibiting animal forms. In anthropology, representing a god or other supernatural being under the form of one of the lower animals. The zoömorphie element in classic mythology appears in such cases as that of the Sminthean Apollo, and the metamorphoses of Jupiter; it is very strongly marked in the religion of ancient Egypt, and traces of it may be found among the Jews and in the Apocalypse.

**ZÖOPHYTE**, a term meaning literally animal plants, borrowed from Aristotle by Cuvier, and used by him as a synonym of *Radiata*. The term has no longer any specific value, but is often loosely applied as a designation for many plant-like animals, as sponges, corals, etc., more or less resembling plants in appearance.

**ZÖPFL**, tsöpfl, **Heinrich Matthias**, German legal scholar: b. Bamberg, Upper Franconia, Bavaria, 6 April 1807; d. Heidelberg, 4 July 1877. Educated at Würzburg, he became a lecturer at Heidelberg in 1828, in 1839 professor extraordinary of constitutional law, and in 1842 professor ordinary. He was elected university representative in the first chamber of Baden in 1850, and sat in the Unionsparliament at Elfurt. Among his works are 'Grundsätze des Gemeinen Deutschen Staatsrechts' (1841; 5th ed., 1863), and 'Deutsche Staats- und Rechtsgeschichte' (1834-36; 4th ed. as 'Deutsche Rechtsgeschichte,' 1871-72).

**ZORELLA ISLANDS**, East Indies. See XULLA ISLANDS.

**ZORGITE**, a mineral from Zorge and Tilkerode in the Harz. Massive; brittle; hardness, 2.5; specific gravity, 7 to 7.5; lustre, metallic; color, lead or sometimes yellowish gray. A selenide of lead and copper in varying amounts.

**ZORILLA**, or **ZORRILLA**, thō-rē'yā, **Manuel Ruiz**, Spanish statesman: b. Burgo de Osma, province of Soria, 1834; d. Burgos, 13

June 1895. He studied law at Valladolid and became an advocate at Madrid, where in 1856 he was chosen to the Cortes, in which he identified himself with the Progressive party, and displayed a vigorous hostility against the Neocatholics. Banished in consequence of the insurrection of June 1866, he remained in France until the revolution of 1868, when Serrano appointed him Minister of Commerce, Education and Public Works. In 1869-70 he was Minister of Justice, and later president of the Cortes. He was a supporter of Duke Amadeus of Aosta for the Spanish throne, and when the latter became Amadeus I, was made Minister of Public Works. In 1872 he assumed the head of a radical ministry, but after Amadeus' abdication retired. Upon the accession of Alphonso XII in 1875 he went to France and for 18 years was the leader of the Spanish Republicans. He was continually under the observation of both the French and Spanish secret service officers and for his participation in the military revolt of March 1884, he was sentenced to death, although still on French soil. Broken in health and spirits, he at length abandoned his leadership and was permitted to return to Spain. Consult Villareal, 'Ruiz Zorilla desde la Expulsion de España hasta su Muerte 1875-95' (1903).

**ZORN**, tsörn, **Anders Leonard**, Swedish painter: b. Utmedal, 18 Feb. 1860. He studied sculpture and painting at the Stockholm Academy. In 1882 he settled in London, where he attained special success as a portrait painter, and in 1889 went to Paris. He traveled widely in Sweden, Italy, Spain, England, the United States and elsewhere; while in the United States he painted several portraits. He ranks among the leading contemporary Swedish artists, and his work includes landscape, genre, portrait painting and sculpture, as well as etchings of great merit, which are chiefly copies of his own paintings. Among his paintings are 'Irish Maidens'; 'The Toast'; 'Italian Street Scene'; 'Summer in Sweden' (National Galleries, Berlin); 'Midsummer Night Dance at Dalecarlia' (National Museum, Stockholm); 'Nude' (Metropolitan Museum, New York), and portraits of Renan, King Oscar, King Charles of Sweden, of himself (Uffizi Galleries), Harald Wieselgren, etc.

**ZORN**, Philipp, German jurist: b. Bayreuth, 13 Jan. 1850. After study at Munich and Leipzig, he became a lecturer at Munich in 1875, and in that year went as professor to Bern. From 1877 he was at Königsberg, and in 1900 took a chair in the legal faculty at Bonn. In 1899 he participated as an expert in the Peace Conference at The Hague. Among his works are 'Staat und Kirche in Norwegen bis zum Ende des 13ten Jahrhunderts' (1875); 'Staat und Kirche in der Schweiz' (with Gareis 1877-78); 'Staatsrecht des Deutschen Reichs' (2d ed., 1894-97); 'Deutsche Kolonialgesetzgebung' (1901), and 'Die Deutsche Staatssprache' (1903); 'Die Deutsche Reichsverfassung' (1907); 'Staats- und Verwaltungsrecht' (1914), etc.

**ZORNDORF**, tsörn'dórf, Germany, a village of Brandenburg, Prussia, 53 miles north-east of Berlin. It is celebrated for the Prussian victory won by Frederick the Great over the

Russians under General Fermor, 25 Aug. 1758, the Russians losing 21,529 men and the Prussians about 11,000. See SEVEN YEARS' WAR. Pop. 988.

**ZOROASTER**, religious reformer of ancient Persia. Termed Zarathustra in the Avesta or primitive Iranian code, and in later Persian Zardusht, its meaning has been variously interpreted—one of its roots is undoubtedly "camel." Its modern form Zoroaster was adopted from the Greek and Latin. The story of his birth and activities has little authentic basis, although his historic personality is admitted. All details are scanty, and it is impossible to distinguish between legend and fact, as is true in general of old time founders of religions, whose personality and exploits later ages have magnified out of all proportion to their real stature and deeds.

Greek and Roman writers make frequent mention of him as founder of the wisdom of the Magi and tell of his childhood and solitary life. Plato in his 'Alcibiades' (I, p. 122) makes one of the earliest references. Pliny, Plutarch, Dio Chrysostom are explicit in their accounts, which border on the miraculous. No mention is made, as might be expected, in the cuneiform inscriptions of the Achaemenids, the ancestral royal line of Persia, although Darius and his successors were loyal followers of the prophet. Darmesteter terms Zoroaster a myth, the incarnation of the storm-god. As Dr. Geldner states, however, the French scholar does not distinguish between the Zoroaster of the younger Avesta and of the Gathas, or "songs," in which the very words of the sage are expressed, his authentic sayings, the last survivals of the sermons which he spoke at the court of King Vishtospa. In these psalms, hymns, or songs, he appears as a man on solid ground, like some later world-prophet, with his alternation of confidence and despair, but with his hold on God firmly retained in all changes of fortune. The Gathas, on the other hand, furnish no precise historical data, merely a number of verses that allude to personal events interwoven with sage reflections and counsel—a kind of modern pastoral admonition. A comparison to the Psalms of David will illustrate this point of literary content to a certain degree.

Admitting, then, his historical personality, what do the Persian traditions tell of his origin? His father bore the title Spitama, indicating a noble line; his mother's name, too, is mentioned. His birthplace was on the hill of the river Darga (Darya). Another legend traces his birth to Ragha in Media, the seat of the imperial hereditary church in Sassanian times. Like others of his type—Mohammed, for example—he had heavenly visions in early years and conversed with archangels and the Highest. At the age of 30 he had a celestial vision on the banks of the river. An angel invited him to a conference with Mazda, or the Highest, a symbol of the new era and religion which he was to found, abolishing the crude notions of his age and environment and developing a loftier ideal of the Supreme and humanity. Sent by Mazda to the court of King Vishtospa, king of Bactria in epic legend, he suffered indignities at first and was thrown into prison—how familiar these points in the

narrative! Then on gaining his liberty, he converted to the new faith the king himself, wife, brother and the two viziers, all of whom became ardent devotees and gave strength to the cause, despite the many severe trials it had to endure. Finally, on an invasion of the kingdom, Zoroaster was slain in his 77th year by a Turanian. His sons and daughters are frequently mentioned. As to the date of Zoroaster, the chronology is obscure. The time of his birth varies from the extravagance of Greek writers who place him 5,000 years before the Trojan War to the Parsee tradition, which puts his birth at 660 a.c. and his death at 583 b.c. Edward Meyer and Duncker give 1000 b.c. as date of his birth, after careful study of available sources.

While the doctrines in general of Zoroastrianism are discussed elsewhere, the personal declarations of its founder as expressed, as before stated, in the Gathas, are eminently quotable. His conviction of his mission and its sacred message is breathed in the words: "I am thy chosen one from the beginning; all others I consider my opponents." "To thee I cry: Behold, O Lord, and grant me assistance, as a friend grants it to a dear friend," so sounds his appeal. "Tell me right, O Lord—will the good deeds of men be rewarded already before the best life comes?" is his inspiring question. "Who sustains the earth here below, and the space above, that they do not fall? Who made the waters and the plants? Who has yoked to the winds the storm clouds, the two swiftest of things?" is in the spirit of Job's glorification of the Creator. Consult Jackson, A. V. W., 'Zoroaster, the Prophet of Ancient Iran' (New York 1899); Ragozin, Z. A., 'The Story of Media, Babylon and Persia' (New York 1888).

**ZOROASTRIANISM**, the religious system of ancient Persia as founded by Zoroaster, whose religious teachings are preserved in the Avesta, one of the world's oldest sacred books. The character of the Persian religion in pre-zoroastrian times has been a frequent subject of inquiry, but while nothing authentic is known, there is every reason to infer a certain similarity with the ancient faith of the Hindus. Iran and India were not so distant from each other as to make impossible communication one with the other. If we turn to Herodotus as informant (Hist. i, 31ff.) the Persians are said to have worshipped from antiquity the sun, moon and stars, the earth, the waters and the wind, the crassest polytheism. He intimates also that they borrowed some religious notions from Assyria and practised certain rites against which the prophet protested. His account too of the Magian ceremonies indicates that they were not inconsonant with Zoroastrianism. Ed Meyer in the *Reports of the Prussian Academy* (1908) shows how recently discovered Hittite inscriptions have a distinct bearing on the old creed of Iran, upon which the religion of the prophet was based, that Aryan folk-religion, polytheistic in its nature, many of whose divinities, Mitra and the rest, are not strangers in the Indian pantheon, while diversities as well as similarities abound in the theologies of both.

**Dualism.**—The first characteristic element of Zoroastrianism is its doctrine of dualism.

which personifies the opposing principles of good and evil, and recognizes the universal sway of these hostile forces. Briefly to describe this vital feature, the powers of good are led by Sharamazda or Ormuzd ("the Wise Lord"); those of evil by Ahriman ("the Spiritual Foe"). These opposing hosts, as if trained to combat and command by Oriental despots, have in their return an array of warriors, with the skill and persistency of actual armies. On one side are bands of angels and archangels; on the other companies of demons and archfiends. Under the general name of Amesha Spentas ("Immortal Holy Ones") are grouped the six archangels, who personify fundamental virtues and abstract ideas, and whose Persian names represent "Good Mind," "Perfect Righteousness," "Wished of a Kingdom," "Earthly Harmony," "Salvation," "Immortality." In addition, are a number of angels and lesser divinities, called "Worshipful Ones" who are more eminent than the rest, and include divine personifications of the planets, fire, air, water, the spirits of the righteous ("*fravashis*"), and some abstract notions like religion, glory, victory, Mithra, a divinity who incarnates light and truth. The opposing army, commanded by Ahriman, is less disciplined. Its chief archfiend is the demon *Æshma* (*Daeva*). A crowd of lesser fiends and demons ("*daeva*," "*druj*") accompany the six archfiends.

**The Millennium.**—The world's history is nothing but the story of the contest between good and evil, light and darkness, which shall endure for 12,000 years, divided into four periods of 3,000 years each. The first period is one of spiritual existence. Conscious that Ahriman lives, Ormuzd makes the world a spiritual creation before it assumes the material form. When Ahriman discovers his enemy at work, he arouses to life his army of demons and fiends. In the second Epoch Ormuzd creates the material world, which is invaded by Ahriman and his cohorts. The third period marks the contest for mastery between the rivals and the battle for the human soul until Zoroaster is born. A new Epoch is now commenced, as the fourth and last 3,000 years begins. The prophet and his three sons, to be born in ages to come, the last being the Messiah, liberally "he who will benefit and save the world," preside over the final eon. This dualism is an approach to monotheism, as it teaches the ultimate sway of Ormuzd—its hopeful philosophy of the world's regeneration is not to be overlooked. Throughout the conflict, man is the chief factor, for all depends upon his choice as free agent, of the good. The final aim of Zoroaster's system is to assure world perfection by the individual's adoption of the right path. This will come to pass, with the setting up of the "Good Kingdom," the "Wished for Kingdom," or the "Kingdom of Desire," as the Avesta expresses it. As the world enters the stage of regeneration, Ahriman forms his hosts for a final battle. They are defeated, and good is to reign forever. Accompanying the advent of the Messiah (*Saushyant*) occur the resurrection of the dead and the judgment of the world, to be.

**Code of Ethics.**—One sometimes over-

values old-time ethical codes, because we are apt to emphasize their good features. A study of the ethics of Zoroastrianism cannot but arouse admiration for their lofty qualities. They bear the stamp naturally of their environment, but in moral elevation do not yield to standards that we term modern and of which we are justly proud. A fair idea of their character can be gathered from the profession of faith required from converts and preserved in its entirety in the Avesta. These few paragraphs are condensed from Professor Jackson's translation in Ragozin's 'Media' (p. 111): "I forswear henceforth all robbing and stealing of cattle and the plundering and destruction of villages belonging to worshippers of Mazda. I promise householders that they may roam at will and abide unmolested, wherever dwelling with their herds; I swear this with uplifted hands. Nor will I bring plunder or destruction, not even or avenge life and limb. I confess myself a worshipper of Mazda, a follower of Zarathustra. I profess good thoughts, good words, good deeds"—which last phrase is the motto of the religion of Zoroaster and is found throughout his sayings and injunctions. Each day man must preserve the purity of body and soul. Earth, air and water are to be kept free from defilement. To speak the truth and act honestly are fundamental; to be kind and generous the highest duty. To till the field and raise cattle, are part of one's religious requirements. Marriage is insisted upon, even among kindred. The deed, the action, is the only source of salvation. God is manifested in virtuous thoughts, words, deeds.

**Ritual.**—In the Gathas, which, as before stated, is the scanty source of Zoroastrian personal teaching, there is little, if any, mention of ritual or ceremonials. He is less the law-giver there than the prophet, it has been aptly stated. Yet a full ceremonial worship developed, the priesthood was at the head and its office was hereditary, with the Mobeds and Herveds, the Levites and Kohanim of Zoroastrianism. The Magi were of Median origin. Annual sacrifices were originally offered but were less and less insisted upon as praise and thankgivings took their place with oblations of consecrated milk, water and bread. Lengthy litanies accompanied these rites, which were of special significance in connection with the preparation of "haoma," the sacred drink, like the Indian "Soma." A curious practice arose in the disposal of the dead. No bodies could be burnt, buried, or thrown into the water, as thereby defilement to the elements would be caused, they were consigned to high places, to be devoured by dogs and birds, a custom still in vogue among the Parsees and Gabars in their so-called "Towers of Silence." Practices of abstinence and asceticism, what is termed "mortification of the flesh" are not encouraged but are condemned as foolish and wicked and as strengthening the arch enemy's hands. The excessive reverence paid to Fire, which won for the Zoroastrians the name of "Fire-worshippers," was a later development as were numerous forms of incantation and purification.

**Resemblances to Judaism and Christianity.**—These are many and striking. Ahura-mazda, supreme Ruler, with the attributes of

omniscience, omnipresence and eternity, with creative power which he employs through his Spenta Mainya, or "Holy Spirit," with the host of angels and archangels in his train, suggests unmistakably the Old Testament Yahveh, especially in certain books, written under later influences, and which appeared more magnified in the Gospels. So Ahriman, Ormuzd's adversary, reminds one of Satan in later epochs, and whose future end is similar; these, too, are almost parallel ideas as to the world's regeneration the Messiah, the resurrection of the dead and everlasting life. Zoroaster receives his law from Aheramazda on the "Mountain of the Two Holy Communing Ones," as does Moses on Sinai. There are six periods of creation in the Avesta like the six days in Genesis, and a single pair, Moshya and Moshyana, like Adam and Eve. The deluge of the Bible is paralleled by the devastating winter. Shem, Ham and Japhet are recalled by the three sons in the Avesta. Similarities in ritual details are many and have been studied at length. Here as is usual the critics disagree. The larger number trace these analogies to the influence exerted on Judaism by Zoroastrianism during their period of the Exile, if not earlier. On the other hand, the contrary view, advocated by James Darmesteter, is held by some—that early Persian thought was influenced by Judaism, and that Neoplatonism, through Philo, left also its mark on the Avesta. It is impossible at present to decide definitely the point at issue; one must await fresh discoveries and identifications in the East, to give us more exact knowledge. Perhaps a common influence was at the root of both Jewish and Persian ideas.

**Historical Growth.**—While Zoroastrianism was the national religion of Persia, it was accepted by Turamans as well as Iromons, and spread to Armenia, Cappodocia and the entire near East. With the Sassanides, the national church was restored, and the priesthood became strongly organized with unlimited power and an authoritative religious lawbook. The head of the hierarchy, with his seat at Rai in Media, was next in power to the king. New sects now began to arise, but the Mohammedan onset in 636 with the persecutions that followed, spelled overthrow to the religion of Zoroaster. Today only a few followers of the prophet are found even in Persia. In and around Bombay the Parsees, limited in number, profess allegiance to him and his religion, but the creed has developed into a pure monotheism.

**Bibliography.**—In addition to Jackson and Ragozin as given above, consult Jackson, 'Grandriss der iranischen Philologie' (11.612ff. Strassburg 1896-1904); Karaka, 'History of the Parsis' (London 1884); Lehmann, 'Zarathustra' (Copenhagen 1899-1900); Moffat, 'Zoroastrianism and Primitive Christianity' (in *Hibbert Journal*, 1903, 1768-1780). As to analogies with Judaism, consult treatises by Kohut, Schoer, Stabe, while for the general student are the works of Schrader, Spiegel and West, E. W.

**ZORILLA Y MORAL, José, hō-sá' thōr-rēl'ya e mō-rāl',** Spanish poet: b. Valladolid, 21 Feb. 1817; d. Madrid, 23 Jan. 1893. He studied for the law at Toledo and Valladolid, but turned to literature. His attempts in poli-

tics showed him to be unfitted for such a career. From 1855 to 1866 he was in Mexico, latterly at the court of Maximilian. His plays, of which 'Don Juan Tenorio' is now the best known and is still a great favorite in Spain. Others are 'El zapatera y el rey'; 'Traidor, inconfeso y mártir'; 'El Alcalde Rouquillo' and 'El Rey loco.' The plays were hastily written and are without finish, but have continued effective through their strong appeal to national patriotism, and their adaptability to theatrical requisites. His 'Leyenda de Alhamar,' 'Granada' and 'Leyenda del Cid' were picturesque presentations of national legends in the general manner of Scott, and very popular. Zorrilla was not a careful artist, but an improvisator of great readiness and skill, both lyrical and dramatic. He suffered bitter poverty in 1871-83, for, although his plays were still highly successful, they were not protected by copyright. He later received a government pension of 30,000 reales; was awarded the gold medal of the Spanish Academy in 1885, and in 1889 was crowned national laureate at Granada. A bronze memorial was erected to him in Madrid in 1900. An account of him may be found in the autobiographic 'Recuerdos del Tiempo Viejo' (Old-Time Memories, 1880-83), which work, however, is not wholly dependable. His collected works were published (Madrid, 4 vols., 1895; 1905).

**ZOSIMUS, zōs'i-mūs** (Gr. Ζώσιμος), Greek historian of the 5th century A.D. He lived at Constantinople and wrote a history of the empire in six books, the 'New History,' which is frequently referred to by Gibbon. He begins with the change of constitution introduced by Augustus, and his first book brings him to the reign of Diocletian, 305 A.D.; in the second, third and fourth books the history of the 4th century is given with more detail; the fifth and sixth books are occupied with the period from 395 to 410. From internal evidence the work must have been written about 450-502. Zosimus was a pagan, and severely criticized the Christian emperors, making the change of religion largely responsible for the decline of the empire. His work is on the whole trustworthy, but his pagan bias in some instances leads him to various misinterpretations of the acts of the Christians. The best editions are those of Bekker (1837) and Mendelssohn (1887).

**ZOSTERA, a genus of marine plants. See EEL-GRASS.**

**ZOTAL. See MESCAL.**

**ZOUAVE, zoo-äv, a soldier in the French army. Zouaves were organized in 1831 and were originally mercenaries belonging to a Kabyle tribe. The Zouaves in the pay of the dey of Algiers were, when Algeria became a French possession, incorporated with the French army there, preserving their Arab dress. Ultimately the native element was eliminated, and the Zouaves became French soldiers in the picturesque Arab costume. As such they distinguished themselves in the Crimea, which was their first European service, and the Franco-Italian War of 1859. There were several regiments of Zouaves among the volunteer Federal troops in the American Civil War, so-called because of their wearing an adaptation of the costume of the French Zouaves. The**

Papal or Pontifical Zouaves were recruited from French soldiers at Rome in 1860 and under General Lamoricière, a former commander in Algeria, defended the temporal sovereignty of the Pope. They were unsuccessful against the Italian troops at Rome in 1870, and after serving in France against the Germans and the Commune they were disbanded in 1871.

**ZOUCHE, Richard**, English legal scholar: b. Anstey, Wiltshire, 1590; d. London, 1 March 1661. He was educated at New College, Oxford; in 1617 was admitted an advocate of Doctors' Commons, and in 1620 became regius professor of civil law at Oxford. In addition to his university duties he had a large practice in London. In 1641 he was made judge of the High Court of Admiralty. He was a Royalist, though not a pronounced one, at the civil war; and, although replaced in the judgeship in 1649, was nevertheless appointed by Cromwell to a special commission of oyer and terminer, and retained his academic appointments. He was regarded with some suspicion by both political parties; but after the Restoration he was appointed to the commission which reinstated the professors and Fellows of Oxford who had been removed under the Protectorate of Cromwell. On 4 Feb. 1661 he was restored to the bench. His writings include a descriptive poem, 'The Dove, or Passages of Cosmography' (1613); a comedy, 'The Sophister' (1639), and many works of a professional sort, most important of which are 'Elementa Jurisprudentiæ' (1629), a general system of legal science, and 'Juris et Judicii Fecialis Explicatio' (1650), regarded by critics as the first treatise containing a systematized arrangement of what is now known as international law.

**ZRINYI, zrēn'yē, Niklas (Miklós)**, COUNT, Hungarian soldier: b. 1508; d. Szigetvár, 7 Sept. 1566. He distinguished himself in the siege of Vienna by Charles V, and in campaigns against John Zápolya and Sultan Suleiman. As ban of Croatia from 1542, he defended that territory against the Turks, and became famous for his defense of Szigetvár (or Sziget) in 1566. His garrison of scarcely 3,000 was reduced to 600, and on 5 September the enemy succeeded in firing the outer fortifications. Zrinyi retreated to the inner fortress, but this also was soon on fire. He thereupon ordered the gates to be opened, and after firing a mortar filled with broken iron into the midst of the Turks, who were surging along a narrow approach to the castle, led a sally of the garrison. He fell, mortally wounded, and the defenders were forced back, but a slow match ignited 3,000 pounds of gunpowder stored within, and great carnage among the Turks ensued. The catastrophe has been made by Theodor Körner the subject of his 'Zrinyi: Ein Trauerspiel.'

**ZSCHOKKE, chōk'kē, Johann Heinrich Daniel**, Swiss author: b. Magdeburg, Germany, 22 March 1771; d. Blumenhalde, near Aarau, 27 June 1848. He left his native place in 1788, and for some time wandered about the country as play-writer to a strolling company of actors, but afterward studied at the University of Frankfort-on-the-Oder. In 1792 he began life there as a private teacher, and produced several pieces for the stage. He subsequently settled down in the canton of the

Grisons and became director of an academy at Reichenau, where he wrote a history of the Grisons (1798). He then became head of the department of public instruction at Aarau, and was soon afterward sent by the Helvetic executive directory to Unterwalden as government commissioner, for the purpose of restoring tranquillity. He acquitted himself so satisfactorily that his powers as commissioner were extended to the cantons of Uri, Schwyz and Zug. In 1800 he was appointed commissioner for the organization of the Italian territories of Switzerland. In 1804 he became a member of the board of mines and forests, and in the same year began the issue of his highly popular *Schweizerbote* (*Swiss Messenger*). Through the greater part of his life Zschokke appeared as one of the most distinguished and energetic public men in Switzerland, but he found time to cultivate his favorite literary pursuits, and it is chiefly by his numerous writings, historical and fictitious, that he is known to the world at large. Among his works may be mentioned 'Ueberlieferungen zur Geschichte unserer Zeit' (1811-27) (Contributions to the History of Our Time); 'Des Schweizerlandes Geschichte für das Schweizervolk' 1822) (History of Switzerland for the Swiss People), one of the best of his works, and 'Bilder aus der Schweiz' (1824-26) (Pictures from Switzerland). As a writer of tales he possesses a European reputation, and among them we may refer more especially to 'The Creole,' 'Alamontade,' 'Jonathan Frock,' 'Clementine,' 'Oswald or the Goldmakers' Village' and 'Master Jordan.' The work, however, which has had the most extended circulation is his 'Stunden der Andacht' (Hours of Devotion) (1809-16; 27 editions in his lifetime), which, though rationalistic, has yet, from the pious feeling pervading it, found admirers among all classes of readers. Editions of his works were published (40 vols., 1824-28; 35 vols., 1851-54), and an edition of his 'Novellen' (12 vols., 1904). Consult the studies by Münch (1831); Keller, 'Beiträge zur Politische, Thätigkeit Zschokkes' (1887), and Wernly (1894).

**ZUAZO, thoo-ā'thō, Alonso**, Spanish jurist in the New World: b. Olmedo, 1466; d. Santo Domingo, West Indies, 1527. A learned canon of Valladolid, he was appointed jurist of the commission which, at the request of Las Casas, was sent to the New World. He was given authority to organize justice in the West Indies, and to appoint judges. For his opposition to the complete abolition of enforced labor, he was denounced by Las Casas, although in Santo Domingo he emancipated the Indians who had been held in slavery by the officials. In 1518 he was dispatched to Cuba to systematize the administration of justice in the island, and from 1525 until his death was auditor of the audiencia of Santo Domingo. Icazbalceta, in the 'Colección de Documentos para la Historia de México' (1858-66), gives an interesting narrative, written by Zuazo from Cuba in 1521, regarding the condition of the natives there and in Santo Domingo.

**ZUBLY, John Joachim**, American Independent Presbyterian clergyman: b. Saint Gall, Switzerland, 1725; d. Savannah, Ga., 23 July 1781. The date of his arrival in America is

unknown, but in 1760 he became the first regular pastor of the Independent Presbyterian Church in Savannah, coming thither, according to the church record, from Wando Neck, S. C., where he was located prior to 1758. In 1775, at the provincial congress of 4 July, he was one of five delegates elected to represent Georgia in the Continental Congress, and was selected to draft a petition to the king regarding the "unhappy situation of affairs." In a letter of 3 Sept. 1775 to the Earl of Dartmouth, he denounced the suggestions made in England of arming the slaves to bring the Southern provinces to obedience. He took part in the adjourned session of the Continental Congress assembled 13 Sept. 1775. When he discovered the intention of the Congress to declare the independence of the United States, he revealed to Sir James Wright, royal governor of Georgia, the plans being made. One of the letters was seized, and Samuel Chase, of Maryland, referred to the fact on the floor of Congress. Zubly hastily withdrew, and in Georgia openly made common cause with the Tories. In 1777 he was banished, and half of his estate seized. He remained in South Carolina until the royal government was re-established in 1779. He then resumed his work as a pastor and continued it until his death, which occurred before the end of the war. He was an eloquent and learned preacher. Consult Jones, C. C., 'History of Georgia,' Vol. II (1883).

**ZUCCARELLI**, dzoo-kä-rél'lë, or **ZUCCHERELLI**, Francesco, Italian painter: b. Pitigliano, Tuscany, 1702; d. Florence, 30 Dec. 1788. He studied painting at Florence and Rome, and after gaining some success in decorative landscape, worked for five years in London decorating the Opera-House and executing views of the Thames. He returned to England in 1752 and became well known in London, where he was patronized by the royal family, especially the Prince of Wales, and the aristocracy. He was one of the original members of the Royal Academy in 1768. After 1773 he lived in his native country. He painted landscapes principally, his work inclining to the classic, the best examples of it ranking with that of his leading contemporaries; but he also executed much of an inferior quality. He frequently painted a tiny pumpkin as a signature, his name meaning "little pumpkin." Numerous examples of his art are in Venice, the Palazzo Reale containing 21. A large number, too, are in Windsor Castle, and he is also represented in Glasgow, Edinburgh, Paris (Louvre), Petrograd (Hermitage), Milan (Brera), and other cities.

**ZUCCARO**, dzook-kä'rô, or **ZUCCHERO**, Federigo, Italian painter: b. Sant' Agnolo in Vado (Urbino) 1543; d. Ancona, 1609. He studied under his brother Taddeo in Rome, and was employed by Gregory XIII to paint the vault of the Cappella Paolina in the Vatican, but having quarreled with some papal officials and painted a scurrilous picture he fled to France and ultimately reached England in 1574. There he painted portraits of Queen Elizabeth, the Earl of Leicester and other distinguished persons (21 were exhibited in 1866), and afterward worked in Venice until he returned to Rome to complete his work in the

Cappella Paolina. On the invitation of Philip II he went to Madrid in 1586 to paint for the Escorial, and on his return to Rome he founded the Accademia San Luca, of which he became the first president. Many portraits of English personages in the Elizabethan era are wrongly ascribed to him, but some genuine works from his brush are extant. He was also something of an architect and sculptor. His frescoes, painted on an enormous scale and crowded with figures, gave him a great reputation during his lifetime; but modern criticism places his easel paintings far above them. Among his easel-works are 'Deposition from the Cross' (Palazzo Borghese, Rome); 'Descent of Christ into Limbo' (Brera, Milan); 'Sir Walter Raleigh' (Kensington Gallery); 'The Resurrection' (Borghese).

**ZUCCHI**, dzook'kë, Antonio Pietro, Italian painter: b. Venice, 1726; d. Rome, 25 Dec. 1795. In 1754 he accompanied the English architect Robert Adam on his journeys in Italy and Dalmatia, and on Adam's invitation he went to England in 1766. He decorated the interiors of several of the mansions built or altered by Adam, such as Caen Wood (Hampstead), Luton House (Bedfordshire), Osterley House (near Brentford), and Sion House (Middlesex). In 1770 he was elected an associate of the recently established Royal Academy. He married M. A. C. Kauffman (q.v.), better known as "Angelica Kauffman," in 1781 and afterward lived in Rome.

**ZUCHETTO**, tsük-kët'tô, or **ZUCHETTA**, the skull cap of a Roman Catholic ecclesiastic covering the tonsure. That of a priest is black, of a bishop or monsignor purple, of a cardinal red, and of the pope white.

**ZUEBLIN**, Charles, American sociologist: b. Pendleton, Ind., 4 May 1866. He studied at the University of Pennsylvania, was graduated at Northwestern University in 1887 and at Yale in 1889, later studying at Leipzig. He became an instructor in sociology at the University of Chicago in 1892; was assistant professor in 1895; associate professor from 1895 to 1902; and was professor of sociology there in 1902-08. He edited the *Twentieth Century Magazine* in 1911-12. He is well known as a lecturer and magazine contributor. Author of 'American Municipal Progress' (1902); 'A Decade of Civic Development' (1905); 'Religion and a Democrat' (1905); 'Democracy and the Overman' (1911), etc.

**ZUG**, tsoug or zoog, Switzerland; (1) The capital of the canton of the same name, on the northeast shore of Lake Zug, 12 miles by rail northeast of Lucerne. It is popular as a pleasure resort and has fine scenery although it is located in the hilly rather than the mountainous part of Switzerland. The earliest mention of the town is in 1240. It has splendid old mansions and strong watch-towers; several interesting churches; a Capuchin monastery and a convent; a cantonal government building in Renaissance style; a fine town-house in late Gothic style, with a museum of antiquities; an arsenal; manufactures of cottons, enamel-ware, metal goods, tobacco, cigars, soap, etc. In 1435, 1594 and 1887 portions of the town sank into the lake. Pop. about 8,038. (2) A central and the smallest undivided canton

of Switzerland, bounded by Zürich, Schwyz, Lucerne and Aargau, and connected by rail with Zürich and Lucerne. The surface, which is generally mountainous in the southeast and south, where the Rossberg occupies the frontier, slopes more or less gradually north and west till it becomes comparatively flat. The portion of Lake Zug within its borders occupies 10 square miles; while Lake Ägeri, wholly within its borders, occupies two and three-fourths square miles. Of its total area of 92 square miles about 75 square miles are under cultivation. The battle of Morgarten, won by the Swiss 5 Nov. 1315, was fought within its boundaries. The climate, rigorous in the mountainous districts, is mild on the lower southern slopes. The chief exports are cattle, fruits, cider and "kirschwasser." Pop. about 20,013. (3) A lake chiefly in the canton of Zug, but partly also in Lucerne and Schwyz. It is 1,368 feet above sea-level; 12 miles long north to south, and varies in breadth from three miles to one mile at the centre. The shores are low in all directions except the south and southeast. In the former direction the Righi, with Mount Pilatus towering behind it, and in the latter the Rufiberg or Rossberg (5,195 feet), rise in abrupt and lofty precipices, presenting scenery of the grandest description. At the foot of the Rossberg the depth of the lake is not less than 650 feet. Steamers ply upon it, and the fishing, principally of pike and carp, is very productive.

**ZUIDER-ZEE**, *zī'dēr zē* (Dutch, *zoi'dēr-zē*), or **ZUYDER ZEE**, or **SOUTH SEA** (as opposed to the North Sea), Netherlands, a large gulf penetrating deeply between the provinces of Friesland, Overijssel, Gelderland, Utrecht and North Holland; about 80 miles long, 45 miles greatest breadth, but only 10 miles broad between Enkhuizen and Stavoren. The islands Texel, Vlieland, Terschelling, Ameland, and several smaller islands separate it from the North Sea, with which it communicates by various channels, the principal being Marsdiep, between the Helder and Texel, and the Vlie Strom between Vlieland and Terschelling. It contains the islands of Wieringen, Marken, Urk, and Schokland, and numerous sandbanks, especially in its northern portion; has on its shores numerous towns, and receives the waters of the Yssel, Vecht, Eem Kuinder, and other streams; but is generally shallow, and only navigable by vessels of small draft, much of its area being only three feet in depth, while its maximum depth, in the southern portion of the former lake, is only 19 feet. Oysters and plaice are plentiful. The Zuider-Zee is of modern origin, having been formed chiefly since the 12th century by successive irruptions of the sea. In earlier times there were here only a lake and marshes, the lake being called Flevo by Pliny and Tacitus. The reclamation of the greater portion of the Zuider-Zee has long been a pet project with the Dutch and plans for the work were formulated as early as 1886. But while the area thus available was much to be desired, financial considerations barred the way for many years. However, a bill authorizing the work which is to create a new province became a law 14 June 1918. The area to be reclaimed is 523,000 acres, of which it is estimated about

475,000 will be fertile. The completion of the work will require 15 years and the cost is figured at 66,250,000 florins. A dike is to be built from the island of Weiringen to the coast of Friesland, a distance of 15 miles; and the land then drained and prepared for cultivation.

**ZULIA**, *thoo'lē-ā*, Venezuela, the most northwestern state of the republic, surrounding Lake Maracaibo (q.v.), bounded on the west by Colombia and on the east by Falcón. It was formerly united with Falcón, but is now politically independent. Lake Maracaibo is surrounded by low lands, but a great part of the rest of the province is mountainous. Agriculture is the chief industry; coffee, sugar and cacao are raised. Area, 24,969 square miles; pop. 100,000. Zulia is also the name of a famous trade route connecting northeastern Colombia with the Venezuelan port of Maracaibo. The Zulia River forms a part of this route. The navigation of the latter river has often been the subject of international controversy between Colombia and Venezuela.

**ZULOAGA**, *thoo-lō-ā'gā*, **Félix**, Mexican politician, president of the republic: b. Alamos, Chihuahua, 1814; d. Mexico, 1876. Having entered the national guard as a lieutenant, he fought against the Yucatan secessionists in 1842-43, on the conclusion of which he was promoted to the rank of lieutenant-colonel. In preparation for the war with the United States he directed the fortification of Monterey, Saltillo and the southerly approaches of the capital. From 1848 to 1853 he was not in active service. In the latter year he was promoted colonel, and subsequently variously employed. On 17 Dec. 1857 he conspired against the Liberal government, and finally on 11 Jan. 1858 the brigade of which he was the commander declared Comonfort (see COMONFORT, YGNACIO) deposed and Zuloaga president. Zuloaga entered on the office 23 January, and the "War of Reform" began, the Liberals being under the leadership of Benito Juárez. In December the garrison deposed Zuloaga, who finally resigned, and appointed as a substitute General Miramón (q.v.), who assumed office 2 February. In 1860 Zuloaga published a manifesto proclaiming himself constitutional president, but subsequently he came to an agreement with Miramón. When the French invaded Mexico in 1862, he withdrew, but in 1864 he returned and submitted to the empire and promised fealty to Maximilian. This promise he broke and attempted, in 1865, to overthrow Maximilian; but he was unsuccessful.

**ZULOAGA**, **Ignacio**, Spanish painter: b. Eibar, a town in the Basque provinces, 1870. He is descended from a family of artistic craftsmen, his father having been a noted damascener (Placida Zuloaga), and his great-grandfather the organizer and director of the royal armory at Madrid. He was at first sent to Rome to study architecture, but subsequently turned to painting and spent five years in Paris. Here he devoted himself to the private study of the old Spanish masters, and produced his first work which was exhibited at the Paris Salon (1890). Zuloaga then returned to his native country, and after a long struggle for recognition, rose to the foremost rank as a truly representative Spanish artist.

He modeled his work on the style of the old Spanish masters, painting directly without preliminary drawings, with strong sure lines and splendid imagination. His works are to be found in the leading cities of Europe and also in the United States. The American Hispanic Society, which presented an exhibit in the United States in 1908, possesses a half-portrait of Zuloaga, 'The Gypsy Bull Fighter's Family' and 'Mlle. Lucianne Bréval as Carmen.' Canvases that are well known abroad are his 'Avant la Corrida' (Brussels Museum); 'Don Miguel' (Vienna Gallery); 'Portrait of a Lady' (Pan Museum); 'Amies' (Barcelona); 'Madame Louise' (Venice); 'The Topers' (Berlin). Zuloaga has also painted a number of pictures in propaganda for the arousing of his country to a national consciousness of the evils which beset it, principally from the excessive power of the church and the degrading indulgence in bull-fighting. The most striking of these are his 'Cardinal'; 'The Victim of the Feast'; 'The Idols of the People'; 'The Brotherhood of Christ Crucified.' In 1917, exhibits were held in several cities in the United States, which won enthusiastic praise. Among those which were particularly noticed were 'Portrait of Maurice Barrés'; 'My Uncle Daniel and His Family'; 'Anita Ramirez'; 'Basque Peasant,' and several fine portraits of ladies. The colors used are generally sombre, occasionally heightened by bright contrasting hues. The treatment of the subject is intensely realistic, often brutal in its impassioned sincerity. Yet his work always makes, through its imaginative quality, a certain spiritual, almost mystic, æsthetic appeal. The choice of detail is deliberate and careful; and the subject matter well conceived and arranged. Consult Brinton, Christian, 'Modern Artists' (New York 1909); Utrillo and Others, 'Five Essays on the Art of Ignacia Zuloaga' (New York 1909); 'Catalogue of Paintings by Ignacia Zuloaga, Exhibited at the Hispanic Society of America' (il.); Sargent, J. S., 'Ignacio Zuloaga,' and Wyer, R., 'Ignacio Zuloaga's Exhibition' (in *International Studio*, December 1916).

**ZULULAND**, zoo'loo-lánd, South Africa, a country lying on the southeast coast of Africa, now a province of Natal, and since 31 May 1910 a part of the South African Union; it is bounded on the north by Portuguese East Africa and the Transvaal and on the west by the Orange Free State. Area, 10,424 square miles. The principal rivers are the Tugela, on the Natal boundary; the Buffalo, which joins the Tugela on the left, about midway up the Natal frontier, and forms the remaining portion of the boundary between Natal and Zululand; and the Umvolosi, which flows into Saint Lucia Bay. From the coast at Saint Lucia a range of mountains called the Libombo range runs northward nearly parallel to the coast, separating the country into two regions. The coast region is malarial, but fertile, and is cultivated chiefly by the whites. The inland region is comparatively healthful and is fertile. Rich gold reefs have been found, and excellent coal exists. The coal is being worked and a railway has been constructed for 98 miles along the coast, extending north from

Durbar. There are great plantations of sugar, tea, cereals, fruits and vegetables. The country, which was on 30 Dec. 1897 annexed to the colony of Natal, is mainly inhabited by the Zulus, who have long been distinguished as the most warlike of the Kaffir tribes. The country inhabited by the Zulus was formerly much more extensive. In the beginning of 1879 the Zulu king, Cetewayo or Ketchwayo, with a large army of fairly disciplined troops armed with rifles, came into collision with the British in South Africa. This was partly due to a long-standing dispute as to the claims of the Zulus to the Utrecht district in the southeastern angle of the Transvaal, partly to other causes, which at last induced Sir Bartle Frere, the governor-general of the British provinces in South Africa, to send an ultimatum to Cetewayo. To this no reply was sent, and war ensued. On 22 January a portion of a British column was attacked at a place called Isandula or Isandhlwana, about 10 miles from Rorke's Drift on the Buffalo, by 20,000 Zulus, and completely destroyed. As soon as possible after the news of the disaster reached England, strong reinforcements were sent out, and on 4 July following the Zulu army was totally defeated at Ulundi. On 28 August Cetewayo was captured. Meanwhile Sir Garnet (later Lord) Wolseley had arrived with supreme military and civil authority in this part of Africa, and the Zulu territory was parceled out by him among several chieftains who were placed under the paramount supremacy of the British government, and were not to be allowed to keep up standing armies or to import firearms or ammunition. British residents were appointed, one in North and one in South Zululand. In 1883 Cetewayo was restored to a portion of his dominions, but was opposed by some of the chiefs. After severe fighting he placed himself in the hands of the British at Ekowe or Eshowe, where he died in 1884. Subsequently the Boers of the Transvaal made themselves masters of a considerable portion of the territory and incorporated it with their own republic. In 1885 the British assumed a protectorate over the coast of the country and in 1887 annexed all the rest. Tongaland was later incorporated with Zululand and was annexed with it to Natal. An uprising among the Zulus occurred in 1906 and its leader Dinizulu was captured and later tried for high treason. He was imprisoned but afterward was pardoned and pensioned £100, about 219,606, of whom the whites number about 1 per cent. Consult Ingram, J. F., 'Natalia: History of Natal and Zululand' (1897); Stuart, J., 'A History of the Zulu Rebellion' (1906; new ed., 1913).

**ZUMALACARREGUI**, thoo-má'lä-kä-rä-gë, Tomas, Spanish soldier and Carlist leader b. Ormaiztegui, province of Guipuzcoa, 1788; d. Segama, Navarre, 23 June 1835. He distinguished himself in the war of independence, subsequently entered the regular army, became a lieutenant-colonel in 1825, and later colonel Ferdinand VII made him governor of Ferrol, but Cea Bermúdez, the prime-minister, removed him. Soon after the death of Ferdinand, he became the head of the Carlist bands in the Basque provinces and Navarre. With great

ability he organized these troops into a really formidable force, and wielded them with remarkable success against such generals as Valdés, Quesada and Rodil. Finally, when the constitutional army had been signally outfought Don Carlos, against Zumalacárregui's advice, determined to attack Bilbao. Zumalacárregui's plan was to march upon Madrid by way of Victoria and Burgos, and he regarded the siege of Bilbao as a waste of time. It was during the operations there that he received the wound from which he eventually died. He was the most able figure of the first Carlist War. Consult Henningsen, 'Twelve Months of Campaign with Zumala-Cárreguy' (London 1836).

**ZUMARRAGA, Juan de**, thoo-mär'rá-gá, Spanish prelate in America: b. Durango (Biscay), 1468; d. Mexico, 3 June 1548. He was for many years guardian of the convent of Abrojo in Spain, and in December 1527 was appointed bishop of the newly established see of Mexico. He greatly developed the Mexican missions, but directed considerable misguided zeal against Aztec manuscripts, which he gathered together all over Mexico and publicly burned. Only comparatively few escaped this destruction. His see was elevated to an archbishopric in 1548. He left many letters and other literary remains, a considerable number of which appeared in the 'Cartas de Indias' (Madrid 1877).

**ZUMBO**, South Africa, a town of Portuguese East Africa, near the confluence of the Loangwa with the Zambesi, and on the frontier line of North Rhodesia, 450 miles from the mouth of the Zambesi. It marks the western point of the Portuguese territories on the Zambesi, and was formerly the seat of an important trade, but its trade declined. In recent years the development of the territory adjacent and the general improvement of Portuguese East Africa has given a new impetus to Zumbo which has, in some measure, restored its commercial activity.

**ZUMPT**, tsoompt, **August Wilhelm**, German classical philologist: b. Königsberg, 4 Dec. 1815; d. Berlin, 23 April 1877. He was nephew of Karl Gottlob Zumpt (q.v.). He was a professor in the Friedrich-Wilhelms gymnasium of Berlin from 1851 to his death. Among his publications are editions of 'Rutilius Namatianus' (1840) and the 'Monumentum Ancyranum' (1845); 'Commentationes Epigraphicæ ad Antiquitates Romanas Pertinentes' (1850-54); and 'Studia Romana' (1859); 'Das kriminalrecht der Römischen Republik (1865-69)'; 'De Monumento Ancyrano Supplendo' (1869); and 'Der kriminalprozess der römischen Republik' (1871). The larger part of the last two volumes of the German edition of Ihne's 'History of Rome' is the work of Zumpt.

**ZUMPT, Karl Gottlob**, German philologist: b. Berlin, 20 March 1792; d. Karlsbad, 25 June 1849. Educated at Heidelberg and Berlin, he was, in 1827, appointed professor at the latter, where he did much effective work toward the improvement of instruction in the Latin language. Among his writings were a Latin grammar (1818; 13th ed. 1874); editions of Quintilian (1831); Curtius (1826; 1846), Cicero's orations against Verres (1831) and the 'De Officiis' (1838); 'Ueber den Stand der Bevöl-

kerung und die Volksvermehrung im Altertum' (1841); 'Ueber die bauliche Einrichtung des römischen Wohnhauses' (1842); 'Ueber den Bestand der philosophischen Schulen in Athen und die Succession der Scholiarchen' (1843); and several treatises, such as 'Die Religion der Römer' (1845). An abbreviation of the grammar (1824) reached a 9th edition in 1866.

**ZUÑI**, zoo'nē, N. Mex., Pueblo village about 40 miles southeast of Fort Wingate, near the western boundary of the state. The residents constitute a distinct linguistic stock and call themselves Ashivi. They are the descendants of the people of Cibola, recorded by the Spaniards. The Spaniards first visited them in 1539 and were driven away, but Spanish missionaries later gained considerable influence among them. In 1680 the Pueblos revolted against the Spaniards, and for 12 years they remained free from their authority. The villagers retain their ancient beliefs and ceremonies and are peaceful agriculturalists, weavers and pottery makers. With the Hopi they are regarded as the most truly typical of the Pueblo tribes.

**ZUÑI MOUNTAINS**, a detached range in Valencia County, N. Mex. The general trend is from southeast to northwest; length, 45 miles. The mountains do not rise more than 10,000 feet above sea-level, and this is only from 3,000 to 4,000 feet above the surrounding plateau. The range is heavily timbered. It is of geological interest on account of its isolation and the simplicity of the stratification.

**ZUÑI SALT LAKE**. This lake is in a large crater-like cavity in the plain 40 miles south of the Zuñi Indian pueblo in western New Mexico. The lake is encrusted with salt which is an important source of local supply. The Indians have used the salt for many centuries and regard the lake as sacred. Its diameter is less than a half-mile and on its shores rise two recent volcanic cones, one with a deep crater. The hole in which these features occur is a mile in diameter, 200 feet deep and rimmed by a low encircling ridge of scoria and rock fragments ejected from the hole, doubtless by a volcanic explosion.

**ZUNIAN**, or **ZUNYAN**, a Pueblo Indian stock of the New Mexico-Arizona region. Their tribal emblem is "the sacred water-spider," from the Indian name of which they are often called Shi-wi-nas. They are of the greatest interest to the ethnographer and student because they still retain to a great extent their primitive condition and culture. They are skilled in pottery-burning. They cultivate the arid regions and plant wheat, barley and corn in fields. Cattle, horses, sheep and pigs are kept. The language has a superior grammatical structure and traces of an earlier language, now dead, are to be found. The dances, festivals and other tribal customs differ little from other Indians of the pueblos. They have always practised monogamy. The ravages of smallpox and other diseases have reduced their numbers to below 2,000. See PUEBLO INDIANS.

**ZUÑIGA**, thoon-yé'gá, **Alvaro Manrique de**, Spanish viceroy of Mexico: b. Seville, about 1530; d. Madrid, about 1600. He entered Mexico in October 1585 as viceroy, and his adminis-

tration was, according to the historian, Juan de Torquemada, one of prudence and wisdom. A dispute with the audiencia of Guadalajara, however, on a point of jurisdiction, nearly precipitated civil war upon the colony. Philip II, on the basis of reports circulated by his foes, finally removed him in 1589, and directed Pedro Romano, the bishop of Tlaxcala, to investigate Zúñiga's government. Romano persecuted Zúñiga with great cruelty until 1596, when the latter sailed for Spain, where he was successful in getting revoked the sentence of confiscation pronounced against him.

**ZÚÑIGA, Dionisio de**, Central American missionary: b. Guatemala, about 1550; d. Chiapa (now in southern Mexico), about 1620. He became a Dominican in Chiapa province, and for the greater part of his life was a missionary among the Quiche Indians. He wrote a grammar of the Quiche language and prepared also in Quiche a volume of sermons and several religious treatises, besides translating Francisco Viana's works, originally written in the dialect of Vera Paz.

**ZÚÑIGA Y AZEVEDO, e ā-thā-vá(thō, Gaspar de**, COUNT OF MONTEREY, Spanish viceroy in America: b. Andalusia, about 1540; d. Lima, Peru, 10 Feb. 1066. He took vice-royal charge of Mexico, 5 Nov. 1595, and in 1596 sent an expedition in command of Sebastian Vizcaino for the exploration and occupation of Lower California. Vizcaino was hampered by lack of provisions, and returned after accomplishing little. By royal order, he was again sent out by Zúñiga in 1602, when he explored the coast of Upper California. In 1597 Zúñiga drove out William Park, an English pirate who had taken possession of Campeche. Among other expeditions organized by him was one commanded by De Oñate (see ONATE, JUAN DE) and Zaldívar to take New Mexico. During his administration in Mexico he was a benefactor of the natives. In 1603 he became viceroy of Peru, though he did not enter Lima until 1604.

**ZUNZ, tsunts, Leopold**, German Jewish scholar: b. Detmold, Germany, 10 Aug. 1794; d. Berlin, 17 March 1886. He studied at the university, to 1839 he was in Prague as preacher at the synagogue of Berlin; and in 1824-32 was editor of the *Spenersche Zeitung*. From 1835 to 1839 he was in Prague as preacher at the synagogue there, but in 1839 returned to Berlin to become director of the normal seminary, a position he held until 1850. In 1845 he was made a member of the board of commissioners for the promotion of the educational interests of the Jews. His writings are remarkable, in their age, for their broad view, their grasp of the subject, their clearness of presentation and their charm of language. He was the first to take up the scientific study of the Jews' rabbinical literature in his 'Etwas über die rabbinische Litteratur,' published in 1818; and his 'Die gottesdienstlichen Vorträge der Juden' (1832) is considered the authoritative work on the biblical exegesis and the homiletics of the rabbinical writings. Among his other works are 'Die Namen der Juden' (1836); 'Die synagogale Poesie des Mittelalters'; and 'Litteraturgeschichte der synagogalen Poesie' (1865).

**ZURBARAN, thoor-bā-rān', Francisco de**, Spanish painter: b. Fuente de Cantos, Estremadura, 7 Nov. 1598; d. Seville, 1662. He was educated in the school of Juan de Roelas in Seville, and early formed his style on that of Caravaggio. He is thence frequently known as the Spanish Caravaggio. He first brought himself into notice by a series of pictures for the chapel of Saint Peter in the cathedral of Seville, illustrating the life of the titular apostle; and about 1625 he executed his celebrated picture of 'The Glory of Saint Thomas Aquinas' (Seville Museum), which is esteemed his masterpiece, and one of the finest works in Spain. Another famous series is his 11 pictures illustrative of the life of Saint Jerome painted for the monastery of Guadalupe. No less famous is his series of three pictures in the monastery of Santa Mariá de los Cuevas, in Seville, which were produced on his return from Guadalupe. These pictures, which are now in the Seville Museum, represent the 'Virgin Extending her Mantel over a Group of Carthusian Monks'; 'Saint Hugo Surprising the Monks at a Secret Feast in the Refectory'; and 'Saint Bruno in Conversation with Pope Urban II.' His 'Crucifixion' (1527) in the church of San Pablo is a notable picture. As early as 1633 he signed himself painter to the king. In 1650 he executed for the palace of Buen Retiro the 'Labors of Hercules' in 10 pictures, now in the Madrid Museum. From this time on he seems to have been a great favorite at the court, though he continued to paint monks and church dignitaries with great spirit and faithfulness to truth, which have gained for him the position of one of the three greatest of Spanish painters. Though he painted several large compositions, he preferred small and simple ones, generally religious in subject. He especially made studies of the Spanish friar. His works are to be seen in some private collections, and in the galleries of Saint Petersburg, Pesth, Munich, Paris and London. Consult Bermudez, 'Diccionario de los más ilustres profesores' (1800); and Lefort, 'La peinture espagnole' (1894).

**ZÜRICH, zoo'rīk, Switzerland;** (1) a city, capital of the canton of the same name, situated at the northeast extremity of the lake of the same name. It is divided by the Limmat into unequal parts, forming an upper and lower town, connected with their suburbs by several bridges. The streets in the oldest quarters are narrow, crooked and dark, but have undergone considerable improvement. The principal buildings are the cathedral or Grosse Münster, on a hill near the right bank of the Limmat, a heavy massive structure in the Byzantine style; the Fraumünster, on the left bank of the river; Saint Peter's Church, with a fine tower and clock; the town-house; the town library, containing 130,000 volumes; the museum, with a collection of home and foreign periodicals, and a rich library; the university; the new Swiss Polytechnic School; the arsenal; the music buildings; the railway station; the theatre and the post office. Two public promenades add to the attractions of the city, besides a botanical garden and many smaller parks and walks connected with a variety of institutions, public and private. Manufactures of silk and cotton, including dyeing and calico-printing, are

extensive; those of candles, soap, tobacco, paper, leather and machinery are also considerable. Besides the university, founded in 1832 and having a professional staff of 150, and over 1,300 students in theology, law, medicine and philosophy, there are the Polytechnic School which is maintained by the government and in 1917 had a teaching staff of 262, Schools of medicine and of arts, secondary and elementary schools of all kinds, deaf and dumb and blind asylums, orphan and several other hospitals. Learned and other societies of various descriptions abound. Zürich is of great antiquity and early became a Roman station. In 1219 it was declared a free imperial city. The preaching of Zwingli in the cathedral made it the centre of the Swiss Reformation. Here, in 1443, the Swiss defeated the Austrians, and here also, in 1799, the Russians were defeated by the French. The Treaty of Zürich, signed here 10 Nov. 1859 by the plenipotentiaries of France and Austria, closed the Franco-Italian war by Austria's abandonment of her right to Lombardy. Pop. (1918), estimated 213,900.

(2) A northern canton bounded north by Schaffhausen and the grand duchy of Baden, west by Aargau, south by Zug and Schwyz, and east by Saint Gall and Thurgau; area, 666 square miles. Though not properly mountainous, it has on its south and southeast frontiers several lofty ridges, remarkable for their parallelism. Except the Lägern and adjoining heights, they have their longer axis from southeast to northwest and form a succession of terraces lowering gradually toward the north. The general slope is toward the left bank of the Hornli and the Schauenberg, both in the east. The general slope is toward the left bank of the Rhine, which drains part of it directly and part indirectly, by the Thur, Töss, Glatt and Limmat. Of the lakes, about 40 in all, the most important are those of Zürich, Greiffen, Pfeffikon, Türler and Katzen. The climate is on the whole temperate, but mists are prevalent, particularly on the lower grounds. In some parts the prevailing rock is the Jura limestone, but a more recent formation, consisting chiefly of marl and sandstone in almost horizontal strata, is still more largely developed. One remarkable feature is the immense number and magnitude of the granite boulders which cover the surface. The minerals are few and of little value. The soil, with the exception of a few favored spots, is far from fertile and hence, though the arable land is comparatively large and carefully cultivated, the corn produced falls short of the consumption. In some districts a wine of tolerable quality is produced. Wood seldom forms forests, but occupies many scattered patches and hedgerows. Game is scarce, fish almost superabundant. In no canton have manufactures made more progress. The great staples are silk and cotton goods. The inhabitants are almost all Protestants, and education is very generally diffused. Zürich was admitted into the Swiss Confederation in 1351 and readmitted in 1450, after a 10 years' alliance with Austria. The government, formerly somewhat aristocratic, became decidedly democratic in 1831. A new democratic constitution was adopted in 1869. Zürich holds the first place in the Swiss Confederation. Pop. about 550,000. (3) One of the principal

lakes of Switzerland, chiefly in the canton of Zürich, but partly also in Schwyz. It forms a long irregular curve, bending round from southeast to northwest, convex on the south and concave on the north side; greatest length, about 27 miles; greatest breadth, two and one-half miles; greatest depth, 469 feet. Its scenery is distinguished not so much for grandeur as for beauty. The mountains around, nowhere exceeding 1,700 feet above the lake, which is itself 1,342 feet above sea-level, commence in wooded heights and descend to the water's edge in gentle slopes, covered with vineyards, orchards, gardens, cultivated fields and verdant meadows, and studded over with country-seats and smiling villages. A considerable traffic is carried on upon the lake by means of sailing vessels and numbers of steamers. It is well supplied with fish. Its chief feeder is the Linth Canal (completed in 1816), communicating with the Wallenstätter-see. It discharges itself at the town of Zürich by the Limmat.

**ZURITA Y CASTRO**, thoo-ré'tá ē kās-trō, Geronimo, Spanish historian: b. Saragossa, 4 Dec. 1512; d. 3 Nov. 1580. He was educated at Alcalá, and in 1543, he was sent to Germany on a diplomatic mission to Charles V by the inquisitor-general of Aragón. Subsequently he was made councillor of state and secretary to Philip II. Appointed chronicler of Aragón, he traveled in quest of data through Spain, Sicily and Italy, and finally in 1562-80 published in six volumes his 'Anales de la Corona de Aragón' (continued by Argensola and Blasco-Lanuzá 1622). He also made important corrections, in, and additions to, Lopez de Ayala's (see AYALA, LOPEZ DE) 'Crónicas de los Reyes de Castillas.' For a biographical sketch and some correspondence, consult Dormer, 'Progressos de la Historia en Aragón' (1860). The 'Anales' was looked upon as a work of very great importance during more than a century after its publication, and several editions of it have been issued, notably in 1558, 1610 and 1669, and annotated editions of it have been published within the past 25 years.

**ZÜTPHEN**, züt'fēn, Netherlands, a former fortified town in the province of Gelderland, 27 miles northeast of Arnheim on the right bank of the river Yssel, where it is joined by the Berkel. Its chief edifice is the 12th century church of Saint Walpurgis. The town was at one time a member of the Hanseatic League, and had a considerable foreign trade. It still has an active home trade, more especially in sending grain and timber, both rough and prepared, down the Yssel. Pop. about 24,000.

**ZUYDER ZEE**. See ZUIDER-ZEE.

**ZWEIBRÜCKEN**, tsvi'brük-ēn (Latin, *Bipontium*; French, *Deux-Ponts*, "Two Bridges"), Germany, a town in the Rhine-Palatinate, on the Schwarzbach River, 54 miles southwest of Mannheim. It was the capital of the mediæval Duchy of Zweibrücken, until the end of the 18th century. It is well built and has Protestant and Roman Catholic churches and a synagogue; gymnasium, a *realschule* and several other schools; courts and public offices occupying the former ducal palace; an orphanage and hospitals; manufactories of silk plush, machinery, chicory, tacks, chains, leather, etc.,

and a trade in corn and cattle. The edition of the classics known by the name of 'Bipont' was published here in 1779 and subsequent years. Pop. about 15,250.

**ZWEMER, Samuel Marinus**, American missionary: b. 12 Aug. 1867 at Vriesland, Mich. He graduated at Hope College, Holland, Mich., A.B. 1887; B.D., New Brunswick Theological Seminary 1890. He was ordained a minister of the Reformed Church in America 1890, and became a missionary at Busrah, Bahrein and other stations in Arabia 1891-1905, afterward residing in Cairo, Egypt. He was the organizer and chairman of the Mohammedan Missionary Conference, Cairo, 1906, and has traveled extensively in Moslem lands. He is the author of 'Arabia the Cradle of Islam' (1892); 'Topsy Turvy Land' (1902); 'Raymond Lull' (1904); 'Moslem Doctrine of God' (1906); 'Islam, a Challenge to Faith' (1907); 'The Moslem World' (1907); 'The Moslem Christ' (1911); 'The Unoccupied Mission Fields' (1910); 'Zig-zag Journeys in the Camel Country' (1912); 'Childhood in the Moslem World' (1915); 'Mohammed or Christ' (1915); 'Life of William Borden' (1916); 'The Disintegration of Islam' (1917). He is editor of *The Moslem World*, a quarterly review, New York.

**ZWICKAU**, tsvīk'ow, Germany, a town of Saxony, on the west bank of the Mulde, 60 miles west-southwest of Dresden. It has several interesting churches, among them two ancient Gothic types recently restored, that of Saint Mary, dating from the 15th century; a gymnasium with a library; a town hall built in 1581, which has archives dating from the 13th century, and an old castle converted into a penitentiary. The chief source of its wealth is the rich coal beds in the vicinity, employing 8,000 miners, and yielding annually 2,500,000 tons of coal. The mines were known as early as 1348 but have been worked only since 1826. There are also manufactures of linen and cotton goods, dyes and chemical products, numerous tanneries, dye-works, bleach-fields, oil, saw and other mills, and a considerable transit and general trade. It was the birthplace of Robert Schumann, the composer. See ANABAPTISTS for the "Prophets of Zwickau." Pop. about 73,538.

**ZWINGER**, tsvīng'ēr, Theodor, Swiss scholar: b. Basel, 2 Aug. 1533; d. there, 10 March 1588. He studied at Basel and at Paris, and after a course in medicine at Padua, became a member of the Basel medical faculty. He lectured there on Greek in 1565-71 and subsequently on ethics, and from 1580 was professor of the theory of medicine. Zwinger was a type of the universal scholarship of that time, and wrote a 'Theatrum Vitæ Humanae' (1565), a kind of general encyclopædia, then regarded as a marvel, but now having only a bibliographical interest. His 'Methodus Apodematica' (1578), contains material valuable for local history. Consult 'Athenæ Rauricæ' (1778), which contains a list of his writings.

**ZWINGER**, The, a public building in Dresden, containing a valuable collection of works of art and scientific treasures. The word Zwinger is a general name for a prison or any confined place.

**ZWINGLI**, zwing'lē, Ger. tsvīng'lē, or **ZUINGLIUS ULRICH**, a celebrated Swiss reformer, was a contemporary of Luther (q.v.), and was born at Wildhaus, canton of Saint Gall, on 1 Jan. 1484; d. Kappel, 11 Oct. 1531. Ulrich was the third of eight sons of the bailiff of that place. He studied at an early age in Basel and Bern, and continued his studies in Vienna, where he occupied himself with philosophy, and again in Basel, where he devoted his attention to theology, under the direction of Wyttenbach. In 1506 Zwingli became parish priest at Glarus, and here employed his time, as Luther had done in the Augustine monastery at Erfurt, in the diligent reading of the Holy Scriptures. He copied the epistles of Saint Paul in the original Greek, and even learned them by heart—an acquisition which afterward proved of great service to him in his public discussions. He accompanied the forces of Glarus during the campaigns of 1512, 1513 and 1515, in Lombardy, in the cause of the Pope against the French, in the capacity of chaplain, and was rewarded for this service by the grant of a pension from the Pope. In 1516 he became preacher in the convent of Einsiedeln, then a celebrated place of pilgrimage. Here he began to make known publicly his ideas of reform, preaching against the pilgrimage of Einsiedeln, which he termed an abuse and a corruption of the doctrine of the Christian Church, and calling upon the bishops of Sion and Constance to promote a reformation of religious doctrines, upon those points in which Zwingli considered that the Church had departed from the primitive teaching. Up to this time, however, his ideas of innovation excited no rebuke upon the part of the authorities, and he was, not long after, invited to Zürich, and entered on his office of preacher in the cathedral 1 Jan. 1519, with a discourse in which he declared himself for the use of the simple Scriptures without regard to the prescribed texts and lessons. At Zürich Zwingli delivered a series of sermons on the Holy Scriptures; and these discourses in which he inveighed against what he declared to be the errors and superstition of the times, laid the foundation for his future work of reformation. The occasion which launched him on his career was similar to that which had aroused Luther. In 1518 Bernadin Samson, a Franciscan monk of Milan, appeared in Switzerland to preach the indulgence proclaimed by Leo X. to all who should subscribe alms to the building of Saint Peter's Church at Rome. Zwingli, who was then preaching at Einsiedeln, opposed him there, and afterward in Zürich, with all the power of his eloquence, and brought the indulgences into so much odium that Samson was not even permitted to enter Zürich; and the Council of Zürich finally obtained from the Papal Nuncio the recall of Samson to render an account of his mission at Rome. From this time Zwingli gradually went further in his plans, supported by the Zürichers. In Zürich his innovations were so far promoted by the government that in 1520 a decree was issued ordering that the Holy Scriptures should be taught "without human additions." In 1522 the reformation was extended to external ceremonies. In this year Zwingli was forbidden to preach by the bishop of Constance. In it also he wrote his first work against the fasts of the Church and began the

study of Hebrew. In 1523 the government in Zürich invited all theologians to a public conference in Zürich, to convict, if possible, Zwingli of an error in doctrine. About 600 persons, clergy and laymen, were present at this disputation. Zwingli exhibited his opinions in the form of 67 propositions, which were to form the subject of discussion. The celebrated John Faber, the vicar-general of the bishop of Constance, refused to discuss any of Zwingli's propositions save the last one, which denied the supreme authority of the Church, whereupon the Council of Zürich decreed that Zwingli had not been convicted of error or heresy, and "might continue to freely announce the holy gospel and the Word of God according to the new order." In a second dispute Zwingli urged his objections to images and the mass and the former were soon afterward removed from the churches by order of the council and the latter abolished. In 1524 Zwingli married Anna Reinhard, a widow, and the next year published his commentary on "True and False Religion." The Reformation in Switzerland was now fixed upon a firm base; and Zwingli continued the work with undiminished zeal, warmly supported by the cantons which espoused the Protestant cause. The religious orders were suppressed and all questions of marriage were placed under the jurisdiction of the civil tribunals, as well as the administration of the Church revenues. In general, Zwingli agreed in his opinions with the German reformers; like them he assumed the Bible as the only rule of faith, rejected the Papacy, attacked the authority of the priesthood and declared that his object was to restore the Church to the simplicity of primitive times. His views differed on some points from those of Luther, particularly in regard to the real presence, and on some less important matters relative to the liturgy. In order to remove this wall of partition from between the two parties which adopted the new doctrines, a meeting between the Saxon and Swiss reformers was held at Marburg (1-3 Oct. 1529) at the suggestion of Philip, the Landgrave of Hesse. The former were represented by Luther and Melancthon, the latter by Zwingli and Ecolampadius. Although a complete union was not effected, yet a convention was agreed upon, the first 13 articles of which, containing the most important matters of religious faith, were recognized by both parties; and the 14th declared that, though they could not agree as to the real presence of Christ in the eucharist, they would behave reciprocally in the spirit of Christian charity. In 1531 an open war broke out between Zürich on the one side and the Catholic cantons of Lucerne, Schwyz, Uri, Unterwalden and Zug on the other; and Zwingli was commanded to take the field, bearing the banner of the canton, which it had been usual for an ecclesiastic to support. A battle ensued at Kappel, on 11th October. But the enemy were more than twice as strong as the Zürichers and under better officers; the latter were, therefore, defeated and Zwingli was among the slain. The spot where he fell is marked by a monument. The Reformed Church in Switzerland afterward received from the hands of Calvin (q.v.) its present organization. The collected

works of Zwingli were published at Zürich in 1545. A complete collection of Zwingli's writings was also published at Zürich in eight volumes in 1828. E. Zeller has attempted to deduce Zwingli's doctrines from his writings, 'Das theologische System Zwinglis dargestellt' (Tübingen 1853). There are numerous biographies of this reformer, for example, 'Huldreich Zwingli, sein Leben und Wirken' (1895-97) by Stähelin. Consult also Jannsen, 'History of the German People' (1903).

GEORGE E. RINES.

**ZWOLLE**, zwól'lě, Netherlands, capital of the province of Overijssel on the Zwart Water, 60 miles northeast of Amsterdam. Formerly it was a member of the Hanseatic League and was a strong fortress with 11 bastions and three forts. It is a well-built city, with handsome boulevards on the site of its ancient ramparts, and three fine suburbs. Its corn market is one of the best in Holland. Its chief buildings are Saint Michael's Church, dating from the 15th century, a large and splendid building with a famous organ; the government buildings with the provincial archives; the town-hall, dating from 1448, but since remodeled; and the courts of justice. The town has a Latin school, a school of navigation, an industrial school, a public library with rare works on geography and local history, a museum of natural history, a theatre, etc. Zwolle has communication with the sea by means of the Willemsvaart Canal and is the centre of the northern and eastern canal systems of the Netherlands. It manufactures oil, spirits, iron goods and linens, carries on shipbuilding and a trade in corn and cattle. In a monastery in the neighborhood Thomas à Kempis lived and died. Pop. 34,224.

**ZYLONITE, XYLONITE**, same as celluloid. See CELLULOID.

**ZYLONITE**, a material made by treating cellulose or vegetable fibre with nitric and sulphuric acids, dissolving the resulting pulp in camphor and then drying it. In its liquid state, collodion, it was used in surgical operations as early as 1848; in 1855 zylonite was manufactured by Alexander Parkes of Birmingham, England, and put on the market as parkesine. About the same time several factories for the manufacture of zylonite were established in France and Germany, England and the United States. In 1869 celluloid (q.v.), a kind of zylonite, was first manufactured and has entirely superseded all other forms of zylonite.

**ZYMOTIC DISEASE**, any disease caused and continued by a living germ introduced from without into the body and there multiplied. The term was formerly applied to epidemic and endemic contagious diseases because they were supposed to be produced by some morbid principle acting on the system like a ferment (Greek ζύμη). The chief of such diseases include measles, scarlet fever, smallpox, typhus, diphtheria, whooping-cough, croup and erysipelas (qq.v.). With the development of present theories and scientific knowledge of infectious disease, the term zymotic has been almost abandoned. See BACTERIOLOGY; DISEASE, GERM THEORY OF; MALARIA; NOBIOLOGY.
